All the varied experiences of trouble with telephone circuits caused by high tension line influence brings out one fact like the handwriting on the wall. That is that fuses, as ordinarily designed, are of little use. The voltage of the induced earth seeking currents is so great and the amperage is so exceedingly small that no fuse of the present designs for telephone work will operate. If the trouble is due to inductive disturbance the discharge will have passed so quickly and the current flowing will be so small that the ordinary type of fuse will hardly be disturbed. If, however, the trouble is due to contact with the high tension line, the arc established by the opening of the fuse will be maintained and more damage than good will result. Experiments are being made with specially designed fuses that are very much longer than the ordinary three and one-half inch fuse. The result of these experiments can, of course, only be determined by time and experience. As considerable trouble has been found in keeping the carbon cut-outs clear, there are being used protectors which have a pair of copper blocks, separated from each other by wires. Briefly, we must depend on a grounded lightning arrester for protection from the inductive disturbances, and on these specially designed crossings for mechanical protection from actual contact crosses. In this connection it will immediately occur to the competent installer to look to his grounds at substations and to make them the best he knows how. As for protection for the cables, there should, of course, be lightning arresters at the entering terminals of wires that are liable to be exposed to lightning or high tension discharges.

Attention was called in the first number of this article to the Power Company's telephone line, which is on the north line of the Power Company's double 33,000 volt transmission line. The protection on it was also described, and it was noted that when current was on the high voltage line above it, there was an induced alternating current of 700 volts on this telephone circuit. The writer talked over this wire last summer from New Milford to Waterbury and New Britain, and over the 60 miles of line the conversation could perhaps best be described as "poor commercial." With New Britain cut off and talking over about 35 miles of line to Waterbury telephone transmission was "fair commercial." Translated out of the telephone language one would say that conversation over the 60 miles of the Power Company's telephone line was hardly good enough to sell, but might be sold if the buyers' need was sufficiently great, and that communication over the 35 miles of line was salable, but was not the quality of goods that an up-to-date telephone company would put on the market. It is reported that the protection on this wire has not proved a success and that it has practically been eliminated. It is further stated that the employees at the power station stand on a highly insulated stool when they use their telephone line. In addition to this the Power Company is to lease a good circuit of the telephone company between the above points, all of which seems to go to

Digitized by Google

prove that telephone circuits on very high tension line poles are not a success.

A thoughtful review of the conditions which have been set forth brings us to a number of conclusions which are important results of the experience gained with these early installations. For the mechanical protection of the lines the short span crossing should be used in preference to all others, and the screen or underground crossing only as a last resort. Where the lines tend to parallel each other they should be separated by a distance at least slightly greater than the sum of the heights of the two-pole lines. Where this is not possible, efficient lightning arresters should be placed directly on the lines at each end of the exposed portions. In addition to this the cable terminals at which the lines enter and the subscribers' stations that are on these lines should have fuse and lightning arrester protection. While the fuse in the protector is not especially efficient as a protection from the high tension current influence, it should, nevertheless, be a part of the equipment, and on lines exposed to high tension crosses should not be located on the building, but on the pole from which the subscriber's service wire comes or in the service wire itself. Worthy of emphasis also is the importance of frequent and intelligent inspection of these protective devices to make certain that they are in proper working order. As all of the protective devices now on the market are designed for currents under 5,000 volts, any voltage over this should be considered as high tension and treated accordingly. If insulated screens are used, it should be borne in mind that their insulation should be as high as that of the power line, otherwise, their efficiency is destroyed. Also, when grounded guards are used they should be of such size as to burn off the high tension line at the instant contact is established without being severed by fusion themselves. Unless the grounds on these guards are as near perfect as may be obtained, the tendency upon contact with the high tension line is to continue to arc and not burn off. This means that anything short of a ground with practically no resistance is useless.

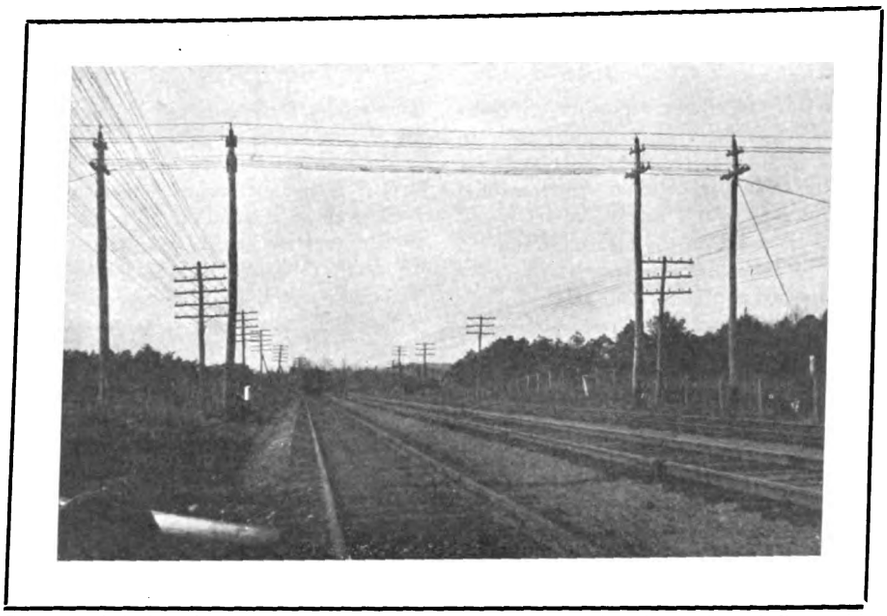

Fig. 11. A double high-tension crossing; 6,600 volt transmission line above telegraph lines, with screen beneath power wires.

The writer had thought to give figures on the cost of these crossings, but such figures would probably be of little value, as the cost of material and labor varies slightly in different parts of the country, and with the distance of the crossing from the base of supplies. Any telephone construction engineer can figure these costs for himself and his territory. The essential feature is to choose the type which shall give the highest economy through the most efficient protection.

Measured Service

By James B. Hoge.

THE method of charging for the telephone in the future will undoubtedly be that of measured service. All of the other public service corporations have been compelled to abandon the flat-rate plan of making charges and adopted a unit of measured basis. Over sixty per cent. of the patrons of the public service corporations think this the only just way of making charge for any commodity furnished, and they object to paying more than their share of the cost of such commodities where less than forty per cent. reap the benefit. In other words, the flat rate induces every one to be more or less extravagant in the use of the commodity. The forty per cent. that are compelled to use abnormal quantities of water, electricity, gas or telephone service would undoubtedly prefer a flat rate as long as possible, but the sixty per cent. that can get along with a reasonable amount of service will demand a fair charge on a measured basis for the commodity furnished them. The most striking illustration of this is the fact that practically all of the municipalities owning their own water works have already gone on a measured basis, or are seriously considering the matter of installing meters, and where they have been installed for a few months, so as to give the citizens an opportunity of trying them out, they have been found to give very general satisfaction.

The installation of proper meters or measuring devices entails a large expense on all of the public serving corporations, and yet it benefits them for the reason that it cuts down waste that cannot help but be costly to these companies. The meter system for telephone companies will be different in some respects from those in use by water, electric light and gas companies. It will be based on a minimum charge which will entitle the subscriber to a limited number of calls; all over that number to be paid for at a fixed rate per call. This will insure a sufficient revenue from each instrument to cover the cost of maintenance and fixed charges on installation expenses. The minimum charge and rate for additional calls will vary in different localities to suit local conditions. The adoption of this system will be an advantage to both the public and the telephone companies. It will correct many of the abuses to which the telephone is now subjected by many of the best meaning subscribers. Where the telephone is paid for according to the number of calls its use will be limited to necessary personal and social calls, and frivolous conversations will be largely eliminated. It will also have a tendency to do away with telephone borrowing, so-called. This is one of the most serious abuses of the telephone to-day. It not only annoys the subscribers to have non-subscribers ask for the use of their telephone, but it also ties up their lines so that important calls for them must be refused on the ground that their lines are busy. At present telephone companies are furnishing this service to non-subscribers gratis, which is not fair to invested capital.

Abstract from paper on "The Future of Independent Telephony," read before the West Virginia Association at the Parkersburg Convention.

Digitized by Google

The meter system applied to telephony, by putting the social use of the telephone on a business basis and eliminating other abuses which at present exist, will do much to increase the popularity of the instrument, and will at the same time have a great tendency to increase the number used by making it necessary for every user to have an individual instrument.

The Development of the Telephone Cable*

By Thomas Stanley.

THE requirements of toll line cables are somewhat different from those used for subscriber and local trunk lines. In the one case the length of the cable is small, while in the other it is apt to attain considerable proportions. On the other hand there does not exist in the case of toll line cables the necessity for crowding into a given sized sheath the maximum number of conductors. On account of the increased length care must be taken to reduce the resistance of conductor and static capacity as low as possible. The limit of transmission over a standard underground cable of the dry core type in which No. 19 gauge wire is used, is under the best conditions 60 miles. When, however, an additional length of subscriber cable must be used in making up the line, which is always the case in actual practice, the limit of transmission is reduced to about 35 miles. This latter figure has therefore been taken as the commercial limit of transmission of cable lines of the dry core type.

The first step in the development of a distinctly toll line cable was to increase the size of conductor from number 19 to number 16 B. and S. gauge. The next step was an attempt to reduce the static capacity by entrapping within the cable a greater amount of dry air. With this object in view a cable was constructed in which conductors were separated by small cork wedges placed at intervals equal to the lay. This arrangement is shown in Fig. 9 where the two conductors of a pair are shown at *a* and *b*, and the cork wedges at *c*, *d*, *e*, etc. When the cable was pulled through the duct, the mechanical shocks resulting therefrom dislodged the wedges so that in the end the cable was worse than useless. The cost of construction was found also to be excessive, so that for the present this scheme was abandoned.

A modification of this idea consisted of covering the conductors with a layer of powdered cork. But this plan also proved a

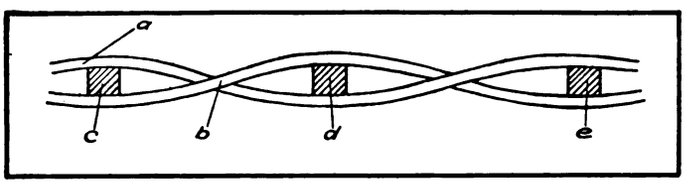

Fig. 9. Arrangement of pair with cork separation blocks, in special type of cable.

failure, and was very soon abandoned. The development of a toll line cable now lies in the direction of increased size of conductors. The advent of the Pupin load coils, by making it possible to counteract the effects of capacity by placing, at stated intervals, points of high impedance, has obviated the necessity of experimenting further along the troublesome line of reducing capacity. So that it does not seem possible that in the near future any radical changes will be made in this direction in the construction of toll line cables.

In constructing cables for submarine, or, more properly, subaqueous work, the same methods as those used in the transatlantic cables were, up to a few years ago, closely adhered to, and it has been within only a few years that any radical change in construction has been adopted. The points aimed at in the construction of the early subaqueous cables were: Flexibility to enable the cable to adjust itself to the uneven bottom; rigidity to render it proof against mechanical shocks; imperviousness to the entrance of moisture. To accomplish these ends, each conductor was made up of stranded wire, and the pairs were bound together with rubber tape, which served the double purpose of maintaining the flexibility, and also, it was supposed, of preventing the entrance of water.

The conductors were made up each of three strands of No. 22 B & S gauge soft drawn copper wire twisted together, and covered with an insulation of rubber compound 3-32 in. in thickness. Over the rubber was wound one layer of light tarred tape. In order to guard against the chemical action that would take place between the rubber and copper, the latter was coated with a layer of tin. The conductors forming a pair were twisted together, the lay not to exceed 4 inches. The pairs were laid up around a central core of jute called *"the filling."* The cable was bound together by two layers of heavily tarred jute serving, and over this was placed two layers of heavy tarred tape. Thus a cable was formed of altogether flexible material, and material of such sort as to resist the action of the water. In order to

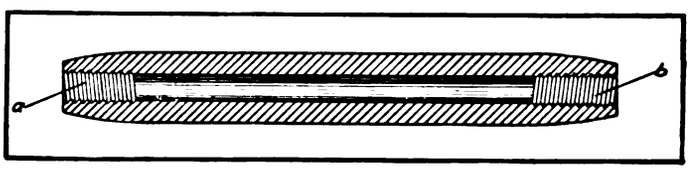

Fig. 10. Steel sleeve used for making a close and firm splice in armor wires in submarine cable.

gain sufficient rigidity, an armor consisting of iron wires, wound helically about the cable, was added, and on top of this were wound two layers of twine. The wire of which the armor was constructed was No. 4 B. W. G. galvanized iron. They were laid on close together in one layer, and the lay was about 24 inches. These armor wires, when necessary, were spliced with a sleeve nut of steel constructed as shown in Fig 10; a right hand thread being tapped at one end, as shown at *a*, and a left hand thread at the other, as at *b*. The two wires to be joined were introduced at opposite ends, and by turning the nut were drawn in so as to "butt." Solder was then run in between the sleeve and wire and a perfectly tight joint thus formed. In Fig. 11 is shown such a cable. One of the conductors is shown at *a* where the three strands can be plainly seen. The rubber insulation is shown at *b*, and the tape with which it was covered can be seen at *c*. At *d* is shown the jute filling, and at *e* and e^1 the two layers of jute serving. The armor wires are plainly seen surrounding the whole, and a joint in one of them, made by the sleeve nut, is denoted by *m*.

This type of cable had the following electrical properties. The static capacity was comparatively high, being as high as .275 M. F. per mile. The resistance of one mile of conductor is 28.372 ohms at 60° F., and the insulation resistance 250 megohms per mile after being immersed in water for 48 hours.

While this type of cable is referred to as old, it is still largely used, and it was only about one year ago that three or four of them were pulled out of the Hudson River at the crossing between Courtlandt street, New York, and Jersey City. The great objection to this class of cable lay in its high capacity, and attempts were made to change the material used for insulation. It was also found that even where the wires of which the conductors were made had a thorough coating of tin, chemical action between the rubber and the copper was sure to take place eventually. This local action resulted not from the fact that the tin was subject to corrosion, but because it could never be so carefully placed but that some slightly bare spot would result. Corrosion started at this point and caused the copper to be eaten away from underneath the tin on both sides of the weak point.

* Continued from the issue of December 30th, 1905.

Again, it was found the materials with which the cable was made were not impervious to moisture. A new type of cable was therefore made up in the same manner as that described above, with the exception that outside of the jute was placed a lead sheath of the thickness of ⅛ inch. Over this lead sheath was wound two layers of twine. This type of cable, while not so flexible as the one previously described, possessed the advantage of greater stability and tensile strength. It was perfectly impervious to moisture, and when removed, its junk value was considerable. A cable of this type is shown in Fig. 12.

A desire arose to do away with the iron armor for the following reasons: It was found that the greatest liability to mechanical injury came from the anchors of vessels catching underneath the cable, and either tearing it loose from the moorings or badly kinking it at the point of seizure. It was argued that iron armor offered little protection in these cases. Again the iron armor be it never so well galvanized was corroded by the action of the water to such an extent that after the cable had been in use for any considerable length of time the diameter of the wires was reduced and the tensile strength thereby decreased. A new type of cable was then developed in which the armor wires were replaced by a second lead sheath placed over the inner one. It was supposed that this outer sheath, taken in connection with the inner one, would be equally efficient in resisting mechanical shocks, and, being more flexible, would be less liable to cause the cable to be torn loose from the moorings when caught by a ship anchor. It would also be more easy to handle in both shipping and laying.

With the advent of the lead sheath and the consequent protection from moisture, rubber was replaced by paper as a means of insulation. The paper so used was saturated with asphalt and wrapped around the wire in the same manner as in underground cables with the difference that two layers were used laid in reversed directions. The saving of space owing to the difference in thickness between the rubber and paper insulation allowed of a greater number of conductors being placed in a given sized sheath than was heretofore possible. Since economy in diameter is not a feature in subaqueous cable work, the space saved by the change in material of insulation was taken up by a larger sized conductor. The presence of the lead sheath making it no longer necessary to have a flexible conductor, solid wire was substituted for the stranded wire heretofore used. The gauge was increased

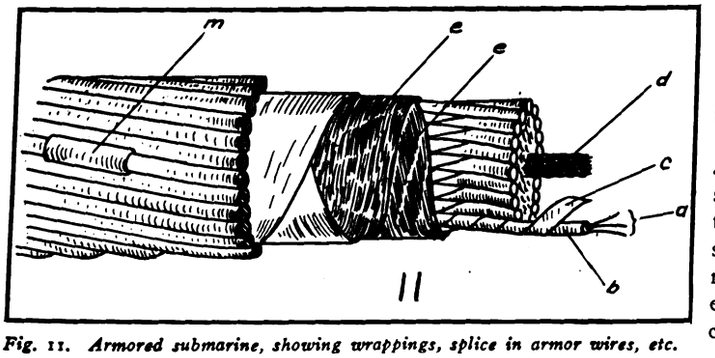

Fig. 11. Armored submarine, showing wrappings, splice in armor wires, etc.

to No. 16 B. & S. A sample specification for this type is as follows:

Conductors.—The conductors shall be of soft drawn copper No. 16 B. and S. gauge having a diameter of .05082 inches. They shall have a conductivity of 98 per cent. that of pure coper.

Insulation.—The insulation shall consist of manila paper saturated in asphalt and wrapped loosely in two reversed layers about each conductor.

Lay.—Each set of conductors forming a pair shall be twisted together, the length of the twist not to exceed 3 inches.

Serving.—The core shall be tightly wrapped with two layers of twine saturated with a bituminous compound.

Sheath.—The core shall be encased in a lead sheath containing 3 per cent. of block tin, perfectly continuous from one end of the cable to the other and being free from flaws or imperfections of any kind. The thickness of this sheath shall be at least ⅛ inch. Over this shall be placed a second or outer sheath of the same composition as the inner, of such a bore as to fit tightly and having a thickness of at least 5-32 inches.

Electrical Tests.—Each conductor shall have a resistance of not more than 24 ohms per mile when layed and ready for service at 60° F. The insulation resistance between each conductor and all others grounded on the sheath shall be not less than 500 megohms per mile at 60° F. after the cable has been layed and ready for service. The capacity between each conductor and all others grounded on the sheath shall not exceed .175 M. F. per mile after the cable has been layed and ready for service.

The double lead sheath cable received a set back shortly after it was introduced. Such a cable laid across the Hudson River from Fishkill to Newburg was injured shortly after being laid by the anchor of a passing vessel. It was found that the sheaths were punctured. A reaction set in against this type for general use, and at present they are only laid across small streams. Another type was developed in which armor wires were placed over

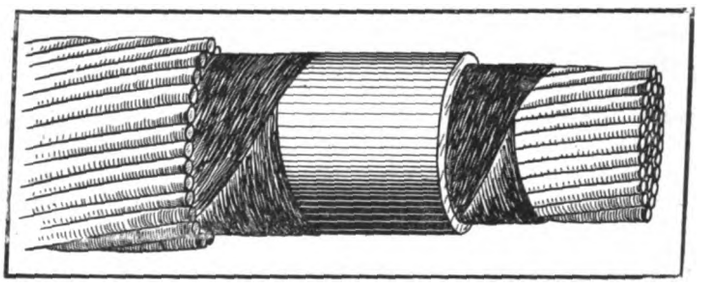

Fig. 12. Type of submarine cable using lead sheath, with jute servings and iron wire armor.

the lead sheath. In this case where only a single lead sheath is used, the following specifications apply:

Conductors.—The conductors shall be of soft copper No. 16 B. and S. gauge, having a diameter of .05082 inch. They shall have a conductivity of 98 per cent. that of pure copper.

Insulation.—The insulation shall consist of soft manila paper saturated in asphalt and wrapped in two reversed layers loosely about each conductor.

Lay.—Each set of conductors forming a pair shall be twisted together, the length of the twist not to exceed 3 inches. The pairs shall be laid up in reversed layers.

Serring.—The core shall be tightly wrapped with one layer of twine saturated with a bituminous compound.

Sheath.—The core shall be encased in a lead sheath containing 3 per cent. tin and having a thickness of 5-32 inch. The sheath shall be covered with three layers of tarred jute.

Armor.—The armor shall consist of galvanized iron wires No. 4 B. W. G., having a diameter of .238 inches. They shall be laid side by side, and wound helically around the core; the lay not to be less than 18 inches nor more than 22 inches. The armor shall be covered with two wraps of hemp laid in reversed directions, each to be saturated with a compound of 65 parts mineral pitch, 30 parts fine sand, and 5 parts water. The completed cable to be whitewashed to prevent its sticking to the reel.

Binding.—At intervals of 100 feet bands of No. 14 B. and S. sheet brass ¾ inches wide shall be wrapped about the armor, the joints being brazed.

Electrical Tests.—The resistance of each conductor shall be not more than 24 ohms per mile at 60° F. The insulation resistance of each conductor and all others grounded on the sheath shall be not less than 500 megohms per mile at 60° F. The capacity between each conductor and all others grounded on the sheath shall be not more than .175 M. F. per mile; all these conditions to hold after the cable has been laid and ready for service.

TEXAS ASSOCIATION TO MEET AT WACO IN APRIL.

MEMBERS of the Texas Independent Telephone Association will hold a convention at Waco from April 25 to 27. As the dates of the convention coincide with the Knights Templars' state meeting the members will be enabled to secure reduced railroad rates and the attendance should be large.

A Cumberland Confidence Game

A BELL GIFT WHICH COSTS THE SUBSCRIBER MORE THAN THE PATRON OF THE INDEPENDENT SYSTEM IN THE SAME DISTRICT PAYS FOR SERVICE FURNISHED ON A STRAIGHT BUSINESS PROPOSITION.

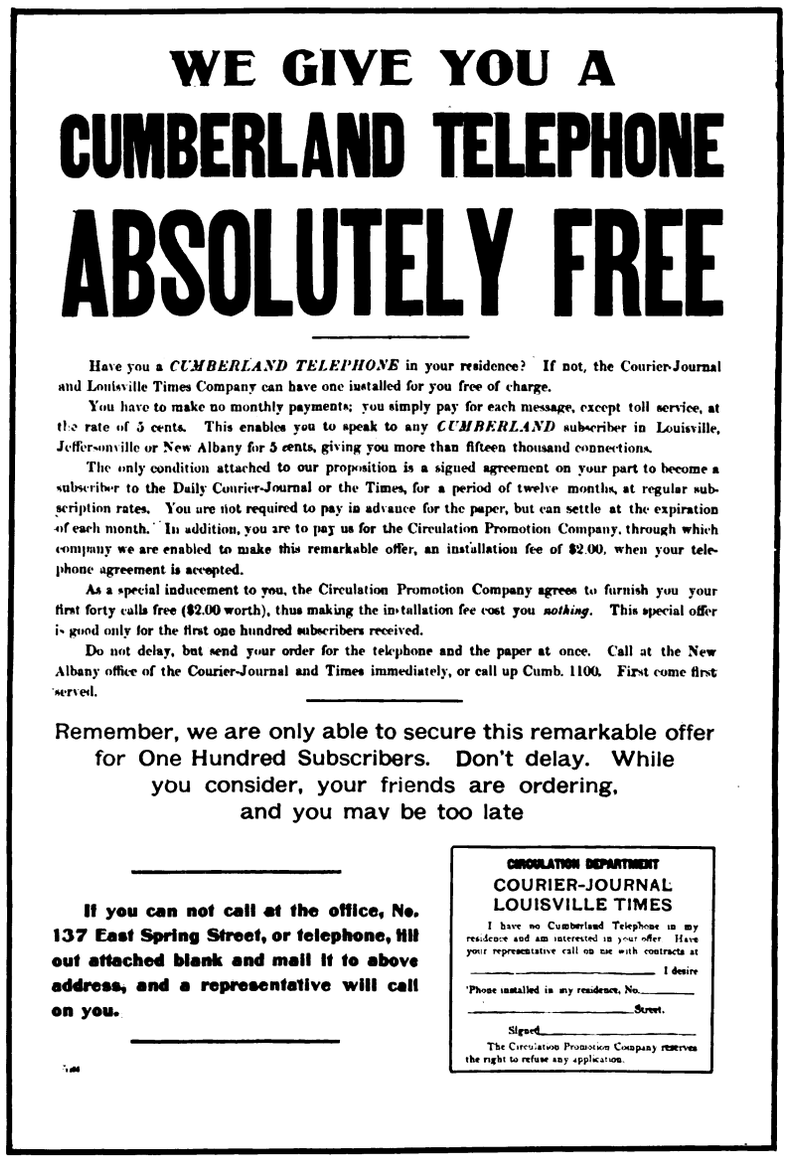
GRATITUDE is due to Bret Harte for the lines of the poem which so ably stamp the ways of the "Heathen Chinee" as peculiar, for they may well be applied to the devices of one of our leading Bell telephone companies.

Some time ago we mentioned a scheme into which the Cumberland Telephone Company had entered with the *Times* and the *Courier-Journal*, two newspapers in Louisville, Ky., for the purpose of increasing its subscription list. The plan upon the face was very alluring. Parties who contracted for a year's subscription to either of the newspapers were intended to understand at the time they made the arrangement that they might get a Cumberland telephone absolutely free.

In order to show exactly how the Cumberland intended to derive an exceptional profit from those unwary enough to seize this attractively prepared bait, further details of the purpose and meaning of this extraordinarily deceptive product of advertising ingenuity are herewith set forth:

Although by the terms of the offer as contained in the advertising columns of the paper a telephone might be expected practically free, an investigation of the actual conditions attached to the contract furnished under this arrangement would compel the signer to pay *for two calls a day, on a two-party line, the sum of* $46 *per year.* According to the terms of this remarkable *gift contract* a subscriber is required to guarantee the company $10 in case the telephones are destroyed by fire, and $15 if the instruments become injured while in his custody. For service, moreover, he is called upon to guarantee a revenue from not less than two calls a day, at five cents each. This amounts to $3 per month and $36 for a year. There must be added to these figures the price of a year's subscription to the paper, $8, which, with an installation charge of $2, brings the total up to $46. This is the minimum charge for two-party line service with slot machines, and *provides for only two calls per day.* Additional calls must be paid for at the rate of 5 cents each.

At new Albany, Ind., there were distributed early in March hand bills which purported to extend to the inhabitants of this place a similar offer. An examination of this poster will show that the possibility that knowledge of the "installation fee" had spread was foreseen, and an attempt made to sugar coat the pill. It is to be noted, however, that this is good for only the first hundred subscribers. The cautious inquirer will not need to look far into this statement to see a loop hole for a second deception in a place where the first is so obvious!



WE GIVE YOU A
CUMBERLAND TELEPHONE
ABSOLUTELY FREE

Have you a *CUMBERLAND TELEPHONE* in your residence? If not, the Courier-Journal and Louisville Times Company can have one installed for you free of charge.

You have to make no monthly payments; you simply pay for each message, except toll service, at the rate of 5 cents. This enables you to speak to any *CUMBERLAND* subscriber in Louisville, Jeffersonville or New Albany for 5 cents, giving you more than fifteen thousand connections.

The only condition attached to our proposition is a signed agreement on your part to become a subscriber to the Daily Courier-Journal or the Times, for a period of twelve months, at regular subscription rates. You are not required to pay in advance for the paper, but can settle at the expiration of each month. In addition, you are to pay us for the Circulation Promotion Company, through which company we are enabled to make this remarkable offer, an installation fee of $2.00, when your telephone agreement is accepted.

As a special inducement to you, the Circulation Promotion Company agrees to furnish you your first forty calls free ($2.00 worth), thus making the installation fee cost you *nothing.* This special offer is good only for the first one hundred subscribers received.

Do not delay, but send your order for the telephone and the paper at once. Call at the New Albany office of the Courier-Journal and Times immediately, or call up Cumb. 1100. First come first served.

Remember, we are only able to secure this remarkable offer for One Hundred Subscribers. Don't delay. While you consider, your friends are ordering, and you may be too late

If you can not call at the office, No. 137 East Spring Street, or telephone, fill out attached blank and mail it to above address, and a representative will call on you.

CIRCULATION DEPARTMENT
COURIER-JOURNAL
LOUISVILLE TIMES

I have no Cumberland Telephone in my residence and am interested in your offer. Have your representative call on me with contracts at _____. I desire 'Phone installed in my residence, No. _____ _____ Street.

Signed _____

The Circulation Promotion Company reserves the right to refuse any application.

Reproduction of Handbill Thrown Out in New Albany, Indiana, During the Early Part of March. The Original is Printed Upon a Sheet 12x18 *Inches in Size and the Words "Absolutely Free" are in Letters* 1 11-16 *Inches Tall. Note the Small Type in which Actual Costs are Set Forth!*

The excuse for the practice of such trickery may be stated in a single sentence: The Louisville Home Telephone Company gives first-class unlimited service on a two-party line for $24 a year. But one must be deeply prejudiced if he can make this justify the obtaining of subscriptions for its rival by such underhand methods as those in use.

That the plan is both weak and wicked may be easily seen. In the first place the proposition is so worded as to give the impression that the people would be actually able to get telephone service at a nominal cost. This is, upon investigation, found to be far from correct, Further, the phraseology of the advertisement is such as to cause a person to act without due consideration, and this, of course, is what is intended. Last, but not least, it appeals to a class of people who, if pressed with fair and legitimate arguments, would be found unwilling, if not unable, to pay the cost of such service.

After a deliberate analysis of this remarkable state of affairs it becomes self-evident that the Bell is forced to the last ditch, and is ready to take desperate measures to prolong its life. This means that the Cumberland is reduced to putting its service on the premium list. It withdraws from the number of those who place the furnishing of telephone connections in the highest rank of public service, along with the other great necessities of transportation, light and water. Forgetting its old cry of "good service at just rates" it puts its plant, erected at enormous cost, at the disposal of an unwilling public on the same terms as those on which gaudily decorated lamps and thinly plated silver are given with a few pounds of tea by the dealer who is allowed to rest but a few months in a town. These low business standards are sure forerunners of its utter destruction.

QUERIES

USE OF A SLOW ACTING RELAY.—(676.)

Will you please explain how a slow acting relay operates in a trunk circuit to give a disconnect signal? R. N.

We assume that the circuit to which you refer is an incoming trunk from a toll board, something similar to one of the standard circuits shown in the accompanying diagram, Fig. 676. This shows an incoming trunk from a toll board of standard type. Although there are various trunks for this purpose, using a slow acting relay, and with different arrangements of other parts of the circuit, the particular portion to which you refer is wired the same, and operates in the same manner in all of them. Its purpose is to enable the operation of a single relay in the talking strands to perform two separate controlling functions.

The circuit shown at the left is an incoming trunk to be connected directly to the subscriber's line by the insertion of the plug in his multiple pack. At the toll board end the trunk terminates in a jack, by means of which the toll operator may connect her cord with the trunk in the usual manner. The disconnect signal at the toll board, which is represented by the lamp O is controlled by a double wound relay, with windings N and P. The winding N is bridged directly across the strands of the cord circuit. The winding P, which is a secondary winding, is designed to lock the relay, as may be seeen from the circuit, when it has once been energized by the passage of current through the winding N. That is to say, a single impulse of current of sufficient strength passing through winding N will cause the lamp to be lighted, and to remain lighted until the locking circuit through winding P is broken. In practice this locking circuit, it may be stated, is broken by means of a special pair of contacts in the listening key, which open when the operator comes in on the connection to supervise.

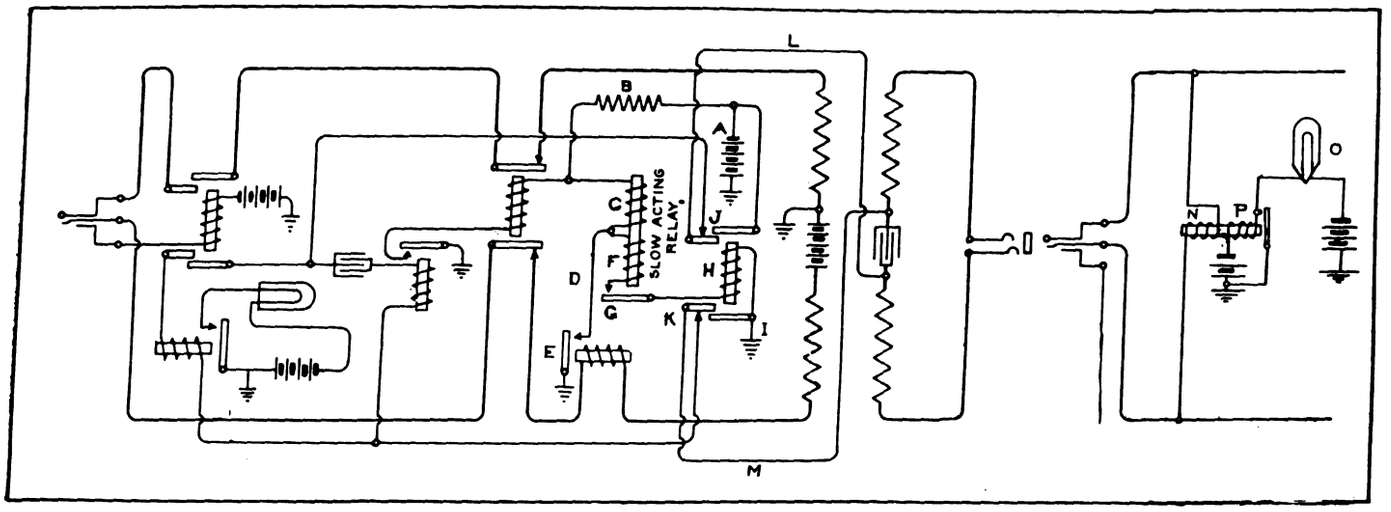

Fig. 676.

The method in which the slow acting relay operates to cause the passage of current from the trunk switchboard to the toll board to operate the disconnect relay is as follows: When the called subscriber is on the line a low wound supervisory relay, which is included in one of the talking strands of the cord circuit, is energized, and the ground connected to its armature E is brought into electrical connection with the central point of the winding of the slow acting relay. Current from the negative pole of battery, A, flows through resistance B and winding C of the slowing acting relay to this ground. This causes the armature of the slow acting relay to be drawn up and held, closing the contacts. It will be seen that when this condition of affairs is obtained there is a circuit from negative battery A through resistance B, windings C and F of slow acting relay, armature G, winding H of the cut off relay, to ground I. It will be noted, however, that a portion of this circuit between the central point of the winding of the slow acting relay and the ground I has considerable resistance, which is effectually short circuited by the path to ground through armature E of the supervisory relay. The winding H, therefore, will receive no current, and the cut off relay will not be energized during the time that the called subscriber has his telephone off the hook.

When he hangs up his telephone the disconnect signal should be given to the toll operator. It should be noted in this connection that the first disconnect signal is properly given to the toll operator, who supervises on the connection; and when she finds that it may be taken down she withdraws her plug, and this gives the disconnect signal to the trunk operator. It is the disconnect signal given to the toll operator, direct from the subscriber, with which we have to deal. When the circuit at the hook contacts of the substation instrument is broken, the supervisory relay allows its armature E to fall back, and removes the ground from the central point between the windings C and F. This permits the current to pass through both windings in series, also through the winding H of the cut off relay. As the windings C and F are so arranged as to neutralize each other, the passage of current through them both will tend to destroy the magnetism in the core of the relay, and cause it to release its armature. It is obvious, also, that the passage of current through winding H will cause this relay to draw up its armature, the effect of which is to throw current from the negative battery A and ground I, through contacts J and K, wires L and M, out over the line to the toll board, and to energize the disconnect relay through its winding N.

In order that this may be the result, it is necessary that the cut off relay shall operate very quickly, as the circuit through its winding is broken as soon as the armature of the slow acting relay falls away from its contact. The slow acting relay is so constructed that this is what actually takes place, an impulse being sent over the line by the operation of the cut off relay, which is almost immediately de-energized by the subsequent falling away of the armature of the slow acting relay, which restores the circuit to a condition which permits the disconnect signal from the toll board to be properly received by the trunk operator.

THE EDITOR'S PAGE

TELEPHONE NEWS SERVICE.

IOWA Independent telephone men have taken the first step in the establishment of an enterprise which promises to confer most important advantages not only upon their stockholders and subscribers, but upon all the citizens of the entire State. It is planned to systematically and completely gather local news from city and rural districts, and transmit reports each day to the leading daily papers for publication.

The project is a result of the growing demand on the part of the various papers for a system of gathering news which shall be more efficient than the one at present in operation. At the recent convention held at Des Moines a committee was appointed to confer with the press representatives, and an outline of the method in which the two interests should co-operate for the maintenance of this important public service was drafted.

The plan provides for the maintenance at a central point of a force which shall receive the news as it arrives in a continuous series of messages from the numerous outlying sources of information. The systematic use of the existing facilities in furthering this end is to be provided for as follows:

Each telephone station or farmer's line will be utilized for the transmission of reports to its central checking station. A certain number of these central checking stations will be assigned to a definite district, and to the headquarters of each district will be forwarded all reports received by stations located within its boundaries. From the district headquarters the news will be transmitted by telegraph, over simplexed telephone lines, to the general headquarters. At a predetermined hour each member of the press association will be placed in connection with all other members and with the distributing station, and the news for the preceding twenty-four hours, systematically classified, will be given out.

Newspapers will be able to derive most important advantages from this method of receiving reports. News will be gathered from sources in close proximity to the points where important events occur, by authorized persons. This, in itself, will be an almost invaluable aid to the securing of a complete and accurate service. Transmission will be accomplished without the loss of time which is attached to the present method of forwarding reports of matters of secondary importance by mail. The low cost of conducting this service compared to the plan involving the use of the telegraph and the duplication of messages to the various papers will bring about substantial economies.

The telephone companies will likewise be substantial gainers. The headquarters of the service will be established at the Clearing House. In this special service there will be realized, upon what is substantially a by-product of the regular use of the lines, a profit which it is expected will more than pay the entire expenses of the Clearing House Association, and is very likely to leave a sum for distribution amongst the supporting companies as dividends. As this amount will be obtained without the need of extra investment in construction, it may be set down as just so much additional profit on necessary investments. Moreover, its operation will tend to still further unify the great body composed of the interconnecting Iowa systems, and promote the feeling of community of interest which is doing so much to advance the progress of the Independent companies.

The details are being worked out by an organization which already has a firm foundation for the carrying on of the business, and its practical success is assured. When it is in effective operation it will confer upon the Iowa association a prestige which will still further emphasize the prominence of the state in Independent telephone development.

A CONSPICUOUS PRODUCT.

AS an example of apparent simplicity in complex objects the modern telephone switchboard deserves to take equal rank with the most conspicuous products of engineering skill. The highly satisfactory results which are to-day secured by switchboard designers are the result of numerous efforts to not only secure a simple, compact and accessible arrangement of a very great number of similar parts, but to combine in the manner best suited to the practical requirements of operation and maintenance a considerable number of diverse elements.

These elements, moreover, are of such a nature that the electrical and mechanical requirements which control their location must all be fully determined and carefully observed. For instance, in the designing of apparatus, these have an especial effect in relation to its bulk, which therefore is an important factor in the matter of its location. The various apparatus connected in the circuits in use in a modern switchboard call for insulation which shall be appropriate for alternating ringing current at a potential of about 100 volts, as well as for a direct signalling and transmission current of 24, 40 and 48 volts, according to the type of the board in use. This leaves wholly out of consideration the fact that somewhere in the switchboard must be run a circuit for lighting, which ordinarily carries the usual 110 volt lamps. The problem of insulation is one, therefore, which brings into effect important mechanical reactions, but it is not the only one, nor in fact is it the most serious one which has been overcome by the united efforts of switchboard engineers.

Those who have been connected with the work for a considerable time are able to tell of numerous instances of the most annoying and baffling troubles, which have been traced to inductive disturbances rather than to difficulties caused by leakage from one circuit to another. The necessity of avoiding such inductive troubles has made it necessary to consider the circuit of a line and all its various parts, not only those that are permanently connected, but those which enter into the connection from time to time when a cord is connected to the main line circuit, as a metallic pair, which must be free from twisted parallel wires at all times. This, although many of its details have not been of a nature to class them amongst the more important problems to be solved, has brought about a great deal of most careful work, in order that no cross talk might exist in a closely laid up cable, which is likely to have numerous branches giving opportunities for the splitting of pairs. The use of colored wires has permitted the development of a scheme which is of most substantial use in securing the correct arrangement, as laid down by the engineering force, which can be exactly and economically followed by the men who do the actual wiring in the shops. Further refinement in details may be noted by the consideration of the fact that a switchboard comprises movable parts which cover an extremely wide range, considered both in relation to the extent and the force of movement. When the high state of efficiency and economy, and the ease with which the apparatus may be installed and maintained are considered, the telephone switchboard assumes a leading place amongst industrial products.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

REFUSING SERVICE ON PUBLIC LINE.

A recent statute of this state fixes a penalty against telephone companies for refusal to furnish service within the territory in which telephone companies do business. We some time since took absolute control of a party line, running past the residence of a farmer, and refused to allow the farmer to connect or to furnish him a telephone. At the same time we did furnish the service which we refused to him to other farmers on the line; said farmers being located on all sides of the party to whom we refused service.

The question which we wish settled is this, to wit: Can this party so refused recover the statuary penalty when the facts in the case are as stated with the additional fact that the parties whom we took on the line objected to having the party on the line, and said to us that in case we took him on the line, they would withdraw from the company and go elsewhere? C. T. CO.

A TELEPHONE company is a common carrier of intelligence, and is bound by the same rules that apply to other common carriers such as railroads, express companies and steamers. As a common carrier, a telephone company is bound to furnish all who apply with telephone service. There is no exception to the rule even where other patrons of the company object to the applicant. It might be, however, that by ascertaining why the other patrons object to being on the same line with the applicant, you might find that their reason was a sufficient one to justify you in refusing. The justification must not be a frivolous one, or a pretext, but would have to amount to some reason making the use applicant proposes to make of his telephone an illegal one. An example of such an illegal use as would justify a refusal of service is that applicant proposes to use the telephone in a gambling establishment. For the rule that telephone companies are common carriers see Hackett v. State, 105 Ind. 250.

ORDINANCE FOR JOINT USE OF POLES UNFAIR.

AT Utica, N. Y., a referee has rendered a decision in the case of the Utica Home Telephone Company against the city of Utica, which was an action to enjoin the defendant from interfering with plaintiff's poles and wires on Dakin street in that city. The Utica Home Telephone Company, the Utica Gas & Electric Company and the Central New York Telephone Company, prior to 1905, were all lawfully maintaining their separate poles on the same side of Dakin streets. In May, 1905, the common council, being about to pave the street and construct a stone sidewalk which would occupy the place taken by the poles, directed the three companies to move to the north side of the street within five days and use the same poles. The Utica Telephone Company contended that the regulation requiring the joint use of poles was unreasonable and did not move its poles, although the other companies moved theirs. The common council then directed the city engineer to immediately remove the poles and anchors of the company and an injunction was at once obtained by the company. The referee held that if simply a transfer from one side of the street to the other had been ordered, giving the plaintiff the same rights on the north side that it had on the south, the regulation would have been reasonable and enforcible. The terminal pole of the plaintiff received its wires from a lateral subway and thence, from its cable box and numerous arms, the wires are distributed as the exigencies of the business required. The referee found a good deal of force in the idea that a company whose business requires such a pole should have the entire control of it, and should not be compelled to use it jointly with other companies, at least unless the requirement of joint use should be accompanied by regulations that reasonably insure the safety of employees and were binding on all parties. It was therefore held that the direction of the city for joint use was unreasonable, and an injunction was accordingly granted.

TELEPHONE LINES TRANSFERABLE AS REAL ESTATE.

We have a patron who sold his farm here and we want to know if his telephone would have to go with the farm, as nothing was said about it when the farm was sold. We built the main line along the public road. The farmer builds his line from his house out to our line. He also furnishes his own telephone, and pays us fifty cents per month for the use of our main line, and fifty cents per month for switching, making one dollar per month, so let us know if telephones in such cases go with farms when sold, or if it is customary for him to take down telephone and take it with him. G. T. E.

UNLESS the party erecting the telephone line and the party on whose land the line is erected agree otherwise, the telephone line becomes affixed to the real property and is considered as part of it. Therefore, when the real property is sold, and nothing said about the telephone line, the telephone line is naturally included in the sale, and is disposed of as part of the real estate. Upon these principles the editor considers that the telephone line in your case goes with the farm, as nothing was said about it when the farm was sold. The man selling the farm would not have the right to take the system down and take it with him. See the following cases: Amer. Union Tel. Co. v. Middleton, 80 N. Y. 408. Boston Safe Deposit & Trust Co. v. Tel. Co., 36 Fed. 288. N. Y., Ont. & Western Railway Co. v. W. U. T. Co., 36 Hun. 205. Shelbyville Water Co. v. People, 140 Ill. 545. Frechet v. Drake, 12 Pacific 694.

FRAUD CHARGED IN EXTORTIONATE RENTALS.

IN an answer filed in the Circuit Court to the Chicago Telephone Company's bill for an injunction, the Wapaul Electric Company accuses the telephone company of extortion in the rentals charged for special apparatus. The company is charged with fraud in demanding $50 extra for its metallic service telephones, and the answer asserts that the old Bell telephone is almost worthless.

The answer alleges that the Chicago Telephone Company by fraudulent representations extorts $175 a year for a metallic circuit telephone by pretending that the extra charge of $50 is necessary because of changing the circuit. It is charged that the installation of a new telephone often changes an apparent "grounded wire" service into a metallic circuit.

The answer declares that the charge of $30 a year for a desk extension is extortion, for the reason that the investment does not exceed $10 and the maintenance $1 a year. It asserts that the rental amounts to 300 per cent. a year, while 30 per cent. would be a reasonable return on the investment. The answer alleges that the company charges $3 a year for a button and buzzer which does not cost to exceed $1 to install and 20 cents a year to maintain, and that the switchboard, for which a rental of $6 a year is charged, can be installed for 50 cents. It is alleged that each of the company's "special arrangements," for which $6 to $20 a year is charged, are frauds of a like nature, since the apparatus involved need not cost to exceed $1 and nothing for maintenance.

IN THE OPERATING FIELD

INTERSTATE COMPANY TO APPLY FOR FRANCHISE IN CHICAGO.

BACKED by ample capital, the Interstate Independent Telephone and Telegraph Company is ready to apply for a franchise in Chicago. State Senator Henry H. Evans, of Aurora, president of the company, in a recent interview declared that he would have no trouble in securing the necessary capital for construction purposes, should the City Council decide for competition in the local field. He also stated that the proposed new service would place Chicagoans in communication with 50,000 residents of Illinois who are now using the Independent telephone service.

The company offers a flat rate of $80 for business telephone and $45 for residence service in exchange for a twenty-year franchise. It is willing to pay 5 per cent. of its gross receipts for compensation, and to set aside $10,000 in cash to secure the city from loss or injury during the period of construction. It will give a bond for $100,000 as surety.

The Interstate Company at present is in Whiteside, Kane and Will counties and in Springfield and Peoria.

An ordinance providing for the grant to the Interstate Indepent Telephone and Telegraph Company has been introduced into the City Council by Alderman Burns.

INDEPENDENT FRANCHISE UP FOR CONSIDERATION IN CINCINNATI.

AFTER a delay of over two months the application of the Queen City Home Telephone Company of Cincinnati for an Independent franchise has been taken up for consideration by the Council Committee on Railroads and Telegraphs. A large amount of statistics and general information relative to the value of two telephone systems has been presented to the board.

A great deal of this matter sets forth the advantages of competition and the great improvement in service together with the decreased cost resulting from the competition thus created.

There have been received numerous letters from residents in various cities where there is Independent service in which the writers state that they are decidedly in favor of a competing Independent company.

Philadelphia, Pa., and Cleveland and Hamilton, Ohio, are the principal cities which are used as a basis for argument.

ILLINOIS INDEPENDENTS ORGANIZE FOR MUTUAL ASSISTANCE IN BUSINESS.

SIXTEEN Independent telephone systems in the neighborhood of Galesburg, Ill., recently formed an organization for the purpose of co-operating with other Independent district organizations to fight the Central Union for toll and long distance business. Among the larger cities represented were Galesburg, Burlington, Canton, Kewanee, Monmouth, Macomb and Aledo.

The officers elected were: President, W. J. McQuiston, Monmouth; vice-president, C. M. Erwin, Macomb; secretary-treasurer, R. G. Roadstrum, Galesburg.

Measures were taken to connect with the systems of other districts and to promote a central clearing house.

Illinois is divided into nine districts, and this is the sixth, comprising the counties of Mercer, Knox, Henderson, Warren, Hancock, McDonough, Schuyler, Adams and Brown.

One of those present at the meeting was W. B. Burke, of Burlington, Iowa, representing the Mississippi Valley Telephone Company of eastern Iowa. He reported that within the next thirty days the line will be extended across the Mississippi River at Burlington, Iowa, which will place the Sixth Illinois district in direct communication with eastern Iowa, opening up direct long distance communication with Muscatine, Ft. Madison, Davenport, Ottumwa, Des Moines and other Iowa towns.

DEVELOPMENT ON PRINCE EDWARD ISLAND PROVIDES SATISFACTORY SERVICE.

FROM a report submitted at a meeting of the stockholders of the Prince Edward Island Telephone Company, it was learned there are upwards of six hundred telephones in operation, three hundred and seventy-five being in Charlottetown. During the past year a great deal of new construction has been done both in the town and country. Lines have been rebuilt and new toll offices opened.

During the coming year the service will be greatly extended, it being the object of the company to give the subscribers in rural districts every facility in the way of telephone communication. The officers who were re-elected are: B. Rogers, president; A. E. Ings, treasurer, and H. James Palmer, secretary.

REMEDY OF DEFECTIVE STATUTE URGED BY OHIO INDEPENDENTS.

PRESIDENT FRANK L. BEAM, of the Ohio Independent Telephone Association, has recently mailed letters to Independent telephone men in Ohio urging them to support a bill which has just been introduced in the legislature. This bill, if it becomes a law, will permit an Independent telephone company to enter Cincinnati.

The bill amends the present laws providing that companies beginning operation, as well as those already operating in a city, may be granted the right to construct conduits, lay cables and construct other underground facilities. By a technical defect in the law, as it now stands on the statute books, only companies at present in operation can be granted the right to lay conduits, and this has been taken advantage of to bar Independents.

In his letter President Beam says: "The bill is one to insure to newly organized telephone companies the right to occupy city streets with conduits and underground construction, and without this change in the law no new exchange can ever be constructed in Cincinnati."

NEW PLANT FOR INDEPENDENT COMPANY AT EVERETT, WASH.

PLANS and specifications for a two-story brick building to cost $20,000, prepared by B. F. Turnbull, have been accepted by the directors of the Farmers' Mutual Independent Telephone Company, of Everett, Wash.

The company has actively begun soliciting business among merchants, under the supervision of J. E. Friars, who will probably take the position of manager of the local office.

The plans represent a handsome front elevation in modern classic to be built of pressed brick and galvanized iron construction. The building will contain all the latest improvements known and will occupy a ground space of 50x64 feet. French plate glass windows will be used throughout.

A switchboard having a capacity for 7,000 telephones has been ordered, and the construction of the building will be started at once. Part of the first floor is to be arranged with a kitchen and dining room for operators, and the remaining space will be taken up by offices and public booths, and a resting room for the girls.

The second floor will be given up to the switchboard and the

INDEPENDENT TELEPHONE MEN IN FIFTH OHIO DISTRICT HOLD MEETING.

INDEPENDENT companies forming the fifth Ohio district held a meeting recently at Lebanon, Ohio. Owing to the absence of Mr. W. Gilbert Thompson, Mr. Frank Binkley was selected chairman. The convention was called to order at 1:30 and proceeded to elect the following officers for the ensuing year. W. Gilbert Thompson was re-elected president, and E. E. Williams secretary.

The convention chose the following delegates to meet at the State Association at Columbus on March 29: Clermont County, W. R. Fee, W. H. Baum, regulars; J. D. Wakefield, G. H. Eveland, alternates. Preble County, A. M. Fudge, S. A. Morton, Elam Fisher, regulars; Lee Lush, S. B. Douglas and J. S. Stewart, alternates. Butler County, W. Gilbert Thompson, J. C. Slayback, F. M. Hughes, regulars; O. M. Bake, Charles Griesmer and F. W. Whitaker, alternates. Oxford Telephone Company, S. H. Allen, regular, and E. E. Williams, alternate. Warren County, J. E. Stoops, Frank Binkley, regulars; M. C. Wykoff and Gibson Lowe, alternates.

W. Gilbert Thompson was chosen to represent the fifth Ohio district at the National Interstate Independent Telephone Association's convention in St. Louis in June.

MERIDIAN HOME TELEPHONE COMPANY FORTUNATELY ESCAPES LOSS FROM TORNADO.

OWING to the major portion of its line plant being underground, the Meridian Home Telephone Company suffered very little damage on account of the recent tornado at Meridian, Miss. When the city was subjected to the greatest damage the circuits were mostly run in underground cable. In the outlying portion of the town a large number of poles were blown down or broken off, but these are now almost all reset and the business is being conducted as usual.

MEETING OF THE IOWA INDEPENDENT TELEPHONE ASSOCIATION HELD AT DES MOINES.

PROJECTS which promise to be of substantial benefit to the Independent telephone men of Iowa were outlined at the recent convention.

The rapid advancement of the Independent movement in Iowa was shown by the fact that there were present about 250 delegates, and these men represented 126,000 Independent telephones.

Papers were read and discussion held on the following subjects: S. S. Lichty, of Waterloo, the president of the association, complimented its members on the progress made. He denied a report which had been published that the purpose of the meeting was to effect a combination. "Our Friend, the Farmer," was the subject of an address to be presented by Dr. Nelson, of Dayton. As he was not present the subject was discussed informally.

On the second day papers were read on "The Best Method of Handling Subscribers' Toll Accounts," H. A. Douglas, Cedar Rapids; "Care and Maintenance of Equipment," R. A. Walker, Iowa Falls; "Better Long Distance Connections," C. H. Smith, Sioux City; "The Clearing House," Geo. T. Hewes, Des Moines; "Our Needs in Iowa," E. E. England, Mount Pleasant.

Thursday was given over to the discussion of "District Organization," Charles C. Deering, Boone; "Tactics of the Opposition," J. H. Shoemaker, Waterloo; "Toll Service," George N. Bandy, Des Moines; "Manager's Experiences," G. T. Everett, Columbus, Neb.

A communication from President James B. Hoge, of the National-Interstate Association, called attention to the damage which has been done Independent companies which have entered into service contracts with the Bell interests.

Committees were appointed as follows: Auditing—F. M. Boardman, Nevada; Levi Baker, Shenandoah; E. E. England, Mount Pleasant. Credentials—D. M. Griswold, Des Moines; E. H. Martin, Webster City; F. Fischer, Shenandoah.

The officers elected are as follows: President, P. C. Holdoegel, Rockwell City; secretary and treasurer, Charles C. Deering, Boone; chairman of executive committee, J. S. Bellamy, Knoxville; chairman of legislative committee, U. S. Alderman; chairman of program committee, C. H. Smith, Sioux City; chairman of entertainment committee, H. S. Baker, Sioux City.

The matter of gathering news for the *Evening Press* association of Iowa during the hours of the day up to 2:30 p. m. was presented by J. H. Smith of Dubuque.

A committee was appointed to confer with the representatives of the *Evening Press* association on this matter. The next convention of the association will take place in Sioux City.

IF YOU ARE SUPPLYING

your operators' transmitters with any type of primary battery, you should have a duplicate set in reserve, both connected to a double throw switch. In case of trouble with one, you can then use the other without delay. The best switch for this purpose is the

Trumbull All Copper Knife Switch

It is made in both single and double contact types. If single contact is used, the positive or negative poles of each set of batteries are connected together and the common wire run direct to the transmitter. The other poles of the batteries are then connected to the knife blade contacts and the pivot point of the blade to the primary of the transmitter induction coil.
If a double contact switch is used, each set of batteries is connected independently to the contact points on one end or the other of the switch, and the pivot points of the blades to the transmitter circuit.
Just let us have your name on a post card and we will tell you why you should use the Trumbull switch and no other.

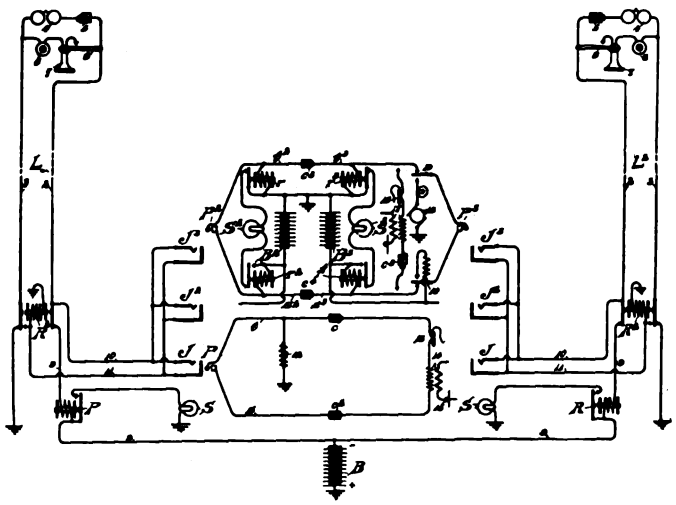
TELEPHONE PATENTS

TELEPHONE SYSTEM.

W. W. Dean, Chicago, Ill., patents (No. 814,118, dated March 6, 1906; filed June 15, 1905; serial No. 161,533) and assigns to the Kellogg Switchboard and Supply Company, Chicago, a telephone system.

This invention refers to a two-wire multiple switchboard and discloses means for testing the line circuits to determine whether they are in proper working condition or not.

Referring to the illustrations, one of the line wires 3 is normally grounded and wire 2 is connected to battery through the line relay



R and wire 9. Line 2 is permanently connected to the tip springs of jacks J, J^2, J^3. The testing cord is terminated in plug P, the tip circuit of which is grounded through retardation coil 12. Condensers c and c^2 provide for connection of an operator's listening set 13, 14, 15, if so desired. The test is carried out in the following manner:

When the plug P is inserted in either the multiple or answering jacks a circuit is completed from battery B, wire 9, line relay R, contact of cut-off relay R^2, wire 10, tips of jack and plug, cord strand t, retardation coil 12 to ground.

If the circuit is in working order the line relay will be energized and the line signal s illuminated. It will be noticed that this test is carried out without operating the cut-off relay or otherwise affecting the normal condition of the circuit. This circuit is intended to be used by an operator for ascertaining the condition of each line at the beginning of the day's business by a "morning test."

The operator's set is to enable a conversation to be carried on without the use of a separate cord. The cord circuit shown above is the regular circuit employed for connecting subscribers' lines and is here shown to indicate the normal operation of the line circuits.

GUY ANCHOR.

Lester D. Pitcher, Daytona, Fla., patents (No. 810,807; dated January 23, 1906; filed September 5, 1905; serial No. 277,044) a guy anchor. This invention relates to a type of anchor which is designed to be screwed into the ground. A shaft is provided with a spiral flange attached thereto by any suitable means, such as riveting. The upper end of the rod is formed into an oblong opening to receive a wedge, and also to serve as a point of attachment for the guy wire. In operation the device is screwed into the ground and when it has been sunk to the required depth the key is inserted transversely through the opening in the shaft and down into the ground to prevent the anchor from twisting out under the strain of the guy wire.

TELEPHONE ATTACHMENT.

Bernhard Ehrlich, Vienna, Austria-Hungary, patents (No. 814,680, dated March 13, 1906; filed May 3, 1905; serial No. 258,609) an hygienic protective attachment for telephones.

The principal feature of this invention lies in the use of sheets of antiseptic material which are fastened to the cap of the receiver in the form of a pad. Through the centre of this pad is an opening which corresponds with the opening of the ear piece. Before the telephone is placed to the ear the top sheet is torn off and thus a new, clean surface is always exposed for contact with the ear. A wire grating is provided to cover the opening in the ear piece for the purpose of excluding all foreign matter.

TELEPHONE SYSTEM.

Ralph Sherer, Eaton, Ohio, patents (No. 813,330; dated February 20, 1906; filed October 17, 1904; serial No. 228,785), a selective telephone system for party lines.

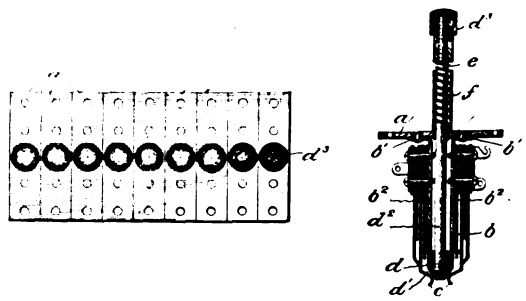
In this invention means are disclosed for preventing any other than the called party listening on a party line. This the inventor accomplishes by means of special mechanism operated by an electromagnet located in the subscriber's instrument, which cuts out all but the desired station. The control of the electromagnet is effected by a step by step mechanism designed to be actuated by a succession of rings from the calling subscriber or operator.

SWITCH KEY.

Edward B. Craft, Chicago, Ill., patents (No. 814,277; dated March 6, 1906; filed December 7, 1904; serial No. 235,851) and assigns to the Western Electric Company, of Chicago, Ill., a switch key.

In this invention a U-shaped supporting plate is employed to hold the contact springs and also serve as a guide for the plunger.

In the illustration this plate is shown at b, which is attached to



a frame plate a by projecting lugs b^1. To each of its sides are attached the necessary switching springs and through the base the plunger d projects. To the upper surface of the frame plate a a tube f is attached, which serves to enclose the spring e employed to retract the plunger after it has been depressed. The object of this invention is to provide a key of the vertical plunger type of such form that a number of keys may be compactly mounted side by side upon the key shelf of a switchboard. With this arrangement each individual key may be conveniently removed from above for purposes of inspection, adjustment, etc.

PIONEER INDEPENDENT TELEPHONE FACTORY
Established 1893 No. 58 West Jackson Blvd., Chicago

TO GET THREE OUT OF TWO SEEMS IMPOSSIBLE

Yet the Illinois and Sandwich Duplexers easily make two metallic circuits into three

Just stop and think what this means to you in increased facilities without spending a cent for new line construction.

Here are the facts in the case: By connecting our duplexers to the two existing metallic circuits a new one is formed which utilizes each pair of wires as one side of an independent metallic line.

To eliminate all noise due to induction we provide a very simple and efficient balancing device which requires no skill in its manipulation and which will make the new circuit absolutely quiet.

Seems almost too good to be true. Let us prove it by sending a set on 30 days free trial.

We know you are interested; therefore don't delay, but write to-day

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A DEVICE FOR CALLING ON RURAL LINES.

IN the operation of rural lines where a large number of subscribers are connected to the same circuit, it frequently happens that one party wishes to talk to another on the same line. In the act of signaling the exchange is notified, and this places an unnecessary burden upon the operator which should be avoided. To overcome the difficulty Willix & Young, of Mount Vernon, Ia., are placing on the market apparatus which can be attached to any instrument and which enables subscribers to call one another without signaling the exchange, or vice versa. Referring to the illustrations, Fig. *A* shows a generator equipped with the device together with the various parts and Fig. *B* illustrates a home-made relay which is required in connection with grounded lines. The generator attachment consists of a commutator *1* which is attached to the end of the armature shaft and takes the place of the normal vertical contact spring. Associated with it are contact springs *3, 4, 5, 6,* so arranged that when the generator handle is turned to the right the armature circuit is maintained closed continuously and the usual alternating current is delivered for operating the instrument bells on the line. When the generator handle is revolved the other way the armature circuit is closed only during one-half a revolution so that a series of current impulses of either positive or negative sign (depending upon the point of commutation) are being delivered. The line drop at the exchange being grounded and the act of reversing the direction of the armature movement transferring one of the armature coil terminals from one side of the line to ground the drop is actuated through the grounded circuit. If the line is a regular grounded circuit then the relay is necessary. This may be made by anyone according to directions furnished with the generator. This essentially consists of a ringer with a fan substituted for the regular bell tapper. The fan is suspended in oil which dampens its oscillations when actuated by alternating current. When pulsating current is sent over the line the armature is attracted in one direction only. Under this condition the fan receiving several impulses in quick succession, all tending to move it in the same direction, it overcomes the resistance of the oil and moves far enough to close a contact which connects the drop to the lines. A portion of the current will then pass through the drop and it will operate.

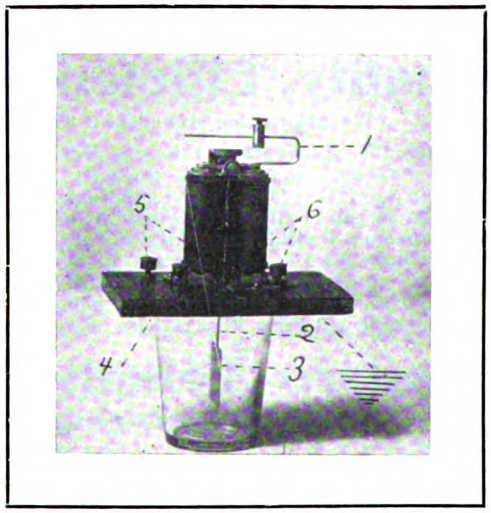

Fig. B. Relay for use on grounded lines.

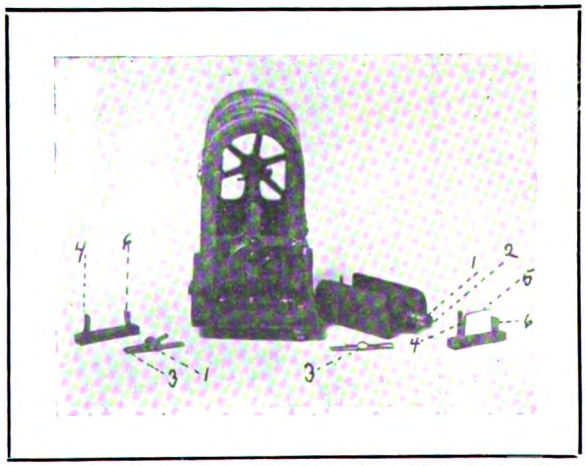

Fig. A. Generator and auxiliary parts for calling on rural lines.

From the foregoing it will be readily understood that turning the crank in the usual way operates the bells and when moved in the opposite direction the drop is actuated without interference. The manufacturers claim that the devices give excellent results and cite a case where 18 telephones on a grounded line using this apparatus have been working for the past fourteen months without any trouble. Further particulars together with a descriptive folder can be secured from the firm.

CUTTING DOWN THE WASTE.

RECORDS showing that 229 "excess minutes" were used for every 100 paid for, when toll messages were timed by a visible clock dial, have recently been made public by the Calculagraph Company, 1437 Jewelers' Building, New York.

In October, 1902, sixteen calculagraphs were purchased by a telephone company and installed, one each, in different exchanges. The records of toll messages made by those sixteen calculagraphs during the month of November were analyzed for comparison with manual records made in the same sixteen exchanges during a previous month.

It was found that while 1,663 fewer toll messages were sent in November, the receipts were larger than during the previous month, and the number of *"excess minutes"* was increased from 6,929 to 22,846, or 15,917 more *"excess minutes"* were shown on the calculagraph records than on those made with a pencil.

The value of those 15,917 toll minutes was $1,126.20, which represents the net earnings of the sixteen calculagraphs for one month, or an average of $70.39 for each instrument.

This result was so satisfactory to the officials of that telephone company that they have since placed an order for one hundred and thirty-eight (138) calculagraphs, Model 6, for use in other exchanges in their territory.

M. C. STONE, 344 PENNA AVE., N. W., WASHINGTON, D. C., is placing on the market a type of paper sleeves for cable conductor splicing that embraces many good features of construction. These sleeves are automatically woven under high tension from a special grade of paper. When completed, they form compact seamless tubes of absolutely uniform dimensions and great strength. They are designed to meet the heat and moisture tests required of sleeves intended for use in cable splicing, and being free from ragged ends and interior obstruction, can be applied with rapidity and satisfaction. They are made with diameters ranging from ⅛ to ¼ inch and can be secured in any lengths desired. Further particulars and prices will be furnished by the company on request.

THE FARR TELEPHONE AND CONSTRUCTION SUPPLY COMPANY, CHICAGO, ILL., has issued a supplementary condensed price list of line construction material. In it quotations are given upon the ordinary lines of construction material such as pins, brackets, crossarms, insulators, lag and bolt screws, guy rods, pole steps, wire cable hangers, rubber cable batteries and protective devices. Copies will be sent to all interested parties without charge.

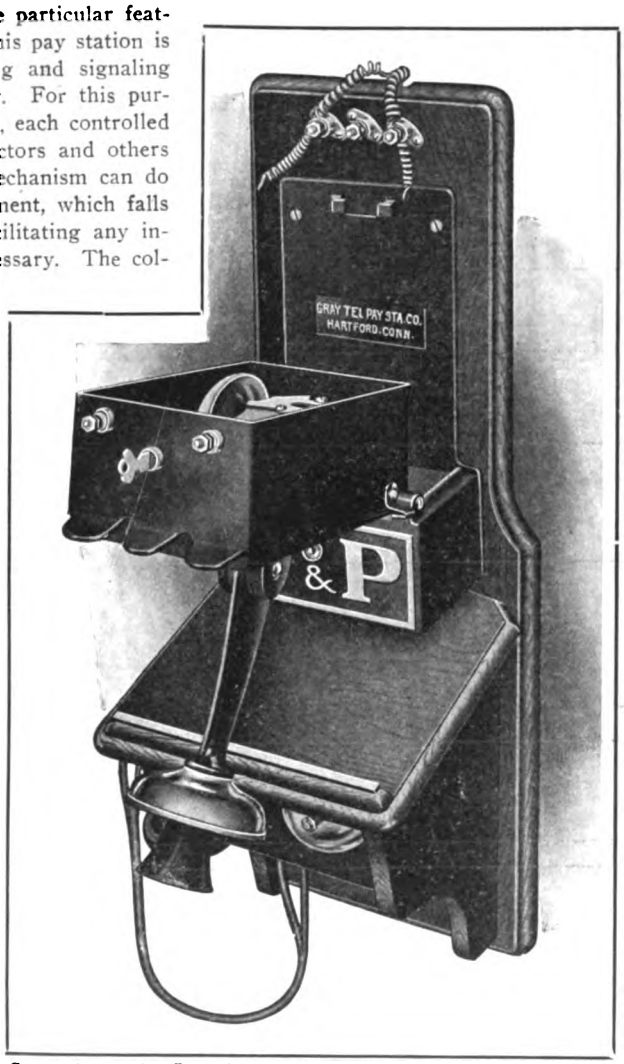
IN THE MANUFACTURING FIELD

AUTOMATIC PAY STATIONS.

PAY station business is generally conceded to be an important source of revenue for a telephone company. By the use of automatic coin collecting mechanism, all responsibility is taken away from the storekeeper in whose place of business it may be, and telephones can be installed in localities where without this apparatus it would be impossible.

To meet the demands of different classes of service the Gray Telephone Pay Station Company, of Hartford, Conn., has placed on the market several types of apparatus, one of which, model No. 23, is illustrated herewith. The particular feature of interest in connection with this pay station is the separation of the coin receiving and signaling mechanism from the money drawer. For this purpose the box is divided in two parts, each controlled by a separate lock and key. Inspectors and others who have occasion to get at the mechanism can do so, by unlocking the upper compartment, which falls forward on hinges, thus greatly facilitating any inspection or repairs that may be necessary. The collector alone, on the other hand, has access to the money drawer, which is independent of the mechanism chamber. This type is designed for nickels, dimes and quarters, and thus can be advantageously used for toll or long distance service as well as local business.



Gray Automatic Pay Station, with money drawer locked while mechanism is exposed.

When ordered in large lots any suitable lettering or design can be placed on the front of the money drawer. The operation of the device relies upon the gravity principle, the simple act of inserting the coins in the slots operating the signals. Further information respecting this and other types of automatic pay stations manufactured by the company will be furnished upon request.

THE WESCO ELECTRIC SUPPLY COMPANY, ST. LOUIS, Mo., has issued the March number of its advertising magazine, "The Live Wire." In it there are numerous interesting stories and short articles relating to electrical apparatus manufactured or for sale by this firm. Accompanying the magazine is a letter from the sales department which draws attention to the present facilities for filling orders promptly. Amongst other items the firm is prepared to ship immediately are paper insulated cables of 25, 50 and 100 pair capacity, telephone wire, brackets, pins and crossarms, besides telephones. Extra supplies have been secured to prevent delays and the firm is very desirous of receiving inquiries relative to electrical apparatus of any description.

GERMANY LEARNING AMERICAN MANUFACTURING METHODS.

WITH a view toward becoming better acquainted with American principles of operation and design of telephone apparatus, George Wolf, a representative of the C. Lorenz Company, of Berlin, Germany, has been visiting the factory of the Dean Electric Company at Elyria, Ohio. He has been making a careful study of the methods involved in the construction of Dean apparatus, as well as familiarizing himself with the factory organization. As a result of Mr. Wolf's investigations, the German firm has entered into an agreement with the Dean Company to use its designs for apparatus upon a royalty basis. This is another gratifying proof of the supremacy of American manufacturers of telephone apparatus.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Rochester, N. Y., reports having closed contracts for switchboards in the following places: Holton, Kan.; Tonopah, Nev.; Nashville, Tenn.; Elkhart, Ill.; Grand Ridge, Ill.; Bryson City, N. C.; Brantford, Ont., Can.; New York City, N. Y.; Sunset, La.; Mt. Upton, N. Y.; Carthage, Ill.; Central Square, N. Y.; Marcus, Ia.; Franklin, N. C.; Auburn, N. Y.; Ladd, Ill.; Diagonal, Ia.; Lytton, Ia.; Woodstock, Ill.; Rochester, N. Y.; Seattle, Wash.; Fontana, Kan.; Clarkesville, Tenn.; New Cambria, Mo.; Cambria, Mo.; Rupert, Ida.; Elkville, Ill.; Ohio, Ill.

FRANK B. COOK, 240 West Lake street, Chicago, Ill., has received from the Dean Electric Company the order for the complete switchboard protection for the new exchange at Quincy, Ill. Specifications call for Cook's No. 8 self-soldering protector. The distributing frame has a capacity of 4,160 pairs, and is to be equipped with 3,200 pairs of the No. 8 protectors.

McMeen & Miller are the engineers who are in charge of the construction.

THE SWEDISH-AMERICAN TELEPHONE COMPANY, Chicago, Ill., has recently issued a clever four-page folder which sets forth in a unique and attractive manner the original features which the products of this company possess. The subject matter is of a useful nature, and it is so arranged as to be interesting. A copy will be forwarded to any office of a telephone company who sends a request.

THE NATIONAL CONDUIT AND CABLE COMPANY, 41 Park Row, New York, has issued a pamphlet entitled "Copper Gossip." The general business outlook and copper market situations are considered at length. Quotations upon copper in both the New York and London markets are given for the five weeks, January 18 to February 15, 1906, and compared with those of the same period a year ago. Statistics relative to the American exports, imports for the months of January and February are also included, together with figures covering the condition of the stock markets in Europe. This folder will be mailed to all interested persons who send their names to the company.

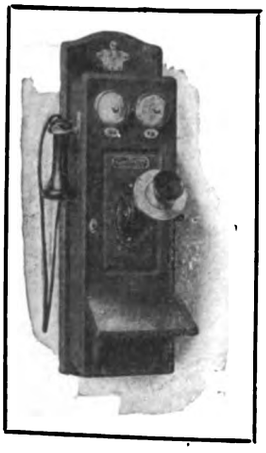
PEOPLE who know tell us we do not overestimate the qualities of our New Beauty Telephone when we say it is the finest instrument ever placed on the market. At first we were inclined to be conservative in our remarks about it because we wanted to secure the opinions of people who knew from experience. Those opinions, couched in terms which leave no loophole for an argument against this telephone, are being secured constantly, and confirm our prophecy that it would become the greatest seller we ever handled.



The U. S. Government specifies them—that is a pretty good recommendation, isn't it? There must be a reason for this.

If you have any questions to ask about quality, price and guarantee, we can answer them to your satisfaction better than anyone else. Write to-day. We can show you.

THE WEEK'S MESSAGES

FINANCIAL.

HUDSON, N. Y.—The Columbia Telephone Company has declared its sixth quarterly dividend of 1¼ per cent., payable April 2.

MINOT, N. D.—The Minot Light & Telephone Company, Minot, N. D., has increased its capital stock from $50,000 to $100,000.

MARIETTA, O.—The Marietta Telephone Company has increased its capital stock from $100,000 to $150,000.

YORKSHIRE, O.—The Yorkshire Telephone Company has increased its capital stock from $10,000 to $20,000.

FRANCHISES.

COLUSA, CAL.—W. T. Rathbun has applied to the Board of Supervisors of Colusa county for a franchise to construct and operate a telephone system at Colusa.

MAJENICA, IND.—The Majenica Telephone Company is seeking to obtain a franchise at Andrews.

NAMPA, IA.—A. K. Stoddard has been granted a franchise for a home telephone company at Nampa, and construction of the line will commence in about sixty days.

SHEFFIELD, IA.—The People's Mutual Telephone Company of Sheffield is seeking a franchise at Dougherty.

WEATHERSBY, MISS.—Ware & McInnis, who operate a telephone system at Mendenhall, have applied for a franchise at Weathersby.

TRUMANSBURG, N. Y.—The Trumansburg Home Telephone Company has secured the right of way from Trumansburg through Covert to Interlaken for an extension of its system.

WESTERLY, R. I.—The New England Shaver Telephone Company, of Providence, has applied for a franchise at Westerly.

COMBINATIONS.

CORINNA, ME.—The West Penobscot Telephone Company has purchased the interest and franchise of the Corinna Telephone Company. It proposes to commence the construction of new lines.

KENSAL, N. D.—The Kensal Telephone System has been sold to L. C. Lane of Courtenay, who will greatly improve it.

ELECTIONS.

BONDVILLE, ILL.—The Bondville Telephone Company has elected the following officers: President, W. H. Scott; vice-president, Peter Keller; secretary, Otis Norton; treasurer, C. A. Crawford; manager, G. L. Seifkin.

HILLSDALE, KAS.—The Star Center Hillsdale Telephone Company has elected the following officers: President, C. W. Litsey; vice-president, E. P. Roy; treasurer, C. Burdg; secretary, C. E. Wisler.

QUINCY, MICH.—The Southwest Quincy Telephone Company has elected the following officers; President, Wm. Phelps; vice-president, Hiram Corless; secretary, Arthur Luse.

MANKATO, MINN.—The Mankato Citizens' Telephone Company has elected the following directors: W. D. Willard, J. H. James, H. A. Patterson, J. R. Thomas.

ALMOND, N. Y.—The Almond Mutual Telephone Company has elected the following officers: President, W. L. Fenner; vice-president, H. G. Stillman; secretary, D. A. Stebbins; treasurer, Alvin Berry.

WATERVILLE, N. Y.—The Waterville Telephone Company has elected the following officers: President, I. D. Brainard; vice-president, S. S. Bissell; treasurer, P. A. Terry; assistant treasurer, W. J. Butler; secretary, H. M. King.

CARPENTER, S. D.—The Carpenter Telephone Company has elected the following officers: President, T. L. Wood; secretary, E. H. Baker; treasurer, A. P. Janer, Carpenter, S. D.; directors, T. L. Wood, David Cox, Samuel Birks, W. M. Mason, and I. L. Gunmson.

NEW COMPANIES.

HINDSVILLE, ARK.—The Hindsville Telephone Company has been organized and will operate a telephone system in Hindsville.

ENDERBY, BRITISH COLUMBIA.—Agitation is being started at Enderby for a local telephone system. Address W. & H. Harris.

GRAND TOWER, ILL.—The Big Muddy & Grand Tower Telephone Company, Grand Tower, Ill., has been incorporated with a capital stock of $600. Incorporators are M. W. Baysinger, C. D. Gardiner and James Hudson.

OAKLAND, ILL.—The Oakland-Isabel Telephone Company is to be incorporated with a capital stock of $24,000. Incorporators, Elza Blair, of Borton, and others.

ROCK GROVE, ILL.—The Rock Grove Farmers' Mutual Telephone Company has been formed with a capital of $6,000. The incorporators are Lewis E. Rote, William Fisher and Martin Brobst. The company will construct a line between Rock Grove and Monroe.

LOCKMAN, IND.—The South Side Telephone Company, of Lockman, has been incorporated with a capital stock of $2,000. Incorporators are J. C. McKinney, C. W. Spurgeon, C. Carmichael, D. E. Eddy, and Geo. W. Treux.

MANSON, IND.—The People's Co-Operative Telephone Company has been incorporated.

ADAIRVILLE, KY.—The Red River Telephone Company has been organized with the following organizers: T. H. Baird, J. D. Ryan, and W. R. Smith.

HARRIS GROVE, KY.—The Obion Telephone Company has been formed with A. V. McRee as president.

LOUISVILLE, KY.—The Central Home Telephone Company has been organized with a capital stock of $5,000,000. The object of this company is to purchase a number of Independent systems in Kentucky and Indiana.

ATLANTA, MICH.—The Montmorency County Farmers' Telephone Company has been organized with a capital stock of $2,000. President, H. Lundeen; vice-president, Wm. Briley; secretary, T. Mathews.

GLENDORADO, MINN.—The Glendorado Rural Telephone Company has been organized with the following officers: President, O. H. Stay; vice-president, E. Indrehus; secretary, W. F. Penrod; treasurer, S. Kittleson. The company is to build a line from Glendorado to Foley.

REDWOOD FALLS, MINN.—The Redwood County Telephone Company has been organized with the following officers: W. H. Gold, president; F. E. Davidson, vice-president; Geo. L. Evans, treasurer; A. C. Miller, secretary and general manager.

SANBORN, MINN.—An Independent Telephone Company has been formed at Sanborn with a capital stock of $15,000. H. J. Frink, who recently owned the Sanborn Telephone Exchange, will co-operate with the new company, and many new rural lines will be built.

MIDWAY, MO.—The Midway Telephone Company has been organized with the following officers: J. E. Bradley, president; L. B. Burnett, vice-president; Jos. Hood, secretary, and John Batten, treasurer. The company will secure trunk-line connection with the Home Telephone Company at Carthage.

ROGERS, MONT.—The East Fork Telephone Company, with its principal place of business at Rogers, has been incorporated with a capital stock of $6,000. Lines will be built from Rogers to Lewiston. The incorporators are A. V. Rogers, J. D. Clark, S. F. Bowman, of Rogers; J. W. Miller and Walter C. Downing, of Lewiston.

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

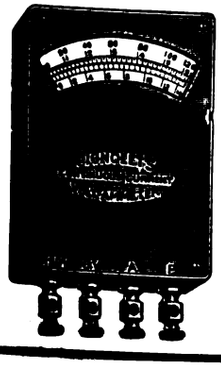
TO BE FOREWARNED IS TO BE FOREARMED



If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars? By buying one now you will save its cost many times over before you have had it a year.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

THE WEEK'S MESSAGES

UNADILLA, NEB.—The Unadilla Telephone Company has been organized at Unadilla with a capital stock of $30,000.

STERLING, N. Y.—The Fair Haven & Red Creek Telephone Company has been incorporated with a capital stock of $930. The incorporators are William Bailey, Nelson Cuyler, Veeder Hersey, Milford H. Frost, Herbert Howland, of Sterling; Truman Warner, of Wolcott, and George Robertson, of Red Creek.

VESTAL, N. Y.—The Willow Point Telephone Company has been incorporated with a capital stock of $500,000. The directors are: F. A. Pierce, Chas. Golden, Stephen Noosbickle, E. W. Willis and Orrin J. White, of Willow Point, and L. M. Winans and I. S. Mosher, of Vestal.

SHELBY, N. C.—The Shelby Mutual Telephone Company, of Shelby, N. C., has been organized with a capital stock of $10,000. Charles L. Eskridge is manager.

WASHBURN, N. D.—The Washburn Telephone Company, Washburn, N. D., has been incorporated with a capital stock of $25,000. The incorporators are A. E. Johnson, Washburn; C. N. Hendrise, Thomas W. Allshouse, Steele.

ARLINGTON, O.—The Mutual Telephone Company has been formed at Arlington. P. J. Baker, Chas. Hauman and H. J. Pugh are among the incorporators.

NORTH JACKSON, O.—The North Jackson Telephone Company has been incorporated with a capital stock of $10,000. The incorporators are F. A. Eckis, N. W. Hole, S. H. Goldner, S. J. Clemens and Frank Buchwalter.

PERSONAL.

FRANK B. BURWELL has been appointed district manager for the Bell Company at Charleroi, Pa.

J. E. HANNON has been appointed local manager for the Northwestern Telephone Company at Faribault, Minn.

WILLIAM LEDINGTON has been appointed general manager of the local telephone company at Bellevue, Ohio.

B. C. McCUNE has been appointed manager of the Bell Company at Johnstown, Pa.

MISCELLANEOUS.

EL RENO, OKLA.—The Farmers' Telephone Company and the Topeka and El Reno Telephone Company are to make a connection for the betterment of the service at El Reno.

AURORA, OREGON.—G. W. Scramlin has acquired the property of the Obed Miller Telephone Line, and will connect its lines to his own system, giving him a line of about 250 telephones.

New Construction in the Field

HOLBROOK, ARIZ.—F. W. Nelson, of Holbrook, is interested in the line which is to be built to Springerville. The system will eventually be extended to Fort Apache.

ALHAMBRA, CAL.—The Alhambra Home Telephone Company is to build a line direct to Los Angeles.

KELSEYVILLE, CAL.—The Big Valley Farmers' Telephone Association is to establish an exchange at Finley.

LANCASTER, CAL.—The Antelope Valley Telephone Exchange, owned and controlled by O. F. Goodrich, will build 65 miles of new line to the Gold and Borax Mines via many inland towns.

ARMSTRONG, BRITISH COLUMBIA, CANADA.—The Armstrong Light & Power Company is to build a telephone system throughout the municipality.

BELLECHASSE, QUEBEC, CAN.—The Bellechasse Telephone Company is to extend its lines, connecting with many of the parishes in the counties of Lotbiniere, Dorchester, Levis, Bellechasse, Montmagny and other places.

DANIA, FLA.—M. A. Marshall, of Dania, is interested in a new telephone line which is to be built from Dania to Fort Lauderdale.

HARRISONVILLE, ILL.—The Harrisonville Telephone Company will connect with the rural lines at Waterloo.

HAGERSTOWN, IND.—The Hagerstown Independent Telephone Company contemplates extensive improvements in its system.

SIOUX CITY, IA.—The New State Telephone Company is to build a line to Sloan.

ASSARIA, KAS.—The Assaria Mutual Telephone Company is to build a telephone system for Assaria.

BURLINGTON, KAN.—The Burlington Telephone Company is to rebuild its system at Burlington, and will also construct a line to Westphalia.

EDNA, KAS.—The Edna Mutual Telephone Company is to build lines to Bartlett and Altamont.

SALINA, KAN.—The Salina Telephone Company is to spend about $50,000 in rebuilding its telephone system.

AUBURN, KY.—The Home Telephone Company, which has just established an exchange at Auburn, is to install an exchange at Rockfield.

BILLINGS, MICH.—The Billings Telephone Company is to build lines to Estey and to Hope.

LEWISTON, MINN.—The Lewiston Telephone Exchange contemplates increasing its capital stock from $10,000 to $25,000 for the purpose of making extensions to its system.

MINNEAPOLIS, MINN.—The Tri-State Telephone Company, of Minneapolis, is to build a long distance line to Thief River Falls.

ST. PETER, MINN.—The Nicollet County Telephone Company is to build a number of county lines.

BOONVILLE, MO.—The Boonville Telephone Company is to spend $12,000 in the extension of its system.

NAPOLEON, MO.—The Napoleon Telephone Company is soon to commence the extension of its system over a large territory east and south of Napoleon.

MILLIGAN, NEB.—A telephone exchange is to be installed at Milligan. The City Clerk can give information.

STAPLEHURST, NEB.—The Staplehurst Telephone Company will construct a line between Staplehurst and Seward.

FIERRO, N. M.—The Grant County Telephone Company is to build a line from Fierro to Mimbres Springs.

NANTICOKE, N. Y.—The Nanticoke & Northern Telephone Company is building a line from Nanticoke to Caldwell.

COLUMBIANA, O.—The Columbiana County Telephone Company is to build a line to Salineville.

SHARON, O.—The Farmers' Rural Telephone Company expects to extend its lines through Granger township to Remson Corners.

DRIFTWOOD, OKLA.—The Driftwood Telephone Company is extending its lines to Mirabile.

EL RENO, OKLA.—The Topeka & El Reno Telephone Company is to build a line to Union City, and to make connections with a number of rural lines.

ALTOONA, PA.—The United Telephone Company is to build a line from Altoona to Bedford.

FORT PIERRE, S. D.—The Great Western Telephone Company is to build a line from Fort Pierre to Rapid City, also a line from Presho to Fort Pierre.

MADISONVILLE, TEXAS.—The Madisonville Telephone Company is making extensive improvements in its system.

SHERMAN, TEXAS.—The North Texas Telephone Company, which recently increased its capital stock from $10,000 to $20,000, is building lines all over Grayson and Cooke counties. The company has also purchased the exchange at Whitesboro.

WENATCHEE, WASH.—The Farmers' Telephone Company is to install a new switchboard and other apparatus.

AVOCA, WIS.—The Avoca & Pride Hollow Telephone Company is soon to commence the construction of its system.

NEW LONDON, WIS.—The Interurban Telephone Company is to build a line to Sugar Bush. The old line between New London and Tustin is to be replaced by a metallic circuit.

RUSSELL, WIS.—The Borst Valley Telephone Company is to build additional lines from Russell to Independence.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

NORTH'S Solid Back Transmitter combines ample volume, perfect articulation, deep penetration and natural pitch. It reproduces the voice high or low, loud or soft—a loud voice without breaking or blurring.

The full round volume is attained by entirely eliminating dampening springs; there is no unequal pressure on one side of the diaphragm, which is dish-shaped for confining its action to the path of the voice vibrations.

A small amount of polished granular carbon in a specially formed shallow cell eliminates packing.

All parts are made in jigs and tested accurately to a ten-thousandth part of an inch and there are no accidental transmitters in the product.

Just as a precaution, though, hey are tested by an engineer before leaving the factory, under conditions approximating actual service.

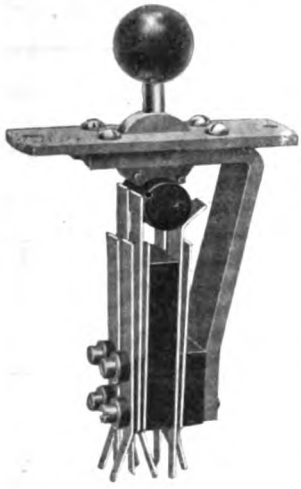
CENTURY
100 % GOOD



TO GIVE GOOD SERVICE,

it is necessary to have a switchboard that will give no trouble. One of the most essential parts of a good switchboard is a ringing and listening key.

We are illustrating the key used in our switchboards made by us. We have used the same type without any change for over five years. The first ones made are still giving perfect service.

All springs are made of German silver provided with platinum contacts. The insulation is of hard rubber.

This key will never give any trouble. Perfect contacts are assured at all times.

PERFECT PLUGS

are as necessary as good keys---our plugs are made to accurately fit jacks.

The different parts of the plug are assembled so that it is impossible for them to ever become loose. This prevents the breaks in the insulation, which cause short circuits.

The insulation is of the best quality of hard rubber.

The sleeve is held on by a knurled nut which can easily be removed.

We will be pleased to submit samples of our switchboard parts for your inspection, local or common batteries.

Little Things That Count

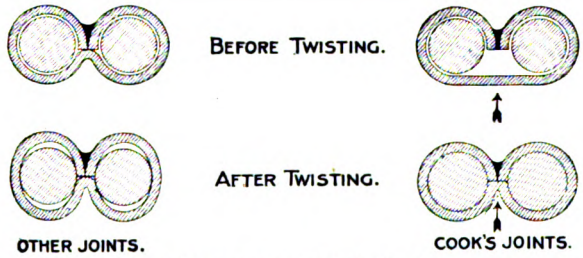
In MONARCH TELEPHONES the talking circuit is carried from the transmitter to the batteries by insulated cords. The ringing circuit passes through the hinges on the door, but these hinges are equipped with spring contacts as shown in the illustration. This feature positively precludes trouble from poor ringing contacts. A "LITTLE THING," and yet it counts.

MONARCH TELEPHONE MFG. CO., - - CHICAGO, U. S. A.

A PERFECT JOINT

The Cook Self-Welding Wire Joint

A joint made with the Cook Self-Welding Wire Joint is STRONGER THAN THE WIRE ITSELF



In the Cook Joint the mere act of twisting draws the sleeve into the recess between the wires, stretching it absolutely tight around both wires, making a perfect self-weld.

Send for a FREE SAMPLE, twist it up, cut it in two and see for yourself.

Air and moisture cannot penetrate and corrode the wire and joint. A perfect connection is assured by the use of the COOK SELF-WELDING WIRE JOINT. ALL SIZES. FOR COPPER OR IRON WIRE.

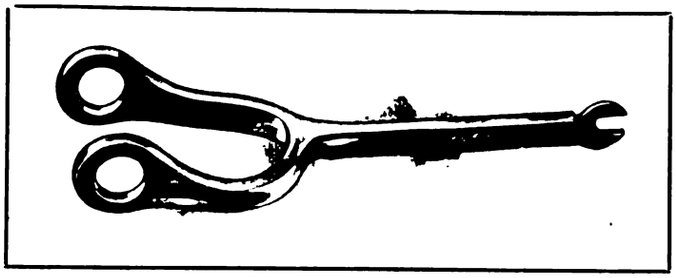
DEAN TELEPHONE APPARATUS



The accompanying illustration shows the

New Dean Removable Switch Hook Lever

It is made from one piece of **heavy sheet brass,** and is unbreakable, has the appearance of a solid metal hook lever, of the neatest possible design, besides eliminating the defects of the cast, punched and riveted hooks of other manufacturers. Great strength is insured in this hook lever by doubling the metal over, not only on the body of the lever, but in both prongs, making the latter very rigid.

This is only one of the many valuable features of the Dean Wall Telephones that will increase your exchange revenue and decrease your cost of maintenance.

INDIVIDUALITY

There are two kinds of individuality; that which means originality of conception and design without departure from that which is considered good practice; and that which stands for construction that is different from anything else without any improvements to recommend it.

An examination of the **Swedish-American** apparatus, illustrates the fact, that it is possible to depart from the old ruts into which telephone designers have fallen.

It will be found that all parts of their telephone are different from any others, but at the same time a definite advance in the art of telephony has been made.

Have you ever noticed the general similarity in the apparatus of all other makers? One might suppose that the ultimate goal had been reached and that there could be no further chance for improvement. Now compare any of the apparatus on the market with that of the **Swedish-American Telephone Company** and you will see that definite and apparent improvements exist.

For instance take the ringer movement. In others the only difference lies in the size of the screw holes, or perhaps, in the method of adjustment or some other minor detail. The general design is exactly similar in all of them. On the other hand the Swedish-American movement has been changed both mechanically and electrically, and in every way it differs from others.

It will be seen that the permanent magnet is mounted between the coils. The armature is in actual contact with the permanent magnet and is pivoted thereto. In the other forms the permanent magnet does not come closer than a distance of one-fourth of an inch. The permanent magnet greatly helps to increase the sensitiveness of the ringer movement. The closer the permanent magnet approaches the armature, the stronger the magnetic field. The stronger the magnetic field, the more sensitive the ringer movement will be. It is easy to see, therefore, why the **Swedish-American** ringer movement is 25 per cent. more sensitive than any other.

One does not see much change in the construction of transmitters of late. Everybody seems to be striving to get as close as possible to the Bell solid back transmitter and when they reach that goal they are satisfied.

It does not seem to occur to the designers that a transmitter better than the Bell can be made, so they rest on their laurels. It is an actual fact, however, that the improvements in the **Swedish-American** transmitter have made it greatly superior to the Bell long distance transmitter. It is just the same with all the parts of the telephone. You can see individuality in the lines of all the apparatus.

Take the generator for example. It has 30 per cent. more winding space than any other, and this means a 30 per cent. increase in the output. The induction coil is so mounted that an inexperienced person can replace it in ten seconds without soldering the wire and without danger of disturbing the circuit.

Their receiver is extremely sensitive and has an indestructible shell. Even the method of wiring is original with the **Swedish-American Telephone Company.** The wiring is arranged in the form of a cable, and each wire is insulated with a different colored material. You can trace any wire in the telephone by the color of its insulation without removing the telephone from the wall.

In these days of close competition, it does not pay to rest on your oars. You must keep a continual lookout for any improvements which will make apparatus more convenient for the customers and at the same time more efficient.

The **Swedish-American Telephone Company** is always looking for means of improving their output, and their customers are not slow to appreciate this fact.

Other points of individuality originated by the Swedish-American Telephone Company and copied by their competitors are:

A protector which covers the bell clapper.
Binding posts for the connections of the batteries.
All exposed metal parts insulated from the circuits
No hinge contacts.
Ringer and transmitter arm bolted on.
Receiver cord binding post inside the cabinet.
Receiver hook does not depend upon contact springs for tension.
Switch-hook perfectly self-contained.
All bridging telephones wired for condensers whether so equipped or not.

AKRON, Ohio—
OAKLAND, California—
TACOMA and
BELLINGHAM, Washington

have all gone Automatic—Akron for 3,000 lines, Oakland for 5,000, Tacoma for 4,000 and Bellingham for 1,000.

Merit, absolute merit, was the reason why Automatic Telephone Equipment was selected by the Independent Companies in these cities.

They wanted the best, the very best, in telephone equipment.
They took their time and looked hard for it everywhere.
They found it in the Automatic.
That's where you will find it when you are ready to see it.
That's where the Independent Companies in all these cities found it—they adopted the Automatic:

Don't Grope Around in the Dark on the Private Branch Exchange Proposition

It's too important. You can't afford to neglect it

Get a copy of our Bulletin No. 14 and become familiar with the best apparatus made for this work. Also find out what the biggest operating companies consider modern operating practice.

There's no better way for you to keep up with the times on this or any other telephone subject than to keep in close touch with us. Because we are handling the majority of this class of work. We are confronted with all kinds of operating problems. They give us an experience that you can take advantage of without cost.

All kinds of professional and industrial institutions are interested in the problem—how to transact more business in less time.

It is easy to show them why a Private telephone system is one of the biggest helps. No necessity for telling you this, but it is a statement that will bear repeating.

It is not difficult to promote the growth of these systems, in connection with your exchange, because you can in many cases show in dollars and cents how a private telephone system will pay for itself in time saved.

You will agree, so will any business man, that a thing that will pay for itself in time saved is a good proposition. After that, all time saved is clean profit.

Suppose you write us **now, to-day,** and send us the names of those several parties you have had in mind for these systems. We will outline a plan that with your help will land them. Will you do it?

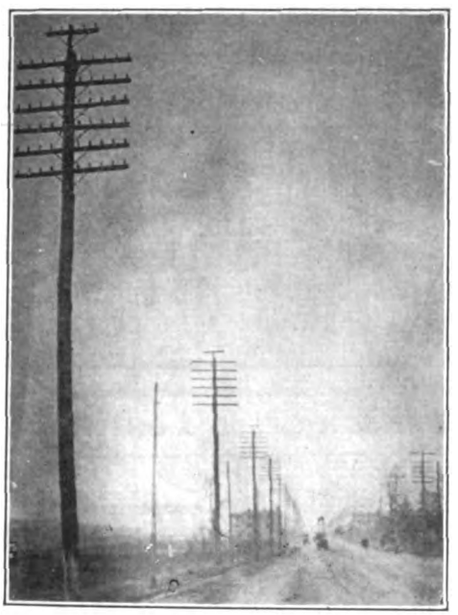
WE MAKE CABLE

Construction Is Costly

The matter of line construction is of perhaps more importance to a small company than a large one. With the latter there is generally no difficulty in securing funds for improvements or reconstruction; whereas the small concern is limited in its expenditures. For this reason it is most important that its construction work shall be done economically; durability and future growth being given due consideration.

Open wire lines put up to stay and designed to reduce to a minimum the costs of maintenance and depreciation are excessively expensive. As the number of cross arms increase so does the size of the poles and every item in the bill for construction is increased proportionately. But after every precaution has been



An open wire line expensive to maintain, fifty foot poles, 8" tops, 20" diameter, four feet from ground.

Base of pole shown opposite. Note the comparison between it and the man.

taken, the continuity of open wire circuits is most uncertain. No matter how well the wires are installed, a sudden drop in temperature will cause them to snap and in one night sufficient damage can occur to eat up profits for six months to come.

In the spring it is necessary to have all the slack pulled out of spans. This takes time and labor, yet if not done crosses will surely occur and the continued expense for maintenance under these conditions to say nothing of the faulty service given, will prove a heavy drain upon the resources of any company.

The only way you can be saved these troubles and expenses is by either putting up cable in the first place or substituting it for your present open wire lines.

Stromberg-Carlson cable represents the highest degree of excellency in manufacture and efficiency in electrical properties. It is standard in every respect and for that reason you should use it and no other.

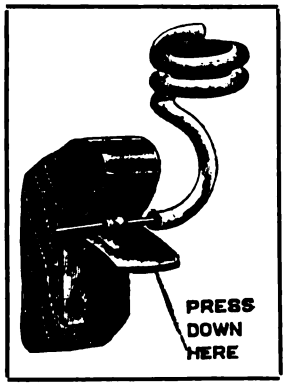
And by Simply Specifying

FAHNESTOCK SPRING BINDING POST



in your order, you get a cell which is absolutely free from all terminal troubles. Just consider what this means: namely,

The connecting wires will remain permanently attached.

There will be no maintenance expense due to faulty or dirty connections, and

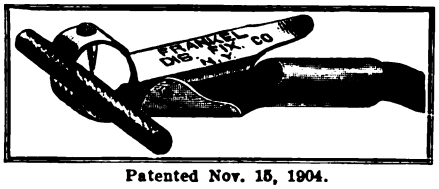
The cell will be able to deliver its current undiminished by any resistance at the terminals.

These facts are worth your attention, because they have a bearing on your pocketbook.

FAHNESTOCK ELECTRIC COMPANY
129 Patchen Avenue, Brooklyn, N. Y.

Frankel Electric Testing Clips

Saves Baring the Wire



Dozen lots $1.50 doz.
100 lots 11c. each
500 lots 10c. each
1,000 lots 9c. each

Patented Nov. 15, 1904.

The teeth grip the line or binding post. The pin pierces the insulation and makes a perfect connection.

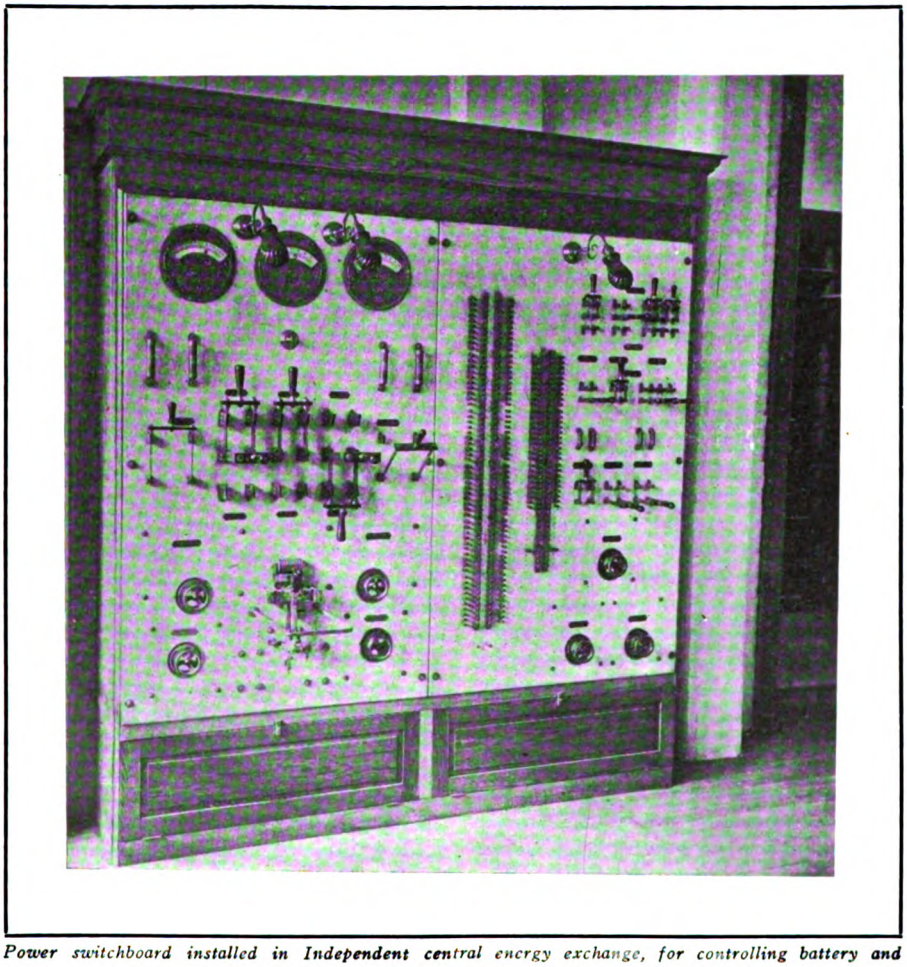
Power Data for Telephone Men*

By P. Kerr Higgins.

ON account of the large amount of power delivered, its dangerous voltage, and the fact that one side of the system is connected to ground, the electric railway system is of especial interest to the operator of a city telephone exchange.

Several systems of distribution have been introduced and may be classified as: The slot system, using an underground conduit; the overhead trolley; the third rail; the storage battery; the mono rail. The trolley system is conceded to be the best suited for average conditions and in the present state of the art is the only system for country use. In the larger cities there is a tendency toward the open conduit system, this being necessary in order to meet city ordinances requiring all wires to go under ground.

The storage battery system is an ideal one but the present development of the lead plate accumulator does not permit of its being made commercially successful. Nevertheless there is a bright future ahead of this system when the weight and delicate nature of the present form accumulator have been done away with in an improved type. That the slot system will eventually replace the overhead trolley in the cities is certain and very desirable because it avoids unsightly encumbrances in the streets of the city and from the standpoint of public safety. The mono or single rail system is beginning to make considerable progress in this country, having been made a success in Europe. It is now being agitated for a line between Los Angeles and Ocean Park, a distance of over twenty miles, a permit having been obtained for an experimental line between Ocean Park and Santa Monica, California.



Power switchboard installed in Independent central energy exchange, for controlling battery and ringing current.

The consideration of the method of supplying and delivering energy to drive the cars affords an interesting contrast to the small amount of power used in a telephone exchange. To get some idea of the power necessary, we find that to propel a car weighing one ton along a set of rails at a speed of 15 miles an hour means 2,000 lbs. moving at a rate of 1,320 feet per minute, which means 1,320 x 2,000 or 2,640,000 foot lbs. per minute; 2,640,000 ÷ 33,000 is equal to 80 horse power, one horse power being equal to 33,000 lbs. per minute. This would be the horse power necessarily furnished by the generators under perfect conditions, that is with absolutely no loss, a condition which never exists. It is therefore safe to say that it would take ninety horse power to do this work.

If this speed is increased, more horse power is necessary to neutralize or overcome the increase in wind pressure, created by the moving car. The electrical energy put into the motors to provide mechanical power is measured in watts. The action actually taking place is a series of pulls and pushes between the armature and the field of the motor and these must be properly proportioned to the speed desired.

The motor equipment of a car may be divided up into units, e.g., if 250 horse power is required it may be divided between two or more motors, the number used being dependent upon the design and space available on the car body, and also the service desired. The watts are equal to the total horse power x 746 and this result divided by the voltage gives the amperes at full load. The watts are calculated upon the consumption per second, but the foot pounds ultimately given out is rated similar to a gas or steam engine horse power.

The overhead trolley system is the most frequent source of disturbances in a telephone exchange. In such a system, as is known, the current is fed to the car motors from a trolley line, along which a pulley attached to the trolley rod runs. The vibration of this wheel with its makes and breaks is a frequent source of noise on unbalanced telephone lines. The trolley wire is generally of No. 0, B. & S. gauge, supported and insulated above

*Continued from the issue of March 24th.

Digitized by Google

the tracks by means of poles and bracket supports. In order to maintain a uniform difference of potential along the entire route, feeders are run out and tapped off to the trolley at several points. The trolley wire is of hard drawn copper wire stretched along the entire track from pole to pole. The arrangement of the brackets on the poles is such that while supporting the trolley wire, they nevertheless leave it more or less flexible to prevent the trolley from being bent out of shape by the pressure of the trolley rods and wheels. The amount of current consumed by a car varies from 50 to 150 amperes according to load and speed, hence the necessity for keeping down the loss to the minimum. A fall in potential means slowing up of the speed of the cars and dimming of the lights in the cars.

The current leaves the generator station and travels along the trolley, enters the car system through the trolley wheel down the rod to the controller to the motors, thence to the rails and back to the generating station. The motors commonly used are what is known as the series type in which the pull increases as the current increases and decreases as the current falls; the speed also increases as the E. M. F. at the armature terminals is raised and vice versa. The controller is so arranged as to connect the motors up in series, in parallel, or series-parallel. By means of this controller, the current supply is controlled and the speed and power regulated. The importance of keeping up the voltage and consequently the current is seen; it is apparent if several cars are on the same section and each consuming 100 amperes, the voltage under these conditions being the current × the resistance which in such a large wire is very small, a serious fall of potential could easily take place were it not for a proper distribution of the cars and a judicious use of feeders. The use of these feeders constitutes a large investment.

One of the most important features, from the standpoint of telephone men, in addition to inductive disturbance, is the feature of electrolysis which is frequently due to bad bonding, resulting in loss of power and electrolytic action on lead cables and pipes in the ground; the same rule applies to bonding as to the distribution of feeders, the result of both being loss of current. It was for a long time customary to use fish plates, but lately a welding process has been introduced which produces very much better results. This bonding is an important feature of street railway work from the standpoint not only of the railroad company but of those companies using conduits containing factors of metal, such as iron or lead. In the operation of the system many such defects very rapidly use up the pressure, due to poor electrical contact, this being especially noticeable when a large amount of current is required. The rails are really a set of conductors used for returning the current to the power house, and if not returned it will be distributed to the earth and return back to the power house by way of any good conductors in the ground (such as lead cables or iron pipes) and electrolytic action takes place under such conditions. It is thus seen that the energy which is not conducted back is a positive danger to conductors in the earth used for any purpose. This leakage can be easily explained by a reference to Ohms law, in which we find that the current is directly proportional to the voltage and inversely proportional to the resistance. The action may be explained in the light of an accumulator, such action being similar to a secondary battery, the rails forming one pole, the ground being the electrolyte and the cable sheath or iron pipe the other pole and the metal is likely to be carried from point to point of the attacked conductor as shown by its honyecombed condition.

The motors of a car may be connected up in many different ways, all of which form themselves under two main groups, series and parallel. Under the first group we find them subdivided as follows: In series with more or less resistance; in series without resistance; in series with each other and fields shunted. Under the other group we find similar external conditions, only the motors are in parallel instead of in series. The governing of these several conditions is accomplished by the manipulation of the controller. Three factors must be considered in the design of all motor equipment. These are acceleration, weight, and rate of speed. The controller is well named, being the controlling factor in each of these elements. This instrument is, in reality, a manipulator of the circuits governing the starting, running and stopping of the car, and these results are obtained by a gradual cutting out of resistance and the effecting of the above combinations in the controller, which are intended to start up the car gradually and avoid the jerk. The fundamental principle in the design of the controller is gradually increasing the volume of current passing through the motors, by an arrangement whereby the armatures, fields and resistances are gradually changed from being in series to being in parallel.

All that has been said heretofore applies to the average traction line which uses a direct current of 500 volts. Of late, however, the trolley systems have been broadening and expanding until we now have long enough lines to require the use of sleeping cars and the old direct 500 volt system will not serve under the new conditions. These conditions introduce the necessity for a sub-station, more or less remote from the main generating station, and the longer the line the more sub-stations are necessary. This means the transmission of current to the transformers at the sub-station at a high voltage, which necessitates high insulation all along the line. There is being introduced on systems of this nature the feature of alternating currents, and it is felt by many who should be competent to judge that single phase alternating current is what will be mostly used in the future. The present practice is three phase alternating current using rotary converters, but this is too complicated to permit of future developments on long lines. It is apparent that on such systems enormous voltages have to be used and when these parallel telephone lines they are bound to pump more or less induced currents into them, producing noisy lines.

Special insulation of high voltage circuits is very necessary on account of their ability to arc across space. The insulators used are commonly about five inches high and five inches at their greatest diameter and when entering or leaving the power house, etc., the wires are carried through a terra cotta pipe eight, ten or twelve inches in diameter. These insulators are tested for a minimum of 20,000 volts. A second insulation is also provided cemented to the first, tested to a voltage of 40,000 volts. Telephone lines run on same poles should be placed below the bracket arm so that in case of a break it could not fall on the bracket arms. In the construction of high tension lines, they should always be run over the telephone, as the liability of the heavy wires to break is less than the light telephone wires. Some companies have also put in, on the span crossing other lines, a device for automatically disconnecting the wire about one foot from the cross arm on each side of the crossing, so that should the line break down the piece of wire between the point of breaking and the automatic cut out would be dead. This device consists of a hook under tension so that when the tension is withdrawn, a spring disengages the hook and opens the circuit leaving only the stub of the wire on the pole. The whole device is placed inside a hood cover for protection.

The function of the rotary converter is the transforming of alternating into direct or continuous current at the receiving end of a transmission line, or the changing of low voltage alternating current into high voltage alternating current by transformers at the transmitting end. An illustration of this may be given, as power originating in an alternator (3 phase) 500 volts, enters the transformer being raised to say 5,000 volts, at which pressure it goes to the line, travels over it and so enters the step down transformer at the receiving end, stepping down to 500 as at first; the current is however still alternating in character, in which condition it enters the rotary converter and comes out at 500 volts continuous current. Another combination can be made starting with 220 volts direct current through rotary converter, from which it comes out 3 phase 500 volts alternating; it may then enter a 3 phase step up transformer to 5,000 volts to line; arriving at the sub-station or receiving end it enters a step down transformer and comes out 500 volts; passing through another rotary converter it comes out 220 volts direct as at the beginning. We will now consider the transformer. The alternating trans-

Digitized by Google

former consists of a magnetic circuit, containing two direct coils, termed high and low pressure coils; the employment of a coil will transform the pressure higher or lower according to the coil used, in either case the watts remaining practically the same. In the illustration given it will be noted that two styles of transformers were mentioned, step up and step down.. Transformers are designed specially for these purposes. In designing transformers one turn of wire is used for each volt used, e.g., 220 volts would have 220 turns of wire. The ratio or difference between the primary and the secondary is termed "the ratio of transformation," e.g., 220 on primary and 440 on secondary would be a ratio of 2 to 1.

The necessity for care in handling wires which come in contact with these high potential circuits is obvious. Shocks from 110 volt circuits seldom, if ever, affect any one seriously; the feeling being slightly of a prickling nature, with slight contraction of the muscles. At 220 volts a similar feeling exists but more intense. In all cases the feeling and effect of an electrical shock varies with different persons and the condition of the skin, whether dry or moist, at the time of receiving the shock. The shock from an alternating current, even an ordinary hand generator, is much more severe in its effect than direct current of a similar voltage. The necessity, therefore, of being especially careful with alternating currents is apparent. The resistance of the average human body is about 2,500 ohms and varies from this up to 5,000 ohms. It may here be noted that it is not the voltage or pressure but the amperage or current that produces death; the one of course is productive of the other, but the current is the fatal factor. From this it is apparent that there is less danger in the voltages running into a hundred thousand than in the lower ones, for the reason that the higher frequencies associated with such high voltages tend to very greatly increase the resistance of the body and so the current encountering resistance internally is likely to pass off to ground or return on the surface only and while stupefying in its effect is less liable to be fatal. It is therefore extremely important in the handling of all electrical apparatus to open the main switch on the circuit to be tested or repaired before any work is done. If, however, this, for any reason, cannot be done, then great care should be had to handle only one conductor at a time and avoid any part of the circuit at a different potential from this point; the use of rubber gloves and shoes in such a case is also absolutely necessary. So far as possible work with one hand only, keeping the other at your back or in your pocket. This precaution carried out several times easily becomes a fixed habit.

When high tension is used always be on the lookout for leakage on poles, cross arms, etc., which is frequently present and dangerous; to this end before doing any work on such systems with live conductors one should see that he is properly insulated from ground and other conductors. The effect of an electric shock on the human body first attacks the nervous system and causes spasms, followed by burning of parts of contact due to electrolytic action and all the symptoms are those of suffocation from drowning and the same methods for resuscitation are employed by producing artificial breathing. If relief can be had at once the chances are that the sufferer can be brought back to consciousness. Those taking part in releasing one receiving a shock must be very careful to protect themselves from contact with the body unless they are sure the current has been shut off. Use rubber gloves in all cases, if possible, or wrap hands in thick layers of paper and stand on some good insulator. If oxygen gas can be obtained some should be pumped into the lungs of the sufferer, but in no case should stimulants be poured down the throat, as this is injurious.

The Ohio Convention

By L. A. Parrish.

LARGE attendance and enthusiastic and useful discussion of many problems made the third annual convention of the Ohio Independent Telephone Association at Columbus one of the most satisfactory meetings ever held by Independent telephone men. Delegates and officials numbered 300, of whom 283 were in actual attendance. Interested telephone investors and non-members, with manufacturers' representatives, probably made the number over 400, while other interested parties and friends of delegates made a total of those who at one time and another attended the three sessions easily as great as 500.

Interest in the proceedings was intense and by every indication available the practical observer could judge that the morale of the Independent forces in Ohio is unexcelled and its fighting force is available in every unit for continued battle. The actual investment represented in the association is estimated by President Frank L. Beam to be over $30,000,000, while the apportionment of delegates at one per 1,000 telephones would indicate in the neighborhood of 262,000 instruments in use.

The convention, a one-day session, with evening banquet, was opened Thursday morning by President Beam, who introduced Mayor Dewitt C. Badger, of Columbus, to welcome the convention to the city and to turn over key and latchstrings to its members. In a happy address Mayor Badger convinced his audience that the city was delighted to have them in its midst and was perfectly willing and anxious that the delegates should thoroughly enjoy their stay.

J. C. F. Hull, president of the Second National Bank, Bucyrus, responded and thanked Mayor Badger and the city of Columbus for the gracious reception extended the association.

President Beam's annual address touched on the growth of sentiment in favor of the Independent movement as shown by the fact that formerly no news relating to it would be published, while now the fullest news is given and the people gladly read it, because there are over 25,000 stockholders distributed in all the communities and over 250,000 subscribers in close touch with the system.

President Beam showed that twelve years ago the Bell Company had fewer than 50,000 telephones after eighteen years of undisputed sovereignty in the Ohio field. One year ago the Independents had approximately 190,000 in use, and to-day over 250,000, a gain in twelve months of 60,000, or more in one year than placed by the Bell in the first eighteen years. To-day the Independents have 367 incorporated companies, with an actual investment of over $30,000,000, in Ohio. This, President Beam stated, is the invincible argument in favor of maintaining the association which, by combining power, had swamped a wealthy monopoly and rescued the telephone from the service of the rich and placed it in reach of all.

The report of Secretary-Treasurer Ralph Reamer showed the number of telephone companies eligible to become members of the association to be 325.

The following committees were appointed by President Beam:

Auditing—J. D. Johnson, Celina, chairman; J. B. Rhodes, Zanesville; C. L. Norton, Cleveland; C. H. Hollander, Newark.

By-laws—Dwight E. Sapp, Mount Vernon; W. L. Cary, Cleveland; G. P. Thorpe, Cleveland; A. H. Doudna, Bridgeport; S. Crosby, Wooster.

Finance—C. Y. McVey, Cleveland, J. S. Brailey, Jr., Toledo; G. R. Johnston, Columbus; W. G. Thompson, Hamilton; E. L. Barber, Wauseon.

Grievances—W. P. Bogardus, Mount Vernon; Washington Hyde, Warren; F. A. Knapp, Bellevue.

Nominations—W. F. Laubach, Akron; I. H. Thiedieck, Sidney; J. S. Devore, Bryan; J. B. Hoge, Cleveland; Colonel W. D. Rush, Greenville.

At this point in the proceedings C. Y. McVey, of Cleveland, announced that he had received information that the Senate was then in session and that there was danger that the Howe bill,

Digitized by Google

which levied additional tax on telephones, would be taken from the calendar and passed, in which event it would become a law, as the House had already passed the measure. Mr. McVey moved that a committee of five go to the Senate immediately to try to head it off. President Beam explained that the amount added annually to the taxes of the Columbus Citizens' Company had been calculated, and it would amount to a fraction of a cent under $1 per telephone. It was a bill in which the value of the Columbus Citizens' equipment would be subtracted from the capitalization and a little over one-half per cent tax laid on the difference. An amendment made the committee to consist of nine members, and the motion was adopted. The committee appointed consisted of G. P. Thorpe, Wilmington; James S. Brailey, Jr., Toledo; J. C. F. Hull, Bucyrus; B. C. Hendrickson, Medina; C. D. Juvenal, Springfield; W. H. Baum, Batavia; W. F. Laubach, Akron; J. S. Devore, Bryan; W. W. Fisher, Bellefontaine. The convention entrusted the committee with the following resolution, offered by Mr. Laubach and unanimously adopted:

"Resolved, That it is the sense of the Ohio Independent Telephone Association in convention assembled that the Howe House bill should be defeated on the ground that it is unwise, inexpedient and obnoxious and a menace to the Independent telephone interests of Ohio."

James B. Hoge, of Cleveland, president of the National Interstate Telephone Association, then addressed the convention on the subject of the progress and development of the national association. The address was accompanied by maps of the country and of Ohio, and with diagrams illustrating the main points. He asserted that there are 3,200,000 Independent telephones working to-day, representing an actual expenditure of over $300,000,000 in cash. The story of the rise and progress of the Independent movement is marvelous. In the cities the development is wonderful. In Cleveland for the past two years it has been 500 telephones a month, and at present it has risen to 1,000 a month. The Columbus Citizens' Company is growing at the rate of 500 a month. The Frontier Company, at Buffalo, is growing at the rate of 500 to 750 per month, and Philadelphia is reaching out over 1,000 per month. The story everywhere is the same. He said the "Ohio plan" is well spoken of everywhere and is being adopted.

In the morning session W. B. Woodbury, of the new Detroit company, reviewed briefly the history of the Independent company in charge of which he is now placed. He insisted that there should be no temporizing or flirting with the Bell people, but they should "be licked and licked good." He scored the "lying, underhand" methods of the monopolists in Detroit, and said they were unavailing, for he had 1,000 contracts in the safe at his office, and they were rolling in at the rate of from 40 to 75 per day. He said the Bell arithmetic was not good, for they had reported everywhere that 98 per cent of the tenants of the Majestic building, one of the greatest office buildings in America, were not in favor of a double system and were refusing to listen to the new company's agent. Independent arithmetic showed that 40 per cent of the tenants of that same building had contracts for the Independent telephone, and he had the contracts in his safe when the lie was floated.

Mr. E. L. Barber reported to the convention the situation in the South. He praised the Ohio plan and said that his experience in Ohio had given him power and that he had used the same tactics there. Mr. Barber said they would have a new line through to the Gulf within four months, and a new six to eight copper line to Mobile. In Kentucky they had formed a holding company for the small companies liable to be gobbled up by the Bell and to meet the same tactics which had to be knocked out everywhere.

The "question box" was opened in the afternoon session, the first query being: "Are telephone securities a better investment to-day than they were two years ago? If so, why?" A significant thing is that the first question was abandoned as requiring no answer by all the speakers, and each tried to answer the second and show "why." W. G. Thompson, of Hamilton, led the discussion and gave the credit of the advance in securities to the Ohio plan of consolidation. Dwight E. Sapp, of Mount Vernon, showed that the Columbus Citizens' Company common stock is now at par and that bids of 112 do not bring out any of its preferred stock. He said that recently, within the space of six weeks, the entire issue of Newark telephone stock was absorbed in the local market at par and premium.

President H. A. Lauman, of the Columbus Citizens' Company, gave a historical talk relative to how he and others invested in the system. He said that now investment was reasonably certain of 6 to 10 per cent on telephone securities, and he ascribed this to the principle of "E Pluribus Unum" as illustrated in the growth of the United States coupled with confidence in the stability of the system.

H. P. Folsom, of Circleville, paid a tribute to President Beam and said that much of the success is due to him and the principle that if we help one another we help ourselves. He said President Beam had been called in to doctor many a decrepit telephone company about to be gobbled by the Bell, and so far the doctor had not lost a single patient.

Judge Lewis Brucker, of Mansfield, and President Ford, of the Independent Company of that city, also spoke.

In reply to the next query, "What is the remedy for State legislative interference?" James S. Brailey, Jr., of Toledo, said the association must go into politics, must send friends and even its own members to the Legislature. He explained the Howe bill by saying that if a telephone company had $1,000,000 stock and $1,000,000 bonds outstanding, a total of $2,000,000, and its assessed valuation were $500,000, the difference, $1,500,000, would be assessable at $6 per thousand, or in that case $9,000 annually. In Mr. Brailey's opinion the telephone companies pay enough taxes when they pay 1 per cent of the gross receipts and ordinary taxes on equipment and plant. It discriminated against the Independent companies, for it would never catch the Bell, whose stock and bonds in the State would never exceed its taxable value and hence there would be no difference to tax. He advised the association to keep in close touch with the Legislature.

H. P. Folsom, of Circleville; O. F. French, of Cleveland, and Wm. S. Peters, of Delphos, thought great benefits had accrued last year and two years ago in discussing the questions of standardization, accounting and other questions.

A. C. Davis, of Parkersburg, secretary of the West Virginia Independent Telephone Association, gave a résumé of the condition of telephone affairs in his State.

Judge Brucker, of Mansfield, gave a history of the trouble between the Ashland people and the Mansfield people because the Ashland people cut in on the Bell exchange and toll line while holding with the Independents. This was denounced in unmeasured terms by several delegates, who said it was a mistake for Independent companies to flirt with the Bell. "If the Ashland people will not give up the Bell, let us cut free from the Ashland people," was a sentiment loudly applauded. Secretary Davis said radical measures of this kind had straightened out a similar matter in his State and had brought two rebellious Independent companies to terms. He quoted the constitutional provisions of the West Virginia association and said all such disputes were settled before any company was allowed to enter the association.

W. F. Laubach, chairman, filed the report of the nominating committee. It was recommended that the duties of secretary-treasurer be divided. The report of the committee was accepted unanimously and voted equivalent to an election of the officers named. These are as follows:

President, Frank L. Beam (third term); secretary, Otto O. Welsheimer, new district manager for Ohio of the United States Telephone Company, stationed at Columbus; treasurer, Ralph Reamer (re-elected second term); delegates to national convention, E. L. Barber, Wauseon; James S. Brailey, Jr., Toledo; Lewis Brucker, Mansfield; I. H. Thiediecke, Sidney; J. C. F. Hull, Bucyrus; W. G. Thompson, Hamilton; J. H. Metheany, Lima; W. W. Morrison, Toledo; J. B. Rhodes, Zanesville; G. P. Thorpe, Wilmington; J. B. Hoge, Cleveland; Dwight E. Sapp, Mount Vernon; F. L. Beam, Columbus; Cyrus Huling, Columbus; O. F. French, Cleveland; G. R. Johnston, Columbus; W. F. Laubach, Akron; E. L. Coen, Vermillion; Leo Fleisch, Piqua;

Digitized by Google

L. H. Beatty, Ravenna; Washington Hyde, Warren; H. P. Folsom, Circleville; J. C. Reber, Dayton; J. M. Saltzgaber, Tiffin.

Mr. Thompson, Judge Brucker and Mr. Ford were named a committee by the acting president to escort President-elect Beam to the chair, where he made an address thanking the delegates for the honor conferred and thanking the officers for their thorough loyalty to him. George W. Beers, of Indiana, closed the convention with a short address on the Cincinnati situation.

At night about 200 delegates and friends sat at banquet at the Hartman, Hon. Harry M. Daugherty, of Columbus, being toastmaster. A fine spread, plenty of good music and a genial company were features. Walter B. Richie, of Lima, responded eloquently to the toast "Ohio's Future," and the play of wit between him and the toastmaster was very pleasing to the guests.

Judge C. B. Matthews, of Cincinnati, gave a clear statement of the "Cincinnati situation," and Frank A. Davis, of Columbus, responded to "Why we should maintain a State association." Colonel J. D. Powers, Louisville, Ky., responded to "The general telephone situation as viewed from a neighboring State."

Standing with bowed heads and sincere respect, the delegates and guests silently drank in clear, cold water a toast, "The Governor of Ohio Lying on His Bed of Pain—May He Be Restored to Us."

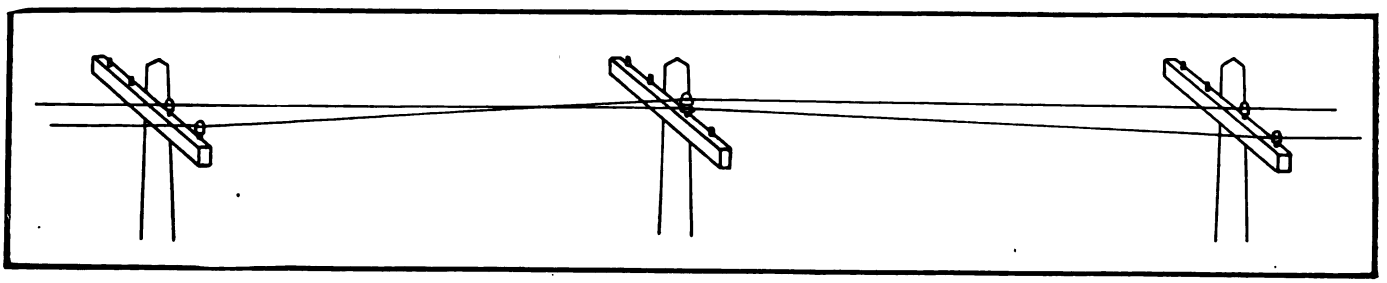
Late at night the banquet closed with hearty expressions of pleasure by the guests at the very successful event it had celebrated.

A Single Pin Transposition

By William Laneau.

THE accompanying illustration shows a method of transposing wires which presents several advantages over the old style double pin form. The old style transposition is too convenient for carelessly cut in "test stations," that soon develop into "cut outs" and "noisy lines" from bad connections, when made by linemen in a hurry.

The new style is no easier to cut than any other portion of line, so linemen will usually refrain from cutting in "test stations" where they are not authorized.



By the Use of a Double Grooved Insulator a Transposition can be Made on a Single Pin, Which is Much More Satisfactory than the Double Pin Transposition.

With the old style transposition there was usually trouble from broken pins, due to unequal strain of wires. Also it frequently happened that linemen in working on poles would carelessly place a foot or knee on the upper wire causing it to come in contact with the lower one, making a temporary loop cross.

In addition, the old style transposition was never a thing of beauty, however neatly made, and unless "run in" as the lines were being constructed, necessitated the cutting of each wire and insertion of three and sometimes four joints for each transposition.

With the new style the strain on the pin is equalized, consequently trouble from broken pins is eliminated. It is impossible for careless linemen to cross the wires at the transposition and the general appearance of the whole line is improved. It may be objected that the unused pin looks bad, but this can be remedied by placing an insulator on that pin. In this connection an amusing story is told of friction between departments.

A new line was erected by the construction department and a single pin transposition used, with unused pin left without glass. The maintenance inspector reported that the new line had not been properly insulated, and a construction man was sent over line. He reported that all wires on poles were properly insulated. The maintenance inspector reported again the absence of glass insulators on the wire, and a construction man was again sent over line to place glass where needed. On his return he reported as before that all wires on the line were equipped with glass. This happened several times, with consequent correspondence between the Superintendents of Construction and of Maintenance until feeling between them got rather warm. They then decided to go over the line together and on so doing the Superintendent of Construction was able to show the Superintendent of Maintenance that all wires were properly insulated. Although the unused pin with no glass had no wire attached, to prevent further reports from incompetent maintenance inspectors, insulators were put on all unused pins.

To cut in a new style transposition, tie as illustrated, then cut on pole on either side of transposition pole. This makes the best looking job, but the cut can be made on transposition pole if necessary. Cut long ends on two wires and insert pieces on the other two.

EXPERIMENTS IN THE PRESERVATION OF TELEGRAPH AND TELEPHONE POLES.

ACCORDING to *Forestry and Irrigation*, seven electric companies in California have made arrangements with the United States Forest Service for a thorough co-operative study of seasoning and preserving telephone and telegraph poles. The work centers at Los Angeles, where an agent of the Forest Service will be stationed to make tests under the government authority.

Oregon cedar is the tree chiefly used in this region for poles. The experiments will be devoted not only to the handling of this wood, but to a search for satisfactory substitutes among other species. Possible substitutes are Western yellow pine, incense cedar, redwood, and eucalyptus. The comparative value of these will be studied, and those which promise best will be subjected to such seasoning and preservative treatment as the Forest Service may recommend. In general, the wood will be handled in much the same manner as that which has proved successful in other work done by the service.

In Pocahontas County, West Virginia, also, the Postal Telegraph-Cable Company has established a camp for the cutting and treatment of chestnut telephone poles. The cooperation of the Forest Service was asked by the company to devise methods of seasoning and handling poles. The recommendations for seasoning, which have already been made, have been adopted by the company.

A number of poles are to be soaked in water for about thirty days, to hasten seasoning. Other poles will be air-seasoned without soaking. The value of soaking will be demonstrated by a comparison of the results of these two methods.

The Standardization of Construction

By Frank B. Hall.

ALTHOUGH strong arguments against the standardization of apparatus have been advanced, principally on the ground that it would tend to discourage the development of improvements, there are no such reasons existing why line construction should not be standardized as far as possible. None of the arguments advanced against the standardization of apparatus would apply in this case, and it is probable that the managers, construction men, manufacturers and supply dealers alike would welcome the change if it could be brought about.

You have no doubt noticed in your travels the many different methods and styles of construction work on exchanges and toll lines throughout the country.

One exchange will have heavy, strong poles, well set, but equipped with light cross arms, while the next is as likely as not to have slender, light poles, few and far between, and equipped with heavy standard cross arms. The one will be guyed to anything on which a guy wire can be attached; the other will possibly be strongly guyed and anchored. One will have galvanized hardware, while the iron work attached to the other will be plain or a mixture of both will be found. The line wire used in different exchanges is of all kinds and gauges. The same conditions apply to toll lines.

This condition has in few cases been brought about by a desire on the part of the investor to practise false economy. In other instances lack of experience and the abnormal growth of the business are largely responsible, as pole lines that were originally intended to accommodate a few wires are now called upon to support aerial cables and many cross arms full of wires.

The description I have here given must not be construed as applying to all Independent construction, as there are many extremely well constructed and equipped exchanges and toll lines. Nevertheless there are many exchanges throughout the country which will in the next few years be compelled to reconstruct their outside plants either wholly or in part. There are no progressive companies that are not continually making some extensions. The toll lines, which are the medium that will eventually cement all these groups of exchanges together, have many miles yet to be constructed, and I believe that now is an opportune time to agitate the question of the standardization of construction.

If you are interested you will no doubt ask what remedy I have to propose and how I propose to apply it: the remedy, like a physician's, will not cure all cases, and in some cases the patient may refuse to take the medicine. In order to get proper action the matter would have to be taken up by the National Association and would require the co-operation of State associations. The only pressure that could be used to bring about this improvement would be educational. Let the National Association appoint a committee to draft copies of construction specifications, covering exchange and toll line construction. Let them adopt materials that are best suited for the different uses to which they are to be applied, according to their strength and dimensions. We will take the item of cross arm braces for an example: The braces should be, we will say, 1¼x¼x26 inches and shall weigh when galvanized 286½ lbs. per 100 pieces. Your galvanizing specifications would familiarize your construction man with simple methods of testing galvanized iron or steel wire and hardware. Construction specifications should be illustrated with examples of the proper methods of pole setting, guying, wire stringing, transposing, etc.

Specifications covering cable work should recommend size of conductors, insulation, resistance, static capacity, thickness of sheath and per cent of tin in sheath for aerial cables. When your specifications and standards have been adopted let the secretary of each State Association be supplied with copies for distribution amongst the operating companies in his state.

This need not prevent the adoption of improved methods; as fast as improvements are made let the standard be raised and the fact made known, so that all may benefit by it. Your competitor does not stop progress by adopting standard materials and specifications; as soon as a good thing is introduced by one of the operating or lessee companies, after examination and approval it is adopted as a standard all over the country. The reason that the small exchange owned and operated by the small company does not usually show up as well by comparison with your competitor's small exchange is that your small company has not had the advantage of your competitor's experience. Independent exchanges in the larger towns and cities, as a rule, are as well or better constructed than Bell exchanges, as they can procure the services of competent engineers to look after their interests.

Standardizing materials and methods does not mean that what is now in service should be taken down and discarded or that there should be any loss incurred by the operating company. It would only be necessary for companies to change their construction to the new style when it has outgrown its usefulness or is worn out, and when erecting additions and extensions.

Abstract from paper read before the Parkersburg Convention of the West Virginia Independent Telephone Association.

RESIDENTS OF KANSAS TOWN OBJECT TO BELL SERVICE.

BELL attempts to undermine the Independent business in Kansas are not proving very successful. At Grantville the Bell Company not long ago took over the local system, which was owned by J. S. Banks.

As soon as the subscribers were made aware of the change an agitation was started looking toward the installation of a new Independent system. Messrs. Pankey and Zimmerman took up the matter, and to-day nine-tenths of the former Independent subscribers have contracted for telephone service with the new system, and a large proportion has ordered the Bell instruments disconnected.

In a vain attempt to hold its ground the Bell Company is offering a rate of $1.25 per month with free service to Topeka and all of Jefferson County, but with very little success. The people are well aware that this is a temporary measure designed to kill out the opposition, after which the rates would be raised to a figure high enough to pay the cost of the fight.

MANUFACTURERS ASSOCIATION OF ILLINOIS PRESENTS TELEPHONE ORDINANCE TO MAYOR DUNNE OF CHICAGO.

MEMBERS of the Illinois Manufacturers' Association state that they are ready to subscribe for $10,000,000 of stock in an Independent company to operate in Chicago. An ordinance drawn up by Levy Mayer, general counsel for this association, has been presented to Mayor Dunne by the secretary, John M. Glenn.

The provisions are in part as follows:

For a twenty-year grant either to the present company or to a new company to be organized.

For a uniform toll system within the present corporate limits of Chicago, and for an extension of this service with the growth of the city during the life of the grant.

For a reduction of from 25 to 40 per cent. in the present charges.

For an increase of at least 25 per cent. in the compensation to the city on the rate paid by the Chicago Telephone Company.

The exact stipulation of service rates is left open pending the receipt of reports of a corps of experts engaged by the association to investigate the character of service and the cost in various cities of the United States and Europe.

QUERIES

EFFECT ON CONDENSER ON TRANSMISSION.—(677.)

Do condensers weaken the talking circuit on a party line? J. D. J.

The condenser in a common battery sub-station set has no deleterious effect upon transmission in practice or in laboratory experiments. The number of parties on the line does not alter this effect.

If you refer to the practice of cutting a condenser in series with the receiver on magneto party lines so as to allow of ringing when a receiver is off the hook, this does affect transmission to an appreciable extent, but not enough to be objectionable. Each condenser of 2 m. f. capacity is equivalent to about two miles of additional No. 12 copper circuit.

CONNECTING MAGNETO AND COMMON BATTERY SWITCHBOARDS.—(678.)

I am looking up a simple circuit to connect my board which is Sterling magneto to the switchboard of the F. M. Company, which is a Kellogg Central Energy. I have three metallic circuits for trunk lines to their office, and am under the impression that it will give good service if we install a 4-point jack with 500 ohm ringers on their board, and take our trunk lines direct to the jacks without using relays and repeater coils; they could then have a pair of cords equipped with one plug and cord to connect to their system and the other plug and cord to connect on trunk line. Will this work satisfactorily? A. S.

The plan you outline is as shown in Fig 678, which is all right as far as you go, providing you can get the F. M. Co. to put in the circuits you propose. We take it that the Kellogg central energy circuit is like the one we show in the local half of the combination cord circuit, although the Kellogg Company makes a great many circuits for small switchboards. The use of drops instead of the ringers you propose is worth considering, as you thereby give an indication as to what circuit is calling. You can, however, get a ringer of small size with a latch drop indicator which will do the work, but it is more expensive and takes a lot of valuable room. A ringer or drop should be used in the local half of the combination cord circuit for clearing-out purposes. The common battery half of the circuit will operate the same as the remainder of the cords on the switchboard.

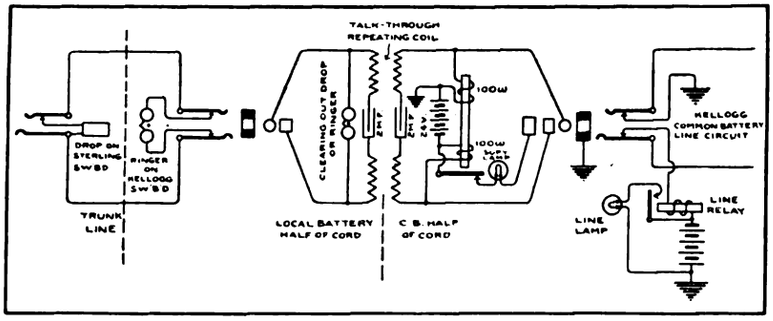

Fig. 678.

INFORMATION OPERATOR.—(679.)

Will you please explain what sort of work is done by an information operator? C. L. F.

An Information Operator has assigned to her the duty of handling all irregular calls in a large exchange which should not be referred to the chief operator. The work is principally concerned with the securing of connection to the proper person when there is any uncertainty with regard to the manner in which he is to be reached. This applies to such cases as the following:

When a person wishes to find a telephone nearest to a given location, the Information Operator, by means of a street list, obtains the required information, and furnishes it to the calling subscriber.

Frequently doubtful calls occur. The switchboard multiple may be marked to indicate that a certain line is a party line, having several subscribers; and, in order to call any one of the parties on the line, it is necessary to know the ring number. If the calling subscriber does not know the ring number he is referred to the Information Operator to have the matter straightened out; the same rule of procedure applies when a call is for a number larger than the highest numbered multiple in the exchange, which would lead the operator to suspect that the party was calling for a subscriber connected to a different and larger office.

Numerous instances of a similar nature arise, in which information is desired for the completion of a connection. All these, to save burdening the subscriber's operator with duties which would reduce her ability to give prompt attention to new calls, are referred to the Information Operator. She is provided with subscribers' lists, lists of changed numbers, disconnections, new connections, etc., which furnish means of securing all information required for the proper carrying on of her work.

The provision of such a special operator is only customary in exchanges where the number of irregular calls is too great to be handled by the Chief Operator. By this means the telephone company handles this class of business rapidly and economically.

GROUNDING COMMON RETURN WIRE.—(680.)

Should the return wire be grounded in a common return system? W. M. T.

The experience of one of the leading engineers who has to do with this type of exchange has been that, as a rule, it is best to ground the common return wire. With a good ground connection on the return it is found that the system is more quiet if some of the lines become crossed with electric light or power wires. In such cases, and with the common return wire grounded, the disturbances would not be passed over the entire system. For instance, when the common return wire comes into contact with the street railway wires, if the common return wire were not grounded at the central, the entire system would be exposed to the current from the street railway circuit. In addition to introducing noisy lines, this would also produce a dangerous condition of circuits, for with the telephone system well insulated in every respect, a cross with the street railway lead would raise the potential of every wire connecting to the telephone exchange to that of the street railway current. A subscriber or employe so unfortunate as to form a connection between the telephone line and the ground would then get a shock from the full voltage of the street railway systems. For these reasons it is advisable to thoroughly ground the common return wire.

PEG COUNT.—(681.)

Please tell me the nature and object of a peg count. C. L. F.

A Peg Count refers to the taking of a count of all calls occurring during a twenty-four hour period in one exchange. It is usually made once a month. The name is probably derived from the custom which formerly prevailed, of moving a plug along in the multiple one jack for each call.

The figures obtained show the number of calls per position per hour, and are used to determine whether the number of operators is too great or too small at each hour of the day, the load even, or if additional swithcboard equipment is required.

STANDARD LINE CONSTRUCTION.

THE members of the West Virginia association at their recent convention heard a paper by Frank B. Hall, which, although brief, served to outline a course for action on a most important subject, and to clearly suggest the necessity for advancement along the lines he points out.

In erecting a telephone plant the first requirement is to provide construction which shall sustain the load to be placed upon it and provide a factor of safety sufficient to bear the unusual stresses imposed during periods of severe weather, such as sleet storms and high winds. While the intensity of the forces produced by such conditions varies throughout different sections of the country, it is nevertheless possible to draw up figures which shall represent the dimensions and strength of material which should be able to withstand the natural forces to which it is likely to be subjected which will hold good throughout a very large section of the country. In special cases, where these dimensions are inadequate, modifications can easily be made.

The second consideration after strength, which insures permanency and freedom from interruption of service, is always economy of construction. In building the vast number of lines which have already been erected and in observing their behavior throughout a considerable period, experience and much valuable information have been gained by many men. If this information could be collected and classified, it would afford data showing the strength, durability, behavior when exposed to the weather and other physical qualities, as well as the suitability of the different dimensions to special purposes, of the various members involved in line construction, which should be sufficient to most effectually determine the very best type. The proposition of standardization would, threfore, not be so difficult as it would be if it involved new experiments in an untried field.

The method in which it would effect economy is evident from the presumption that the use of any excess of material, or improperly designed appliances, or material essentially inferior in nature, or poorly adapted to the use to which it is put, involves not only the liability of inferior service to subscribers, but financial loss to the telephone company. When it is considered that although each individual item of such loss may be small, assuming, for example, that it is only a few cents for a mile of line, nevertheless, if these few cents per mile were multiplied by the number of miles of circuit at present standing in this country, it is obvious that the figures would be enormous.

The advantages coming from the execution of this plan would be felt by the entire Independent organization. They would furnish new companies with a reliable standard, which would enable them to expend their resources with the utmost assurance of obtaining the maximum return on their investments. Interconnecting companies would be upon an equal footing, and the transfer of business from one to another would be upon a much more satisfactory basis. Subscribers to any system would receive the benefit of uniform transmission and security, no matter in what direction from the home office their business should be carried on.

Such action is bound to come at some time, so unavoidable is the conclusion that it is an absolute necessity. As reconstruction is likely to make more rapid progress within the next few years than at any other time, the earlier the standards are established for guidance in this rebuilding the better it will be for the systems of the future. In cases of this kind a saving of time is in the truest sense a saving of money.

ELIMINATION OF WASTE.

THAT the completion of toll calls, in every instance where it is possible, is a duty devolving upon every telephone company as a public service corporation, will not be denied. That the profit to be derived from the performance of this duty in the most complete sense has been shown in practice to be considerable is the conclusion of nearly every company which has made a conscientious and systematic attempt to fulfill this obligation.

Few toll lines of any company are kept constantly busy. As the profit depends upon the number of minutes used by subscribers, under the present system of charging so much for a fixed period of actual conversation, with extra charges based upon additional time, the rate of profit depends absolutely upon the length of time in which the lines are in use by the company's patrons. It is therefore certain that the maximum return on an investment in the line and associated equipment must be secured from a constant use of the wire by subscribers. This condition, which is obviously an unattainable ideal limit, it should be the endeavor of the operating manager to approach as closely as is possible in practice.

The conditions which make it impossible to attain the fullest measure of success in this direction are: First, lack of sufficient business at the originating end to maintain a satisfactory amount of service over the line; which, of course, can only be corrected by the slow methods of securing new subscribers and impressing upon those already connected the merits of the toll service.

The second difficulty, however, is caused by the conditions at the remote or receiving end of the wire; and it has been found that inability to complete a connection on account of troubles occurring in this way is susceptible of correction in a large number of cases.

A number of occurrences, which are all well known and properly classified by operating men, are found to prevent the completion of a call. For instance, the line of the called person may be busy or in trouble, or the person may be out. Such a case presents to a traffic manager alive to the commercial obligations by which he is bound to the management an instance which presents difficulties analogous to an inquiry received by an advertising man. In this latter case, when the inquiry is received, if it does not lead to an order which will produce a profit the advertising manager feels that he has made a failure. In the same way a telephone traffic manager should have in use a method of operating which will insure the completion of nearly every originating call.

The first step in this undertaking falls upon the operator at the terminating end of the connection. In every case where it is impossible to bring the desired person to the telephone immediately the fullest information should be secured. This frequently results in his location at a place where conversation may be carried on from a telephone other than his own. In other instances the time when conversation may be carried on may be definitely determined. The calling subscriber usually finds that this delay is not sufficient to make another method of communication desirable, and the call may be completed at the proper time. The surprisingly large percentage of calls which may be completed through the efforts of a well-trained and courteous operating force make the practise a most profitable one.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

STATUS OF COMPANY AFTER EXPIRATION OF FRANCHISE.

We wish to thank you for the information given us through the Legal Department of your paper, and also wish to avail ourselves of the advantage again. We should like to know the standing of a company holding a franchise in a city of Texas after the franchise has expired. A. T. Co.

THE status of the company depends entirely upon the statutes of the State. The statutes of Texas are not accessible here, so the editor will have to answer according to general principles. These are that if the act of incorporation under which the company is organized gives it the right to use the streets and highways of the State for the purpose of erecting and maintaining a telephone line, the expiration of a franchise from a municipality does not deprive the company of the right to do business therein. Where the State law gives telephone companies organized under it the right to build their lines a franchise from a municipality is a contract without consideration. Macklin v. Home Tel. Co., 24 O. Cir. Ct. R. 446.

If the statutes do not give this right, the franchise from the city is essential, and at its expiration the company is without right in the city.

SUBSEQUENT INCORPORATION OF A TOWN DOES NOT EFFECT FRANCHISE.

Will you tell us the position of a company when it has been operating in an unincorporated town under a permit from the county commissioners, in the event the town incorporates? H. G.

THE position of a telephone company under the circumstance you mention is no different after the incorporation of the town from what it was before. The permit from the county commissioners will be the authority of the company for operating in the town after it is incorporated. It has been held that a franchise granted by a county must be recognized by a town subsequently incorporated within the county. 38 Vt. 193, 100 U. S. 514.

SUIT TO RESTRAIN CONNECTIONS.

THE Green Bluff Telephone Company of Spokane, Wash., has instituted an action against G. M. Nunn, in which it prays for an injunction restraining him from using its lines. It is alleged that the Green Bluff Telephone Company operates two lines between Green Bluff and Mead, and that the defendant, past whose property the lines of the company run, although not a member of the company and without any authority whatever, attached a telephone wire from his residence to one of the wires of the company, installed a telephone in his home, and began at once to use the lines of the company against its will.

A FRANCHISE AN INCORPOREAL HEREDITAMENT.

IN actions to recover taxes paid by the Stockton Gas & Electric Company to the tax collector of San Joaquin County, California, under protest, the court laid down an important principle of law. The taxes were assessed upon a franchise to use the public streets of the city of Stockton for electrical purposes. In addition to the assessment upon its franchise, the company was also assessed each year upon other property in the city, including its pipes, poles and wires. No question was raised that a franchise was property under the terms of the constitution and revenue laws of the state, and that it was taxable as such. The sole question was whether the franchise assessed against the plaintiff was properly assessable in the county of San Joaquin. The company contended that its corporate franchise was assessable only in the city and county of San Francisco, where its principal place of business, fixed by its articles of incorporation, was. The constitution provided that "all property . . . shall be assessed in the county, the city, city and county, town, township, or district in which it is situated." The court held that the franchise extended by the constitutional provision to lay pipes and conduits, or erect poles and supply the inhabitants of a city with artificial light, is an incorporeal hereditament, is real estate in the nature of an easement, pertaining to the streets of the city in which it is exercisable; that it is inseparably annexed to the soil out of which the profit arises, and has a local situation in the place and that place only, where the right is actually exercised. The court therefore held that the franchise was assessable in the city of Stockton and county of San Joaquin and denied the right of the company to recover the amount of the taxes paid under protest. Stockton Gas and Electric Co. v. San Joaquin Co., 83 P. 54.

TEXARKANA ATTEMPTING TO DRIVE OUT BELL TELEPHONE COMPANY.

THE city of Texarkana, Tex., has commenced suit in the District Court asking for an injunction to restrain the Southwestern Telephone Company from carrying on business inside the city limits. Several months ago it was ascertained that the telephone company had no franchise to do business on the Texas side, although it had been operating there for more than twenty years. It was asked by the city council to take a franchise and give the city 5 per cent. of its gross earnings, but refused. The city then granted the Texarkana Telephone Company (Independent) an exclusive franchise for local business for a consideration of $100 per month. The company paid the first $100, and immediately the city proceeded to drive the Southwestern Company out of the territory.

KENTUCKY'S RETROACTIVE FRANCHISE LAW.

THE East Tennessee Telephone & Telegraph Company has sued for an injunction against the city of Paducah in the Federal Court at Louisville, seeking to enjoin the city from circumscribing the rights and privileges and from interfering in any way with the operation of the company in the city of Paducah.

The East Tennessee Telephone Company claims that it operates under a legislative grant which is perpetual, and which cannot be abridged or modified by a municipal board. The grant was secured before Kentucky had franchises, and when the new constitution was adopted and franchises came into existence it was claimed that the law could not be made retroactive, or, in other words, could not force any person or company that already had a right to do business, to buy a franchise in order to do business thereafter. The city about two years ago, after allowing the company to operate a dozen or more years without a franchise, decided that it was necessary for it to get one, but the company refused. Once a suit was brought to "oust" it, but it was compromised by the company paying the city $3,000. Later and recently another disagreement arose between the company and city.

IN THE OPERATING FIELD

INDEPENDENT COMPANY IN NEW MEXICO PROSPERS.

STARTING about a year ago with only eleven subscribers, the Johnson-Mesa Telephone Company, operating in Raton and Folsom, New Mexico, has now nearly one hundred subscribers and is adding new ones daily. At a recent meeting of the company it was decided to erect a metallic toll line between the two towns, and to install an exchange at Folsom to take care of the growing business of the company. Upwards of $800 will be spent during the coming summer to improve the system, which will then have over 200 miles of lines.

The subscribers are all stockholders and the plant is free from debt.

NEW INDEPENDENT EXCHANGE IN SERVICE AT PARK CITY, UTAH.

BUSINESS men in and around Park City, Utah, are all favorably commenting upon the excellent service which is being given by the Utah Independent Telephone Company. The local exchange was opened a little over a month ago and during the interval the construction force has been kept busy installing new sub-station apparatus. The company erected a modern fire proof exchange building and installed a common battery switchboard of the latest type at an expense of $50,000.

Included in the equipment is a toll board having an ultimate capacity of one hundred and forty lines. The toll and long distance lines already built and now under construction will connect this point with numerous towns in Utah and adjoining states. Connection has already been established with Preston, Idaho, on the north and notwithstanding the difficulties of construction encountered, the service is excellent.

INDEPENDENT EXCHANGE AT MONROVIA, CAL., WILL RECEIVE IMPORTANT ADDITIONS.

IMPROVEMENTS in its switchboard plant and extensive cable installations, which will cost about $10,000, are planned by the Home Telephone Company, of Monrovia.

Growth in the number of subscribers during the past year has been rapid. Three long-distance lines are constantly in use and another one to Los Angeles will soon be connected. There will also be a new branch exchange at Sierra Madre to relieve congestion at the Monrovia main exchange.

Another story will be built on the one-story brick building which now houses both the offices and exchange. In the second story the new central energy switchboard will be placed. The first floor will be occupied by the office forces. For lines on the principal streets 12,000 feet of cable will be put in use. The passing of the control of the stock into the hands of Dr. West Hughes, of Los Angeles, marked extensive placing of capital. Local directors of the company are J. M. Baldwin, who is also manager; F. N. Hawes and Frank J. Cornes.

AMERICAN COMPANY LEAVES NASHVILLE.

THE American Telephone and Telegraph Company, which is and has been for a number of years operating in Nashville, Tenn., without a franchise from the city, has been notified by Mayor T. O. Morris that unless the company secured a franchise it would be compelled to quit doing business in Nashville and, as anticipated, the company will transfer its property in Nashville to the Cumberland Telephone and Telegraph Company. The city attorney held that the company might be compelled to submit to any requirements the city might see fit to impose on it or might be entirely excluded from doing business in the city. The mayor addressed the following letter to James E. Caldwell, president of the Cumberland Telephone and Telegraph Company:

"I hereby notify you that the wires of this company must be removed from your poles unless the proper steps be taken to secure the authority for this company to do business in this city."

As a result the Cumberland Company agreed to buy the property of the American Company in the city at the cost price and also to connect the wires of the former company with those of the latter at some point or points outside of the city. It is probable Franklin and Gallatin will be selected.

To the mayor the representatives of the American Company stated its business was so small as not to warrant application by it for a franchise. Heretofore it was supposed the company had a right to operate in Nashville under the law of 1885 and was so advised by its attorneys, but they admitted this supposition was erroneous, and the company was willing to withdraw entirely from Nashville. The mayor was asked if he objected to the sale of the company's property to the Cumberland Company, to which he replied that he would interpose no objection to the sale.

CITY OF LOUISVILLE AIMS DIRECT BLOW AT EXCESSIVE BELL RATES.

AN ordinance which has for its object the regulation of telephone rates in Louisville, Ky., is up for consideration before the governing bodies of that city. In its present form the ordinance forbids the charging of a rate in excess of $4 per month for business telephones. An amendment provides for fines of from $10 to $100 for every failure on the part of the telephone companies to comply with the ordinance.

It is especially directed against the Cumberland (Bell) Company, which is said to have been charging exorbitant rates. If the ordinance becomes a law this company will stand to lose from $100,000 to $1,000,000, as it claims to have 10,000 telephones in service.

It is likely that the terms of the ordinance will be made very rigid on account of the declaration of defiance made by the Cumberland company, which has announced its intention not to comply with it, in case of its passage, on the ground that it is unconstitutional. The councilmen believe that they have the power of regulation in this case, and the members of the Revision Committee are determined to force the question to an issue.

The ordinance has already been passed by the Council, and now awaits the action of the Aldermen.

BELL FAILS TO STAMPEDE IOWA FARMERS.

FARMERS residing in the neighborhood of Boone, Ia., were recently approached with a proposition by the Bell company to the effect that if they would sever their connection with the Boone County Independent system and connect with the Bell they would be given service at half the rates they were then paying. A meeting was called to discuss the situation and after both sides had been heard the farmers unanimously decided to stay with the Independent system, with which they renewed their contracts at the old rate.

MILWAUKEE COUNCIL PREPARED TO PASS ORDINANCE GRANTING FRANCHISE TO INDEPENDENT COMPANY.

ALL indications point to an early grant of an Independent franchise in Milwaukee, Wis. The West Shore Telephone and Telegraph Company has been before the city with an application for a franchise. With a few amendments the proposition it has offered is satisfactory and will be further considered by the common council.

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—6-100 pair and 11-50 pair Sterling Inside Terminal Heads complete with heat coils. Used very little and good as new. Address, Macon County Telephone Co., Decatur, Ill. 580

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

FOR SALE—1,800 line, multiple, lamp signal, Central energy switchboard of latest Stromberg-Carlson make. Just from the factory. Not yet unpacked. Terms to suit. Also modern telephone exchange and electric light plant in progressive South Carolina town of over 2,000 inhabitants, $14,000; $3,000 cash; balance on easy terms. Piedmont Electric Co., Anderson, S. C. 563

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Position wanted by telephone man. Can hold any position. Best of references. Address Box 584, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 584

WANTED—Ten first class cable splicers familiar with underground and aerial work. Must furnish references with application. Also two able cable foremen to supervise work of splicing gangs. Must be well recommended. Address, Box 586, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 586

WANTED—By a large telephone factory in Chicago, young men not over 22 years of age, preferably graduates of high schools or technical schools, to enter an apprenticeship course and be trained to install and operate modern central office equipment. Address, stating age, education and experience, Box 582, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 582

WANTED—Wire chief on exchange of 700 to 1,500 magneto subscribers in Kansas. One who is also good on outside construction. Must be able to handle storage batteries, rural and toll lines. If interested, write stating salary, etc., to Box 583, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 583

THE point is just this! Are you dissatisfied with your present position—or have you an employee who is unsatisfactory—in either case, where could you turn better for relief than to a corps of trained employment experts? We have secured better positions for thousands of men, and have supplied thousands of employers with competent men. Why hesitate? Booklets can be secured for the asking. Hapgoods, Suite 511, 309 Broadway, New York City. 464

WANTED—Telephone men experienced in automatic switch work. State experience and salary expected. Address Supt. of Equipment, Home Telephone & Telegraph Co., Los Angeles, Cal. 581

WANTED—State representative wanted by telephone manufacturer for Pennsylvania and Ohio. One familiar with common and local battery apparatus. Address Box 578, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 578

WANTED—Cable splicer. Young man thoroughly competent to splice lead cables, underground and aerial. Work must be first class. Permanent position to right man. Address York Telephone Company, York, Pa. 576

Agencies and Branches

NEW YORK CHICAGO CLEVELAND
SAN FRANCISCO PHILADELPHIA ATLANTA

Digitized by Google

A purchasing clause has been inserted in the documents which gives the city the right to buy the plant at any time during the life of the license. While the city now pays the Wisconsin Telephone Company a large sum for telephone service, the new company will be required to give free telephones to a majority of the city offices. It is also required to connect with Independent long distance lines reaching the city and not to charge any more than is charged in any city of 200,000 population and upwards for such connections. The franchise will be void in sixty days if the company refuses to so connect with an Independent long distance line.

The company must put up a bond of $25,000 to protect the city from damages and must begin work six months after accepting the franchise and within six months after the beginning of work it must spend $100,000 on the plant. A bond of $25,000 to insure this must be filed. It will be returned when the conditions have been fulfilled.

All wires within three miles of the city hall are to be underground. In twelve years all the wires of the company are to be put underground if the city so orders, and if all other wire using companies are required to do likewise.

It is required that if a company operating a telephone exchange in Milwaukee buys out this company, the conditions of this franchise shall apply to all lines of the purchasing company.

The franchise of the West Shore Telephone and Telegraph Company was selected from among the five before the committee because it appeared to the aldermen that there was the least question about this being an Independent company.

It is said that the ordinance is to be amended so that eight hours shall be the working day of the company's employees and so that union labor shall be employed in all branches where the craft is organized in Milwaukee. This is to be done at the suggestion of F. L. Witters, business agent of the Electrical Workers, and J. J. Handley, of the Federated Trades Council.

The West Shore Company will adopt the flat rate method of charging for service. The provisions of the ordinance regarding the price of service are as follows:

When five thousand (5,000) shall be in operation, the rental for full metallis long distance telephones shall be as follows:

BUSINESS RATES.

	Per Month.
Individual line, service unlimited	$5.00
Auxiliary telephone, portable or permanent desk set in connection with main instrument	1.00
Two parties on one line, unlimited calls	3.50
Three or four parties on one line, unlimited calls	3.00
And the residence rates shall be as follows:	
Individual line, unlimited service	$3.00
Auxiliary telephone, either permanent or portable desk set in connection with main instrument	1.00
Two parties on the line, unlimited service	2.50
Three or four parties on one line, unlimited service	2.00

Until fifteen thousand (15,000) telephones, within the city of Milwaukee, are in operation and connected up with bona fide subscribers the rental per month shall be as above specified, but for each additional 1,000 connected up after the 15,000 are in operation and use, the said grantee may, at its option, increase the rental for telephone service for full metallic long distance business and residence telephones $1.50 per year for each additional 1,000 installed, on all the telephones then used by bona fide subscribers, to said telephone company and exchange.

NORTHERN NEW YORK SOON TO HAVE ANOTHER FIRST CLASS INDEPENDENT EXCHANGE BUILDING.

THE Niagara County Home Telephone Company has started the construction of a new common battery exchange, to take in the twin cities of North Tonowanda and Tonawanda, New York.

The building which is in process of erection will be practically the same as the one at present occupied by the company in Niagara Falls, which was built last summer. This building was designed by General Manager R. M. Eaton, who has produced what is conceded to be one of the best designed buildings for all-around telephone purposes in the country.

The company has ordered for its Twin City exchange equipment which is of the same type as that in use at Niagara Falls. The telephones to be used will be all of stamped steel, no wood instruments of any kind becoming a part of the plant.

It is proposed to have the work so far advanced that the old systems may be cut over to the new on the 1st of July. The company will then be in a position to furnish service conforming completely to the high standards which have so rapidly won the approval of the public in the territory which it covers.

INDEPENDENTS BUILDING LINES IN TENNESSEE AND PREPARING TO ENTER NASHVILLE.

THE Home Telegraph Company of Nashville, which has put up poles and wires on several streets in the city running from the northern to the southern limits, has also put up its poles and wires from Spring Hill, twenty miles outside the city, south to Decatur, Ala., and is now erecting poles from Spring Hill toward Nashville. Poles are also being erected in a northwesterly direction, the intention being to run a line from Nashville to Springfield, Robertson county, some 30 miles distant. The city of Nashville has been temporarily enjoined from interfering with the erection of poles and stringing of wires within its limits.

The Home Telegraph Company is owned and operated by the same parties as the Home Telephone Company, which was refused a franchise by the City Council some months since, and it is generally believed that the telegraph company is erecting the poles and stringing the wires to prepare for the operation of a telephone system. The Home Telephone Company is hard at work in Macon county erecting poles and stringing wires, and many contracts to take this company's service have been made with the people of that county.

ALEXANDER GRAHAM BELL PREDICTS WIRELESS TRANSMISSION OF SPEECH.

BRANTFORD, ONTARIO, has recently held a celebration which was attended by Alexander Graham Bell. The famous inventor in an address delivered during the proceedings stated that the idea which led to the development of the telephone first came to him in Brantford, and it was there that he first succeeded in transmitting speech over a considerable distance.

In a newspaper interview given a few days ago he is reported to have said in response to an inquiry: "I firmly believe the time will come when wires will not be necessary in telephoning. We already have wireless telegraphy. Why not wireless telephony?"

INDIANA MAYOR WILL VETO ORDINANCE ALLOWING COMPANY TO CONNECT WITH BELL LINES.

THAT Mayor Brouse of Kokomo has little or no confidence in the purposes of the Citizens' Telephone Company is shown by the fact that he has vetoed the ordinance just passed by the council granting the Citizens' Telephone Company the right to form connections with the Bell Telephone Company for long-distance service to points not reached by the New Long Distance Telephone Company's lines.

Mayor Brouse contends that the action of the council would be likely to deprive the subscribers of the Citizens' Telephone Company of the advantages that comes of having competition for long-distance service. The ordinance granting the local company the right to connect with the Bell company for non-competing points was passed by unanimous vote of the council, but seven of the twelve have said they would not vote to pass it over the Mayor's veto. Hence the probabilities are that the Independents will remain in possession of the field.

All Copper. Made in 4 Styles

THE SWITCH FOR RURAL LINE PROTECTION

In many instances the instruments on rural lines are provided with knife switches, so that in case of a storm the telephone can be disconnected.

A Trumbull All Copper Switch

is particularly adapted for this use. When closed it makes a positive connection between the line and instrument, and on account of the even tension between the blades and the contact clips there is no possibility of dirty contacts causing noise. No matter how many times it is opened or closed, it will never fail to work successfully.

Let us quote you prices, or, better still, equip one line with them, and be convinced of their superiority over the ordinary type.

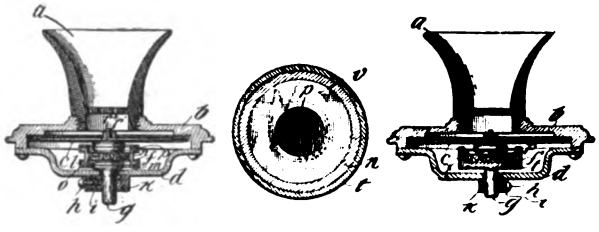
TELEPHONE PATENTS

TELEPHONE TRANSMITTER.

Ernest E. Yaxley, Chicago, Ill., patents (No. 815,889; dated March 20, 1906; filed September 26, 1905; serial No. 280,158) and assigns to the Monarch Telephone Manufacturing Company, Chicago, Ill., a transmitter.

The object of this invention is to provide means whereby the entire granular material contained within the electrode chamber can be subjected to agitation. Referring to the illustrations, the novelty of construction lies in the use of two mica rings *v*, *w*. The chamber *n* is provided with an annular inset or shoulder *u*,



upon which these rings are seated. Each is provided with an entire granular material contained within the electrode chamber chanical contact between the electrodes and the rings is maintained solely by pressure, and is regulated to prevent the carbon particles passing between them to the exterior portion of the containing chamber, by means of the sliding stem *g*. This can be moved in or out and when the correct adjustment is secured it is locked in position by means of the set screw *h*.

By this construction it will be seen that the granular material lies substantially between the planes of the inner surfaces of the electrodes and beyond their faces. Owing to the flexibility of the containing rings vibrations of the main diaphragm will be communicated to every part of the chamber and consequently all the granular material will be agitated.

PARTY-LINE SYSTEM.

Edward A. Buell, De Kalb, Ill., patents (No. 811,692; dated Feb. 6, 1906; filed May 1, 1905; serial No. 258,276) a party-line telephone system.

In this patent the inventor utilizes the ringer movement to actuate step by step mechanism to connect the telephones to the circuit. An auxiliary electro-magnet is employed which returns the ringer magnet mechanism to its normal position after it has accomplished its desired functions. Means are also provided by which the operator at the exchange can eliminate the selective features of the apparatus at all the substations so that any party can call any other without the aid of the operator.

TELEPHONE APPARATUS.

John G. Roberts, Detroit, Mich., patents (No. 815,380; dated March 20, 1906; filed June 26; renewed September 19, 1902; serial No. 124,083) and assigns to the Kellogg Switchboard and Supply Company, Chicago, Ill., a telephone ringing and signaling system.

The principles involved in this invention relate to automatic ringing and signaling. Means are disclosed for the automatic connection of ringing current at specified intervals of time to the calling cord circuit after it is connected to a line; for the automatic disconnection of the ringing mechanism after a prescribed number of rings, if the subscriber does not answer; for the automatic connection of a "don't answer" signal to the answering cord circuit; for the automatic display of a visual signal at the exchange when the called party fails to answer after a given time; for the automatic disconnection of the ringing mechanism from the circuit when the subscriber answers, and for a locking arrangement by means of which the ringing current is prevented from being switched into connection with the line after the party hangs up his receiver and which cannot be unlocked until the plug is removed from the jack.

Owing to the complicated nature of this patent it will be impossible to give a clear description of the means employed and we therefore suggest that parties interested procure a copy.

TELEPHONE CALL.

Peter Thomas Geyerman, Brewster, Minn., patents (No. 811,052; dated Jan. 30, 1906; filed Mar. 14, 1905; serial No. 250,032) a telephone call.

The object of this invention is to secure secrecy on telephone lines carrying a plurality of stations and it also discloses means whereby selective signaling can be attained.

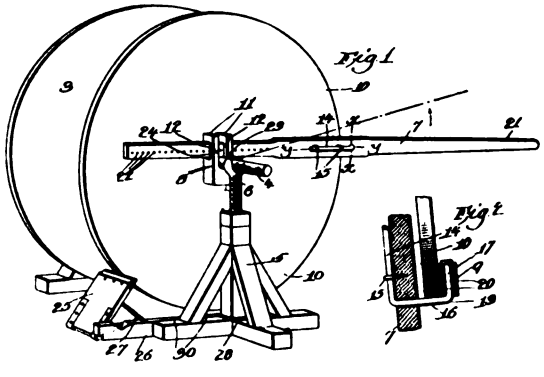
To accomplish these results the subscriber is called upon to perform five different operations. The claims granted are mainly for mechanical arrangements of the parts and do not include any basic statements.

CABLE REEL WINDER AND BRAKE.

George W. Brown, Hyde Park, Mass., patents (No. 815,261; dated March 13, 1906; filed August 16, 1905; serial No. 274,474) a cable reel winder and brake.

The essential feature of this invention consists of the use of a lever to rotate the reel for either winding up or unwinding cable from it.

Referring to the illustration 3 is a reel supported on an arbor 4 mounted on a lifting jack 5; 7 is the lever mounted at one end by a fulcrum block 8 carried by the arbor 4. Attached to lever 7 by means of the U shaped arm 13 is a gripping block 9. This block is pivotally attached to arm 13 and is provided with projections 20, adapted to engage the face of the flange 10 of the



reel 3. A brake 25 is provided to prevent the backward movement of the reel and is controlled by spring 27.

In operation the fulcrum block is slipped on the arbor 4, the lever 7 passed through the slots 12 and adjusted in position which is maintained by the insertion of a pin 24 passing through one of the arms of the fulcrum block and one of the adjusting holes 22 of the lever 7. The lever is then lifted up and as pressure is applied in its descent the gripping block 9 is pressed into contact with face of flange 19 causing the reel to revolve.

Moving the lever upwards disengages the gripping block and the backward movement of the reel is prevented by the brake 25.

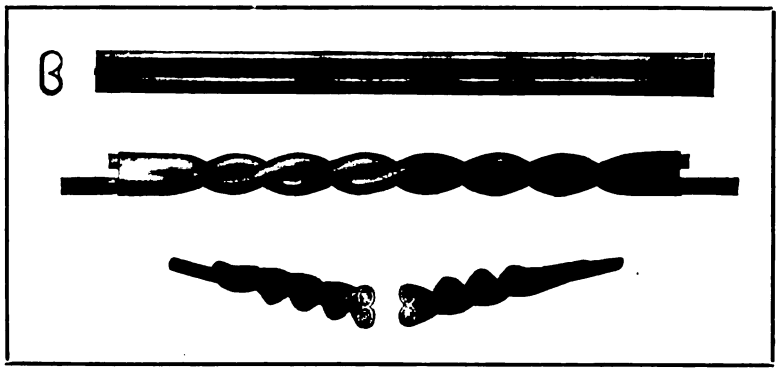
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A TUBULAR FUSE.

EXTREME reliability is claimed for the Fi-ne tubular fuse manufactured by the Fisk-Newhall Telephone Manufacturing Company, Chicago, Ill., of which we present an illustration. The enclosing of the fuse wire within a glass tube protects it from drafts, which are liable to vary the rate at which the wire is heated, and insures that all fuses of a similar rating shall operate on the same current. Moreover, as the amount of air which must be heated in connection with the fuse wire is definite, the time at which the rupture occurs may be very accurately predetermined.

The company claims that the fuse is certain to rupture within three to five seconds of the time that it receives the load for which it is marked. They are furnished in the usual ratings for circuits using small amounts of current. Further information, prices, etc., can be obtained by writing to the manufacturers.



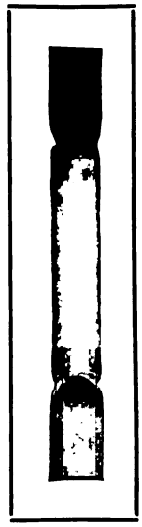
New Wire Connector Made by Frank B. Cook. Note that wire is in contact with sleeve throughout its entire circumference.

A NOVEL BATTERY CARBON.

UPON this page is shown an illustration of a carbon pencil which enters into the construction of the No. 6 Fleur de Lis dry cell, manufactured by the French Battery Company, 69-75 Wells Street, Chicago, Ill.

It will be observed that the form of this pencil is such as to give the greatest possible extent of surface for a given volume of carbon. This enables the company to use in a cell of a given size the maximum amount of active material, which contributes, as the company claims, to give the cell remarkable qualities of efficiency and endurance.

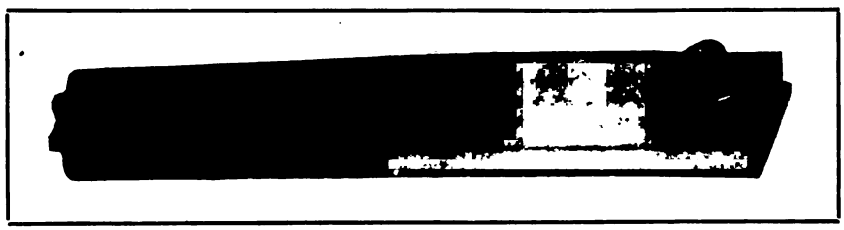
The carbon is imported, and the company states that it is of a very superior quality. All the other materials are claimed to be of the same high grade as the carbons, securing a combination which, from the satisfactory electrical results obtained, and from its economy, makes it extremely desirable. The company will be pleased to furnish detailed information concerning its product to those who forward them inquiries.



Fi-Ne Fuse.

A NEW WIRE JOINT.

FRANK B. COOK, 246 West Lake street, Chicago, Ill., has put upon the market a self-welding wire joint for which he claims important advantages. The illustrations shown upon this page give an idea of the form of this connector. It is so designed that the mere act of twisting draws the sleeve into the recess between the wires, and stretches it in such a way that it is absolutely tight around the entire circumference of both wires. It will be seen that such a device makes a much firmer joint, with better electrical properties than one in which the contact between the sleeve and the wires is obtained only upon two opposite sides of each wire, leaving a large portion of the circumference free from contact with the sleeve. Further details, prices, etc., will be furnished upon application to the manufacturers.



The Special Fluted Carbon Used in the Batteries Made by the French Battery Company.

IMPORTANT PATENT SUIT DECIDED.

THE patent suits over various telephone protective devices, which have been pending for the past three years, have finally come to a termination. Judge Anderson, of the United States Circuit Court for the District of Indiana, has handed down his decision, which gives the Sterling Electric Company of La Fayette, Ind., the exclusive right, title and ownership to all of the patents at issue.

Mr. Cook was one of the incorporators of the Sterling Electric Company, and at the time of the removal of the company to La Fayette was its president. He had assigned to the Sterling Electric Company the right and title in all of his patents and inventions. Mr. Cook retired from the company in February, 1902, disposing of all of his stock. After making the transfer he instituted suits in the United States Circuit Court against the Sterling Electric Company, claiming that it had no right to his patents and inventions and also for a measure of damage. The bill of complaint was not answered by the Sterling Electric Company, but it filed a plea claiming complete ownership of these patents and asking the court to approve and adjudge such ownership.

The cases have been bitterly fought for over three years, Cook being represented by Stuart, Hammond & Sims, of La Fayette, and C. C. Buckley, of Chicago; the Sterling Electric Company by John F. McHugh, of La Fayette, and C. A. Brown, of Chicago.

Mr. Walter E. Doolittle, president of the Sterling Electric Company, stated that the policy of the company in this matter will be an aggressive one. It has suffered untold injury by way of prestige and loss of business and it is its intention to recover every dollar of loss and prestige, and an additional amount for the damage which has been done its business. He says it is in a position to ask for and be granted an injunction, not only against Cook, but against other manufacturers, receive an accounting for the goods they have manufactured and figure a measure of damage.

THE SWEDISH-AMERICAN TELEPHONE COMPANY, Chicago, Ill., wishes to call attention to its bridging instrument, Hercules type, with a condenser installed in the secondary circuit, as shown in the accompanying illustration.

Digitized by Google

Avenarius Carbolineum is a Wood Preservative

which has been on the market for the past 30 years. It is the only preparation known which absolutely protects and prolongs the life of wood exposed to the elements.

It can be applied with a brush, and owing to its high specific gravity readily penetrates to the heart of the wood, expelling moisture and killing all germ and insect organisms.

It gives a durable nut brown stain, and thus serves the purpose of paint at less expense.

POLES, CROSS ARMS, PINS, GAINS, POLE ROOFS, ETC., ARE ABSOLUTELY IMMUNE FROM THE ACTION OF THE ELEMENTS OR INSECT LIFE IF TREATED WITH AVENARIUS CARBOLINEUM.

We have hundreds of testimonials to prove our statements besides the specifications of government engineers and analytical reports from chemists of world wide reputation.

Let us send you copies. Also write for our explanatory booklets.

CARBOLINEUM WOOD PRESERVING CO., 126 Reed Street, MILWAUKEE, WIS.

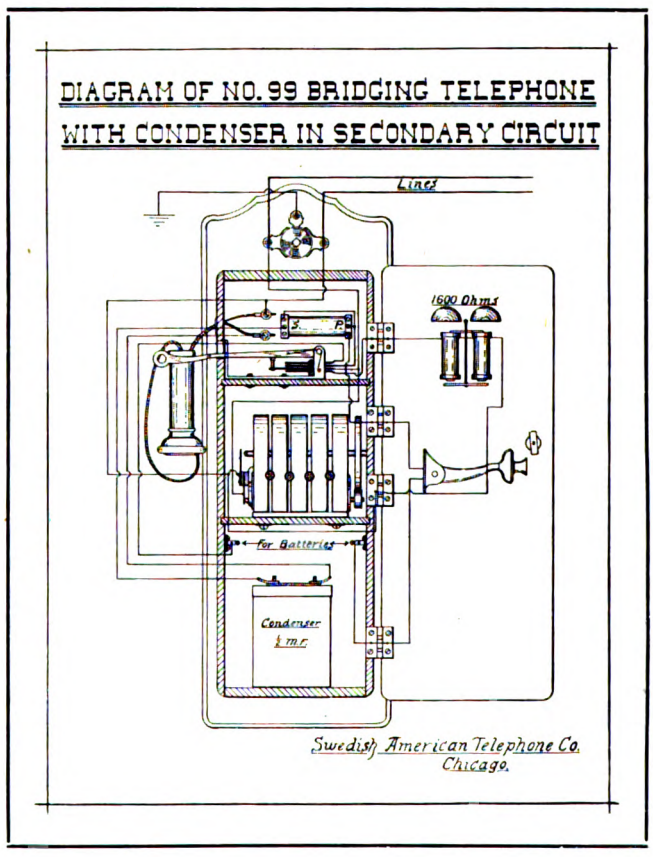
IN THE MANUFACTURING FIELD

All subscribers on heavily loaded rural or party lines have experienced more or less trouble in signalling their central station by reason of curiously inclined subscribers removing receivers from the hook when the bells ring, making it almost impossible to ring a second signal.

This trouble can be effectively and cheaply remedied by using a condenser in the secondary circuit. This can be easily installed in bridging instruments now in service at a nominal cost. The ½-micro farad capacity condenser is the type almost exclusively used and recommended by this company for bridging instruments.

The Swedish-American Company wires all of its bridging instruments for a condenser, whether so equipped or not, in order that, if at any future time they may be required, it will be possible to easily and quickly place them in the instrument. The Swedish-American Company manufactures its condensers of the best grade of rice paper and tin foil. They are so constructed that each layer of paper and foil is in perfectly even layers, preventing any possibility of creased or cracked foil, which would sooner or later result in the burning out of the condenser. Those contemplating the installation of bridging instruments may obtain information from the company.



The Wesco Supply Company, St. Louis, Mo., has recently distributed to the trade its new switchboard bulletin No. 68, which shows a very complete line of magneto switchboards, ringer boards, switching devices, etc. This bulletin is very complete in its description of the various parts and advantageous features of the apparatus shown, and should be of much interest and benefit to those who receive it.

Although this bulletin has been distributed within the past 30 days, the Wesco Supply Company reports numerous inquiries and has already effected the sale of 15 of its new type switchboards, ranging from 50 to 300 lines capacity.

Distinction of Character is the title of an ingeniously designed folder issued by the Swedish-American Telephone Company of Chicago, Ill. Those who wish to learn what are the two important kinds of individuality, and how the Swedish-American Company has observed the better kind in such a way as to result in the improvement of its apparatus, should send for this folder.

The Manufacturers' Advertising Bureau, which has been located on Liberty Street for many years, has removed to 237 Broadway, New York City, in order to secure the greater space required for its increasing business.

The bureau has been established since 1877 and has made a speciality of electrical advertising for many years, and is considered an authority on that subject. The bureau intends to somewhat broaden the scope of its work, and while particular attention will be paid to advertising in the trade and technical journals, as heretofore, it will be equipped to handle advertising in the newspapers, magazines and all other periodicals as well.

Circuit diagrams and illustrations from working drawings and photographs of cabinets are combined in a new bulletin in such a manner as to give very complete and useful information concerning the telephones put upon the market by the Dean Electric Company of Elyria, O. The variety of instruments described includes types suitable for every class of work, and sufficient information is given to enable the reader to determine for himself the merits, and adaptability to his purpose of the high grade instruments furnished by the company. As general conditions dealing with matters which will be brought up in the selection of instruments are discussed in an interesting manner, the bulletin deserves to take equal rank as a source of general information with the other well designed booklets which are issued by this company in a standard form. This bulletin, which may be bound with the others which have been issued, or will come out in the future, may be obtained by writing to the company for bulletin No. 101.

The Stromberg-Carlson Telephone Manufacturing Company, Rochester, N. Y., reports having just closed a contract with the Kinloch Long Distance Telephone Company of St. Louis, Mo., for 10,000 central energy telephones. This is the first order the Kinloch Company placed for new telephones to be used in conjunction with the 17,000 line switchboard now being installed by the Stromberg-Carlson Company.

The Baird Manufacturing Company, 6 Michigan street, Cihcago, announces that the Chipley Telephone Company, of Chipley, Florida, is equipping its rural lines with the Baird Secret Service system. There are now quite a number of telephone companies in the State of Florida using Baird lockouts. This system is also being installed by the Beaver Telephone Company, of Rochester, Pa., which will operate it on a large number of rural lines radiating from that point.

The John A. Roebling's Sons Company, Trenton, N. J., has just issued an illustrated booklet describing the process of splicing wire rope. The illustrations are exceptionally clear and practical, as they are made from photographs taken during the progress of an actual splicing operation. Sixteen separate full page views are given and facing each is a page of descriptive matter which directly relates to that particular part of the work. Great care has been exercised in the compilation of the test to make every detail clear so that an ordinary mechanic can by a small amount of practice turn out a satisfactory splice. The latter part of the volume is devoted to descriptions of the different types of wire ropes manufactured by the company. Parties interested can secure this booklet without cost by applying to the company.

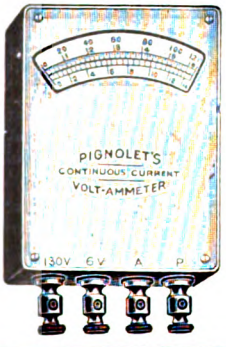
THE VALUE OF A MEASURING INSTRUMENT



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

THE WEEK'S MESSAGES

FINANCIAL.

UPPER ALTON, ILL.—The Star Telephone and Telegraph Company has increased its capital stock from $2,500 to $12,500.

INDIANAPOLIS, IND.—The New Long Distance Telephone Company has declared its regular quarterly dividend of 1 per cent.

ALMA, MICH.—The Union Telephone Company has declared a 2 per cent. quarterly dividend.

LEWISTOWN, MINN.—The Lewistown Telephone Company has increased its capital stock from $10,000 to $25,000.

ROCHESTER, N. Y.—The Rochester Telephone Company has declared its regular quarterly dividend of 1½ per cent.

ADAMSVILLE, O.—The Adamsville Telephone Company has declared a dividend of 6 per cent.

WOODSFIELD, O.—The Woodsfield Telephone Company is to increase its capital stock from $25,000 to $50,000.

HAILEYBURY, ONT., CAN.—The Haileybury and Cobalt Telephone Company has increased its capital stock from $5,000 to $50,000, for the purpose of building a number of extensions, including a long distance line from Haileybury to Cobalt.

FRANCHISES.

LEWISTOWN, ILL.—L. E. Cutler has secured a franchise at Lewistown to build and operate a telephone system, to be known as the North Fulton Telephone Company. He expects to run the company's lines as far as Havana.

NEW ORLEANS, LA.—An Independent telephone company is seeking a franchise at New Orleans. The officers of the new company are as follows: President, Thomas Crouch, of St. Louis; treasurer, L. S. Mitchell, St. Louis; secretary, Philip Werlein, New Orleans. The new company is to have a capital of $2,000,000, with headquarters at New Orleans.

AURORA, MO.—The Farmers' Mutual Telephone Company has been granted a franchise at Aurora.

GLASGOW, MONT.—R. J. Moore has been granted a franchise to build a telephone line from Glasgow to Nashua and from Glasgow to Malta.

ATTICA, N. Y.—The Attica Home Telephone Company, Attica, has been granted a franchise under which it expects to be able to erect and maintain its telephone system and exchange in that city.

FLUSHING, O.—The Stillwater Telephone Company, of Stillwater, O., has been granted a franchise to build and operate a telephone system in Flushing.

PLEASANT CORNERS, O.—The Sandusky Telephone Company, Sandusky, O., is trying to obtain a franchise at Pleasant Corners.

TROUT LAKE, WASH.—The Trout Lake and Glenwood Telephone Company has applied to the commissioners of Klickitat County for a franchise.

COMBINATIONS.

FLORA, ILL.—The Flora Telephone Company has purchased the Friend Telephone system, and a new company will be organized with a capitalization of $20,000.

MATTOON, ILL.—The Mattoon Telephone Company, the Coles County Telephone Company and the Charleston Telephone Company have been consolidated.

PHILLIPSBURG, KANS.—The Enterprise Telephone Company has purchased the exchange at Kirwin.

SUSSEX, N. B.—The Central Telephone Company has taken over the telephone line of the Hampton and St. Martins Railway.

STEUBENVILLE, O.—The National Telephone Company, of Wheeling, W. Va., has absorbed the Phenix Telephone Company of Steubenville.

LOYALSOCK, PA.—The Loyalsock Telephone Company has purchased the rights of the Vallamont Telephone Company, and will build its proposed lines covering Loyalsock township. Other extensions will also be made.

SHERMAN, TEXAS—The North Texas Telephone Company of Sherman has acquired the property of the Whitesboro Telephone Company.

ELECTIONS.

CANTON, ILL.—The Canton Home Telephone Company has elected the following officers: President, Eugene Smith; vice president, N. J. Gorman; secretary and manager, F. W. Plattenburg.

ALMA, MICH.—The Union Telephone Company has elected the following officers: President, Tod Kincaid, Owosso; vice president, James T. Gibbs, Ithaca; secretary, John H. Fildew, St. Johns; treasurer, G. S. Ward, Alma; general manager, W. A. Melchers, Alma.

SPRINGPORT, MICH.—The Springport Mutual Telephone Company has elected the following officers: A. J. Cortright, president; L. A. Carter, secretary; S. T. Doolittle, treasurer; D. C. Hoffman, manager.

SWEDESBORO, N. J.—The People's Rural Telephone Company has elected the following officers: President, G. W. F. Gaunt; secretary, W. B. Gill; treasurer, William Wolf.

CHATHAM, N. Y.—The Chatham Independent Telephone Company has elected the following officers: President and manager, P. G. Babcock; vice president, A. J. Fellows; treasurer, A. N. Van Deusen; secretary, J. C. Carpenter.

CINCINNATUS, N. Y.—The Otselic Valley Telephone Company has elected the following officers: President, J. H. Murray; vice president, P. C. Wheeler; secretary and general manager, A. Fowlston; treasurer, B. R. Corning.

ADAMSVILLE, O.—The Adamsville Telephone Company has elected the following officers: President and business manager, C. H. Hawks; vice president, E. C. Jordan; treasurer, C. A. Guyer; secretary and assistant business manager, C. C. Cazer.

TOLEDO, O.—The Toledo Home Telephone Company held its annual meeting Tuesday, March 13, the following board of directors being elected: One year—Eugene Zimmerman, James S. Brailey, Jr., Clarence Brown, E. J. Marshall and John Manning. Two years—A. H. Bauer, St. Louis; J. J. Robison, R. E. Hamblin, M. V. Barber and Thomas H. Walbridge. Three years—W. F. Robison, Thomas H. Tracy, H. C. Stifel, St. Louis; D. C. Shaw and Jay K. Secor. The by-laws were so amended that five directors will hereafter serve for five years, five for two, and five for one. The officers of the company were re-elected, and are as follows: President, James S. Brailey, Jr.; vice president and secretary, R. E. Hamblin; treasurer, Thomas H. Walbridge. The company reports that 2,000 new telephones have been installed during the year.

NEW COMPANIES.

FORT SMITH, ARK.—The Pan Telephone Company has been reorganized with a capital stock of $120,000, which is to be increased to $250,000. The new capital will be spent in improving the company's system.

YELLVILLE, ARK.—G. A. Ward, D. H. Dodd, R. B. Tegarden, H. H. Galleys, T. N. Matthews and associates have incorporated the G. A. Ward Telephone Company, with $15,000 capital stock.

WALDRON, ARK.—The Citizens' Telephone Company of Waldron has been incorporated with the following incorporators: H. C. Stanton, W. A. Streator, William B. Thurman, W. E. Stone, W. M. Gibson, T. J. Wood and others. The company will establish a $5,000 plant.

APPLETON, ILL.—The Persifer Telephone Company of Appleton has been incorporated with a capital stock of $1,200. The incorporators are F. S. Beamer, R. V. Wyman and J. H. England.

REDMON, ILL.—The Redmon, Isabel and Kansas Telephone Companies have consolidated and a new company has been formed to be known as the Embarrass Telephone Company. The principal stockholders are John Henn, of Redmon, Ill.; E. N. Blair, of Borton, and L. I. Arterburn, of Kansas.

SEWARD, ILL.—The Illinois Mutual Telephone Company, of Seward, has been incorporated with a capital stock of $2,500. The incorporators are Chas. S. Thomas, William McDonald and Geo. D. Bridgeland.

LOCKMAN, IND.—The South Side Telephone Company has been incorporated to construct an exchange and telephone system in Lockman and Brown and Jackson counties.

WESTVILLE, IND.—An Independent telephone company has been organized at Westville with the following stockholders: E. S. Smith, A. J. Forbes, E. W. Weed, E. T. Scott, H. B. Herrold and Jacob Herrold. Connections will be made with long distance lines and Independent lines run in various directions throughout the surrounding country.

ACKLEY, IA.—The telephone exchange formerly operated by Bruening & Symington has been sold to a stock company. The new company is incorporated for $10,000. E. B. Smith, of Waterloo, is president of the company; G. E. McFarland, of Des Moines, vice president; F. J. Martin, of Ackley, secretary, and H. A. Miller, of Ackley, treasurer.

GRAND JUNCTION, IA.—The Junction Mutual Telephone Company, Grand Junction, Ia., has been incorporated with a capital stock of $9,000. President, G. H. Wiltse; vice president, Joe Gannon; secretary, F. O. Van Pelt; treasurer, O. J. Dutton.

RINGSTED, IA.—The Farmers' Mutual Telephone Company has been

THE WEEK'S MESSAGES

organized at Ringsted. A town exchange and a number of rural lines will be built.

MOUNT ANGEL, OREGON.—The Mount Angel Mutual Telephone Company, of Mount Angel, Oregon, has been organized.

SCOTTS MILLS, OREGON.—The Scotts Mills Mutual Telephone Company, of Scotts Mills, Oregon, has been organized.

ELLSWORTH, WIS.—An Independent telephone company has been formed at Ellsworth, Wis. The incorporators are A. Combacker, J. E. Foley, N. N. Buck and W. P. Knowles.

KIRKTON, ONT., CAN.—The St. Mary's, Kirkton and Exeter Telephone Company has been incorporated with a capital stock of $40,000. The directors include W. R. Carr, Kirkton; J. W. Graham, St. Mary's, and I. G. Jones, Exeter. The company plans to connect the three towns by long distance telephone lines. Address W. R. Carr, Kirkton, Ont.

PERSONAL.

F. E. COUVILON has been appointed manager of the Cumberland Telephone & Telegraph Company's exchange at Lumberton, Miss.

R. F. HARDGRAVE has been appointed manager of the Tuscarawas County Telephone Company's exchange at Uhrichsville, O.

B. C. MITCHELL has been appointed manager of the Cumberland Telephone & Telegraph Company's exchange at Dawson Springs, Ky.

C. W. POOL has been appointed manager for the local Independent telephone company, at Tecumseh, Nebr.

E. Y. SANDERS has been appointed manager of the Cumberland Telephone & Telegraph Company's exchange at Boonville, Miss.

J. W. TEMPLE has recently been promoted to the position of special agent of the Cumberland Telephone & Telegraph Company, with headquarters at Union City, Tenn.

MISCELLANEOUS.

OAKLEY, KANS.—The Oakley Telephone Company has been purchased by Mr. Pick, formerly of Bunker Hill, Kans.

SPRINGPORT, MICH.—Stockholders in the Springport Mutual Telephone Company have rejected a proposition to connect with the Bell lines. Connections with Grand Rapids will be obtained over a line to be built by the Citizens' Telephone Company, which was considered to be better equipped to furnish a satisfactory service.

TOLEDO, O.—The Toledo Home Telephone Company reports that a recent peg count kept by its force of 144 operators for a period of 24 hours showed that the girls had answered a total of 186,208 calls for the day, or an average of close to 1,300 for each operator.

CALGARY, ALBERTA, CANADA.—The League of Alberta Municipalities unanimously passed a resolution in favor of municipal ownership of telephone systems with government control of rates. The provincial government will be petitioned to secure powers to expropriate the Bell Company's lines in Alberta.

New Construction in the Field

LOS ANGELES, CAL.—The United States Long Distance Telephone and Telegraph Company is to build about 70 miles of long distance lines.

SAN FRANCISCO, CAL.—The Union Pacific and Southern Pacific Railroad is to construct an Independent long distance line from Omaha to San Francisco. The main line will be 1,800 miles long.

MACON, GA.—The Dublin Telephone Company expects to make many improvements in its system.

ALTON, ILL.—The Star Telephone Company is to construct a line from Upper Alton to Godfrey, and will eventually establish an exchange at Godfrey.

FONDA, IA.—The Northern Telephone Company, of Fonda, Ia., is to build a line from Bisbee to Rolette, at which place it will establish an exchange.

LORIMOR, IA.—The Lorimor Telephone Company is to build a line to Beulah.

RED OAK, IA.—The Red Oak Telephone Company is to build a line from Red Oak to Stennett.

BELLEVILLE, KANS.—The Belleville Independent Telephone Company will rebuild its exchange, making extensive cable installations.

CONCORDIA, KANS.—The Concordia Telephone and Telegraph Company has ordered new central office equipment and will rebuild its system.

LEWIS, KANS.—The Farmers' Telephone Company is to construct a line from Lewis to Rumsey.

MANKATO, KANS.—The Jewell County Telephone Company is to build a full metallic line from Mankato to connect with a metallic line from Belleville, giving connections with Kansas City.

RANDOLPH, KANS.—W. F. Peter is interested in the rebuilding of the telephone line between Randolph and Winkler. A line is also to be built to May Day.

WESTMORELAND, KANS.—The Westmoreland Telephone Company is to build a line southeast from Blaine.

COLUMBIA, KY.—E. A. McKinley and J. N. Murrell, of Cray Craft, are interested in the new Independent telephone line which is to be built from Columbia to Cray Craft.

LAINGSBURG, MICH.—The Laingsburg Telephone Company is to extend its lines in many directions.

STURGIS, MICH.—The National Telephone Company, with an exchange at Sturgis, is to build several additional farmers' lines in Sherman township.

PISGAH, MO.—The Pisgah Telephone Company has commenced the construction of its system.

HARTINGTON, NEB.—The Farmers' Telephone Company, which has recently increased its capital stock to $20,000, is to build a line to Crofton and to St. James.

BOSCAWEN, N. H.—The Canterbury and Boscawen Telephone Company is to build a line to North Concord. Its system will also be extended in Penacock.

TILTON, N. H.—The Citizens' Telephone Company is to construct two new lines.

RATON, N. M.—The Johnson Mesa Telephone Company is to put in a metallic toll line from Raton to Folsom, and to install an exchange at Folsom.

BISMARCK, N. D.—The Capital Telephone Company is to construct a line from Bismarck to Braddock.

EAST PALESTINE, O.—The Unity Township Telephone Company, of East Palestine, is to build lines into Middletown township and Beaver township.

WINDHAM, O.—The Windham Telephone Company is extending its system.

EL RENO, OKLA.—The Canadian Valley Farmers' Telephone Company is to construct several new lines.

CHARLESVILLE, PA.—The Friends' Cove Mutual Telephone Company has commenced the construction of its system. It will connect with the Bedford County Telephone Company.

GROVE CITY, PA.—The Union Telephone Company is building a toll line between Grove City, Harrisville and Slippery Rock.

TURBOTVILLE, PA.—The People's Telephone System, with an exchange at Turbotville, is building lines to Muncy, Dewart, and is to soon commence the construction of a line from Turbotville to Lewisburg.

DELL RAPIDS, S. D.—The Dell Rapids Telephone Company is to extend its system to all parts of the farming region tributary to Dell Rapids, as well as to every nearby town.

EDGEMONT, S. D.—The Edgemont Telephone Company is to extend its lines to the Cheyenne River.

SALT LAKE CITY, UTAH.—The Independent Telephone Company, of Salt Lake City, is building a line to Spanish Fork.

NORFOLK, VA.—Chief of Police Boush has recommended to the police board the installation of a new police telephone system, which will cost $11,600.

HUNTINGTON, W. VA.—The Mutual Telephone Company is to install $8,000 worth of new cable.

MARINETTE, WIS.—The Farmers' Telephone Line is to extend its system in and about Marinette.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

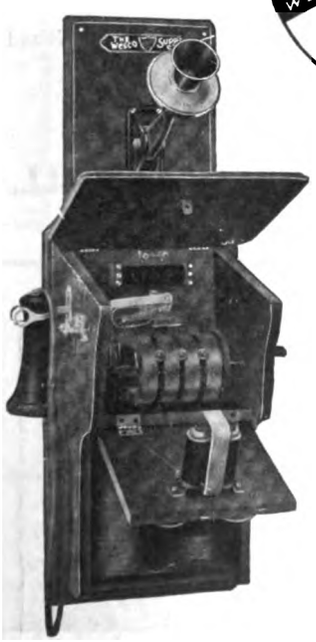
"ALL WORKS OF QUALITY"



The Wesco "Ideal."

Says RUSKIN,

"must bear a price in proportion to the skill, time, expense, and risk attending their invention and manufacture. Those things called dear are, when justly estimated, the cheapest; they are attended with much less profit to the artist than those things which everybody calls cheap. Beautiful forms and compositions are not made by chance, nor can they ever, in any material, be made at small expense. A composition for cheapness, and not for excellence of workmanship, is the most frequent and certain cause for the rapid decay and entire destruction of arts and manufactures."

Our Booklet, "PERFECT TELEPHONES"

will interest all who appreciate the economy of buying THE BEST. Write for it.

DEAN TELEPHONE APPARATUS

To the Aspiring Telephonist

A series of text books in the form of bulletins, 8x10 inches in size, is being published to aid the aspiring telephonist in making advance towards a thorough and useful knowledge of Dean equipment and apparatus.

The method to be followed in presenting our equipment and apparatus will be the natural order clearly and simply defined, as "from the less to the greater." The first subject discussed comes under the heading of Local Battery Telephones, Bulletin No. 101, consisting of thirty-two pages.

All the Bulletins will be made so that when bound together each bulletin will constitute a complete chapter in itself, and will be literally an encyclopedia on the subject of telephone apparatus.

From Electrical Review of March 31-06.

THE DEAN ELECTRIC COMPANY, Elyria, Ohio, in bulletin No. 101 publishes a detailed description, with illustrations, of local battery telephones. In addition to the reproductions of apparatus many diagrams of circuits are given, making the literature of very great interest.

Send for copy—Free.

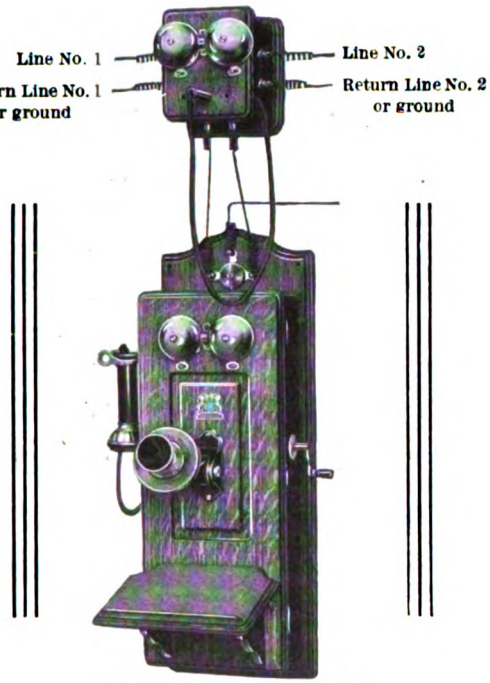
3-WAY, EXTENSION BELL SWITCH



No. 99 CENTRAL TELEPHONE

When plug is inserted in jack as per sketch, lines Nos. 1 and 2 are both connected with the central telephone.

When the plug is inserted in jack No. 1, the central telephone is connected directly with line No. 1. At the same time any signal from line No. 2 will operate the extension bell. When the plug is inserted in jack No. 3 the central telephone is connected direct with line No. 2, and any signal from line No. 1 will operate extension bell.

When the plug is not inserted in either jack, lines Nos. 1 and 2 are connected together, with extension bell bridged across the line.

Prices and further particulars on application.

SWEDISH-AMERICAN TELEPHONE CO.
CHICAGO, ILL.

AKRON, Ohio—
OAKLAND, California—
TACOMA and
BELLINGHAM, Washington

have all gone Automatic—Akron for 3,000 lines, Oakland for 5,000, Tacoma for 4,000 and Bellingham for 1,000.

Merit, absolute merit, was the reason why Automatic Telephone Equipment was selected by the Independent Companies in these cities.

They wanted the best, the very best, in telephone equipment.

They took their time and looked hard for it everywhere.

They found it in the Automatic.

That's where you will find it when you are ready to see it.

That's where the Independent Companies in all these cities found it—they adopted the Automatic:

Chicago, Ill.

Central Energy Telephones

Stromberg-Carlson

TELEPHONE MANUFACTURING CO.
ROCHESTER, NEW YORK

IF you use or contemplate using Central Energy Telephones it will pay you to get a copy of this new bulletin. There is sufficient evidence in it to prove that the telephones illustrated therein are without exception the most modern and nearest to perfection of any ever placed on the market. This statement is not based on the fact that our cabinets are better finished, that we have a better transmitter or a removable hookswitch, but the telephone taken as a whole.

There is not room enough on this whole page to explain all of their good points. By good points we mean the things that make your subscribers satisfied, eliminate troubles caused by accidents or carelessness on the part of users.

It will only cost you a two-cent stamp and a moment's time to get a copy. Just ask for Bulletin No. 15-B.

Shall we send one?

WE MAKE CABLE

You Cannot Control Nature

NO matter how you try, the best you can do is to protect your apparatus as well as you know how, and to construct your circuits so as to reduce the possibility of damage to a minimum.

Just for the purpose of demonstration let us consider the difference between a twenty-five pair open wire line and a cable of the same capacity.

The open wires offer fifty resisting surfaces to the velocity of a wind, the cable only one. The open wires also offer fifty separate surfaces for the lodgement of sleet and snow whilst the cable only has one. In case of a lightning storm the same proportion exists for the path of the discharges to earth, and, if the cable is properly erected its circuits will not be affected, whilst any or all of the open wires can be grounded or opened.

The action of a heavy wind or sleet storm places a much greater strain upon the poles of an open wire line than those supporting a cable lead and consequently the ability of the former to withstand the abnormal pressure is proportionately less than that of the cable poles.

These facts being true, there is no room for argument as to the advisability of using cable.

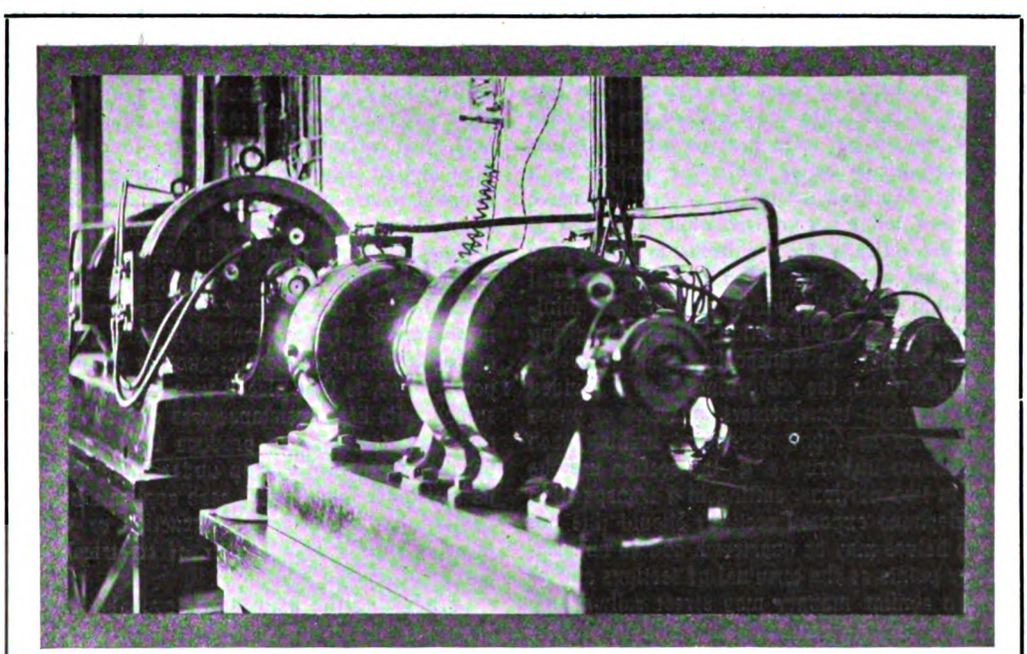
Power Data for Telephone Men

By P. Kerr Higgins.

CONTINUING our consideration of the transmission of power, we come to the line, and what takes place there is all important to the telephone man. On such a line the principal feature is the frequency which has a specific effect upon the conducting capacity of the line, so much so that the tendency to-day is towards the use of very low frequencies. Inasmuch as it is now possible and practical to use high pressures, the feature of resistance does not receive as much consideration as those of frequency and inductance, which is the limiting influence in high tension circuits. The general effects of inductance are such that impedance appears first and very materially interferes with the capacity of the line to carry current. Any increase in inductance causes more and more separation between the pressure and the current, and such diminution in power emphasizes the difference between apparent power and power available.



Machine Equipment Used in Independent Exchange at Paterson, N. J., for Charging Storage Batteries.

In electric lighting the frequency varies from 50 to 120 cycles per second, the ones most often used in telephone work being 50 and 60 cycles per second. Increasing the frequency forces the current out to the surface of the conductor, and a continued increase will eventually makes the conductor inoperative, the cross section of the wire not being permeated by the electrical energy. The effect on the line is to increase the static effect and inductance with the increase in number of alternations, the current and voltage being separated by such. The variation in the power factor is shown by such separation, being due to the difference in phase between the one and the other, and naturally the more widely the divergence the less power is available. These measurements cannot be made by a volt or ammeter, as they do not show the difference in phase, hence the necessity for using a wattmeter which gives readings in true watts. As previously stated, a transmission line shows four peculiar characteristics: Inductance, resistance, capacity and leakage. A magnetic field of force is always present around a wire carrying a current, of which the lines of force lie in a plane perpendicular to the line. The presence of other conductors in the vicinity and parallel to the transmission line subjects it to the influence of the fields of force of the transmission wire. Wires are not materially affected by earth or ground if the distance between them and the ground is greater than three times the distance between wire and wire, hence the relation between the distance between the disturbing wire and ground and the disturbing wire is very important in considering inductive effects.

Resistance is a function of the line in relation to its length and the diameter of the conductor and the metal of which it is made; it also varies slightly with the temperature. Capacity is the peculiar property of a line to store an electrical charge, somewhat in a similar manner to the condenser, and is known as "electro-static capacity," and is the setting up of a stress between the conductor on one side and the earth or a conductor on the other side, the ether forming the dielectric. As dry air is the best dielectric from the standpoint of capacity, it is apparent that any insulation on the wires only tends to increase the capacity effect. It is opposite in effect to inductance, being increased by the presence of other conductors to ground. We can therefore conceive of a long transmission line loaded down with a current being forced through at a high pressure, that quite a good deal of this is expended in creating an inductive field in its vicinity, and we can readily see that the existence of a telephone line in the neighborhood with its extremely sensitive apparatus, the receiver, will be quick to pick up any changes in such a field, and such changes appear in the form of noise, which is at the maximum in a grounded line and at the minimum in a well balanced transposed telephone metallic circuit. The velocity of such currents is given at 180,000 miles per second, only very little less than light, and the inductive influence is slightly faster than this, being about 185,000 miles per second. All energy spent in heat or leakage is lost;

Continued from the issue of April 7th.

Digitized by Google

that spent on the static charge returns to the original line when the supply is cut off.

If the current were constant and uniform, as long as the same conditions existed no noise would be apparent because the noise is due to changes and variation in the inducing current. The magnetic density and power is greater nearest the conductor and diminishes as it gets further and further away from it, in a similar manner to the lines formed in water when a pebble has been dropped into it. Drop two pebbles side by side a few inches apart and the action of one wire upon another can be appreciated; the circles are not exactly the same, but serve to illustrate the action taking place. In order to neutralize such inductive influences we must present to the disturbing wire equal sides or portions of a metallic circuit; there is no cure for a grounded line but to remove it from the vicinity of the disturbing wire. To do the former first one side of the metallic is brought close to the disturbing wire for a predetermined distance, then the other side for the same distance, and the line is cut up in equal parts until a perfect balance is found; this is termed transposing. It must be understood that the metallic line prior to this transposing must be well balanced both as to conductor resistance and insulation resistance, as otherwise time is lost and results will be unsatisfactory. Such transpositions then are simply rotating the current through 180 degrees, which changes their relative positions at each rotation and the exposure of one side counteracts the exposure of the other side. The reason for this is, all induced currents are in opposite directions, and this constant rotation by reversing the currents causes them to neutralize each other. If two or more circuits are parallel to each other it is also necessary to transpose them so as to neutralize the currents mutually induced between the two. This is much harder than the other.

The transposing may be done on either the transmission line or on the telephone line or both. On the standard ten pin arm the sections are divided into quarter mile sections between transpositions. The first transposition being made one quarter of a mile from starting point. As transposing is a very expensive business, costing about one dollar per transposition, it is well to determine more or less theoretically the requirements of the case before proceeding with the work, making a few experimental tests if necessary, adopting that style which employs the minimum number of transpositions per unit section without impairing the efficiency of the transposing. In transposing against foreign wires such as alternating circuits, the disturbing wire is divided off into sections, e. g., between transformers and one or more transpositions cut in as may be found necessary, making each section between transpositions uniform; e. g., the section may be cut in two by dividing in two portions, cutting in a transposition in the middle of the telephone exposed section; should this not be enough then the two halves may be quartered, and so on, considering the transformer points as the terminal of sections and so in a neutral state. In a similar manner may street railways be treated, taking the sub-stations as neutral points and in electric light (arc) systems, taking the lamps as the terminal of sections. The induction from a series arc light circuit is always productive of much disturbance, if parallel to the lines for any length. It may here be noted that when transposing lines against outside interference, all the lines on the pole line must be transposed. In making transpositions it is useless to cut in any more than is necessary to eliminte the disturbance; we so frequently see foremen and others give orders to cut in transpositions on a general principle rather than a specific one; this is waste. If only one pair of wires is on a pole line and no induction is noted, it will be time enough to cut in the transpositions when the other circuit is run or disturbance noted.

When telephone and power circuits must be placed upon the same pole line, it is always necessary and best to have power wires as close together as safety will permit, otherwise the most aggravated conditions, as to inductive influence, will be met with; and in all cases the telephone lines should be below the high tension lines. The writer strongly advises against the joint use of pole lines by telephone and power companies, owing to the danger which is always present, and when the voltage of such circuits is over 5,000 volts it is extremely dangerous. An important feature of every line, whether telephone or power, is the leakage factor. It is a good practice, and one which has been more or less neglected of late by both telephone and power companies, to patrol the lines with a view to keeping up the insulation to a high standard, replacing broken glass, tying in wires which have become loose, clearing trees, branches, kite strings and anything and everything which would have a tendency to impair the insulation of the line. It would also be well from time to time to clean the insulators, as these in time become incrusted with dust, etc., and cause more or less leakage.

Those who are concerned with the maintenance of all electrical apparatus in an exchange may find interesting a certain amount of information concerning the lamps in use for electric lighting. The development of the incandescent lamp began with a glass bulb from which the air had been driven and in which a wire was placed which was heated up to a white heat. It was noticed during the progress of this evolutionary stage that the light increased in brilliancy as the vacuum in the globe was increased, and this led to the use of the mercury vacuum pump, and the discarding of the old air pump, consisting of a cylinder and piston. This improved method of producing a more perfect vacuum made further strides in the development of the lamp possible. The resistance of the wire was increased, then platinum wire was tried, but in all of these experiments the volatility was a drawback and a limit to the brilliancy. It was possible by the use of a high current to bring these wires up to a high state of brilliancy, but on account of the fact that the wire soon became fused the use of platinum wire was finally abandoned. At this time Thomas A. Edison of the United States and Swan of England were both working along the same lines, endeavoring to develop a filament which would be more durable, the result being that carbon in some form was found to be the most desirable. One treated threads with acid, then carbonizing them; the other used bamboo fibre treated in a similar manner, both obtaining good results. Maxim attempted to use paper, and Weston used a cellulose compound to make filaments, but the final outcome of the investigation and experiments was that carbon in some form was the most desirable of all, and this discovery was the means of placing the incandescent lamp on a commercially successful basis. As we can see in the arc light, etc., carbon is very difficult to soften by heat, and so it volatilizes slowly; another feature of carbon, and an important one, is that placed in a vacuum it does not become consumed. Its high resistance was also favorable to its adoption, as this was necessary to produce the required white heat. One peculiar feature of carbon under these conditions is the fact that its resistance lowers with each application of the current and may account for its ultimate destruction or volatilization. The filament is thus a transformer of electrical energy into thermal energy producing light.

Carbonizing the filaments is probably one of the most delicate processes known in connection with electric lighting. The filament forms are placed in a bed of powdered charcoal, direct contact with the air being prevented for a long time. These are placed in an oven in which the temperature is gradually raised to a red heat, the charcoal acting as a preventative of the possibility of the filaments being reduced to ashes by contact with the air. The filaments must be made of very fine grain and be homogenous throughout. When taken out of the oven they are hard and elastic and have to be handled very carefully. Flashing of these filaments is an important feature of the completion of the filament; this is done to even up the surfaces, which have sometimes blowholes and other imperfections, and is accomplished by bringing them up to a red heat in a hydrocarbon gas, such as naphtha vapor. Such flashing almost invariably produces a uniform surface resulting from the deposit of carbon. The filaments are all examined microscopically. After such treatment a certain springiness is observable, as is noticed in the completed lamp. This process of carbonizing while uniforming the surface reduces the resistance; hence rare judgment, care and experience is required in making the requisite exposure to current

Digitized by Google

and gas. This is necessary to obtain equal wattage and candle power for commercial use. It may here be remarked that the bamboo and thread filaments are now obsolete and a viscous nitro-cellulose solution has taken their place. The process consists in forcing under pressure, through a vessel containing alcohol, a cellulose solution, which is then received on a reel. A filament thread is used, which looks like the small gut string on a violin. After drying it is cut up into strips of suitable sizes and is carbonized as already explained. In the carbonizing process the variable thickness of the filament is overcome by varying the duration of exposure, which is made longer for the thicker filaments, and making tests for voltage and amperage to get the proper resistance. This flashing process practically completes the filament which is ready for being placed in the bulb. The wires connecting the outside terminals and the filament are of platinum and pass through a glass base into the bulb. Several experiments were tried with various metals, and platinum decided upon because of its co-efficient of expansion, is practically equal to that of glass. This prevents a rupture of the glass, which would permit the air to enter and destroy the lamp's efficiency. The uniting of the platinum wires and the filament ends is made by a special conducting cement, put together by flashing, using either a carbon gas or liquid to form the deposit. This cement must be hard so as to withstand the heat. Such a joint is known as a graphite joint.

The life of an incandescent lamp is dependent greatly upon the voltage, hence a uniform voltage is conductive to longer life. The causes of giving out and breakage are the entrance of air, vibration, variable voltage and fracture. The loss between the power put in and that taken out is very great. This may be seen in the fact that a 16 candle power lamp takes about 3.5 watts per candle power, or a total of 56 watts; if no loss existed in the transformation of heat into light only 2 or 3 watts would be consumed for 16 candle power. The results from different makes are variable, no two being the same, either as to efficiency or loss. The resistance in the lamp varies as the candle power is increased, being at its highest when cold and at its lowest when at its highest candle power. Treated carbon filaments give much higher efficiency than those untreated, but the average candle power illumination per lamp is less, as also the output, but the resistance is more in the treated lamp. The manufacture of the lamp bulb is done in two portions, that holding the filament or base and the bulb proper. The former is pushed into the latter, using a blow pipe. The tip of the bulb is originally a long glass tube, which is used as an exhaust to take out the air from the bulb, which is then closed up by means of a blow pipe. To the completed lamp is attached a metal base of two rings for the contact points, using plaster of paris for the cementing process.

In the case of arc lamps the series system is frequently used, and in such cases the lamp requires a given current and pressure so as to get the required candle power. The old style of lamp used about ten amperes at 50 volts; the latest type, with enclosed globe, uses 12 amperes at 80 volts. In the open arc style the carbons burn exposed in the air, in the enclosed types they are burned in an enclosed space. In the open arc the consumption of the carbon was much greater, so that while in the open arc they were good for ten hours, in the new enclosed arc they may retain their usefulness 100 hours; this means a considerable saving in labor. Such lamps may be used on constant potential and constant and alternating current systems. The current used is pulsating, the pulsation being effective in keeping the arc light mechanism well adjusted. The candle power of arc lamps is rated as spherical or horizontal, the former being that distributed on all sides of the arc light; the latter that measured by the horizontal plane method being the effective candle power produced. In arc circuits using the alternating current it is necessary to use a hood or reflector on account of the reversal of the arc, the crater being first above, then below, and constantly reversing, the reflector tends to catch all these rays and produces a uniform light, which could not be obtained otherwise.

Warning to Independent Managers

A LETTER FROM THE PRESIDENT OF THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION SUMMING UP THE "CONNECTION FOR TOLL SERVICE" PROPOSITION.

REASONS why Independent exchanges should refrain from making any connection whatever with Bell exchanges are most clearly and forcibly set forth in a letter from President James B. Hoge, which we print upon this page. This letter was written to an active officer of an Independent company which had been approached by the Bell company for the purpose of securing its long distance business. The National-Interstate Association is glad to send out information of this sort in a personal letter wherever such action is desirable, but it thinks at this time, when the Bell is making such strenuous efforts to tie up Independent companies for a period of years, that the publication of such a warning letter will enable it to reach many managers who are perhaps a little doubtful and uneasy.

The association has information from all over the country and is able to take a broad, clear view of the situation. This is likewise the case with the Bell Telephone Company. Both organizations see the same thing coming in the near future; that is, the development of an Independent long distance system which shall give to the manager of every Independent exchange service with whatever parts of the country he may desire connections. The Bell company wishes to take advantage of the lack of thorough knowledge on the part of local directors and owners to hasten connection with its lines. The National-Interstate Association wishes to convey information which will enable every Independent operator to see for himself that his best policy is to wait a little longer and secure the benefits of long distance service without the disadvantage which comes from tying up with the Bell companies. The nature of these disadvantages will be evident from an examination of the letter which is as follows:

THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.

CLEVELAND, O., March 20, 1906.

Dear Sir: It has been brought to my notice that the Bell Telephone Company is negotiating with your people in regard to having you make connections with its lines. I take this opportunity to warn you against making any connection whatever with them. There is not one good reason why you should do so, many why you should not.

Your company, as I understand it, is thoroughly Independent and fairly prosperous. *Why were you organized?* Was it not to secure for the people of your locality good telephone service at fair rates, which the Bell would not give you, and develop territory which it absolutely refused to touch? How many of your subscribers would be enjoying the benefits derived from telephone service to-day if the Bell had retained control of the field and been able to keep Independent companies from doing business? I venture to say not one in ten. *What have you to gain by connecting with the Bell now?* You have built up your properties, not only without its help but in spite of its opposition. Now, when all its efforts to drive you from the field have proven fruitless, it is not only willing but anxious to make contracts with you, probably on almost any terms you care to name. Is it for your own good that it is willing to do this, and will it protect your interests in any contracts it should make with you? Don't you believe it! It wants the business which you control and which it can get in no other way. Remember, too, that this is business that it never would have developed itself.

Digitized by Google

We can only judge future actions of individuals or corporations by the record of their past. How did the Bell act when it had the field to itself? Its history shows that it charged exorbitant rates, gave any sort of service that suited it and developed only portions of the country where it could reap enormous profits. When the Independents entered the field it resorted to everything possible to crush them or drive them out. By cutting rates and often actually giving away service it succeeded in driving an Independent company here and there out of business. Then what was its policy? It immediately raised its rates to what it had been charging before, and sometimes even higher, thus getting back from the people the money it had spent in driving the Independent companies out of business.

Let me cite one instance. South Bend, the St. Joseph county seat in Indiana, is a town of about 22,000 people. Up to 1896 the Bell Company had a monopoly of the telephone service there. It had had control for a number of years and might have been expected to have the territory pretty well developed. Did it? Here are the facts. It had just 240 subscribers and the rates were $24 per year for residence service, $48 for business. Fairly profitable rates, we must admit, considering the number of subscribers. The South Bend people organized an Independent company which commenced operations with about 500 subscribers, over twice what the Bell had after years of exclusive control. The new company charged $18 for residence service, $36 for business. The Bell at once cut rates, charging $18 for residence and $25 for business service; in fact, the Bell gave service at any price, its only object being to drive out the Independents. After four years it succeeded in buying them out—and then? Why, it had to make good the losses sustained in its rate-cutting campaign, so telephone prices were at once boosted to $30 and $48. They remained there till the Home company once more entered the field. Then down came Bell rates again in the hope of turning the trick a second time, but, as one of our most famous statesmen remarked, "You can fool all of the people some of the time, some of the people all the time, but not all the people all the time," and this time the South Bend folks were wise. That they have not forgotten the lesson taught them by the Bell is clearly shown by a comparison of the rates charged at South Bend to-day and the number of telephones that each company has in service. The Bell rates for residence and business, respectively, are $20 and $30. It has rates even as low as $15 and gives considerable free service. Anything to get the business away from the Independents. The Independent's rates are $24 and $36. The following, from a report received last summer, shows the relative standing of the companies:

At South Bend there are	2,718	Independent telephones,	878	Bell
In St. Joseph's county...	3,612	" "	992	"
Divided as follows.....	1,112	" business "	465	"
	2,107	" residence "	487	"
	393	" farmers "	40	"

Five hundred and forty-seven of the Bell subscribers also have a Home telephone and a large number of its subscribers are on party lines. The Independents are adding to their list right along; the Bell is scarcely holding its own. "You can't fool all the people all the time!" This is a typical case. I could cite many others for the State of Indiana alone.

Cleveland, Ohio, furnishes as good an example as any in the country of the way in which the Bell can be forced to come to time when confronted with the right kind of opposition. The Independent local company there is the Cuyahoga Telephone Company. It commenced doing business in 1899, at which time the Bell had 5,600 telephones and was charging $125 for business, $72 for residence service, with any sort of service it cared to furnish. You didn't have to take its telephones, you know; if its rates didn't please you or the service was unsatisfactory, you could go without. Here are its rates to-day:

	Per Year.
Business—Individual line, unlimited.....	$84
Four party line as low as.....	36
Residence—Individual line, unlimited.....	48
With measured party line service as low as.....	24

The Cuyahoga Telephone Company is charging at present:

Business—Individual line, unlimited.....	$72
Four party line unlimited.....	48
With measured four party line as low as.....	30
Residence—Individual line, unlimited.....	48
Four party line, unlimited.....	24
With measured four party service as low as.....	21

The Bell Company claims to have 25,000 telephones in service. It probably has not less than 21,000. The Cuyahoga, as a matter of actual record, had on March 10th 21,646 telephones. The Cuyahoga is growing at the rate of 35 per day, and within the next few years, I feel safe in predicting, will have many more telephones than its competitor.

The people realize what they owe to this Independent company and are proving their gratitude in no uncertain way. The following letters from Cleveland business men, which are only two of a large number we have on file, show how highly Independent telephone service is regarded by the business interests of this city:

CLEVELAND CITY FORGE AND IRON COMPANY.

Cleveland, O., March 13, 1906.

Mr. George W. Beers, Cincinnati, Ohio.

Dear Sir: In reference to having two telephone systems in a city, we can speak from experience in Cleveland and can truthfully say that with the advent of the Cuyahoga Telephone Company here we immediately experienced a reduction in rates, improved service and a large increase in subscribers. We feel that it is a good thing for any city to have competition in any field and are very glad that the Independent movement started several years ago is steadily growing in other cities.

Yours very truly,

(Signed) R. A. HARMAN, Vice-President.

THE NATIONAL-ACME MANUFACTURING COMPANY,

Makers of the Acme Multiple Spindle Automatic Screw Machine.

Cleveland, Ohio, March 1, 1906.

Mr. Geo. W. Beers, Cincinnati, Ohio.

Dear Sir: The contract department of the Cuyahoga Telephone Company has asked us to write you relative to our experience with their service in this city.

Since the first installation of their service in this city we have been pleased with same, especially so in view of the modern equipment which has recently been installed. They give excellent attention to the boards; have always been very courteous and prompt in their attention to their customers. We can cheerfully make this statement, for we have had so much better service than we have been able to secure over the Bell lines.

Yours very truly,

THE NATIONAL-ACME MANUFACTURING CO.

(Signed) O. S. Werntz, Treasurer.

From Ohio to the State of Washington is a far cry, but I want to call your attention at this time to the situation at Seattle, with which, perhaps, you are already familiar. Over 2,000 of the business men of the city, subscribers of the Sunset Telephone Company (Bell) held a meeting at the Opera House on February 21st to take united action against the Bell. Notices to remove Bell telephones were signed and placed in the hands of a committee, to be served just as rapidly as the Home Company could install instruments to take care of those throwing out the Bell.

What does this prove? First, that the Bell, despite the many severe lessons taught it by the Independents, is the same greedy, domineering, arrogant corporation it was in the palmy days of its monopoly wherever it has undisputed control. Second, that the people are determined to have justice in telephone service and rates and realize that they must depend on Independent companies to secure it.

While we are considering this part of the country, Portland, Oregon, should not be overlooked. The Bell Company there, something over two years ago, purchased the Independent plant. As elsewhere, it returned to its same old way, once it had the field exclusively. In less than a year Independent telephone men, taking advantage of the referendum law of Portland, were successful in having the matter of a franchise for a new Independent

Digitized by Google

company left to a public vote. The result: 13,350 for a new Independent franchise, 320 against this. The franchise was granted and an up-to-date Independent system is at present being installed at Portland.

One more example from Ohio, this time showing an Independent company's estimate of the value of Bell connections. The Morrow County Telephone Company has headquarters at Mt. Gilead, with exchanges and toll lines throughout Morrow county. Last summer a Bell spellbinder induced its management to connect up with Bell lines for long distance service. The advantages to be gained by the Morrow county people were set forth in glowing terms. So the connection was made. The result? Well, the Morrow County people have severed that connection. How they *didn't* find it to their advantage to continue it is described in the letter from them:

Mt. Gilead, Ohio, July 19, 1905.

James B. Hoge, Esq., Cleveland, Ohio.

Dear Sir: As you are no doubt aware, this company tried the experiment of allowing the Central Union or Bell Telephone Company to connect up its wires with the two principal exchanges of this company. The reason this was done was that we had heard so much about the benefits our company would derive, etc. We are anxious to do whatever was for our best interest and prevent possible competition. The connection was made on May 9th and continued until July 18th. We tried to give the matter a fair and exhaustive trial. All our subscribers were advised of the connection and allowed their choice of service. We found that nearly 90 per cent. wanted the Independent connections and that we could reach many more stations over the Independent line than we could over the Bell lines.

During this entire period we had but very few calls for points reached exclusively by the Bell and had several dozen calls that could not be reached over the Bell line.

After carefully considering the matter from every side, we were forced to come to the conclusion that the connection was of no benefit to our company and much to our disadvantage and annoyance in many ways, even had it been possible for us to have continued the connection between both the U. S. lines and the Central Union or Bell lines. We ordered the connection severed. We did this with a full knowledge that the Central Union or Bell Company would put in an exchange and make us what trouble they could.

With our best wishes for the future success of the Independent telephone movement in Ohio and elsewhere, we are

Yours truly,

MORROW COUNTY TELEPHONE CO.
A. A. WHITNEY, President.
MARK COOK, Secretary.

The foregoing examples are selected from a large number which might be cited covering all parts of the country. In bringing them to your attention my object was to show:

First—That the Bell's policy at present is the same as it was in the past and never can command the confidence of the people.

Second—That the Independent companies are growing stronger every day and, in direct competition with the Bell, are proving their superiority.

Third—That the people are with the Independents and that if the Independents wish to retain the support of the people they must remain INDEPENDENT not only in name but in fact.

You cannot be an *Independent* company and connect in any way with the Bell. You cannot serve two masters. You must choose between the people and a greedy corporation. Compare the management of the Bell and Independent properties. The former is controlled by men who have no interest in any of the plants they operate beyond the profit they can gouge therefrom. Why should they develop new territory unless enormous profits will be the results? What does it mean to them that the people need the service and that with proper management a fair return can be secured at reasonable charges? The prosperity of any locality means nothing to them, except that it might make it possible for them to force still greater returns from it.

On the other hand, the Independent companies are "Home" companies in the real sense of the word. Local people are interested in the local plant, hold its securities and control its destinies. These people are not only interested in seeing it prosperous as a telephone company, but in making it contribute to the general prosperity of the community by furnishing good service at reasonable rates and developing the new territory as needed. They are men whose civic pride is greater than their lust for dividends and who think the practice of the "golden rule" in telephony is not incompatible with good business sense.

The Bell has no interest whatever in the Independent companies except to get them out of business. You can't afford to treat with that corporation in any way. If you do, sooner or later, by hook or by crook, you will find yourself controlled by it, and from the very start you will be regarded with suspicion by your fellow Independents and by the people. It will be hard to convince them that there is no treachery contemplated in your trafficking with the Bell.

The Bell is naturally trying hard to regain control of the telephone business of the country. Suppose it should succeed (although such a thing is, of course, out of the question), what then? Why, it would do as it did before the Independents freed the people from its tyranny, charge "all the traffic would bear," give whatever service it saw fit, develop new territory when it got "good and ready" and in general live up to its "public be damned" policy. The Bell, however, will never regain control of the telephone field. Already, in spite of the seventeen years of Bell monopoly, the Independents have over three million telephones throughout the country to about 2,500,000 of the Bell, and in States where the Independents have been firmly established they are far in excess of their competitor. Indiana and Ohio are fair examples of such States. In the former there are 175,000 Independent subscribers to about 40,000 for the Bell. In Ohio 227,271 Independent telephones are in operation against 108,991 Bell.

The Independent movement cannot be stopped because it is the movement of the people against monopoly. All efforts to retard it will only result in disaster for those who attempt it, and it remains for each Independent company to decide for itself whether it will form an alliance with the Bell and eventually be forced out of business by new Independent companies or whether it will remain *Independent* despite all the lying promises and schemes of the Bell and be with the Independents in the day of their success.

The bulletin issued by the Indiana Independent Telephone Association for last month (copy enclosed) contains two splendid articles along this line. I want you to read them. One is entitled "Two Systems" and shows forcibly how there can be nothing in common between our Independent people and the Bell. The other, entitled "A New Line of Attack," calls attention to and shows the danger of just such an alliance with the Bell as your people may be considering. Read them both. They contain much food for Independent thought.

In a letter like this it is not possible to more than sketch the situation. All the cases cited are actual facts selected at random from hundreds we have on file. For a comprehensive history of the Independent movement let me refer you to an article in the *Atlantic Monthly* for February, written by Jesse W. Weik, president of the Greencastle (Ind.) Telephone Company, and to Paul Latzke's articles running in the *Success* magazine entitled "Fighting the Telephone Trust." Two of these have already been published in the February and March numbers.

That these articles are attracting widespread attention and placing the Independent telephone situation squarely before the public is proven by the review of Mr. Weik's article given in the *Review of Reviews* for March and the increase in the sales of the magazines containing the articles. What does it mean? Merely that the people are being educated up to the true situation and will be more than ever the friend of the Independent companies as they become familiar with the Bell history and methods

So it is up to the Independent companies to remain strictly Independent—there is no neutral ground—if they want to retain the confidence of the public and the respect of their fellow Inde-

Digitized by Google

pendents and continue to share in the prosperity with which the Independents are everywhere meeting.

I sincerely trust you will be successful in convincing your people of the danger of any alliance at this time, no matter how disguised, with the Bell interests. Just at present the Independents in your State need the help and support of your company, but not half so much as your company will need their help and support in the very near future. Be true to your friends, the people, and your fellow Independents and have nothing whatever to do with the Bell. With best wishes, I am

Yours very truly,

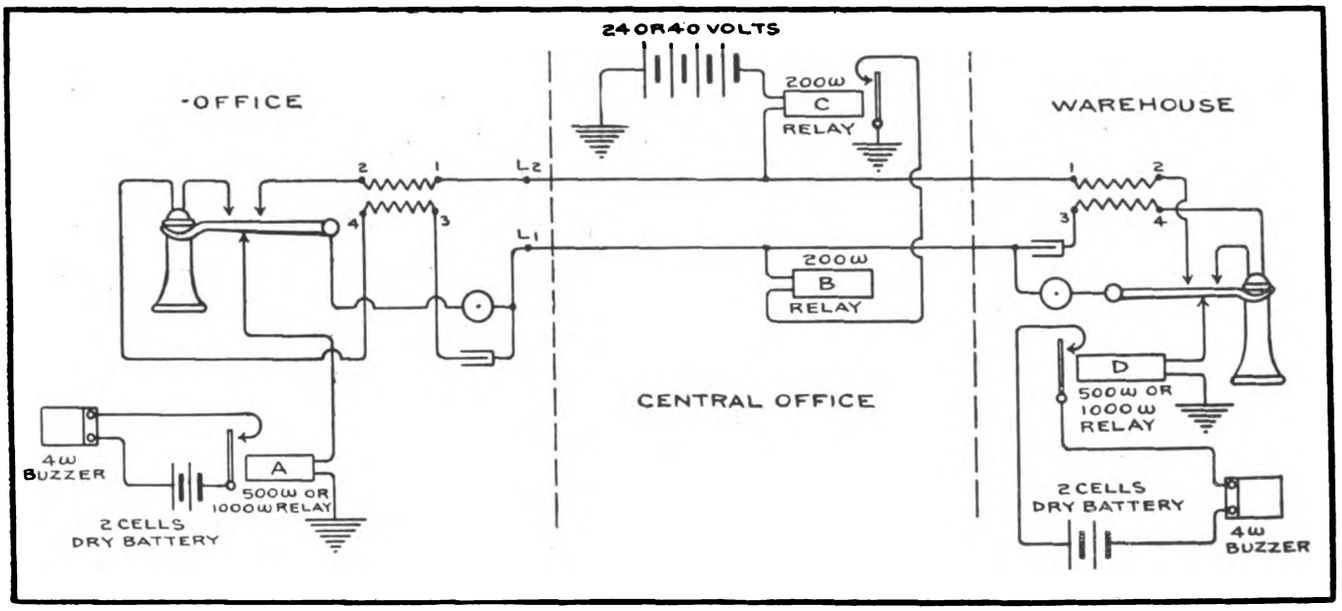
(Signed) Jas. B. Hoge, President.

A Circuit for Private Connection Between Two Common Battery Instruments

By E. B. Jackson.

FREQUENTLY the manager of a common battery central office has to provide for a private line between two stations in separate parts of a town, which are so located that the connecting wires pass through the exchange. In this arrangement the line from one station is usually brought in through the cable to the main distributing frame, and at this point is cross connected to another cable, by means of which it is led to the second instrument.

It is commonly the custom to install magneto instruments upon such a line, using the ordinary ringing generator and local battery for talking. The disadvantages of this plan are obvious, as they bring upon the telephone company the anonyance and expense of maintaining two individual sets of station batteries, and cause the subscriber the labor of ringing for each connection. The troublesome features of this are especially evident to one accustomed to common battery service.



Circuit to Provide for Connection Between Two Stations by Wires Leading through Central Office, With Automatic Signalling and Common Battery Transmission.

The circuit shown upon this page was devised to secure the benefits of a common battery circuit for such a line. It has been in operation between an office and a warehouse in the same exchange district for over a year, and has given good satisfaction. It will be obvious that two cells of dry battery and a four ohm buzzer are necessary at each subscriber's station for signalling; but, as the amount of current used is not great, the same objections do not apply to cells for this purpose that are urged against local batteries for transmission.

The method of operation can be readily traced. For instance, assume that a subscriber at the office wishes to call the warehouse. He simply removes his telephone from the hook, and this causes negative battery to flow through the 200 ohm relay C to L 2 side of the line; thence through winding 1, 2 of his induction coil, contact of hook switch and the switch itself, out through transmitter to L, I, through transmitter at the warehouse, hook, hook contact, relay D to ground. This energizes relay D, and closes its local circuit, causing the buzzer to be operated. It will be observed that the completion of this circuit causes the relay C to be energized, which closes the circuit from the winding of the relay B to ground. This, of course, shunts relay D, but the windings of the two relays are so proportioned that the operation of the relay D is not affected. When the telephone is removed from the hook at the warehouse instrument, relay D is de-energized at once, and the ringing of the buzzer stops. As the battery is supplied through relays B and C, having sufficient impedance to act as an ordinary retardation coil supply system, the lines are available for standard common battery transmission.

INDIANA TELEPHONE COMPANIES URGE CINCINNATI COUNCIL TO GRANT INDEPENDENT FRANCHISE.

THE Indiana Independent Telephone Association of the Eleventh District, composed of the counties of Bartholomew, Brown, Dearborn, Decatur, Jackson, Jefferson, Jennings, Ripley and Ohio, at a recent convention petitioned the City Council of Cincinnati to grant to an Independent telephone company willing to furnish service connections with Independent telephone companies surrounding Cincinnati a franchise to establish and operate a telephone system in that city. The district represents ten counties, twenty-five Independent telephone companies, 15,455 subscribers and 12,000 stockholders in all lines of business. These have traffic relations with the vast system of Independent telephone companies not only throughout Indiana, but also the Central West. It is said that the pressure now being brought from all directions is likely to influence the Council to grant the Independents a foothold in Cincinnati.

QUERIES

USE OF PILOT LAMPS.—(682.)

I noticed that some time ago in switchboards in our territory a pilot lamp was installed for each position, located high up in the middle panel, and operating in connection with any line lamp burning at that position. Some time since a change was made, and switchboards were equipped with one pilot lamp for each panel. This was located low down, below the answering jacks. As this change makes the circuit more expensive to wire, I should be glad to have you tell me what advantages are derived from the practice in order to make it worthy of adoption. C. L. J.

Formerly it was the practice to locate the pilot lamp at the top of the switchboard panel in front of the operator in order that the monitor could tell whether the business at the position in question was being properly handled. At this time it was usual for the business to be supervised by a monitor located at a desk in a part of the operating room from which she could readily see the face of the switchboard. It was her duty to keep watch on the pilot lamps located in the upper part of the panels, and in a case where a lamp was burning for an undue length of time she would make an investigation and determine whether or not the operator was too heavily loaded, or for any other reason neglecting to answer calls as rapidly as the line lamps were lighted. The operator, whose eyes are naturally attracted to the

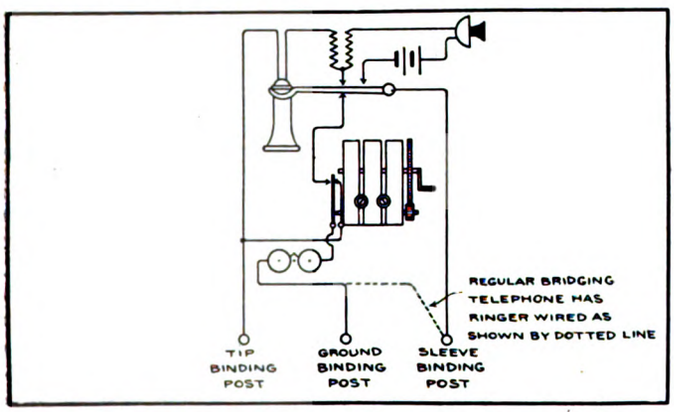

Fig. 683a.

lower part of the switchboard, was compelled to rely upon observation of the line lamps themselves in order to determine when a call was received, and the pilot lamps were of practically no assistance to her. They served merely as a check upon her work

With the introduction of the system of supervision by a monitor patrolling behind the operators, with a group of a definite number assigned to her care, it became possible to make a change in the method of using pilot lamps, which was believed to enable an improved efficiency in the service to be obtained. This results primarily from the fact that a large and comparatively brilliant pilot lamp obviously will more certainly and rapidly attract the attention of the operator to the part of the panel in which the call appears. For instance, if an operator should be in the act of calling a subscriber whose line is connected to a multiple jack at the extreme right of the section, it is possible that she might not instantly detect a signal coming in on the left hand answering jack panel; but the greater brilliancy of the pilot lamp would more quickly cause her to turn to this call, and she could be prepared to answer it while completing the connection to the first number. The monitor, being located behind the operators, in a position where she can readily see the switchboard over their heads as she walks up and down, has no difficulty in seeing the pilot lamps in the lower positions and she relies upon these for the same sort of supervision formerly exercised by a desk monitor.

An additional advantage which is derived from their location in each panel comes from the fact that the patrolling monitor, who, while she is at one end of the switchboard, observes a pilot lamp burning in a panel which may be readily reached by either of two operators, can at once determine which operator should answer the call, without waiting to pick out the particular line lamp, and this facilitates the distribution of business amongst the operators during rush hours.

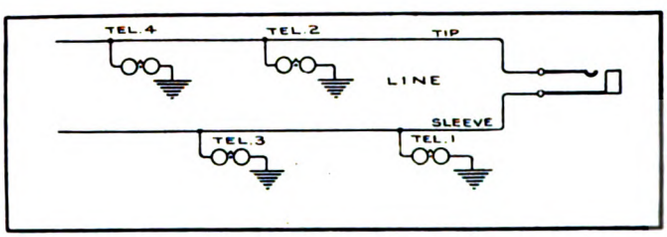

Fig. 683b.

CHANGING TO DIVIDED CIRCUIT SYSTEM.—(683.)

We have several farm lines and would like to change them to work on the divided circuit system. Our lines are full metallic. Must we use a pulsating current generator in each telephone or only at the central office or can we use Warner pole-changer for ringing. Must we have different ringers than the 1,600 ohm now in use? Must we have different ringing keys at the central office switchboard? T. H. N.

It will not be necessary to change the generators or ringers of your telephones for divided circuit operation, but it will be necessary to change the wiring of the latter. This can be done by disconnecting the wire which connects one side of the ringer directly to one of the line binding posts and then connecting this side of the ringer to the middle or ground binding posts of the telephone (Fig. 683a). If there is no ground post on the telephone one can be easily added for this connection.

The instruments should be legged from each side of the line to ground, as shown in Fig. 683b, adjacent instruments being connected to opposite wires of the pair to preserve the balance.

The simplest arrangement of the wiring of the switchboard is to use a master key for switching the ringing current from the generator to the regular ringing keys, so that this current can be either projected over the tip side of line, through the ringers of the telephones, there to be connected to earth and back to generator, or over the sleeve side of line through the telephone

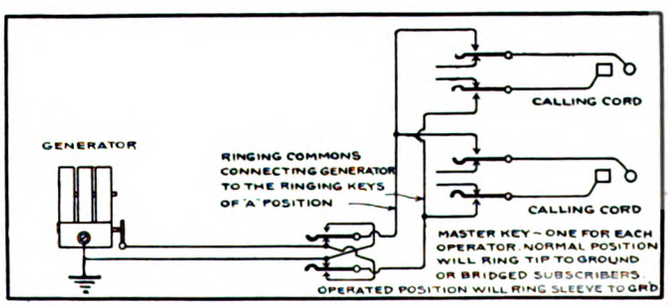

Fig. 683c.

ringers connected thereto, and also back to generator. The wiring of such a master key is shown in Fig. 683c. The trade name for such a key is "single listening key."

A Warner pole changer or other source of ringing power can be used to supply the ringing current for divided circuit use, as it only requires an alternating current to ring the bells.

THE EDITOR'S PAGE

VOICE TRAINING.

POLITENESS of exchange employees is recognized as one of the most valuable means by which a telephone company is enabled to gain public favor. Those who come most in contact with the patrons of a system are naturally the operators, and courteous, considerate treatment of the subscriber by these employees is of maximum value.

It is true that the standards governing the method of handling calls fix the phrasing of responses, on account of the necessity for saving time by the elimination of all unnecessary words. Therefore, there can be no variety in the wording, and the standard responses are designed rather for practical time saving results than for the production of a pleasant personal impression upon the subscriber.

There is one feature in these responses which is capable of being controlled, however, and that is the inflection. Those who have observed the working of an individual operator throughout an entire day are familiar with the fact that constant reiteration of the same words tends to deaden the faculties directly engaged in the work, as indeed is the effect of constant repetition of any act. The evident result is the possibility of developing a monotonous habit of speech, in which, although the words may be clearly enunciated, there will be little life in the voice. Such a tone is one which will be far from producing a cordial response from a subscriber who is having difficulty in securing the desired connection.

The proper use of a rising inflection at the time of the original inquiry for a number is almost sure to convey an impression of personal interest to the subscriber. Another way in which the operator can assist in impressing the subscriber with the value of the service of the telephone company is in the repeating of numbers. Here the object is simply to give the subscriber a chance to challenge in case of a mistake, while the operator does not desire a response of approval in case the number is correct. It is to be presumed that in nearly all cases the operator will understand the number correctly, as it is first spoken by the subscriber, and will therefore repeat back to him the same number which he has given her. The tone which will convey the impression that the operator is sure that she has accurately obtained the call is recognized as the proper one. In a case like this there is the double advantage of a saving of time, as the subscriber is satisfied no reply is necessary, and of giving him confidence that his business will be promptly and accurately handled.

In magneto exchanges, perhaps to a much greater extent than in common battery offices, the matter of challenges upon a line deserves a great deal of attention. The operators become accustomed to cutting in on a line with a challenge, such as "Waiting." "Are you through?" etc. Frequently, they find that the persons who were using the line have left it without giving any sort of a clearing out signal. The tendency is for an operator, after having had this experience many times, to perform this operation in a perfunctory manner, and slur the phrase with which she challenges. It will be recognized at once that, in a case where she does find a subscriber on the line, such an example of careless operating is likely to produce a most unpleasant effect.

To secure the benefits which come from a careful observation of the rules which produce the desired vocal effect, a few general features beyond the mere training in the method of pronouncing phrases is necessary. The most essential of all is the requirement that no operator should be kept handling an unusually heavy load for too long a time. It is a well known fact that the tendency of an operator to raise her voice to a higher pitch when subjected to the nervous strain imposed by a too long continued rush of business is strong. It is therefore highly essential that frequent reliefs should be provided at a time when it is especially to be desired that every effort to make up for slightly slower service, caused by an unusually crowded position, should be made by the telephone company by increasing the care in the handling of each individual connection.

Every business man recognizes that in a case of active competition, such as we see being carried on between the opposing telephone interests of the country, the personal element more frequently than any other is the factor which determines success. As the exchange operators have communication with the subscribers more often than any other employees of the company, it is of the utmost importance that their relations with the subscribers, while to a large extent impersonal, should nevertheless be as cordial and agreeable as is possible. It is safe to say that, other conditions being nearly equal, the subscriber with two telephones is likely, nine times out of ten, to turn to the instrument which brings him a response from the exchange where he is assured of a correct response in a cheerful tone of voice.

AN INFLUENCE FOR PROGRESS.

MANY men who will graduate from some of our leading colleges and technical schools next June have already secured places with various departments of the larger telephone companies. The rapid expansion of the business has created on the part of these interests a demand for men in the higher branches of their work which is wholly beyond the supply. This fact has been most fully realized, and every effort is being made to secure men who, by their training, are fitted to most readily acquire the ability to deal with the technical problems which the companies will have to solve in the future.

The comparatively ready response which is being made by the students to these advances is a significant indication that the pleasant and profitable features of telephone work are becoming more thoroughly and more widely understood than formerly. Vigorous competition has caused the giving out of information to the press, where all details of telephone equipment and development were formerly kept secret. Engineers in general are coming to appreciate the fact that the laying out of a telephone system involves not only engineering skill of the highest order, but offers opportunities for investigations which are worthy of the efforts of the best trained minds.

The result is that the young men whom it is the desire of the telephone companies to interest, in order that they may be in a position to cope with the expansion which is expected to continue at a rapid rate for some time in the future, are already partially familiar with the magnitude and attractiveness of the work into which they are offered opportunities to enter. Perhaps in the future one of the chief ways in which competition will have shown its ability to aid the development of the industry will prove to have been by forcing the general features of telephone development into a prominent place before the public eye, where they shall have made the attractive nature of the work evident to the men who are especially fitted to further the rapid advancement of the art.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

COST OF REPAIRS AFTER STORM.

Will you kindly give me your opinion on the following case: The original routing of a competing company's former line was back and forth across the road. When we built our toll line we got permission to straighten it at our expense. Later the other company's employees changed a wire which went into a farm house. We originally crossed above it, but when they changed it they went over us and to a tree some 150 yards from their line. They were so close to our wires that we strung a ground wire on brackets placed on the top of the two poles adjacent to the junction. During a high wind the other company's wire was disengaged from the tree and fell over our through toll lines. The farmer into whose house the wire ran had notified the other office by telephone of the condition some months previously. Both lines are of 25 ft. poles. Are we not entitled to collect from the other office for the expense of clearing the trouble? The foreman of the other company was notified of the case before it was cleared. C. T. Co.

THE editor does not believe that you could compel the other company to pay the cost of clearing the trouble, at least upon the statement of fact contained in your question. The trouble was caused primarily by the storm and neither men nor telephone companies are held liable for the damages caused by the vicissitudes of nature. Your statement does not show that the other company was negligent in its construction or maintenance of its lines. Had the change you speak of not been made, your company's wire would have been the overrunning one and the other company might have been injured. It may be that a more thorough understanding of the case on the editor's part would lead him to a different conclusion, but upon the facts as stated, he believes your company will have to stand its loss.

CHANGE OF SERVICE AND RAISE OF RATES.

Would you kindly let me know through the columns of your paper whether or not a city council can prevent a telephone company from changing its service from a single line to a party line system when the franchise does not specify what kind of service shall be given? And also, if some subscribers still insist on single lines, could we then make them pay more for the special service? F. M.

A CITY council cannot prevent a telephone company from changing a single line system to a party line system when the franchise is silent on the subject. If the maximum rate that the company may charge is specified in the franchise, the company may not raise the rate even although an improved kind of service is given. You do not state whether the franchise prescribes the rate or not. If it does not, there is, of course, nothing to prevent you charging a higher rate for the special service. See Central Union Telephone Company v. Beadbury, 106 Ind., 5 N. E., 721. It may be, however, that the city had no right to prescribe the rates in this place, and if that is the case, you could certainly raise your rates to whatever figure the service was worth. The city's authority to fix rates, if it exists, is based upon its charter. This should be scrutinized to determine the question. See State v. Mo. & Kan. Telephone Company, 88 S. W., 41.

POWER OF PROBATE COURTS OVER FRANCHISES.

THE Queen City Telephone Company brought an action against the city of Cincinnati in the probate court, in order to obtain the right to put its wires and apparatus in conduits under the streets of the city. The petition averred that the telephone company had made application to the council of the city to prescribe the manner of use by it of the streets in constructing its lines of telephone and telegraph, and transmitting at the same time the form of an ordinance that the telephone company was willing to accept; that the committee to whom application had been referred reported that there was not room in the streets of the city for the accommodation of the lines asked for and that it was inexpedient to make any such grant. The petition prayed that the court direct in what mode the company should construct its lines along the streets of the city so as not to incommode the public in the use of the same. The case passed through the probate court, the court of common pleas, the circuit court for Hamilton County, and finally reached the Supreme Court of Ohio. In the latter tribunal it was held that the company must prove its incorporation according to law, including the due and legal election of directors, and decided that the company in this case had failed to make the proper proof. The court further held that there was no specific question of difference between the corporation and the municipal authorities. It found that no defined plan for the occupancy of the streets had been presented to the council or the probate court for its acceptance or refusal. The court finally decided that the probate court had no power to authorize or direct the construction of the conduits in subways under the streets of a city in the absence of consent by the municipal authorities. The Supreme Court, therefore, ordered the probate court to dismiss the petition of the telephone company. Queen City Telephone Company v. City of Cincinnati, 76 N. E., 392.

INTERFERENCE WITH PRIVATE DESK TELEPHONES ENJOINED.

AT Chicago Judge McEwan has granted a temporary injunction to Mason & Wyman, attorneys, with offices in the Kedzie Building, to restrain the Chicago Telephone Company from interfering with the firm's telephone service. Following the example of others, the attorneys had a private company install extension desk telephones in their offices. This, it is alleged, brought down upon them endless annoyances, the continuance of which is enjoined.

CARE CHANGES WITH CIRCUMSTANCES.

A GUY wire belonging to the Delaware and Atlantic Telephone Company broke, and falling on an electric wire belonging to another company, became charged with electricity. The broken end fell in the grass in a field across which people were accustomed to travel without objection, but without other right. The body of William G. Guinn, a lad 13 years of age, was found in contact with the guy wire, from which he had received a shock that caused his death. It did not appear that the boy had any right to be on the property. The telephone company contended that it was under no duty to the deceased because he was a trespasser, at best a mere licensee. The court held that the telephone company was under a duty to the boy to exercise care even if he was a trespasser against the land owner. "If a trespasser, his wrong would be to the land owner alone, not a public wrong, nor a wrong to the defendant." The court held further that the jury might infer negligence from the omission of a guard wire between the electric light wire and the guy wire which caused the boy's death. The telephone company contended that the danger arose after the construction of the telephone line, and was due to the running of the electric light wire below the guy wire. The court overruled this contention, laying down the rule that the care required of the telephone company changed with the changed circumstances. Guinn v. Delaware and A. Telephone Company, 62 Atl. 412.

IN THE OPERATING FIELD

NORTH CAROLINA COMPANY GIVES OUT TIME FROM FAMOUS OLD CLOCK.

AWAY back in Colonial days a king of England presented a tower clock to the people of Hillsboro, N. C. It was installed in the tower of the court house and ever since has faithfully shown the time of day, telling the hours in the sonorous tones of its old bronze bell. Across the street, with the tower of the famous old court house in clear view, is the exchange of the Morris Telephone Company. Every day on the stroke of twelve the time is sent out to all the subscribers on the rural lines, who thus are enabled to adjust their clocks and watches to the same standard.

The Morris Telephone Company, which operates this exchange, has its head office in Roxboro, a busy little town in North Carolina. Its lines reach out into the surrounding cotton country, and a system of toll lines is under way which will ultimately reach every town in the Piedmont section of the State.

The exchange at Hillsboro was only recently opened. The switchboard is magneto and is equipped for one hundred metallic lines. The construction is of the highest grade and all circuits are metallic throughout.

The officers of the company are R. J. Teague, president; J. D. Morris, secretary and treasurer.

MEETING OF INDEPENDENT TELEPHONE MEN TO BE HELD AT MURRAY, KY.

THE West Kentucky and Tennessee Independent Telephone Association will meet at Murray, Ky., on the third Saturday in April, at 10 A. M. All Independent telephone companies are urged to send delegates, in order that they may participate in the discussion and action for the mutual benefit and protection of their interests.

Dr. A. V. McRee is president of the association, and B. B. Pullen, secretary.

APPLICATION MADE FOR A FRANCHISE IN ANACONDA.

AT a recent session of the city council of Anaconda, Mont., the application of F. H. Stow and others for an Independent franchise was taken under consideration.

The judiciary to whom the request for a franchise had been referred some weeks ago filed a lengthy report favorable to granting it, subject to a special election, when the question would be submitted to the voters of the city, upon the deposit of a certified check by the petitioners to cover the cost of the special election. The terms of the franchise were considered liberal by the judiciary committee of the council.

INDEPENDENT COMPANY IN SYRACUSE, NEW YORK, PUSHING LARGE EXTENSIONS OF ITS CONDUIT SYSTEM.

THE Independent Telephone Company of Syracuse has started work on the twelve miles of underground conduit which will be laid this season. The company is using vitrified clay, multiple duct conduit, encased entirely in concrete. The manholes will be of concrete, oval shaped, a construction which is not largely used for telephone work. The work is in charge of Chief Engineer John D. Pierce.

For aerial distribution the company is now setting poles throughout the city and stringing cables. The plant is an all-cable plant with multiple distributing boxes. No cross-arms or open wires are used within the city. A cable capacity of 3,000 pairs, entering the exchange in 300-pair cables is being installed. The underground work will require 200 men who will be kept busy all summer. Several gangs will be working at one time.

The Independent company is also building several new long distance copper toll lines. The line from Syracuse to Utica is completed and lines from Syracuse to Binghamton and Pulaski are under construction.

Exchanges are being installed in several nearby small towns and these are being connected with country lines so that Syracuse can have communication with the farmers of the vicinity.

The new switchboard at the main exchange is now in use and giving the best of satisfaction. The cut-over was made from the old exchange in nine minutes.

PURDUE STUDENTS VISIT CHICAGO.

ONE hundred and eighty members of the junior classes in mechanical, civil and electrical engineering of Purdue University at Lafayette, Ind., accompanied by several members of the faculty, recently visited Chicago to inspect the factories and power and industrial plants.

The party was in charge of Dean W. F. M. Goss, the mention of whose name is sufficient to admit a student into any manufacturing establishment in Chicago. The other professors were W. D. Pence, C. P. Matthews, L. V. Ludy, J. D. Hoffman, A. B. Smith, A. N. Topping, Albert Smith, A. M. Kenyon and E. J. Fermier. Among the students were seventy-four taking the mechanical engineering course, sixty-four the civil and forty-four the electrical.

Purdue University's department of telephone engineering, now four years old, is to be enlarged and made a more prominent factor in the curriculum of the institution. The demand for graduates in this department of the university has grown steadily and every man who will graduate this year has already found a position. The Western Electric Company has engaged fifteen telephone students and other concerns want more. The laboratory space is so limited that it has been decided to enlarge the electrical building to make more room.

GREAT AGITATION FOR MUNICIPAL TELEPHONE SYSTEMS IN CANADA.

"MUNICIPAL ownership of telephones with government control of rates" is the cry being raised from one end of the Dominion to the other, and it would appear as though the days of telephone monopoly will soon be a thing of the past. Manitoba set the example, which has been followed by the other provinces. The government of that province has appealed to the Dominion Parliament for a change in the act which incorporated the Bell Company to allow governments expropriating the company's lines. Ontario at the present time is busy collecting petitions to be presented to the local legislature praying for municipal ownership of telephones, and already several members of the government have expressed themselves as being strongly in favor of the province owning the telephone systems operated therein.

In the Province of Quebec the league of municipalities passed a resolution to be presented to the local legislature asking for control of telephone rates by the expropriation of the Bell system. The newly formed Province of Alberta is also in favor of this measure, being adopted there, and at the meeting of the Union of Alberta Municipalities held in Calgary recently some strong statements were made regarding the operations of the Bell Company and the exorbitant rates charged, it being shown that telephones could be operated at a profit at less than one-half

GRAY TEL. PAY STA. CO., Hartford, Conn. Total, $3,344.65

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—6-100 pair and 11-50 pair Sterling Inside Terminal Heads complete with heat coils. Used very little and good as new. Address, Macon County Telephone Co., Decatur, Ill. 580

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

FOR SALE—Switchboard and apparatus, outgrown and displaced by automatic equipment: Kellogg switchboard, twenty 8-panel, 3-position, mahogany, equipped for 5,200 main lines, ultimate capacity 6,000 lines; Kellogg toll board of 9 positions; Kellogg telephones, 4,064 wall and 2,136 desk; Sterling terminal rack, with protection; power plant, with charging and ringing machines and storage batteries; offered for sale in whole or in part. For particulars address The Columbus Citizens' Telephone Company, Columbus, Ohio. 548

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Ten first class cable splicers familiar with underground and aerial work. Must furnish references with application. Also two able cable foremen to supervise work of splicing gangs. Must be well recommended. Address, Box 586, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 586

WANTED—By a large telephone factory in Chicago, young men not over 22 years of age, preferably graduates of high schools or technical schools, to enter an apprenticeship course and be trained to install and operate modern central office equipment. Address, stating age, education and experience, Box 582, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 582

WANTED—Continued

WANTED—Wire chief on exchange of 700 to 1,500 magneto subscribers in Kansas. One who is also good on outside construction. Must be able to handle storage batteries, rural and toll lines. If interested, write stating salary, etc., to Box 583, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 583

THE point is just this! Are you dissatisfied with your present position—or have you an employee who is unsatisfactory—in either case, where could you turn better for relief than to a corps of trained employment experts? We have secured better positions for thousands of men, and have supplied thousands of employers with competent men. Why hesitate? Booklets can be secured for the asking. Hapgoods, Suite 511, 309 Broadway, New York City. 464

WANTED—Telephone men experienced in automatic switch work. State experience and salary expected. Address Supt. of Equipment, Home Telephone & Telegraph Co., Los Angeles, Cal. 581

WANTED—Position wanted by an all round telephone construction man who is thoroughly competent, sober and reliable. Best of references. Have completed course in telephone engineering. Address Box 587, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 587

WANTED—Reliable, ambitious young man to act as manager, troubleman and night operator in a small town. Good prospects for the future. References required as to character and capability. State salary. Year contract. Address Box 367, New Britain, Conn. 588

WANTED—Position as manager in common battery exchange by telephone man with 10 years' experience. Salary no less than $100 per month. Address Box 589, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 589

WANTED—Position as traveling representative. My replies to inquiries bring orders. Introduction of new features preferred. Can also furnish system of reports relieving toll agents entirely. Address Warren E. Jaques, General Delivery, Indianapolis, Ind. 585

Digitized by Google

the rates now charged by the company. The question of government control of telephone rates has also been brought up in British Columbia, but so far no definite steps have been taken. In a few days the Saskatchewan municipalities will hold a meeting of the municipal league when the same question will be discussed, and it goes without saying a similar resolution will be carried. It now remains for the smaller provinces—Nova Scotia, New Brunswick and Prince Edward Island—to raise the cry and government ownership of telephones from coast to coast will be an assured thing.

INDEPENDENT FRANCHISE GRANTED IN OAKLAND, CAL.

THE Home Telephone Company of Alameda County, Cal., which is backed by the same financial interests that are behind the Home Company of San Francisco, was granted a franchise in Oakland for fifty years on the following conditions:

First, the Home Company, after five years, is, according to the State law, to pay to the city two per cent. of the gross earnings.

Second, the city of Oakland is to have the free use of one conduit throughout the underground system of the Home Company and the use of all surface poles and connections.

Third, the city is have the free use of fifty telephones.

Fourth, the Home Company to expend, under a $100,000 bond, $875,000 in three years.

In addition to the foregoing conditions the Home Company promised the city to make a bid of at least $20,000 for the franchise. This is said to be the highest bid for a telephone franchise ever made in a city of equal size.

THERE'S ALWAYS A REASON.

"HERE, lad, this bill is not right," said a local alderman when presented with a bill by the youthful collector for the Union Telephone Company of Erie, Pa. "Your company has charged me 15 cents for a message to Girard and your rate ought to be 10 cents, the same as the North East rate. Why must I pay more to talk to Girard than I would to talk to North East, when the distance is the same?" The boy, ignorant of the fact that the bill included a charge for excess time, said haltingly, "I don't know—perhaps it's because Girard is up hill and North East ain't." While the explanation was not entirely satisfactory to the alderman, the charge was paid without further protest.

RALEIGH MERCHANTS' ASSOCIATION IN FAVOR OF INDEPENDENT SYSTEM.

MEMBERS of the Retail Merchants' Association of Raleigh, N. C., recently passed resolutions to exclusively employ the telephones of the Raleigh Telephone Company and to sever connections with the Bell and Interstate companies by September 1, 1906. It was further recommended that the members use their influence with the residents of the city to get them to adopt the Independent system. The Interstate company started business about ten years ago. It sold out two of its exchanges to the Bell about two years ago and it is generally believed that its Raleigh exchange is affiliated with the Bell interests. The Raleigh company is prepared to spend $30,000 on improvements and will do everything in its power to furnish the city with the best service possible.

INDEPENDENTS CUT LOOSE AT SPENCER, INDIANA. AN EARLY BLOSSOM GETS CAUGHT BY THE FROST.

THE following from the February issue of the Central Union News indicates that the heavy snow storms and continued cold weather in March caused havoc not only with the *crocus* and other early spring flowers, but even the *bluebell* got severely nipped by an unexpected Independent cold wave.

"About 2,000 new connections where a year ago the Central Union had sixteen telephones is the way the wilderness is being made to blossom in Western Indiana. A deal has been perfected by which the Central Union secures connection with the Mugg system operating Independent telephones in and around Spencer, Owen County."

As soon as it was definitely established that the Central Union had purchased a majority of the stock and all of the junk of the Mugg Telephone Company, all the Independent telephone companies promptly cut loose.

These included the New Long Distance, the New Home Telephone Company, of Bloomfield; the Bloomington Home, the Farmers' Mutual of Spencer, the Patricksburg system, the Farmers' system at Gosport and the Stinesville system. Also the former Mugg subscribers in Spencer began ordering out the telephones as soon as the Bell doubled the rates, and ordering telephones from the Farmers' Mutual Telephone system, which now has 250 subscribers with a list that is rapidly increasing. All of these companies have entered into contracts with the New Long Distance, which has just completed the installation of a switchboard in Spencer of the latest type, with trunk lines connecting with the other Independent companies in Spencer and Owen counties.

It is predicted that within a short time the Bell will have only a toll station left in Spencer.

Moral: The wilderness should not go into the blossoming business until all danger of cold waves is past.

INDEPENDENT COMPANY AT NIAGARA FALLS ENABLES HOSPITAL PATIENTS TO HEAR SOUSA'S BAND.

NIAGARA FALLS is a city in which the transmission of electricity in all forms and for innumerable purposes is so common that it takes something extraordinary to make any impression upon its people. Nevertheless electricity was recently put to a use which was decidedly novel to that city on the occasion of the visit of Sousa's Band to the International Theatre.

General Manager R. M. Eaton, of the Niagara County Home Telephone Company, decided to put the facilities offered by the Independent telephone system at the disposal of the patients in the hospital, to enable them to hear this concert. With this in view, he secured a special transmitter, which he placed upon the stage and connected directly with the hospital. In order to give this service considerable special wiring had to be done, but by the time the concert was opened Mr. Eaton had a telephone within reach of every patient. Much favorable comment was aroused by this additional evidence of alertness in seeking opportunities to increase the value of its service on the part of the management of the Independent company.

FIFTH DISTRICT OF ILLINOIS INDEPENDENT TELEPHONE ASSOCIATION TO HOLD MEETING.

INDEPENDENT telephone men forming the fifth district of the Illinois Telephone Association will meet in Peoria on April 15, 16 to discuss and devise ways and means for the furtherance of the interests of the Independent telephone exchanges. The Peoria meeting is expected to be the largest ever held in the State, as during the past year the Independent telephone movement has assumed large proportions, and much time and effort have been expended to bring the owners and operators together on a sound working basis. E. R. Conklin, secretary and general manager of the Independent Telephone and Telegraph Company, is president of the organization.

One of the objects of the meeting is to consider means for protecting the smaller Independent companies from the Bell Company. The toll rate question will be threshed out, and the movement for a telephone clearing house started at the meeting held during last January will be further considered. The committee, composed of J. W. Barrett of Pekin, Sid Dailey of Chillicothe and C. A. Camp of Sparland, will submit a report to the meeting, which will be thoroughly discussed and if not adopted will form a basis for further consideration by the members.

All Copper. Made in 4 Styles

IF YOU WILL TAKE THE TIME

to write a letter inquiring about the validity of our claim that the

Trumbull All Copper Switch

is the best on the market, you will receive ample and convincing proof, and incidentally learn a good deal about switches which will be of value to you. There were several good reasons for the design of this switch which, you will notice from an examination of the illustration, differs from any other you ever saw.

Its most salient feature is the U-shaped terminal clip. This novel construction makes faulty contacts impossible; it preserves the surface of the blades by distributing the tension between the two clips, neutralizes any strain upon the parts due to an uneven base, and its adjustment is permanent.

These facts surely must appeal to you if you have ever had anything to do with the ordinary switch. Let us quote you prices and send you particulars regarding their use in connection with telephone systems.

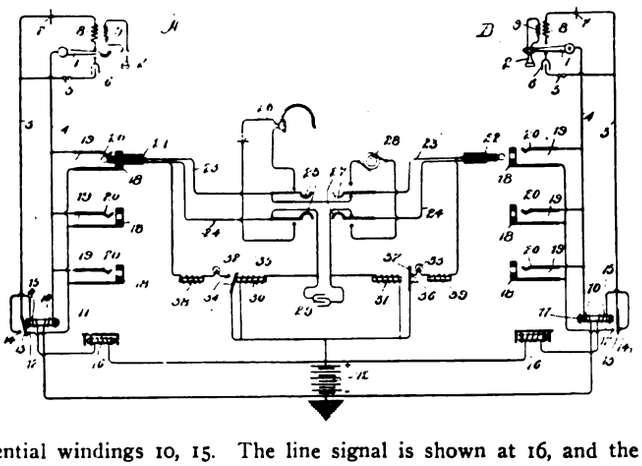
TELEPHONE PATENTS

TELEPHONE EXCHANGE SYSTEM.

Harry G. Webster, Chicago, Ill., patents (No. 816,052; dated March 27, 1906; filed December 3, 1903; serial No. 183,655) and assigns to the Stromberg-Carlson Telephone Manufacturing Company, Rochester, N. Y., a telephone exchange system.

This patent relates to common battery circuits in which only two contact jacks and plugs are employed and discloses means whereby the supervisory signal of each half of a cord circuit may be operated in conjunction with one relay instead of requiring two as heretofore. At the same time, the inductive balance of the circuit is maintained.

Referring to the illustration, 11 is a cut-off relay having differ-



ential windings 10, 15. The line signal is shown at 16, and the supervisory signals at 32, 33, in series with impedance coils 38, 39, respectively. Supervisory relays 30, 31, are provided with circuit closing armature contacts 35, 37.

The circuit operation is as follows: When *A* removes his receiver from the hook a circuit is completed through the closed contacts 14, 13, differential windings of the cut-off relay, line signal 16, and battery 12, thereby displaying the line signal. The operator then inserts plug 21 in the answering jack, which results in the closing of a circuit from the positive side of the battery, armature contacts 35, 34, supervisory lamp 32, impedance coil 38, tip of plug 28, tip of jack 20, through winding 10 of relay 11 to battery. At the same time a circuit is completed from battery through winding of supervisory relay, sleeve contacts of jack and plug, contact 17, armature 13, line 3, substation set, back to battery through winding 10 of cut-off relay.

The circuit through the supervistory relay is only momentary, due to the fact that the differential windings of the relay 11 are unbalanced by the shunt path for the current flowing through the winding 10, formed by the supervisory lamp circuit. This causes the relay 11 to attract its armature 15, which closes with contact 17, opening the line signal circuit and completing the circuit for the supervisory relay as mentioned heretofore.

After ascertaining the number desired, the operator plugs in to the multiple of the line called. A circuit is then formed from battery through supervisory lamp 33, impedance 39, tips of plug and jack, winding 10 of cut-off relay back to battery. This causes the armature of the cut-off relay to be attracted, opening the line signal circuit and the supervisory signal is illuminated. The balance of the circuit is maintained by means of the impedance coil 39.

When the subscriber answers, a circuit is completed through the supervisory relay, sleeve of cords and jack, contacts 17, 13, line 3, substation *B*, winding 10 of cut-off relay 11, battery, thereby opening the supervisory lamp circuit. When the parties hang up, the sleeve circuit is opened and the supervisory lamps are relighted.

TELEPHONE SYSTEM.

William M. Marean, Belvidere, Ill., patents (No. 814,386; dated March 6, 1906; filed June 6, 1904; serial No. 211,263) a telephone system.

In this patent means are disclosed which enable the subscriber to indicate visually instead of orally the telephone number of the line with which he desires to connect his instrument. Step by step mechanism controlled by special apparatus at the subscriber's instrument is employed to operate indicators at the exchange to accomplish this result.

TELEPHONE TRANSMITTER.

Michael Setter, Chicago, Ill., patents (No. 811,098; dated Jan. 30, 1906; filed Dec. 30, 1904; serial No. 238,902) and assigns to the American Electric Telephone Company, Chicago, Ill., a telephone transmitter.

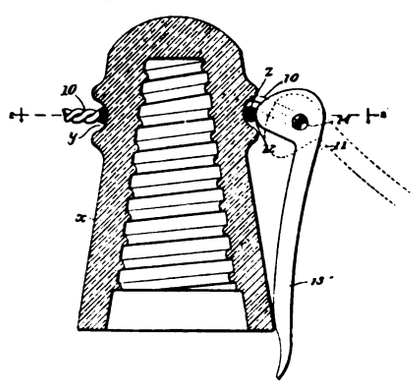
In this invention means are disclosed whereby the front plate is formed out of two metal stampings, held together by reaming the edge of one over the edge of the other. Thus great economy in manufacture is secured as the only machine work required to finish the part is the tapping of the front member of the combination to engage the threads of the mouthpiece.

INSULATOR ATTACHMENT.

Hans Swanson, Warren, Minn., patents (No. 814,887; dated March 13, 1906; filed April 26, 1905; serial No. 257,516) an insulator attachment.

The object of this invention is to provide a means whereby a wire can be readily attached to an insulator and when desired as easily removed.

Referring to the illustrations, *x* is an insulator of the usual type provided with a groove *y* to receive the tie wire, which is



formed into a loop 10 and passes through a cam lever 11, forming a fulcrum therefore. The lever has a cam-shaped nose 12 which engages with the line wire *z*.

In operation the loop is threaded through the lever and passed over the insulator. Then the line wire is placed in position in the groove and the lever handle 13 depressed. This action causes the nose 12 to press the line wire *z* tightly against the insulator, thereby locking both in position, with the line wire pulled taut.

IN THE MANUFACTURING FIELD

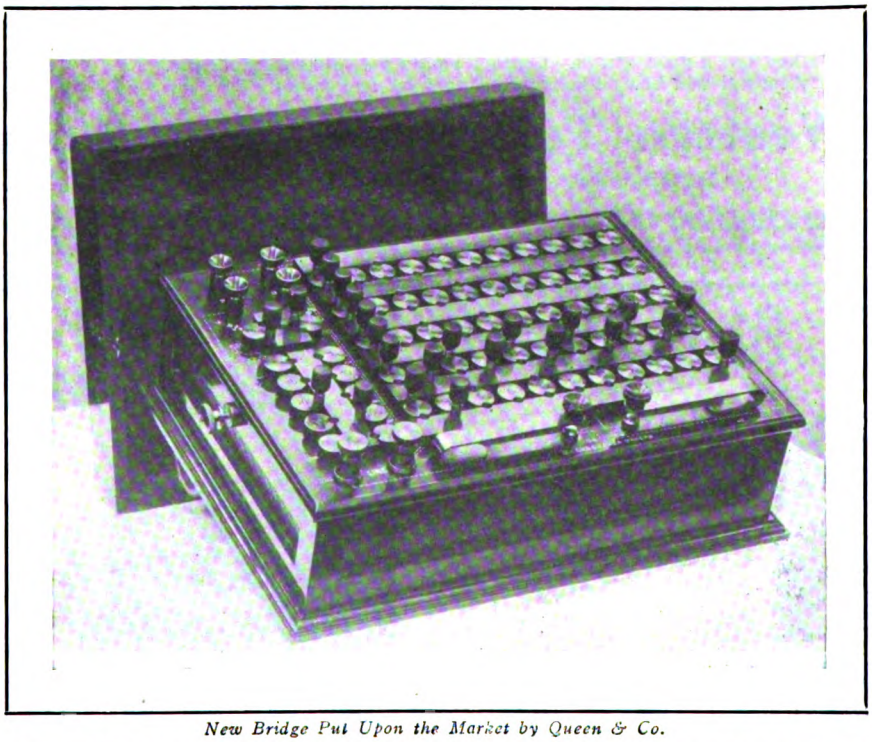
"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

AN ACCURATE, BUT INEXPENSIVE BRIDGE.

A NEW Universal Decade Box and Wheatstone Bridge with several novel and attractive features has recently been brought out by Queen & Co., of Philadelphia. It is in arrangement very similar to the well known Anthony form, but considerably smaller in size.

The rheostat proper consists of fifty coils, ten each of tenths, units, tens, hundreds and thousands, and so arranged that all the coils in any bank can be connected in series, multiple, or various combinations of the two. This arrangement lends itself particularly well to the thorough and complete interchecking of the coils; as, for instance, the ten 100 ohm coils can be connected in multiple and compared with each 10 ohm coil, which latter in turn can be compared with the ten 1 ohm coils connected in series; likewise, this interchecking can be extended to the other coils in the rheostat.

The bridge consists of a unit, ten, hundred, thousand and ten thousand ohm coil in each arm, which latter, by means of a commutator, can be reversed and their equality determined to a nicety.



New Bridge Put Upon the Market by Queen & Co.

Battery, galvanometer and line posts are provided and in the galvanometer and battery keys special care has been taken to use a gauge of metal which will not tire the operator and which will yet allow perfect electrical contact to be made.

The connections are engraved in dotted lines on the hard rubber top, the double line indicating the heavy interior of connections and the single lines showing the galvanometer and battery circuits.

The lower edges of the metal blocks and bars facing each other are beveled slightly, and owing to the circular form of metal block, much greater insulating space is secured than with the older form of rectangular block.

The coils are wound with manganin wire thoroughly shellacked, aged and baked. The accuracy of adjustment of the bridge coils is 1-50 of one per cent, that of the thousand, hundreds and tens in the rheostat, 1-25, the units 1-10, and the tenths, 1-5 per cent, respectively, of their stamped values.

The perforated metallic sides allow a free circulation of air, which together with the zero temperature coefficient quality of the special wire which is used, make the box practically independent of temperature variations.

If requested, a table of readings accurate to 1-50 of one per cent will be supplied with each set, showing the actual measured resistance of each coil. Twenty-four plugs and two travellers are supplied. When not in use, a polished hardwood mahogany cover, similar to the box itself, fits over the hard rubber top and plugs, effectually protecting them from dirt and the action of the light.

This set will be found to be of great value in the ordinary laboratory when accurate measurements are necessary, and yet the expense of one of the large Anthony bridges would not be justified.

THE SPARTAN CROSSARMS, PIN AND BRACKET COMPANY, of Spartanburg, S. C., has been organized with $10,000 capital stock by D. L. Wray, W. J. Gilmore, J. A. Mullinax, J. G. Houser and associates to manufacture crossarms, pins and brackets for telephone and telegraph poles.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Rochester, N. Y., has recently issued bulletin No. 15 superseding bulletin No. 5. In it are described the various pieces of apparatus associated with central energy telephones, besides the complete instruments. Since the former bulletin was issued numerous improvements have been made in the various parts which are fully described in this issue. Amongst these are a new transmitter, a new desk set, a new hotel instrument in an enamelled steel box, and a new hand set in which the switch is operated by pressing the receiver against the ear.

In the portion of the booklet devoted to parts of instruments very minute descriptions accompanied by exceptionally well chosen illustrations are given of each individual piece of mechanism. In the latter portion of the bulletin there are several full page illustrations of a few of the most notable Stromberg-Carlson central energy switchboards. This bulletin is well in keeping with the other numbers issued by the company and should be secured by all parties interested in high grade telephone equipment.

THE WIRE AND TELEPHONE COMPANY OF AMERICA, Rome, N. Y., has prepared a folder showing the various monthly prices of copper since July, 1883. As an index to the growth of the copper industry this little pamphlet will be found of great interest. The fluctuations indicate very clearly the business conditions existing at different periods and give an insight into the extent of production. The back cover of the leaflet draws attention to the business of the company in the way of manufactured wire and telephone products and also to its engineering department. This part of the business attends to all details relative to telephone manufacturing, consulting and contracting. The company is prepared to estimate upon any class of equipment whether interior or exterior.

Interested parties are requested to send for this pamphlet, and, if in the market for wire or telephones, estimates will be cheerfully given.

STEEL SWITCHBOARD CORDS.

SWITCHBOARD cords which secure all the advantages from durability which accompany the steel strand type, with the additional feature of high conductivity which was formerly possessed only by the tinsel conductor cord, are manufactured by the Premier Electric Company, 118 West Jackson Boulevard, Chicago, Ill.

The two illustrations upon this page show the general design and arrangement of the parts in the Premier "B B" cord. Fig. 1 shows the cord with the outer covering removed. It will be seen that the two strands are wound in a spiral, in such a manner as to give a smooth and cylindrical surface, upon which is laid the braided cover. The small figure designated by the letter B in the centre of this illustration represents a very tough and flexible steel spring, insulated with waxed silk. This spring is inserted in the hollow center of the conductor spiral at the plug end of the cord, before the outer linen braid is put on. This braid serves to hold the spring firmly in position. The object of this arrangement is to prevent the conductor convolutions from being thrown out of alignment at a point where the cord is most sharply bent, and is naturally subject to the most wear.

In Fig. 2 one end of the cord is shown, giving a very clear idea of the appearance of the two spirally wound conductors, and the braided cover. The method in which the steel music wire strands are wound with fine copper tinsel strands, to increase the conductivity, is also made clearly evident. The outside braid of the cord is made from a very high grade waxed linen thread, which is designed to become smooth with a little wear, making the cord run easily.

These cords are made in three colors. gray, brown and red, and trimmed to fit any plug. The company furnishes them of any length, and with any number of conductors required, upon receipt of specifications. Further information may be obtained from the manufacturers.

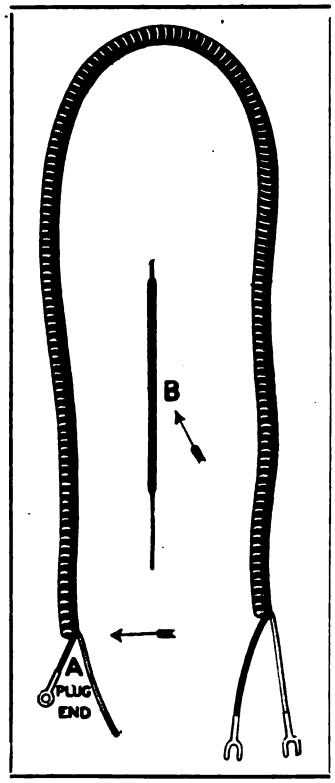

Fig. 1. Premier switchboard cord with braid removed, showing tight spiral arrangement of conductors.

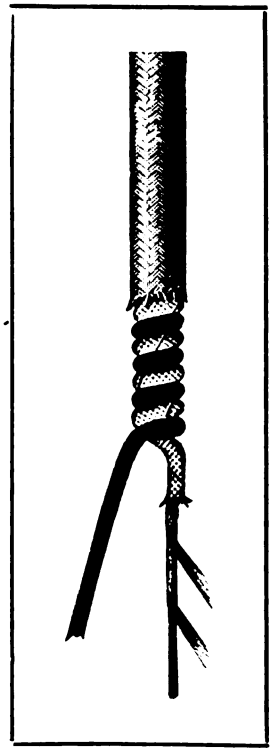

Fig. 2. Dissected end of Premier B B cord.

WILLIAM J. MURDOCK & Co., Chelsea, Mass., are issuing a little booklet describing the "Solid" type receivers it manufactures. These receivers receive their name from the fact that the magnets and terminals are moulded in a solid composition case. Three types of hand receivers are shown, besides a watch case instrument. The manufacturers claim that the adjustment of the parts is permanent, that the case will not break, and that the instrument is correctly designed from both electrical and mechanical standpoints. To all parties interested the catalogue will be mailed upon receipt of a request for the new "Booklet C."

THE ELECTRIC GOODS MANUFACTURING COMPANY, Boston, Mass., is placing on the market a combined telephone and fire alarm system known as the "Safeguard." It is devised to automatically notify the hotel clerk of a fire in a room, and, if deemed advisable, a single plug can be withdrawn which closes the ringing circuits of all the telephone bells and fire alarm gongs. The company states that this system has been placed in operation in a number of hotels. Further particulars can be secured by writing the manufacturers.

THE EWING-MERKLE ELECTRIC COMPANY, St. Louis, Mo., has issued the twelfth number of the "Everbest" Magazine. It contains besides the usual short items of interest, one of which is a very well put and amusing anecdote, an article dealing with the equipment and maintenance of small exchanges. The writer cites several incidents to show the lax state of affairs frequently met with and gives some pointers of value to those who are not expert in the business. The eighth article upon the manufacture of incandescent lamps deals with the physics of a lamp and cites reasons for loss of candle power. Parties desiring to secure copies of this number and future editions are requested to send their names to the company.

THE AUTOMATIC ELECTRIC COMPANY, Chicago, Ill., has prepared a folder which it is distributing to operating companies, in which the argument so long employed by the Bell, that two telephone systems are a nuisance, is very ably contested. Copies of this interesting paper will be forwarded to managers who send their names to the company.

THE CENTRAL TELEPHONE AND ELECTRIC COMPANY, St. Louis, Mo., has issued the April edition of its monthly pictorial post card calendar. The illustration shows an attractive damsel in the act of using a Central Company's telephone. This series of calendar post cards will continue throughout the year and anyone who wishes to secure future numbers should send his address to the company.

THE WESCO SUPPLY COMPANY, St. Louis, Mo., has inaugurated a new department in its monthly magazine, "The Live Wire." Starting with the March issue, a comprehensive price list of almost every item of material used in the maintenance of the wire and substation plant of a telephone exchange will be given. The company states that the quotations are not guaranteed, but are given as the market values at the time of going to press.

This addition to the contents of "The Live Wire" makes that publication of special interest to buyers, since it will furnish from month to month a good general idea of the market conditions. Copies can be secured by addressing the company.

THE STANDARD UNDERGROUND CABLE COMPANY announces the opening of a new office for the convenience of its Southern friends in Suite 1323, Candler Building, Atlanta, Ga. Mr. C. A. Brown will represent the company at this office, and will be glad to give his personal attention to any correspondence with which he may be favored by customers or other inquirers.

WHY

Do All the Leading Telephone Manufacturers and Telephone Companies use

ROCK ISLAND

R·I BAT

DRY CELLS?

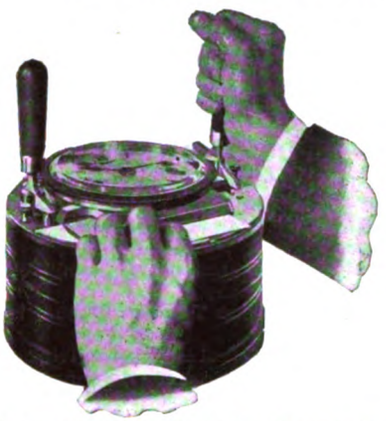
BECAUSE

Every Test they have made has proven them fully 25 per cent. better than any battery they ever used.

Order a sample barrel and convince yourself.

ROCK ISLAND BATTERY CO.
CINCINNATI, OHIO

Do Not Watch the Time Fly
Use a CALCULAGRAPH



The efficiency of your toll service depends largely upon the speed at which the operators can make connections and clear the circuits. If you burden them with the work of computing the elapsed time of a call, one of two things will happen: Either the operator will underestimate the time or subscribers will have to wait. Whichever happens, you lose.

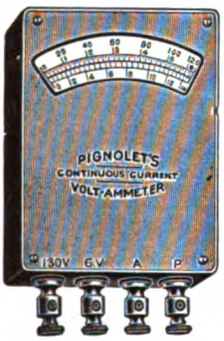
The Calculagraph computes the elapsed time without any aid from the operator, except the movement of the registering handles, and therefore relieves the service of a very serious drag.

IT MAKES NO CLERICAL ERRORS

Write for booklet and sample time tickets.

***The* CALCULAGRAPH CO.**
1437 Jewelers Building, NEW YORK, N. Y.

CHEAP VS. EFFICIENT SERVICE



The cheapest telephone service in the world is dear at any price if it is not efficient.

When a man installs a telephone he wants to be able to use it and not to abuse it.

A grounded line nine times out of ten is noisy, and foreign noise on a telephone line will arouse a feeling of anger in the heart of the user that isn't good for the company. You can keep your lines free from grounds and other troubles by periodic tests with a Pignolet voltmeter, and when they do occur, you can locate them with this instrument, and get them cleared often before the subscriber knew his line was in trouble.

If you need your subscribers' good will, you need my voltmeter to get it.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

THE WEEK'S MESSAGES

FINANCIAL.

SHELBYVILLE, ILL.—The Rose Township Mutual Telephone Company, Shelbyville, has increased its capital stock from $1,020 to $2,040.

TAMARO, ILL.—The Tri-County Telephone Company has increased its capital stock from $25,000 to $50,000.

ATLANTA, MICH.—The Montmorency County Telephone Company has increased its capital stock to $2,500.

HILTON, N. Y.—The Hilton Telephone Company has declared a six per cent semi-annual dividend.

COLUMBUS, O.—The Columbus Citizens' Telephone Company has declared its regular quarterly dividend of 1½ per cent.

COVINGTON, O.—The Covington Home Telephone Company has increased its capital stock from $23,000 to $71,000.

FRANCHISES.

OAKLAND CITY, IND.—A franchise has been granted to C. F. Stevens, representing a new company, to build and operate a telephone system in Oakland City.

RIPPLE, MINN.—Charles Swedback has been granted a franchise for a telephone exchange at Ripple.

GLOVERSVILLE, N. Y.—The Independent Telephone Company, of Johnstown, N. Y., has applied for a franchise at Gloversville.

HERKIMER, N. Y.—The Independent Union Telephone Company has applied for a franchise at Herkimer.

DELPHOS, O.—A number of citizens of Delphos have applied for a franchise to construct and operate a telephone system at Delphos, under the name of the Farmers' Mutual Telephone Company.

PROVO, UTAH.—The Independent Telephone Company has been granted a franchise to construct a telephone line from Provo to Olmsted.

CABOT, VT.—The Union Telephone Company has applied for a franchise at Barre. The company expects to run a line from Barre to Cabot, with its principal offices in Cabot.

LAKE VIEW, WASH.—The Lake View Telephone Company has applied for a franchise to construct lines throughout the county.

COMBINATIONS.

WILMINGTON, DEL.—The Delaware Telephone Company and the Wilmington Electric Light and Power Company have consolidated. The new company will be known as the Wilmington Light, Power & Telephone Company. It will have a capital stock of $1,250,000.

BROOK, IND.—The Mutual Telephone Company has acquired the Brook Telephone Exchange.

NEW WILMINGTON, PA.—The New Wilmington Telephone Company has purchased the old Western Union Telegraph line to Fayetteville, and will use it for a telephone system, establishing an exchange at Fayetteville.

EAU CLAIRE, WIS.—The Shaw Telephone Company has passed into the control of Charles Seguin, who will operate the company in the future.

ELECTIONS.

BROOK, IND.—The Mutual Telephone Company has elected the following directors: J. B. Lyons, T. L. Davis, J. A. Sell, John Sage and Bert Galbraith.

MANSON, IND.—The Manson Telephone Company has elected the following directors: M. Anderson, Russel Hallen, F. E. Bailey, T. Cheney, Thos. Major, A. Carter, J. Custic, Wilbur Curtis, James Nagle.

WENATCHEE, WASH.—The Farmers' Telephone & Telegraph Company has elected the following officers: Z. A. Lanham, president; S. W. Phillips, vice-president; Arthur Gunn, treasurer; H. C. Littlefield, secretary.

MEDICINE HAT, ALBERTA, CAN.—The Alberta Southeastern Telephone Company, Ltd., has elected the following directors: John Huston, Medicine Hat; William Rutherford, Strathmartin; S. T. Fawcett, Elkwater; W. C. Harris, Medicine Hat; F. L. Crawford, Medicine Hat; H. E. Bennetts, Medicine Hat; G. H. Smibert, Elkwater.

NEW COMPANIES.

SUCCESS, ARK.—The Citizens' Telephone Company has been incorporated with a capital stock of $20,000.

BERTHOUD, COLO.—An Independent Telephone Company has been formed at Berthoud with the following officers: C. H. Ramsay, Dr. Bennett, Samuel Southard and others. The company will install an exchange at Berthoud, and cover northern Colorado with independent lines.

CAPRON, ILL.—The Capron Home Telephone Company, Capron, Ill., has been incorporated with a capital stock of $800. Incorporators are F. D. Cornwall, E. W. Dimond and Geo. H. Olsen.

FAIRBURY, ILL.—The Fairbury Telephone Company, Fairbury, Ill., has filed articles of incorporation. Its capital stock is $20,000. The organizers are Geo. C. Monk, of Chicago, C. E. Monk and E. A. Agard, of Fairbury.

MATTOON, ILL.—The merger of the Mattoon Telephone Company with the Coles County Telephone Company and the Charleston Telephone Company consolidates the telephone systems of this region into a single corporation, the Coles County Telephone and Telegraph Company, which has sufficient financial resources for a most satisfactory extension of the service.

BLOOMINGTON, IND.—The Home Telephone Company is preparing to enlarge its local plant

GOSHEN, IND.—The Home Telephone Company, which has recently completed a line from Goshen to Dunlaps, is to build a line to Elkhart.

EAST ENTERPRISE, IND.—The Farmers' Mutual Telephone Exchange Company has been incorporated with a capital stock of $1,000. The company will build and operate a telephone system in East Enterprise, and throughout Switzerland and Ohio counties. Directors: Harvey Sedand, Henry Kuhlman and Wilson Oaks.

WAVELAND, IND.—A. P. Hanna, Charles Patton and others have organized a new telephone system to estalish and operate a telephone system in Waveland.

MEDERVILLE, IA.—The Mederville Telephone Company has been organized at Mederville with Theo. Koester as president, and W. E. Carpenter as secretary and treasurer. The company will build a line from Mederville to Strawberry Point.

LAFONTAINE, KAS.—The Wilson County Consolidated Telephone Company has been organized, and has taken over the Wilson Company and the Lafontaine Telephone Company. The company will extend its system to many other points.

LUCERNE, KAS.—The Farmers' Mutual Telephone Company, of Lucerne, has been incorporated with a capital stock of $2,000.

MEDICINE LODGE, KAS.—The Medicine Lodge Telephone Company, Medicine Lodge, has been incorporated with a capital stock of $15,000.

SAINT JOHN, KAS.—The Douglas Township Telephone Company, St. John, has been incorporated with a capital stock of $1,280.

AUDUBON, MINN.—The Audubon Telephone Company, Audubon, has been incorporated with a capital stock of $15,000. The incorporators are C. R. Billings, John P. Boyer, Albert Carlson, L. S. Cravath, C. Glaum, F. E. Gunderson, E. O. Hanson, A. O. Netland and others of Audubon.

HAWK CREEK, MINN.—The Hawk Creek Rural Telephone Company, Hawk Creek, has been incorporated with a capital stock of $25,000. Incorporators are P. E. Symes, G. P. Mangarud, E. O. Oppegaard, Steve Odegard, O. M. Agre.

HERMAN, MINN.—The Herman Telephone Company, Herman, has been incorporated with a capital stock of $50,000. Incorporators are C. J. Bacon, H. A. Hanson, G. F. Houston, J. D. Houston, A. W. Wells, J. F. Lenden, K. C. Helgeson, E. E. Peck, of Herman.

MINNEOTA, MINN.—The Minneota Telephone Company has been organized with a capital stock of $5,000. The officers are: President, G. B. Bjornson; secretary, F. C. Murray; treasurer, H. J. Tillemans.

RUTHTON, MINN.—The Current Lake Co-operative Telephone Company has been incorporated with a capital stock of $10,000.

DOUGLAS, NEB.—The Solon Telephone Company, with its principal office at Douglas, has been incorporated with a capital stock of $25,000. The incorporators are Geo. B. Hendricks, A. M. Malone and others.

ORD, NEB.—The Independent Telephone Company of Ord has been incorporated with a capital stock of $80,000. Fred J. Bell is president and Rudolph Sorensen secretary.

CENTERVILLE STATION, N. Y.—The Neversink Telephone Company, of Centerville Station, has been incorporated with a capital stock of $7,000. The directors are L. V. Gardner, E. W. Winne and T. H. Wilson, of Centerville.

HANNIBAL, N. Y.—The Bethel Telephone Company, of Hannibal, has been incorporated with a capital stock of $2,000. Incorporators are L. D. Harman, L. J. Sweet and H. W. Robinson, all of Martville, N. Y., and others.

LYCOMING, N. Y.—The Lycoming and New Haven Telephone Company, Lycoming, has been incorporated with a capital stock of $400. Incorporators are D. D. Lawton and D. H. Howard, Lycoming, N. Y.; C. A. May, Oswego, N. Y., and others.

NASSAU, N. Y.—The Rural Home Telephone Company, with offices at Nassau, has been incorporated with a capital stock of $50,000. The directors are I. R. Coughry, E. M. Woodard, P. J. Callan, George Fleming, W. B. Harris, J. E. Carhart, R. I. Hopwood, Albany.

PENN YAN, N. Y.—The Yates County Telephone and Telegraph Company, Penn Yan, has been incorporated with a capital stock of $5,000. Incorporators are Frank E. Spencer, Benton, N. Y.; Fred Culver and M. L. Spooner, Penn Yan, N. Y., and others.

TRUXTON, N. Y.—The Truxton & Cuyler Telephone Company has been

The New Leeds & Northrup Factory

THE rapid growth of the Leeds & Northrup Co., of Philadelphia, is indicated by the accompanying illustrations, which show the new quarters recently occupied by this firm. The building was designed and built to meet the special requirements of constructing and adjusting electrical measuring instruments. It has embodied in it many features of interest. The location at 4901 Stenton Avenue is away from the thickly settled part of the city and has, therefore, all the advantages of ample light and freedom from dust. In selecting the site for location, a lot of sufficient size to allow for future expansion was acquired.

The main structure is 110 feet x 52 feet, three stories in height, fireproof in construction throughout and has all provision for the comforts of the employees.

The laboratory occupies 85 feet of the third floor, and by means of skylights, in addition to numerous side windows, an abundant supply of light, so essential for work of precision, is furnished. The illustration shows the north side, which is practically a duplicate of the south side. Careful study has been given to the arrangement, distribution and insulation of the circuits for use in current, potential and general testing work. This current is furnished by a large battery of storage cells, the terminals of which are connected to a specially constructed mercury switchboard. This switchboard permits grouping the cells in any desired combination for any particular circuit. The battery room is shown at the end of the laboratory, on the right, with the charging panel outside. The mercury switchboard is not visible. All calibrating and standardizing apparatus is permanently set up in circuit with galvanometers best adapted for the demands to be made upon them. It will be noted from the illustration that the Type H Galvanometer is extensively used.

In conjunction with the laboratory, but in a separate building, provision has been made for work in high temperature measurement.

The shop occupies 85 feet of the second floor and is electrically driven. The equipment of tools and machines is specially adapted for the production of electrical measuring instruments. Co-operating with the shop and laboratory is an inspection department through which all apparatus must pass before shipment can be made. This inspection is most rigid, involving both mechanical and electrical tests, and thus insures the highest standard of workmanship, material and adjustment.

The basement is taken up by the heating and lighting plant, shipping room, locker room and wash room for the mechanics, fireproof vault for records and a well lighted room 52 feet x 55 feet for future manufacturing purposes.

The drafting and designing department is located on the second floor so as to be in close touch with the shop. In this department are filed accurate records and drawings of all apparatus manufactured. The sales office, stock room and show room are located on the third floor. In the show room are displayed, in easily accessible wall cases, a complete line of the more important instruments manufactured. In addition to this display a number of instruments are connected in circuit for demonstration under actual working conditions.

The occupancy of the new shop and laboratory has permitted the installation of additional machinery and an increase in their mechanical and laboratory forces. As a result, a larger amount of manufactured stock and standard parts will be carried, which will insure prompt deliveries.

A cordial invitation is extended by the owners to all interested persons to visit and inspect the new plant of the Leeds & Northrup Co.

incorporated with a capital stock of $10,000. The company's line will connect the towns of Truxton, Fabius, Lincklaen, De Ruyter, Cuyler and all villages and towns in the counties of Cortland, Madison, Onondaga and Chenango. The directors are A. D. Theobald, M. D. Dunbar and J. B. Whitmarsh, of Cuyler; F. L. Hilton, A. R. Bryant and F. L. Woodward, of Truxton, and Randolph Hibbard, of Cortland.

PENN, N. D.—The Penn Rural Telephone Company has been incorporated with a capital stock of $7,000.

PLEASANT LAKE, N. D.—The Pleasant Lake Telephone Company has been organized. The incorporators are L. M. Holbrook, Anton Burow, J. H. Watson and W. F. Hanks.

COLUMBUS GROVE, O.—The Farmers' Mutual Telephone Company has been organized with the following officers: S. M. Keirns, president; L. D. Spafford, vice president; Samuel Williams, secretary; E. A. Fancher, treasurer.

OTWAY, O.—The Farmers' Union Telephone Company, Otway, O., has been incorporated with a capital stock of $1,000. The incorporators are F. C. Faul, J. E. Faul, H. R. Dugan, Edgar Dugan, E. J. Ogden, J. A. Laylin and others.

RAGERSVILLE, O.—The Ragersville Telephone Company, Ragersville, O., has been incorporated with a capital stock of $5,000. Incorporators are G. Weiss, Daniel Dall, William Miller, Charles Leiser and F. B. Gerber.

ALINE, OKLA.—The Aline Farmers' Mutual Telephone Company, of Aline, has been incorporated with a capital stock of $2,000. The incorporators are H. C. Geist, B. A. Field, G. A. Reiner, C. F. Geist and George Brown.

ENID, OKLA.—The Skelton Rural Telephone Company, of Enid, has been incorporated with a capital stock of $450. The incorporators are H. A. Thompson, J. J. Field, J. H. Gibson, A. E. Roever, of North Enid; H. E. Whitney, F. M. Barnhisel and H. P. Carter, of Enid.

GRANITE, OKLA.—The Farmers & Merchants' Telephone Company, of Granite, has been incorporated with a capital stock of $5,000. The incorporators are O. S. Laswell, J. A. Rice, J. G. Willis, Howard Arnett and B. F. Van Dyke.

LELAND, OREGON.—The Leland, Illahe & Port Orford Wagon & Toll Road & Telephone Company has been incorporated with a capital stock of $100,000. The company is to build a telephone line paralleling its toll road from Leland to Port Orford, about 90 miles. The incorporators are E. B. Burns, of Marial; Jacob Frye, of Illahe; J. D. Cooley, of Agness.

MOSCOW, PA.—The Pocono Mountain Telephone Company has been chartered with a capital of $10,000. It is to build lines in Lackawanna and Wayne counties. The directors are A. N. Sayre, J. E. Loveland and J. D. Callegan, of Moscow; R. J. Tanfield and William Cobley, of Daleville.

STROUDSBURG, PA.—The Stroudsburg & Bushkill Telephone Company has acquired the Monroe Telephone Company, and a new company is to be chartered under the name of the Stroudsburg & Bushkill Telephone Company. The new company will be capitalized at $33,000, and will make many improvements in its system, as well as establishing a long distance service.

INDIAN MOUND, TENN.—An Independent Telephone Company has been organized at Indian Mound, with the following officers: T. W. Seay, president; W. H. Green, vice-president; C. N. Keats, secretary; A. H. Seay, treasurer. The company will build lines all over the county.

BURLINGTON, VT.—The Burlington Home Telephone Company, with a capital stock of $100,000, has been formed. Patrick Tierney, of Plattsburgh, N. Y., who installed the Independent telephone systems at Plattsburgh, Potsdam and other places, is one of the incorporators of this company.

PERSONAL.

J. B. BRENNEN, formerly division line foreman of the Central Union Telephone Company at Columbus, O., has been appointed superintendent of construction for the Wisconsin Telephone Company, in Milwaukee.

H. B. BRYANT, of Raleigh, N. C., has been appointed manager of the exchange at Greenville, S. C., by the Southern Bell Telephone and Telegraph Company.

A. M. HAUBRICH, formerly connected with the Stromberg-Carlson Telephone Manufacturing Company at its Rochester headquarters, has recently been transferred to the Chicago office in the capacity of Western sales engineer.

WILLIAM J. HIBBERT, formerly with the American Telephone and Telegraph Company in New York City, has accepted a position with the Philadelphia Bell Telephone Company.

J. S. HUGHES, who has been manager of the plant of the Consolidated Telephone Company at Carbondale, Pa., has been promoted to the superintendency of a newly established district organization. He will have charge of territory which includes practically all of Wayne and Susquehanna counties and Lackawanna county as far south as Olyphant.

A. C. REYNOLDS has been appointed manager of the Hudson River Telephone Company's exchange at Port Jervis, N. Y.

A. U. RICHARDSON will take entire charge of the business of the Columbiana County Telephone Company in Columbiana county, Ohio. His headquarters will be at East Liverpool.

LE ROY TUCKER has been appointed manager of the exchange of the Colorado Telephone Company at Craig.

MISCELLANEOUS.

LA CROSSE, WIS.—Connections between numerous farmers' lines and the Independent exchange in this place have recently been made. The La Crosse Telephone Company has secured connections with the exchanges and farmers' lines out of Houston, Nodine, Rushford, Lanesboro and Preston. The Tri-State Telephone Company, which is connected with the La Crosse Company's exchanges, is rushing a double circuit of copper wire from La Crosse to Austin.

New Construction in the Field

MOBILE, ALA.—The Home Telephone Company is building a line from Mobile to Birmingham.

JULIETTE, FLA.—The East Florida Telephone Company is building a line to Dunnellon.

CHAMPAIGN, ILL.—The Home Telephone Company, of Champaign, is to spend $100,000 in rebuilding its system.

WILLIAMSBURG, MASS.—The Citizens' Independent Telephone Company, of Williamsburg, is planning to extend its system from Northampton to Easthampton.

WEXFORD, MICH.—The Wexford County Independent Telephone Company is extending its lines in the township of Wexford, and will also extend its system in Antioch.

BLOOMING PRAIRIE, MINN.—The Steele County Telephone Company is to make a great many extensions to its system.

CALEDONIA, MINN.—The Standard Telephone Company is to spend about $4,000 in improving its system. It will build a line to La Crosse, and expects to install a new five section 500 drop switchboard.

ERSKINE, MINN.—The Independent Telephone Company, at Erskine, owned by A. F. Cronquist, is to build lines to McIntosh, Winger, Fosston, Fertile and Knute.

BLAIR, NEB.—The Blair Telephone Company expects to make a number of extensions to its lines.

CENTRAL CITY, NEB.—The Independent Telephone Company, of Central City, is to build lines to Pierce Chapel.

SOCORRO, N. M.—The Independent Telephone Company of Socorro is to be connected with Albuquerque.

ELLICOTTVILLE, N. Y.—The Home Telephone Company, of Ellicottville, is to install an exchange at Sugartown.

TROY, N. Y.—The Commercial Union Telephone Company is planning improvements to its local service, which will double its capacity. It will increase the number of its switchboards and its cables and circuits in every section of the village.

GREENBRIER, O.—The Hamilton Home Telephone Company, of Hamilton, O., is to extend its lines in Green Brier.

ALBANY, OREGON.—The Home Telephone Company is making many improvements in its system.

JOHNSTOWN, PA.—The Johnstown Telephone Company is to extend its lines through West Taylor Township and Conemaugh Township.

PRICE, UTAH—The Independent Telephone Company is to build a line to Castle Gate and Sunnyside.

GREEN BAY, WIS.—The Brown County Telephone Company, which is to increase its capital stock from $10,000 to $20,000, contemplates numerous extensions in its system.

MONTREAL, QUEBEC, CAN.—The Grand Trunk R. R. is to spend $400,000 in installing a telephone system from Portland to Chicago.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

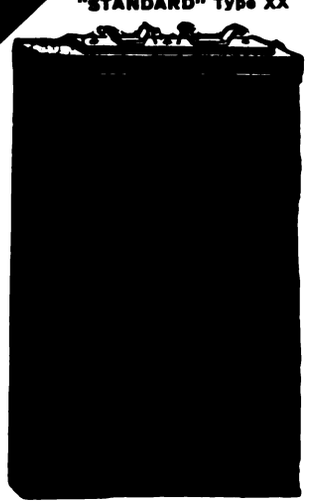
WHAT ARE YOUR INTENTIONS?

"STANDARD" Type XX



Are you figuring on improving the service of your telephone system, or are you going to go on in the same old way, with the same old annoyances, troubles and kicks bound to recur.

Instead of a faulty and poor service line, why not anticipate the complaints which are sure to come, and equip your line with

Andrae Condensers

By their use such things as "listening in" and the breaking of the circuit by leaving receivers off their hooks are made impossible.

They come in three styles—two illustrated herewith—and each style is *fully guaranteed.*

We have a standing offer to *equip an entire line on trial* and will pay *return charges* if you say they're not as represented.

Andrae Telephones Never Disappoint.

Our large catalog No. 11 will be sent you upon request. It's free for a postal. Write for it *to-day.*

LIMITED EDITION OF THE CLOTH-BOUND BOOK "BETTER SAY" FREE

"Better Say" was prepared by **James C. Fernald, L.H.D.,** and deals with common errors in speech and writing. It is packed from cover to cover with helpful suggestions such as the following:

ad-mit' of. "This does not *admit* dispute." Better say: "This does not *admit of* dispute." Unlike *accept* and *permit*, *admit* properly takes *of* in such cases.

new beginner. "I'm a *new beginner*." Better say, simply: "I'm a *beginner*." The *new* is included in *beginner*, and the addition of the adjective is tautological. The finest utterance is in fewest words.

kind of a (an). Omit the article. Not "What *kind of a* man is he?" but "What *kind of* man?" Not "It is a *kind of an* animal," but "a *kind of* animal."

sales'la"dy. A hopeless abomination. Why not also "*salesgentleman?*" If *salesman* is a worthy term to apply to a man, its appropriate counterpart is *saleswoman*, which is the only correct term.

Remember, we charge nothing for the book, giving it away absolutely free in order to bring the merits of our reference works to your attention. With the free book, we will also send full details of a plan by which, for only 7 cents a day, you can own the

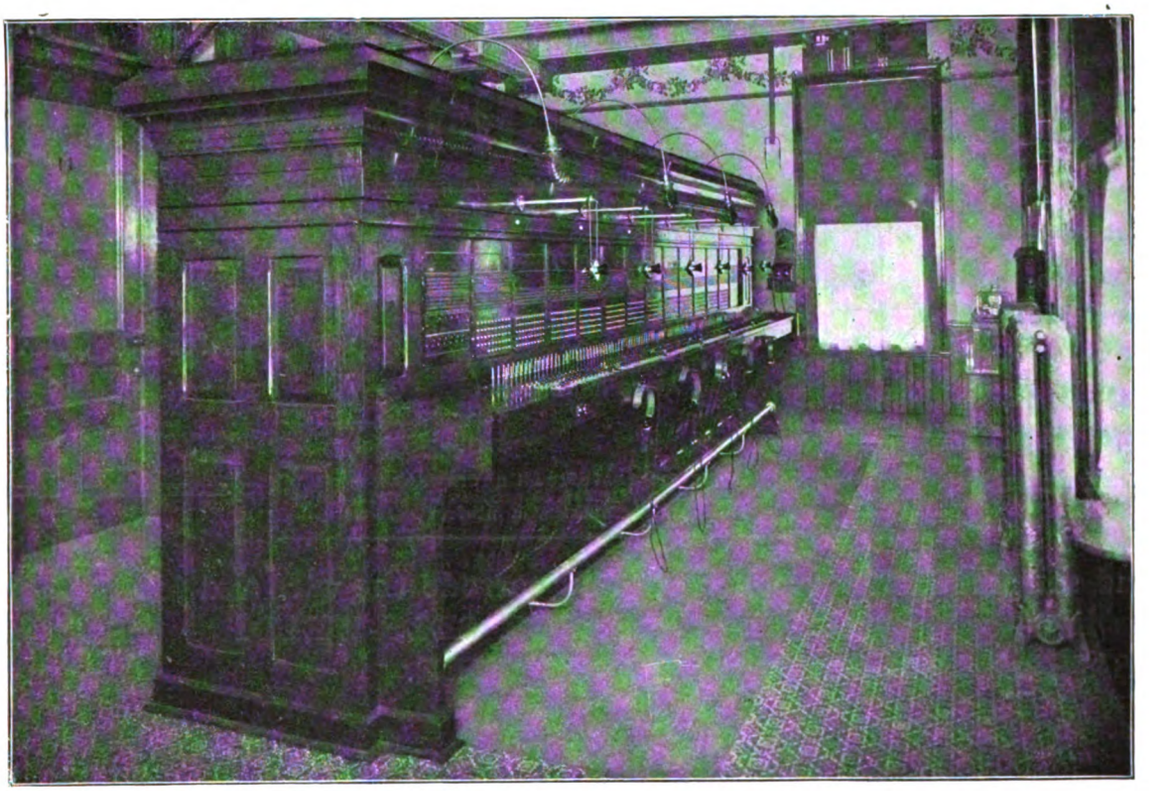
Century 100% Good

DO YOU KNOW that we have been manufacturing a common battery equipment for over six years?

If you are in the market for common battery switchboards or telephones, it would be advisable to make an inspection of and test our apparatus.



You will find it superior in many ways.

We can refer you to Exchanges who have used our common battery apparatus with entire success for a number of years.

Let us make you prices on your requirements in these lines.

Samples will be shipped, charges prepaid.

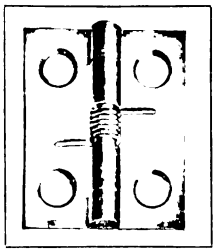
Little Things That Count

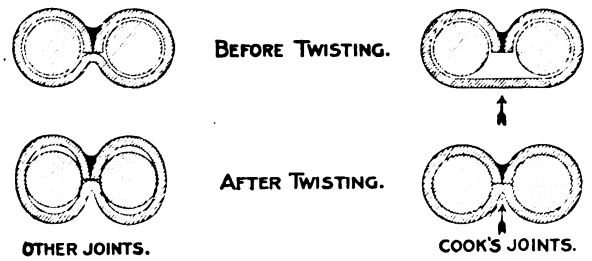
In MONARCH TELEPHONES the talking circuit is carried from the transmitter to the batteries by insulated cords. The ringing circuit passes through the hinges on the door, but these hinges are equipped with spring contacts as shown in the illustration. This feature positively precludes trouble from poor ringing contacts. A "LITTLE THING," and yet it counts.



MONARCH TELEPHONE MFG. CO., - - CHICAGO, U. S. A.

A PERFECT JOINT
The Cook Self-Welding Wire Joint

A joint made with the Cook Self-Welding Wire Joint is STRONGER THAN THE WIRE ITSELF



In the Cook Joint the mere act of twisting draws the sleeve into the recess between the wires, stretching it absolutely tight around both wires, making a perfect self-weld.

Send for a FREE SAMPLE, twist it up, cut it in two and see for yourself.

Air and moisture cannot penetrate and corrode the wire and joint. A perfect connection is assured by the use of the COOK SELF-WELDING WIRE JOINT. ALL SIZES. FOR COPPER OR IRON WIRE.

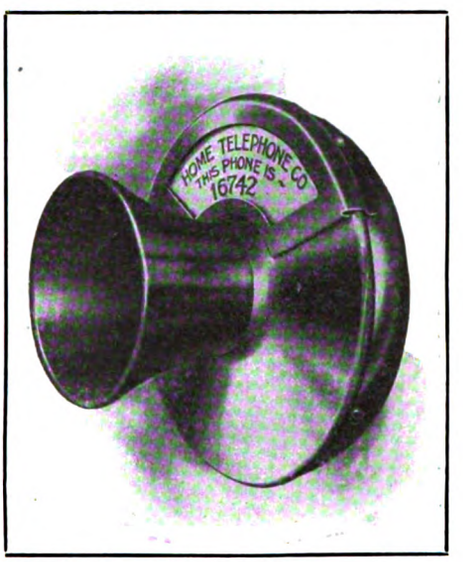
DEAN TELEPHONE APPARATUS

100,000



August 10th, 1904, the first Dean transmitter was placed on the market. During the twenty months of its existence there have been 100,000 put in use, many of which have replaced all other makes. For example, one Ohio exchange alone has replaced over 7,000 other makes of transmitters, many being of the latest design. *There must be a reason.*

Under extreme climatic conditions where other transmitters have packed after being installed only one to three months, our transmitter has stood up without any apparent change.

One exchange in particular, located in a damp Gulf climate, was forced to adopt our transmitter in order to exist. They replaced over 1,000 other modern transmitters with the Dean. It is now over eighteen months since this change was made, and no trouble has been reported.

Our transmitter from the first has set a new standard of excellence, not only in point of transmission, but in careful design and construction. The interchangeability and self adjustment of the parts, together with the moisture and acid proof construction, and the absolute non-packing insure an indefinite life of highest efficiency in operation.

All Dean telephones and switchboards are fitted with these transmitters.

Write for booklet on transmitters.

KELLOGG PHILOSOPHY— —THE BEST IS THE CHEAPEST

KELLOGG
FREQUENCY POLE CHANGER

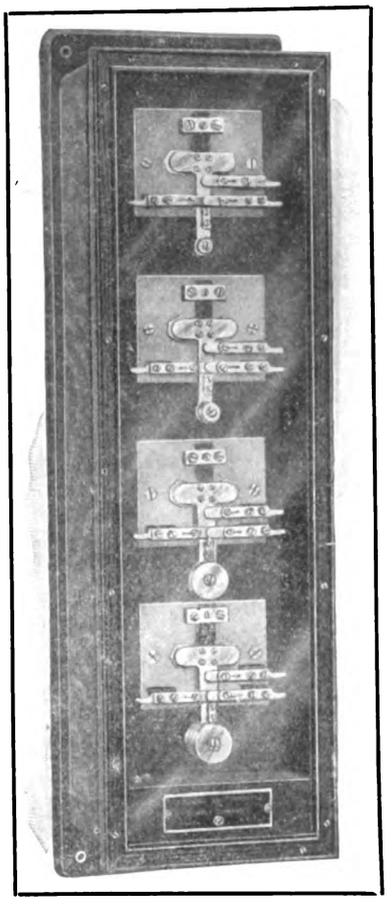
Utmost SIMPLICITY of Operation

THE EFFICIENCY

and beauty of the Selective Harmonic Ringing System of the Kellogg Company has been fully recognized by the entire Independent field, but the difficulty, heretofore, has been that the system required a generating device which involved a rather high first cost, and a relatively large consumption of energy.

The Frequency Pole Changer was designed to meet and overcome all these objections.

It is a very simple device, each unit only involving the use of a magnetic coil and three sets of springs.



"FRONT VIEW"—COVER ON.

ADVANTAGES

1. Requires no attention after once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from Primary or Storage Batteries.
4. Dry cells can be used for the ringing current.
5. They can be furnished to work successfully under any load.
6. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
7. Operates successfully within the limits of 17 to 28 volts.
8. Noiseless in operation.
9. Only three contacts on each vibrator.

This Pole Changer can be used on either Common Battery or Magneto Exchanges

Central Energy Telephones

Stromberg-Carlson

TELEPHONE MANUFACTURING CO.
ROCHESTER, NEW YORK

IF you use or contemplate using Central Energy Telephones it will pay you to get a copy of this new bulletin. There is sufficient evidence in it to prove that the telephones illustrated therein are without exception the most modern and nearest to perfection of any ever placed on the market. This statement is not based on the fact that our cabinets are better finished, that we have a better transmitter or a removable hookswitch, but the telephone taken as a whole.

There is not room enough on this whole page to explain all of their good points. By good points we mean the things that make your subscribers satisfied, eliminate troubles caused by accidents or carelessness on the part of users.

It will only cost you a two-cent stamp and a moment's time to get a copy. Just ask for Bulletin No. 15-B.

Shall we send one?

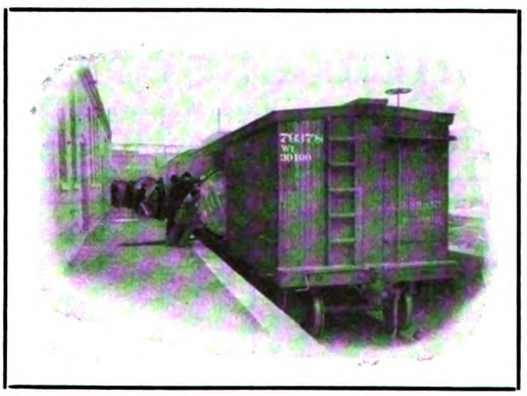
WE MAKE CABLE

All Indications Point Toward the Use of Cable for Future Line Construction

ITS advantages of economy in erection and maintenance alone far outweigh all claims made for open lines. In addition, it possesses exclusive features which effectively demonstrate its superiority as a means of distribution.

The wire plant is the most vulnerable part of a telephone system, and therefore should be constructed with the greatest care. The materials employed must be the best procurable to insure a safe margin of stability, and it is therefore imperative that in their selection due consideration be given to the validity of the claims advanced.



When Stromberg-Carlson Cable Reaches this Point, Everything Possible Has Been Done that Skill and Ingenuity can Suggest to Make it Perfect.

We emphatically state that the best grade of telephone cable on the market is made in our factory and we stand ready to furnish abundant proof.

First of all, we have a modern plant, the apparatus is the latest and the methods employed in manufacture are based upon experiences of the most capable engineers in the business.

Before a length of cable is shipped it is subjected to the most searching tests, and if a fault, no matter how minute, is detected, that portion is rejected. The specifications for our standard output call for the highest grade of manufacture, consequently the qualities of insulation, conductivity and transmission are of the highest order.

Send for our booklet 79B and read it over carefully. If you have had any previous knowledge of the art of cable manufacture you will be astonished at the point of perfection we attain; if you have not, you will learn much of interest that will convince you that where so much care is taken there you will be sure of getting what is right.

You may not be in the market for cable just now, but remember that when you are your best interests will be conserved if you buy Stromberg-Carlson.

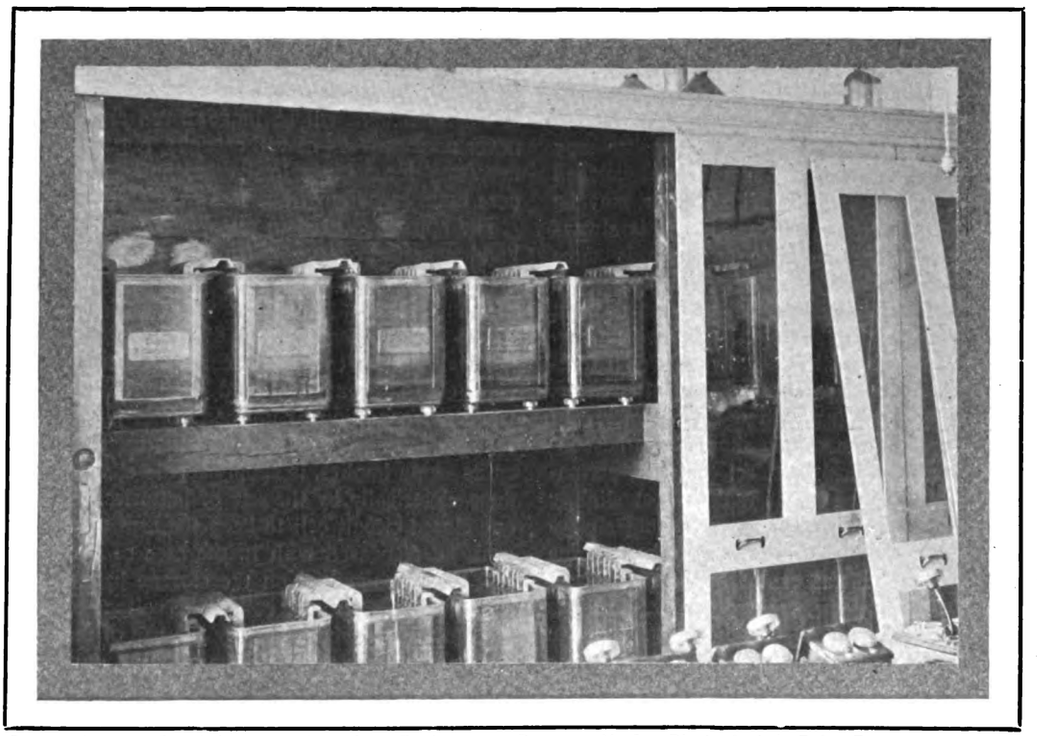
Power Data for Telephone Men

By P. Kerr Higgins.

IN concluding this series of articles it will be appropriate to consider the elements which go to make up the power plant of the average large telephone exchange, both manual and automatic. These elements may be considered under the following heads: Power machines; power board; accumulators; gas or gasoline engine. In considering these it might be well to give the equipment at one or more typical exchanges as indicating what is necessary in such an exchange.

At Louisville, Kentucky, the manual exchange has an ultimate capacity of 12,600 lines. The power equipment consists of a double set of charging machines, made by Roth Bros., each of 12 kilo watts capacity, one to operate on a 500 volt direct power circuit and the other on a 220 volt power circuit. Each generator output is 200 amperes at 60 volts. A ringing dynamotor is also provided with the primary on a 500 volts direct current circuit: the secondary delivers 100 volts alternating, complete with "howler," "busy back" and intermittent ringing attachments. An emergency dynamotor, for ringing purposes, is also provided to be operated by the storage battery. These are mounted on a suitable sub-base. An Italian white marble power board is furnished, having two Weston flush type ammeters, scale 0-200, one for charging current readings and the other the discharge; one Weston flush type voltmeter double scale, 0-3 and 0-75, with a six point voltmeter switch to obtain voltage at different parts of the power circuits and that of individual cells. The following switches are used: 3-200 ampere double pole, double throw knife type for charge and discharge, two 50 ampere 500 volt double pole single throw for motor generator; two 25 ampere double pole single throw for ringing generator, and suitable switches for cutting in the ringing circuits. An I. T. E. over and under load circuit breaker is provided with the charging machines, the whole board being suitably illuminated at night by incandescent lamps. All the apparatus is copper faced and highly polished. A fuse panel, with alarm, is provided, and all circuits and switches properly designated to avoid mistakes. The battery plant consists of two sets of accumulators of 20 cells each, in lead lined tanks, type G. Provision is made for adding plates so as to make the battery have sufficient capacity for 12,600 lines, each battery being sufficient to run the exchange for twenty-four hours without recharging. All wiring is done in iron armored conduit, with flexible circular loom where necessary.



Storage Battery Stand in the Independent Exchange at Paterson N. J. Black Asphalt Paint Protects the Woodwork from Acid. Glass Doors Allow Inspection.

At Grand Rapids, Michigan, the ultimate capacity of the automatic exchange is 10,500 lines. The power apparatus consists of two Sprague 4.1 horse power dynamotors for charging the batteries, run on 220 volt direct current and delivering 75 volts to the battery. Two Holtzer-Cabot type E ½ horse power motor generators run on 220 volt direct with a delivery of 75 volts on the ringing side. An emergency Holtzer-Cabot dynamotor to run off the battery at 50 volts is also furnished. Two battery interrupters for furnishing current to rotate the automatic switches, directly coupled to two Sprague ¼ horse power motors. The power board is of pink Tennessee marble with suitable ammeters, voltmeters, over and under load switches, rheostats and circuit switches, copper faced and polished. The battery consists of two sets of twenty-six cells each, the battery having a capacity of 400 ampere hours. Separate battery is also provided for the toll board, consisting of two sets of twelve cells each.

At Columbus, Georgia, the automatic exchange has an ultimate capacity of 10,000 lines. The power equipment consists of two charging machines, Holtzer-Cabot make, each with a 2

Continued from the issue of April 14th.

Digitized by Google

horse power motor generator, having an alternating current 220 volt motor directly connected to a 75 volt current generator. One ringing machine motor generator consists of a ½ horse power 110 volt alternating current motor connected direct to the ringing generator, arranged to give 75 volts, and equipped with busy back and interrupter commutators. The power board has two panels of Italian marble, complete with suitable ammeters and voltmeters, over and under load and circuit switches, fuse panel, etc. The storage battery consists of one set of 26 cells, 100 ampere hour capacity, in glass jars. The other set twenty-six 50 ampere hour cells.

These give a partial idea as to the power equipment necessary in the average exchange. In connection with some systems using the harmonic system a special ringing machine is necessary to provide different frequencies, e. g., in the Frontier exchange of Buffalo, such a machine has currents of 2,000, 4,000, 6,000 and 8,000 alternations per minute created by four direct connected machines. In order to furnish what is known as "Tone" and "Busy" tests an interrupter must be attached to the ringing machine. Such an interrupter should be one giving a high note or hum, and it consists of a plain metal disc and a commutator built up of metal segments and insulating material in the usual manner. A circuit from the exchange battery includes the primary of a tone test transformer or coil and the interrupter. Such interruptions induce a current in the secondary which is used for special tests such as trouble or busy tests. The purpose of the "Howler" circuit is to raise a party who has left his receiver off the hook, and an interrupter may be used to provide current for this purpose. The howler must not be confounded with the tone test, which is only a mild hum. The principle of the howler is the same as the tone test.

Naturally the efficiency of the power plant, or the amount of energy received for the amount put in should receive careful consideration in designing. The power for such purpose may be derived from a commercial circuit or city supply, or developed by a gas, gasoline, oil or steam engine. The former may be the 110, the 220, or the street car 500 volt circuits. It is always best to use the 110 volt wherever possible as there is some danger associated with the use of the 500 volt circuit. The street railway circuit cannot, as a rule, be depended upon on account of the variation in the voltage. In the selection of which current is most desirable and economical it is always well to remember that direct current motors are cheaper than alternating, but the maintenance and cost of installation are greater. In making the selection the cost of the supply should also be considered. In any case it is always best to select the most permanent and reliable source of supply even if it does cost slightly more. If possible more than one source of power should always be at command, and if not obtainable, a gas or other engine should be installed. The use of a gas engine belted to a direct current charging machine, of say three horse power, develops about one horse power for each pint of gasoline at 75° with an efficiency of 75% for the generator. It will also give similar results with coal gas (20 cubic feet per horse power). The efficiency of the combination of a motor and generator is about 55% for a one kilo watt machine. Such rating varies with the size of the machine, being greater in the larger machines.

The rates charged for commercial current supply varies from four cents to 18 cents per kilowatt hour, according to locality and local conditions existing, and the amount of current required by the consumer. The question has often been asked whether it is cheaper to use the commercial supply or the gas engine supply. In answer to this I would say that for the smaller exchanges, say up to 2,000 or 3,000 lines, the commercial supply is best, but above that it is found that the supply of power by gas engine is about one-fifth of that taken from the commercial supply. It is wasteful to charge storage batteries under any circumstances by means of lamp resistances instead of a generator, and such practice should only be resorted to in case of necessity. It is customary to allow 2% for fall of potential or loss in the supply leads. The practice of running the machines in conjunction with the storage battery in supplying current to the system, during the heavy peak of the load (say from 8 a. m. to 6 p. m.) is found to be real economy. This system permits the charging machines to carry the load of the entire system and whatever is left is stored up in the accumulators, these acting as an overflow reservoir for the surplus energy. The practice of charging batteries at night, which for a long time was considered best, has now been abandoned and the batteries charged during the busy part of the day as stated; provided always that the efficiency of the motor generator does not fall below 51%, at which time it is economy to run the system on the batteries and shut off the charging. The efficiency of the accumulator varies considerably on account of internal changes represented by the I^2R, internal loss in the cell proper. The efficiency as stated should not be less than 80% and the capacity (ampere hour) about 95%, on an eight-hour rating, which is customary with all manufacturers. Great care should be taken not to allow the lead tanks to get grounded, as peroxide will be formed on the lining and a leak result which is hard to repair; neither should any connection exist between the lead lining of one cell and another for the same reason. Anything and everything which has a tendency to pull down the efficiency of the power plant should be carefully avoided, such as dust, poor contacts, deposit in the cell, wrong relations between the internal resistance of the cell and the external resistance, poor commutators on the machines, etc.

Cells allowed to drop in voltage lower than 1.9 volts are hard to bring back to the same state of efficiency that existed prior to letting them down, so that while cells at 1.9 volts may not show any visible deterioration, a careful analysis of their efficiency will show a much lower standard than before, if left at less than 1.9 volts for any length of time. Batteries should be slightly in excess of the capacity necessary to carry the system at full load and will be longer lived and show better results if never used over .75 of full capacity, e. g., if 600 ampere hours are necessary for a given load then the battery should have an ampere hour capacity of not less than 800.

The apparatus used in telephone exchanges may be either the hand generator for very small exchanges; a pole changer for the medium sized exchanges; or a motor generator for medium and large exchanges.

The hand generator is a dynamo in its simplest form and is too well known to require comment here. The pole changer is very cheap, economical and easily handled. In this machine when the condition of no load exists no power is expended, except the internal local action in the battery itself. This machine, as its name implies, is simply a pole changer, the changing being done electrically by the use of batteries. It is customary to use one closed circuit cell to keep the arm vibrating; this may, however, be dispensed with in the case of a central energy system, and the machine run on the storage battery by the introduction of a suitable resistance coil. The voltage or strength of the ringing current may be varied by the use of more or less cells, using a plug and jacks to cut in the required number.

The motor generator is made up of two machines mounted on the same base, with shafts connected by an insulated flexible coupling. Such a ringing machine may be run from the commercial supply circuit. In the primary direct current may be used, and in the generator pulsating or alternating current. The fields in both may be excited by supply from the commercial mains, thus simplifying the machine. The relative efficiency between a motor generator and a dynamotor shows the latter to be preferable. In the case of the dynamotor the conditions are more favorable because of the fact that the two armature windings tend to neutralize each other, being mounted on the same core. Hence, on account of this arrangement the voltage at the generator will depend directly upon that supplied to the motor, being varied only slightly by variation in the strength of the field. In such a machine it is also well to note that the two units are entirely separate, one from the other, electrically. It is much more compact, neat, and of less weight for the same work done. The motor-generator and the dynamotor are similarly wound, being in the shunt wound type, and both are oper-

Digitized by Google

ated in constant potential circuits. The connections of the motor run directly to the mains, and the generator winding is carried to the exchange ringing supply. It is to be noted that the pressure or the current may be regulated by a variation of the resistance in the armature of either the motor or generator, or by rearranging the brushes on the commutator. In the dynamotor such regulation can only be done by inserting resistance in series with either armature. The difference between a dynamotor and a motor generator is the dynamotor is a machine combining the motor and dynamo and is used for transforming a current from one voltage to another. It has one magnetic field in which the armature fields of both primary and secondary rotate, being separate windings over the same core. The motor generator is two separate machines. A motor and a generator run on the same shaft independent of each other and used for the same purpose as the dynamotor, being separate any arrangement of the fields is possible.

The care of power machines and their subsidiary apparatus including accumulators, is extremely important. They seldom receive the care they deserve, with the result that the depreciation in these is enormously greater than it would be if they were properly taken care of. In taking care of such a certain amount of experience is absolutely necessary, in order to detect and observe faults before they become chronic or fatal, and to remedy the faults found.

The same treatment should be accorded power machines in the telephone companies as in the light and power companies. One of the first things to be watched is the temperature of the machine, which should not be allowed to exceed 45 degrees above the temperature of the room. The field coils and armature suffer most in this respect, but no danger may be anticipated if the temperature does not exceed 125 degrees Fahr. Another feature deserving attention is to avoid all vibration due to looseness of the bearings or bolts, or both; maintaining also a perfect alignment of shafts. Sparking should be avoided, a continuous lubrication, vaseline preferred, being used. The brushes should be set diametrically opposite each other, resting as lightly on the commutator as is consistent with a good contact. All the bearings should run perfectly cool. If flats or grooves exist or present themselves on the commutator, the armature should be taken out and evened up by turning on a lathe. The commutator, if properly cared for and in good condition, can be known by the color, which should be a fine dark copper polish. A good machine in good order should run almost without noise. Noise generally indicates that the machine is out of adjustment or something loose. Great care must be had to avoid all dust and to cover the machines when not in use. In the event of fuses being blown they must always be replaced by others of the same denomination so as to avoid the possibility of over loading the machine and damaging the same. All contacts and wire terminal points should be frequently examined for looseness or dirt, which cause trouble. In starting up the machines great care should be exercised to cut out the resistance slowly so as to allow the back E. M. F. in the motor to be fully generated before all the resistance is cut out.

The machine piers should be built on substantial foundations, being located on the first floor if possible. The top of the pier may be made of a slate slab perfectly level; below this the pier should be of pressed brick on the outer walls. The interior of these walls may be either hollow or filled as circumstances dictate, or angle iron may be used. The gas engine pier should be very substantially built of brick and concrete, the outside and top being in harmony with the other piers. Suitable anchor bolts may be used and these are generally furnished by the manufacturers. Great care should be had in making provision for the conduit outlets, as these will be hard to straighten out after the foundations are set.

All leads should be in iron armored conduit, and wherever possible should be laid under the floor. If possible all the charging machines except the gas engine and its associated dynamo should be mounted on one pier; the ringing machines may be on a separate base.

In large battery and power installations the leads are frequently very heavy, so that ordinary splicing cannot be resorted to. In splicing such cables, the wire in strands must be thoroughly cleaned, removing all the insulating material. The best binding wire to use is No. 16 copper. The use of a sleeve is sometimes resorted to instead of binding, and this sleeve may be either brass or copper. In making the joint it should be thoroughly heated and the flux well melted and run. If the lead is very heavy, a hole may be bored in one end and the other reduced to fit this and sweated in. If there is no strain the two wires may be reduced and bound together, the whole being sweated in. In stranded work the strands are fed into each other one at a time, alternating from side to side. They may then be bound together and soldered.

Warning to Investors

By James B. Hoge.

SOME of the paid representatives of our opponents are, apparently, very much exercised about the investing public becoming interested in Independent telephone securities, claiming that their people have recently arranged for large amounts of additional money which is to be used in purchasing Independent properties and fighting the Independents. No one thoroughly in touch with the Independent situation will be at all frightened by such threats. In the past, the Bell people have spent several hundred thousand dollars of their funds in buying out a few poorly constructed properties at fabulous prices. In practically every case new up-to-date Independent exchanges have been built to take the place of those sold, and the new companies have proven stronger and more successful than the ones purchased. A few instances that might be cited are Toledo, Ohio; South Bend, Indiana; Detroit, Michigan, and Portland, Oregon.

The Bell company recently spent considerable money in buying out some of the Independent properties in Missouri, generally paying from two to three times what they were actually worth. Among these are Kirksville, Carrollton, Monett and Pierce City. The City Councils at Kirksville and Carrollton have already granted new Independent franchises, and these cities will be rebuilt by the Independents at once. The Pierce City and Monett people have offered the Independents a franchise in each place, which will be taken up at an early date, and these cities will also be rebuilt with up-to-date Independent exchanges. About a year ago, the Bell purchased a controlling interest in the Independent company operating at New Lexington, Ohio. The Independents recently secured a new franchise for that town, and are now making active preparations to rebuild. In each of the instances just mentioned, the people have pledged their support to the new Independent company, and the Bell's investments in these towns have gone for nothing. There is no doubt, however, that they will continue to spend more of their money in buying out the properties of other weak companies in the hopes of stampeding the Independent movement. They seem to overlook the fact that Independent telephony is far beyond the experimental stage. The Independents were weakest when the movement began. Every month is adding to their strength.

Numerically, we are stronger than our competitor. If necessary, we can readily afford to let them make further purchases,

Digitized by Google

and still have more telephones in service than they; especially in view of the fact that the Independents are increasing upon an average of 50 per cent faster than the Bell. Besides, as proven by past experience, their difficulty seems to be to retain control of the towns they purchase.

We have more than fifty times as many investors in our securities as the Bell. Our investors are not confined largely to old many places in order to hold the business. Neither do the Independent people seem to find it necessary to carry in their directories the names of people who are no longer subscribers in an effort to deceive the public regarding their real strength. This is a common practice with the Bell.

Every Independent man knows that the properties he is looking after are growing and demanding his attention. This situation

OFFICIAL BULLETIN NUMBER TEN OF THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.

MAPS:

A map has been commenced for New York, making fifteen states for which Independent toll line maps are being prepared. These maps will be displayed at the Chicago Convention, showing all lines for which data have been received. IF YOU WANT YOUR SYSTEM INCLUDED, SEE THAT DATA REACH US NOT LATER THAN MAY 25TH.

CONVENTION:

As previously announced, the annual Convention will be held at the Auditorium Hotel in Chicago on June 26th, 27th and 28th. The various committees will meet at the same place June 25th. The Convention program is now being prepared. Every one interested is invited to suggest subjects to be discussed, and the names of gentlemen who could prepare papers on same. If you think certain matters should be given special attention at the meeting, write this office AT ONCE.

IMPORTANT.

The Convention this year will be the most important gathering of the Independent interests that has ever taken place. On account of the publicity given the movement through the magazines, journals and press of the country during the past few months, it will attract national attention.

All Independents are invited to attend. Come yourself, and bring your Independent friends. Give your delegates the proper support, and see that YOUR SECTION *of the country is well represented.*

WARNING TO INVESTORS:

Read President Hoge's letter printed in this issue.

INDEPENDENT GROWTH:

The Independent telephone interests of Oklahoma and Indian Territory have been organized under the name of the Oklahoma and Indian Territory Telephone Association. Mr. H. Furman, of Geary, Okla., is President, and Mr. L. T. Hine, of Purcell, Indian Territory, is Secretary and Treasurer. On behalf of the Independent interests of the country we extend to them a hearty welcome and best wishes for their success.

A new copper toll line from Nashville, Tenn., to the Gulf of Mexico will be completed in about four months. Franchises are pending at Cincinnati, Ohio; Omaha, Neb.; Milwaukee, Wis.; and other large cities at present without Independent exchanges.

The Home Company of Detroit, Mich., is securing new contracts at the rate of seventy-five (75) per day. The Twin City Company at Minneapolis and St. Paul is increasing the number of its subscribers at the rate of 500 per month. Similar activity is noticeable among the Independents in all parts of the United States.

"LOOK FOR THE SHIELD":

This phrase, suggested a few months ago as a slogan, has found favor with Independent people all over the country. We endorse its adoption as the Independent watchword, and recommend its general use in advertising, and on all printed matter.

SUPPLY DEPARTMENT:

The use of the Shield throughout the country is steadily increasing. Independent companies in thirty-seven (37) States are now taking advantage of our Supply Department, and assisting us in introducing the emblem. We will be glad to have your help in this, and will send illustrated catalog if you wish it.

Have you seen the Independent shield buttons? Samples 35c. each.

estates. Over 75 per cent of those having their money invested with the Independent movement are people who are active, and following up their investments in a business-like way which enables their companies to get the cream of the business. In this connection, I should like to quote from a recent address made by Mr. J. H. Shoemaker, of Iowa:

"Think of Iowa, with its hundred counties and only two or three individuals representing our opponents who have authority to determine how far the tactics of to-day may depart from the former fixed policy in any given case. Then think of the Independent men, who are not only in every one of the hundred counties or all of the sixteen hundred townships, but in nearly all of the fifteen thousand school districts as well."

We have no record of Independent telephone companies giving away telephone service free as our competitors are doing in so is general. Judging from reports already received, if the Independent companies would all report to one central point the amount of new money they are going to invest this year, it would be found far in excess of the amount which representatives of our competitor brag about in a "confidential" way to bankers and brokers as being *appropriated* to buy out the properties of the Independents, and injure their securities.

Don't be stampeded! Any one who has money invested in Independent securities to-day has a good investment in a growing business. Independent securities are steadily increasing in value and occupy a higher place in the financial world than ever before—*confidential* Bell statements to the contrary notwithstanding.

THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION,
BY JAMES B. HOGE, President.

Leland Hume---Telephonic Jekyll and Hyde

WHAT HE SAYS AND WHAT HE DOES!

"He should make it a rule, above all things, never to utter anything which does not breathe of kindness, justice, good faith and piety; this last quality is most important for him to appear to possess, as men in general judge more from appearances than reality." Niccolo Machiavelli.

FEAR of competition has led the officials of the Cumberland Telephone Company into many acts which are not to be justified by even the most lax code of business morality; yet of all the men in Nashville there is none whose public utterances are designed to convey the sentiments of an upright character more surely than do those of General Manager Leland Hume. But each step toward the inevitable loss of his company's once uncontested position in the field which it occupies shows some new phase of his character which would never be suspected from his carefully prepared speeches of piety and good will and upright loyalty to the things which are just. In a fight he is vigorous, resourceful—but he wishes to win by craft and concealed means, rather than by coming out in the open. His methods have received most unfavorable criticism from citizens who have acquired some knowledge of the methods he has used to defeat Independent franchises in city councils. At such times the improper use of money has been frequently mentioned. The way in which he sought to influence the action of the governing board at Spring Hill is revealed in the following letter which was printed in the Nashville *American* on the 7th of April. To prevent the reader from becoming wholly disgusted at the contemptible effort to force this young man's father to abandon his convictions, we have broken the description by the insertion of utterances of the sort Leland Hume has made in public, before his fellow employees. Here is the letter:

"To the Editor of *The American*:

Since you published in this morning's *American* a clipping from the Columbia *Herald*, giving the substance of my recent discharge from the Cumberland Telephone & Telegraph Company, I desire to ask for sufficient space in your columns to state my case, so that I may not suffer in the estimation of the public from being discharged further than my conduct has merited.

For something over five years past I have been connected with the electrical shops and the electrical engineering department of the Cumberland Telephone & Telegraph Company, doing electrical and engineering work of various kinds in its service. On Monday morning, March 26, while at work at my usual duties in the electrical engineering department, I was unexpectedly summoned by telephone to the office of Leland Hume, the General Manager of that company, for my first interview with him.

> "My Fellow Employees * * * I promise you, as a servant of this company that I will give to you everything that is your due."

Upon reaching the office Mr. Hume informed me that he had on the day before been on a visit to Spring Hill to the family of his brother-in-law, W. C. Branham, and had learned there that the Mayor and Board of Aldermen at Spring Hill, of which Mr. Branham is a member, had granted a franchise for another or Home Telephone exchange, at Spring Hill, and that he had learned that my father, Dr. James O. Hardin, an Alderman at Spring Hill, had voted in favor of this franchise. I replied that

> "The fact that you are on the pay roll is proof that the company wishes you well, and the men that have been with the company the longest will be the first ones to testify to its kind, considerate treatment."

this was the very first intimation I had even of the intention of the Home Company to build in Spring Hill, as I had had pressing duties that had occupied all my time in the electrical department, and I had not kept posted on other affairs, and that I further presumed that my father had acted as he thought right and without conferring with me. I stated further that while I always desired to do what I could honestly in behalf of the company I was working for, I could not see how the way in which my father voted in the matter (entirely unknown to me) could in any way affect my connection with the technical work in the electrical department of the company, and why I should be drawn into the matter in any way whatsoever.

At this time, I understood from Mr. Hume that the franchise granted must be for a local exchange only, and I told Mr. Hume that I honestly believed two telephone systems would be impracticable in so small a place as Spring Hill, and that, had I known in time, I might have expressed my honest convictions on this point to my father openly in the interest of the company I was working for.

Mr. Hume thereupon immediately told me to talk to my father over the long-distance telephone and ascertain definitely what

> "I am here to say that there is not a day that we are not engaged in trying to do the right thing."

had been done in regard to the franchise, and whether he had voted for it, which I immediately did, ascertaining from my father that he had voted in favor of the measure, as he and other members of the Board had deemed it expedient, and that a franchise had been definitely granted. This I reported to Mr. Hume; whereupon he said that unless my father and all of my people could be loyal to my interests and those of the company I was working for that I might never expect any favor from them again, and that "he would not give the snap of his finger for my chances in the future with his company after this."

> "A man must be true to himself, or he will never strike the right road to success. Now, you show me a man that is true to himself inside and out, and I will show you a man that the company can lean upon."

He ended this our first interview on this subject by stating that he was not discharging me for this, but "unless every one of my blood could be loyal to the company" I might expect no favors from him toward advancement in the future.

The following Sunday I spent in Spring Hill and conferred with my father and Mr. Branham in regard to the matter, stating the substance of my interview with Mr. Hume. Both expressed surprise and astonishment that Mr. Hume could hold me responsible and my position with the company in danger on account of the way my father, a public officer, had voted. I further learned that the franchise that had been granted by the Mayor and Board of Aldermen at Spring Hill was for a competing long-distance telephone company.

> "If you want to succeed in your undertakings, in your legitimate, and honest undertakings and endeavors in this life—in other words if you want to succeed in your business—your corner foundation principle must be DO RIGHT."

On Monday morning, April 2, I was again summoned to Mr. Hume's office, and I opened the conversation, saying that I presumed he wished to see me in regard to the matter under discussion recently, and I stated to him that I had been to Spring Hill and had seen Mr. Branham and my father in regard to the matter, and had ascertained from them that a franchise had been finally granted to an Independent long-distance company.

Mr. Hume then offered the following suggestions: He said that he had heard all the papers granting this franchise had not been signed, and that if I would go out to Spring Hill and talk

Digitized by Google

with my father and the Mayor and other Aldermen of the town board and prevent the signing of the franchise ordinance, I might retain my position with the company; otherwise I could not. I immediately told him that my father had acted as a free citizen and according to the dictates of his own conscience, and that, while I might have—as I had told him previously—had I

> "There has been no exception to the rule so far, that the man who DID RIGHT came up on his feet every time and made a success, and the man who DID WRONG would sooner or later, and has sooner or later, taken a plunge into a pit so deep, and into an abyss so dark, that, as far as my knowledge goes, he has gone beyond redemption."

known of the matter before it was acted upon—expressed my views to my father, I had learned two days previously that a right of way had been granted for a competing Independent long-distance line, and that I would not take any stand whatever to prevent them from getting a right of way through that or any other town. Mr. Hume replied that he did not want any one on the payroll of the Cumberland Telephone & Telegraph Company who believed in any form of competition whatsoever in

> "You cannot afford to be discharged by the Cumberland Telephone and Telegraph Company; its reputation for fair dealing is too well established."

the telephone business, and that I might prepare to quit their service, whereupon I walked out of his office and arranged my business in the department in which I had worked so as to leave the service.

Mr. Gardner, their electrical engineer, had stated to me that my work was entirely satisfactory.

I desire the foregoing statement to be considered as though made on oath by me.

Thanking you for giving this matter space, I am very respectfully yours,

JAMES O. HARDIN, JR.,
1909 West Broad street, Nashville, Tenn.

Progress on Mexico's Independent System

BY "NOLEYE."

IN the City of Mexico the sub-soil is of such a nature as to offer the greatest variety of obstacles to the laying of the underground conduit plant now being installed by L. M. Ericsson & Company, who control the Independent system.

CALLE DE MORELOS

the large 37-way pipes had to be laid, was not an easy task, partly on account of the many obstacles encountered in the way of sewer and water pipes and three different systems of electric light cables, but principally on account of seepage water, which is encountered in some parts at three feet below the surface. Nevertheless, there have been laid 15 kilometers of ducts of all kinds, representing over 400,000 duct-feet of conduit and about 200 manholes, most of them made of concrete after the Moscow and Warsaw patterns, which are greatly admired by American and English engineers who have had occasion to see them and study their advantages here.

The greater part of the large cables have already arrived, and are now stored in the city, and the engineers are only waiting to clear up the debris in and around the central building to commence laying them. There are 600, 300 and 100 pair types, and thanks to the system of distribution which the company has adopted and found so practicable in Russia, there will be very little waste in the way of dead or reserve lines, which generally eats up a large part of the capital, without remuneration to the investor, in many underground telephone systems.

A glance at the accompanying plan will show that the laying-out of the system was well studied and that there was no wild rush and senseless jumping around from one street to another or—what is so common in ordinary underground work—"doubling-back" and crossing of one's own routes, which is a useless expenditure and consequently waste.

With the system branching out as it does, it is possible to reach every block within the limits of the underground construction and distribute subscribers' lines within each block either by means of inside cables or by aerial lines, without crossing a single street.

There will be only one central in the city proper; of the suburban towns each will have its own branch office, connected to the main office by underground trunk lines. Only beyond these branch offices will the overhead lines begin, for which purpose 6,000 poles are already at hand, having been cut specially, and imported from Norway.

Phosphor bronze wire and porcelain insulators will be used exclusively for these lines. Nothing but metallic circuits will be tolerated in the whole system, and these, in connection with the long distance instruments which will be installed, ought to give Mexico as good a telephone service as there is anywhere in the world.

The "Independent" interest will have another important ally in this company and one who is not afraid to measure its arms against the "Bell" monopoly as far as fighting spirit and quality is concerned.

Since the new system has been started here, the Bell has begun to make some feeble show of reconstructing its tumble-down system too, and is laying down underground ducts in some of the streets; but it is not at all likely that its 1,500 subscribers, who have been fed on promises for years, and who have spontaneously signed contracts with the Independent company, will keep their instruments many days after the new central office is open. They are simply tolerating the Bell instrument until the Independent company is ready to give them service, and thousands of people who have no telephone at present or have thrown out the Bell in course of many years on account of bad service are waiting for the coming of the new exchange with impatience.

At all events the company has come to stay here and fight the Bell and hopes to raise the "Independent" flag on that battered fortress.

WHY INDEPENDENT COMPANIES SUCCEED—AN EXAMPLE FROM TEXAS.

DESTRUCTION of property is no insurmountable obstacle to the Independent manager who is capable of making instantaneous use of all the resources available. This was most strikingly brought out by the rapid reconstruction of the plants of the Texas Telephone Company, of Waco, in two separate towns after disastrous fires.

On December 23, there was a fire in Clifton, Texas, that wiped out the entire business portion of the town, including the building occupied by both the Bell and the Independent companies.

The morning after the fire the manager of the Bell company made a Paul Revere ride across the muddy prairie and up the Bosque Valley, while Mr. J. B. Earle, the Independent general manager, sat in his office with a blue print of the town and a stenographer, dictating orders for new material, including poles, cables and an entire inside equipment.

On the morning of the 26th, three days after the fire, the Independent company's material was on the ground and in six days the exchange of one hundred and twenty-five telephones was working. In order to make this splendid record the company had built a temporary exchange building in the street at the corner where the new exchange was to be permanently located. The Bell company succeeded in getting its thirty-four telephones in position in twenty-nine days.

An even more remarkable record was recently made at McGregor, where the Brazos Valley exchange of three hundred and twelve telephones was burned on the night of February 6. Mr. Davidson, the company's superintendent, was in McGregor at the time, and rang up headquarters at 11:40, stating that the exchange building was on fire, and would be a total loss. Without waiting for further details, specifications for a new central energy switchboard of four hundred line capacity were immediately telegraphed to the manufacturer with instructions to spare no expense in giving the quickest possible delivery.

Cable was at once procured to rebuild the business portion of the town, putting one block of underground to office in four hundred pair cable, which had to be shipped from the manufacturer. The entire equipment of cable, switchboard, power board, terminal facilities, etc., were ordered, received and installed by the 21st, or just fifteen days from the date of the fire. This extraordinary record was due to the fact that the board was built by relays of men working day and night, and the entire apparatus, filling almost one-half car, came by express. As a result, the people at McGregor are stauncher friends of the Independent company if possible than before the fire.

The Bell employees were up before working hours the morning after the fire, each with his arms full of telephones, trying to place them with the Independent subscribers, assuring the people that it would take sixty days to rebuild the exchange.

As a result of the fire, the Independent company lost one subscriber and gained fourteen. Many subscribers went to the company's local manager immediately and asked to settle their bills, assuring him that they would not only wait for the exchange to be rebuilt, but would ask no rebate for the time the exchange was out of service. The company regards this as a most pleasing proof of the appreciation of the Texas people toward a company which came to their relief and gave them good service at reasonable rates and developed a rural business to the fullest possible extent, where before its arrival, telephone lines were not thought of.

BELL BEATEN IN WESTERN NEW YORK.

INDEPENDENTS in Northern and Western New York are watching with much interest a losing fight which the Bell is waging with the Independent company at Rushford.

This concern, which started in a very small way in 1898, has been growing very rapidly. In 1904 the capital stock was increased to $7,000 and a sub-licensee contract was entered into with the Bell. The results were disastrous and the directors made all haste to sever connections with the Bell company at the expiration of their term in 1905 and joined the Independent ranks. Immediately the usual Bell tactics were adopted; free service and other well known baits being offered, but the efforts have so far been a dismal failure. The Independent company, on the other hand, has been growing rapidly, and is in direct toll connection with all towns and cities in Western New York, including Buffalo.

THE EDITOR'S PAGE

THE INDISPENSABLE TELEPHONE.

THERE is being told a story of an amusing instance of conversion to the telephone habit which well illustrates the point that the instrument is demonstrating its value in the country on an even more extensive scale than is occurring in the cities. A certain farmer was convinced that the advantage of being able to communicate with the town which furnished him at once with supplies and a market for his products was one worth the expense. His wife, however, objected to the interruption of her duties which would be caused by the repeated answering of calls and the frequent jangling of the bells on a party line. So the two agreed that, as it was a business proposition, the instrument should be installed at the entrance to the hen house, where the farmer spent most of his time. The social advantages of the instrument soon made themselves evident, however, and the stable seemed to be the proper location, as a point half way between, from which the men could call either person. From this but a single step was required to put the instrument completely in favor with the wife, to whom repeated saving of steps had made it a most grateful aid, and we see the instrument at last triumphantly installed in the kitchen to ring at will.

Aside from its uses as an aid to the transaction of business and a producer of profits, the telephone on a rural line is a much appreciated convenience to those members of a family who are prevented by the poor facilities for transportation from frequently enjoying the society of their neighbors. In the evenings whole communities are brought together upon the useful party lines, to listen to graphophone concerts, and talks are held in which all participate. Not only does it bring together neighbors who would otherwise, perhaps, become little acquainted with one another, on account of the comparatively wide separation of their homes, but it permits members of a family to remain as closely united as if they were all dwelling beneath the same roof. Co-operation in work is brought about at times when it is most needed. The distribution of labor, which is so serious a problem in places where the number of men is too great very often for economy during the dull season, when there is little work, and far too low at the busy season, is equalized by this system of communication, which makes it easy to locate each of the men available at the place where the necessity is. Hardly a week goes by without some public notification of an instance where a telephone has saved property from fire or other disasters.

Uses of the rural line are constantly being extended and systematized. The government weather service is being greatly increased in value through the co-operation of the telephone companies. On a great number of lines throughout the country, at the present time, at a designated hour in the morning, a general signal is given on the lines. This is known as the weather call and every farmer goes to his telephone and receives the prediction for the coming day. The plan has passed the experimental stage, and as the Weather Bureau is endeavoring to secure the co-operation of the greatest possible number of telephone companies it is likely that the benefits of this regular service will soon be available to all rural line subscribers. Plans for a regular news service over the telephone lines in many sections of the country are already well under way. In this way the isolated telephone subscriber is able to keep in touch at once with those near at hand and with all the outside circumstances which are capable of affecting his affairs in any way.

The increase of comfort and pleasure in the lives of those who are most widely separated from their neighbors is undoubtedly due in no small degree to the almost universal use of the telephone.

A VALUABLE DEMONSTRATION.

THE increase in the number of telephones in individual business establishments is progressing at a rate which causes the use of systems of this class to influence further development to an extent which is hardly capable of being realized. Formerly only the heads of firms of considerable size were accustomed to use the telephone from their desks. In these cases the instrument was regarded rather as a means of administering to the personal convenience of the user than as an essential provision for the carrying on of his business. Now there are few establishments indeed which would not rather do away with the services of a considerable number of clerks than to give up their telephones.

The modern policy of concentration of important affairs under the control of a comparatively few highly trained members of the organization brings about the necessity for speedy communication. Such men are able to give instantaneous decisions concerning many of the affairs upon which they must pass. By the use of the telephone they eliminate delay from waiting for conferences, and other causes, and are enabled to greatly increase the amount of business which they can handle in a single day. The telephone has been the subject of careful consideration along lines which determine absolutely its value in an organization and has "proved in."

The use of this method of communication in business hours by many employees has been most valuable from the standpoint of educational influence. It has led many members of the force in every place where large interior systems, or numerous lines are in use, to acquire the telephone habit.

Thoughtful men are growing more and more to appreciate the necessity of eliminating waste. Our large manufacturers now derive their principal profits from articles which a few years ago were thrown away. Meat packing houses are believed to have received their first start toward the development of a very profitable industry through preparing for sale the material which a few years ago was cast into the Chicago sewers. Chemical engineers are familiar with many instances where the introduction of a method for working over a waste product into a salable form has in a very few months put an unsuccessful business upon a most substantial paying basis. Such a course the reasoning man of modern business training applies to his own life. To accomplish the highest results in the limited number of years which are given him he must make each day count to the utmost. His time must be employed in such a way as to produce valuable results in either business or pleasure. It is the elimination of the actions which take time without giving a reasonable return that enable him to derive the highest profit from his business, and the most perfect enjoyment of his leisure hours.

One of the principal ways in which time is lost is by moving from place to place. It is in the business establishments that the average man is first brought to a realization of this truth, through observing the practical results and economies effected by the use of the telephone. This is one of the reasons why the building up of the residence telephone list follows the installation of the business instruments, slowly perhaps, but with absolute certainty.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

JOINT LIABILITY FOR INJURY FROM FALLING INSULATOR.

In THE AMERICAN TELEPHONE JOURNAL for March 24, 1906, in answer to a question by "R. F." you state that the telegraph company might also be liable, referring to the case of Quill v. Empire State Tel. & Tel. Co., 34 N. Y. S., 470, 37 N. Y. S. 1149. That case was reversed by the Court of Appeals sec 159 N. Y. S. 1, 53 N. E. 679, 6 Am. Elec. Cas. 303. Your statement seems, therefore, to be very misleading.

The query above mentioned is as follows:

An insulator improperly adjusted fell and injured a man passing below. We erected and were maintaining the pole, but the crossarm from which the insulator fell was occupied by the wires of a telegraph company under contract with our company. Are we liable under these circumstances?

IT is true that the case cited in answering this query was afterwards reversed; but it was on the ground that the defendant was not liable because "a city employee, having no relation whatever to any of the corporations owning or using the pole, went upon it for the purpose of making some temporary alteration in the position of the wires, and in attempting to do so lifted directly upward a wire that rested against one of the pins, and which caught upon the glass insulator, raised it up from the pin and threw it to the ground." No such facts appear in the question asked, and the editor assumed that the interrogator was responsible for the improper adjustment.

The opinion adds, "Nor is it (the telephone company) responsible for every act done or omitted on the lower arm of the pole, simply because it owns it." The editor said, "The telegraph company *might* also be liable," because the circumstances were not so fully stated in the query as to enable him to determine as to whether it was actually liable. A case may be valuable for practice and as an illustration, although afterwards reversed. We are glad to have the reversal called to our attention and cheerfully accept the correction.

TELEPHONE COMPANY NOT HELD LIABLE FOR $5,000,000 BACK TAX.

THE Circuit Court at Hopkinsville, Ky., has passed upon the the suit of Frank A. Lucas, revenue agent for the city at large, against the Cumberland Telephone & Telegraph Company, in which the plaintiff sought to collect five years' back tax on $5,000,000 worth of property alleged to have been omitted from assessment. The court sustained the demurrer of the telephone company, holding that the property of the company sought to be assessed was not liable for state and county taxes, as the notes, bonds, etc., held by said company had already been assessed by the State Board of Valuation and Assessment, or should have been. An appeal will be taken.

APPLICATION FOR REBATE DENIED.

COUNSEL representing The Hudson River Telephone Company, at a Special Term of the Supreme Court at Albany, N. Y., made an application for judgment in proceedings to review the assessments against it under the franchise tax act. It was alleged that the assessment against the company's property at Troy was made at full value, while other property is assessed at seventy-nine per cent of its value. The company has paid the tax and the application asked for a rebate of $225.84.

The Assistant Corporation Counsel appeared in behalf of the city of Troy and objected to the order on the ground that the city of Troy had not been made a party to the proceeding and that a judgment could not be entered directing the city of Troy to pay back the alleged overpayment until the city should have a chance to contest the alleged inequality of the assessment; in other words, that a judgment would not be entered against the city of Troy until it has its day in court. Justice Fitts held the point well taken and denied the motion.

RIGHT OF ABUTTING OWNERS TO COMPENSATION IN TENNESSEE.

THE question of whether telephone poles and wires erected in the street constitute an additional burden upon the fee of abutting owners for which they are entitled to compensation, has recently been decided for the first time in Tennessee. The facts in the case show that S. J. A. Frazier and wife platted some land opposite Chattanooga, and called it "Frazier's Addition." They retained the fee to the land covered by the streets, and simply dedicated them to the public use as a way of travel. The telephone company planted its poles on the land in front of complainants' property, rigged them with wires and used them in the operation of its business. Section 1830 of Shannon's Code, being the state law, provided that telephone companies may construct and maintain lines over the public highways and streets of the state. On behalf of the complainant it was contended that a proper street purpose can only be something connected with the use of the street as a passage way for moving objects, people, animals and vehicles, or with the maintenance of ingress and egress to and from the houses upon the street and the passage of light and air, and that therefore the use of a street for telephone poles is not a proper one. On the other side it was said that in the most correct sense a street is a means of intercommunication between the people of a city, and that the telephone is therefore but an improved method of subjecting the streets of a city to an old use, and that poles and wires are necessary adjuncts thereto. The court held that the telephone poles were not an additional servitude upon the land, and that the complainants were not entitled to compensation for the use of the streets by the telephone company. Frazier v. East Tenn. Tel. Co., 90 S. W. 620.

CENTRAL UNION CONFRONTED WITH AN ULTIMATUM FROM THE CITY OF ROCK ISLAND.

ROCK ISLAND, Ill., has brought its long existing fight with the Central Union Telephone Company, involving the constitutionality of its franchise there, to a crisis by the adoption in the council of a resolution ordering the company to accept its franchise under penalty of having its poles chopped down and wires cut. The company demurred at clauses in the ordinance providing for maximum rates, franchise taxation and the recognition of union labor. The city claims the company has no franchise to operate within its limits, and some time ago commenced chopping down the poles. The company proposed a compromise, but on protests of the Retail Merchants' Association the council issued this ultimatum.

CUTTING WIRES THAT INTERFERE WITH FLAG NO CRIME.

ON Lincoln's birthday four wires belonging to the Fairfax Telephone Company at Redwood Falls, Minn., were cut by a man who gave as his reason that they interfered with the floating of the United States flag upon holidays when the wind blew from the north. He was arrested for malicious destruction of property and upon trial was acquitted, the defense being that the wires were in position without authority and the company had not shown ownership of them.

IN THE OPERATING FIELD

BELL COMPANY LOSING GROUND IN NEW YORK STATE.

WITH the signing of a contract between the Inter-Ocean Telephone Company and the Freeville Telephone Company practically the entire suburban and rural systems of Tompkins county, New York, are affiliated with the Independent interests.

The Freeville company recently cancelled its sub-license contract with the Bell and returned the leased transmitters and receivers. New equipment, including a switchboard, was installed and the business resumed.

Desertions from the ranks of the Bell company have been very frequent of late, the small companies appreciating the benefits to be derived from connection with the Independent lines. Not the least of these is the very complete toll and long distance service which reaches many small points not touched by the Bell lines.

MAYOR OF SAN FRANCISCO SIGNS ORDINANCE FOR SALE OF TELEPHONE FRANCHISE.

AN act of great importance to Independent interests in the Western States was recently consummated when Mayor Schmitz, of San Francisco, Cal., signed an ordinance authorizing the sale of a franchise for a telephone system.

The sale will take place on April 23. In so far as the towns on the Pacific coast are concerned the granting of an Independent franchise will mean a rapid development of long distance lines, as the large business with San Francisco will enable extensions to be profitably made from numerous rapidly growing systems in the less important cities.

TRI-COUNTY TELEPHONE COMPANY OF ILLINOIS TO EXPAND.

STOCKHOLDERS of the Tri-County Telephone Company of Illinois recently passed a resolution at the annual meeting raising the capital stock from $25,000 to $50,000 and also decided to move the principal office from Tamaroa to Mt. Vernon. A decision was also made to transfer the franchises and lines in Perry and Franklin counties to the respective stockholders in each. This was done to further the interests of the stockholders residing in these counties and will result in direct control of the county systems by local parties.

Franklin County, which has 2,000 instruments in service, will at once start an aggressive campaign for business and will build new lines and reconstruct others. The system in Perry County will be known as the Tamaroa Telephone Company.

Long distance lines are to be built by the Tri-County Company to connect all the towns together and to enable the subscribers to communicate with points in the adjacent territory. This company, which started business about eight years ago with ten telephones, now has over five thousand subscribers and connects with many of the Independent systems in Southern Illinois. The officers of the company are J. T. Payne, of Jefferson county, president, and A. Wolf, Mt. Vernon, secretary.

BELL PRACTICE OF GRANTING FAVORS ONLY WHEN OPPOSITION APPEARS CONDEMNED BY NEW JERSEY PAPER.

COMMENTING upon the attitude of some members of the Hammonton Town Council, the *South Jersey Republican* very clearly indicates its belief that the Delaware and Atlantic company should receive no favors from the city. In the course of the article a review of the Bell methods is given in which it is shown that prior to the organization of the Hammonton Telegraph and Telephone Company the Bell refused to do anything for the betterment of its local service and only came to the city because it was the most convenient route by which its lines could be carried to Atlantic City. Now, finding that the Independent company is getting the lion's share of the business, it is offering every inducement and has applied for an amendment to its franchise.

The Hammonton company, which has just started in business, has already secured one hundred and twenty-five subscribers which are listed in the directory. The officers are A. J. Rider, president; M. L. Jackson, vice-president; S. Anderson, treasurer, and L. F. Horne, secretary.

MICHIGAN ASSOCIATION HOLDS ANNUAL CONVENTION.

OVER one hundred and fifty men prominent in the Independent field of Michigan attended the ninth annual convention of the State Association, held at Ann Arbor on March 22-23. The convention was called to order on the afternoon of the 23d by President E. B. Fisher, of the Citizens' Telephone Company, Grand Rapids, who in a very interesting way welcomed the delegates and outlined the purposes and work of the association. The balance of the afternoon was given up to a number of addresses by prominent Independents. R. E. Hamblin, of Toledo, Ohio, spoke at length upon the favorable conditions in Northwestern Ohio. C. B. King, manager for the local company, selected as his topic a talk concerning competition. During the course of his speech he referred to the opposition of the Bell and very clearly demonstrated that the Independents were able to hold their own.

"Progress and Prospect" formed the subject of some remarks by W. O. Hunt, of Adrian. The growth of the Michigan Independent system was outlined and the speaker phophesied that within a short while the entire State will be covered by a complete network of Independent lines.

W. S. Vivian's paper upon the progress of the traffic association brought forth a lively discussion as to whether the sending or receiving company should check the overtime charges on long distance calls. The majority appeared to favor delegating this work to the receiving office.

Other numbers on the programme were "Our Investments," by E. S. Wagar, of Edmon and "The Detroit Situation," by W. B. Woodbury, general manager of the Home Company of Detroit. Each of these speeches was listened to with a great deal of interest, as the subjects formed matters of prime importance to all the members who were present.

H. H. Hutchins sent a paper upon history, which was read, and F. V. Newman, manager of the Grand Rapids exchange, read a paper on "Crowding Collections," which aroused an exceptional amount of interest. Other papers presented were "The Cedar Supply," by H. P. Grover, which ably dealt with the lumber conditions; "The Outlook in Indiana," by W. L. Moellering, of Fort Wayne, and "Ohio's Successes," by Frank L. Beam, president of the Ohio Association. Information gained from these addresses showed the remarkable strength of the Independent movement which in the State of Indiana had been the means of the Bell's undoing, there being 190,000 Independent telephones to 35,000 Bell.

On Friday morning a gratifying report of the traffic association was read by its president, C. E. Tarte. The vice-presidents of the six districts next delivered their statements relative to the condition in their localities. Wm. Robinson, of Muskegon, treasurer of the association, presented his statement of the financial

Digitized by Google

affairs and was followed by the report of the secretary, J. B. Ware. The next item on the programme was the election of officers, which resulted as follows: President, E. B. Fisher, Grand Rapids; secretary, J. B. Ware, Grand Rapids; treasurer, William Robinson, Muskegon; executive committee, J. H. Fildew, St. Johns; C. E. Tarte, Grand Rapids; W. B. Woodbury, Detroit; J. B. Ware, Grand Rapids; E. B. Fisher, Grand Rapids.

Delegates at large to the National-Interstate Convention, to be held in Chicago on June 27, 28, 29, were elected as follows: J. B. Ware, W. B. Woodbury and F. W. Howard. E. B. Fisher was selected as member of the executive committee of the National Association.

In every way the convention was a pronounced success, the members taking part in discussing the various papers with a great deal of enthusiasm. Inasmuch as many items of interest were brought forward, it is the unanimous opinion of the members that the future development of the Independent movement will be even more rapid than the past.

The meeting place of the next convention was not decided upon, but was left to the discretion of the president and executive committee, who will report later.

NEW COMPANY ORGANIZED AT EXETER, N. H., WHEN OLD ONE SELLS OUT.

ALTHOUGH the Exeter, N. H., Telephone Company has passed into the hands of parties affiliated with the New England (Bell) company, the town will not be long without Independent service. A new company, to be known as the People's Telephone Company of New Hampshire, has been organized. The incorporators are Warren Brown, of Hampton Falls; Warren M. Batchelder, of Hampton; George A. Carlisle and Augustus Young, of Exeter, and Daniel J. Bakie, of Kingston. This company will construct an Independent system in Exeter and surrounding towns, franchises having been secured in Exeter, Kensington, East Kingston, Kingston and Hampton Falls.

More than 150 subscribers of the old Independent line have been pledged to the new company and many more will subscribe as soon as the company is in operation. It is understood that the work of construction will be started in the near future.

WOMEN INCREASE LAW AND ORDER VOTE BY TELEPHONE CAMPAIGN.

FEMININE voters in Topeka, Kas., employed the telephone to great advantage in a recent election. During the greater part of the campaign the weather had been too severe for the ladies to get out to work for their candidate and, appreciating the necessity of keeping in touch with the situation, they utilized the telephone to bring their arguments before doubtful voters. On the day of election the operators at the exchange were kept busy by calls from the feminine population, who worked from the opening to the close of the polls to get their friends to face the inclement weather and vote for their candidate.

So successful were they that very few of the women stayed away and consequently a heavy vote was polled in favor of the movement which they favored.

REMARKABLE GROWTH OF A MUTUAL COMPANY IN OHIO.

FROM a start with fifteen subscribers on March 19, 1903, the plant of the Mercer County, Ohio, Mutual Telephone Company has grown to its present size with over 800 subscribers receiving service.

At the annual meeting held in Celina on March 14 President Kraner outlined the history of the company. The idea of a mutual company originated with him in December, 1902. On January 3, 1903, a meeting was held as a result of a call sent out by Mr. Kraner, J. L. Monow and J. A. Wilson to consider the organization of a company. Hopewell township was first organized two weeks after the subject was broached and on the 29th of January line No. 1 was surveyed and staked. Development thereafter was very rapid and lines were built to connect with the Independent systems at Celina, Rockford and other towns in the county. In 1904 the company had established the Wabash division and was then in a position to give service to almost every point in the entire county. The money invested represents over $15,000, which was raised entirely by the subscribers.

At the meeting several hundred farmers were present who had direct interests in the company and many of whom had been patrons since the first lines were constructed.

Display Card Shown in Windows of Business Establishments in Niagara Falls, N. Y. Public Sentiment Is Strongly in Favor of the Niagara County Home Telephone Company, Which Is Giving Exceptionally Good Service.

SITUATION IN FRANKLIN COUNTY, OHIO, PROMISES RAPID INDEPENDENT GROWTH.

GANSEY R. JOHNSTON, general manager of the new Franklin County Telephone Company, has issued a statement to the stockholders and patrons of the line outlining the policy of the management in the near future.

Mr. Johnston states that the slowness of development in the county in the past few months has been due to the absorption of the energies of the officials of the various companies in the Independent improvements in Columbus, which have made it necessary to concentrate there all the labor available.

July 1, the total number of telephones on the fourteen Franklin County exchanges was 1,600. On the 1st of January this year the number, in spite of the work in Columbus, had risen to 1,741, and in the past two months over 300 more have been added. Increased switchboard facilities are needed at Canal Winchester, Worthington and Westerville, and the boards have been ordered. Two carloads of wire, almost 350 miles, have been shipped to various points in the county, and will soon be in use. Cable work will be under way within a short time in Worthington, Westerville, Groveport and Grove City and additional toll lines will be built between Harrisburg and Columbus, Canal Winchester and Pickerington, and Dublin and Worthington while additional operators have been put to work at Canal Winchester.

The growth of the system in Columbus has been at the rate of 125 telephones a week and the operating force has been doubled.

KANSAS MUTUAL COMPANY REPORTS GOOD PROGRESS.

ABOUT three hundred and fifty delegates recently met in Columbus, Kansas, at the convention of the Cherokee County Mutual Telephone Company.

M. A. Householder, secretary of the company, delivered a report of the company's condition, which showed a steady growth of the business. Upwards of 750 telephones are now in service in the county and free interchange of service is given with several other exchanges. During the past year the toll lines have been greatly extended and direct service is now given to Melrose, Baxter Springs, Hallowell, Sherwin Junction, McCune, Oswego, Weir, Crestline and Sherman City. Besides new toll lines to be constructed a large number of local lines are being organized which will extend the service to almost every point in the county.

The officers elected are: Wm. Shaffer, president; Emerson Hull, treasurer, and M. A. Householder, secretary.

QUERIES

BREAKING OF A COPPER LINE.—(684.)

Last summer our company put up a new copper wire line. With the approach of cold weather considerable trouble was experienced with the wire breaking, and we had to frequently send a man out over the line, the breaking usually being found due to poor joints. We thought that it was due to defects in the wire; but later in the winter we had much colder weather, and a sleet storm, which put a heavy strain upon the line, and during this time there was not nearly so much trouble caused as during the earlier part of the winter when the stress on the wires was only moderate. Can you account for this? R. P. F.

The trouble with your line is no doubt due rather to careless workmanship in splicing than to any defect of wires. If the skin of a hard drawn copper wire is broken, even to the slightest degree, the strength of the material is substantially weakened at this point, and any undue stress will cause it to break. Throughout the summer the lines were subject to practically no greater tension at one time than another, and no breakage was to be feared. The arrival of cold weather, however, caused them to contract and increased the tension, and this resulted in the breaking of the wires at all weak points. It is probable that the first cold weather picked out all such places along the line, and your repairs were probably so carefully made that perfect joints were obtained. This would account for the absence of the trouble in the more severe weather which occurred later.

USE OF LAMPS AS RINGING INDICATORS.—(685.)

We have a Warner pole changer for ringing power giving 75 volts direct current at generator terminals. We now have an eighty ohm buzzer on each section for resistance. We want to put in lamps for this resistance. What candle power and voltage for the alternating current would you advise and what make of lamp and sockets? What candle power and voltage for positive and negative current? We use 80 ohm, 1,600 ohm series and bridging and 2,500 ohm bells for selective ringing. Lines are from 2 to 9 miles long. We wish the light to burn so that the operator can see if lines are working. Generator lead is 50 ft. long, of No. 12 copper wire. B. T. Co.

The plan you propose is not feasible, as the amount of current which will be available for lighting the lamps when ringing these high resistance ringers will not be sufficient to even heat the lamp filament enough to make it red.

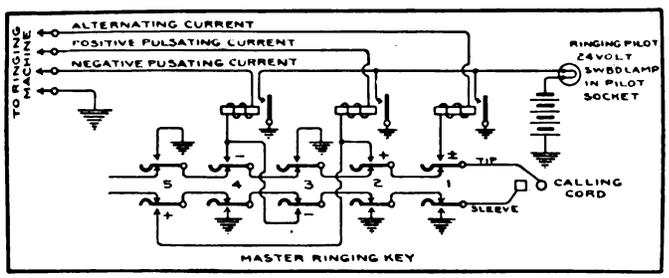

Fig. 685.

You could substitute low impedance alternating current relays in place of the buzzers and connect their contacts to pilot lamp, which can be made to operate from a local battery. This scheme is shown in Fig. 685. It would be necessary to provide one relay for each of the power leads, i. e., one for the alternating, one for the positive pulsating and one for the negative pulsating currents. A common lamp could be used for a pilot, or if desired one lamp for each relay. Of course, it would be necessary to have a complete set of relays and the necessary pilot lamp at each operator's position in order to make your plan effective.

CALL WIRE TRUNK.—(686.)

I should like to have you explain the nature of a "call wire trunk." L. R. G.

A call wire trunk consists of a line terminating in a multiple jack at a subscribers' or toll operator's position or a desk, and in a cord and plug at an incoming trunk operator's position. Such a line is used for the transferring of connections which originate at the first position and terminate on a line multipled at the incoming trunk position. It derives its name from the fact that instead of having a calling-in signal associated with the line itself, it is operated by directions given over a call wire, or order wire. For instance, a trunk operator may have at her table ten incoming call wire trunks from a given office terminating in plugs, and numbered from 10 to 19. At the other office these lines terminate in the multiple jacks in front of the subscribers' operators. Assuming that a subscribers' operator receives a call from line 401 in her own exchange for number 127 at the distant office, she will depress the key which puts her in communication with the trunk operator at that office, over the order wire, and say "127." The trunk operator will immediately give the number of the trunk, as "15," the assignment being transmitted back to the original office over the call wire. The trunk operator inserts her plug into multiple jack No. 127, and the subscribers' operator inserts her calling plug into trunk multiple jack No. 15, her answering plug being connected to the line of the subscriber desiring the connection. The connection between the lines being thus established some one from the considerable number of plans which have been invented is employed to ring the desired subscriber. On completion of the conversation a disconnect signal is given to the office originating the call. Disconnection here causes the appearance of a disconnect signal at the incoming trunk position. It will be evident that no portion of the trunk circuit is in use for either talking or signalling until all the details of the connection are determined, and this is the essential feature of a call wire trunk.

ORDER WIRE.—(687.)

Will you please tell me exactly what is meant by an order wire, and where and how it is used in exchange operating? L. R. G.

An order wire circuit consists of a pair of wires leading from the secondary, or receiver circuit of an operator's telephone set, to which they are permanently connected, to one set of springs on a key located at the position of a distant operator. By means of this key the second operator can at will connect her talking circuit to the order wire for such communication as may be necessary. The object of this arrangement is to enable the operator at whose set the circuit terminates to be reached instantly for the purpose of receiving instructions, which would be impossible if it were necessary for her to go through the regular process of answering a signal.

The principal use of this arrangement is for communication between a subscribers' operator or a toll operator and an operator at an incoming trunk position. The method in which the call wire is used in this connection has been explained in connection with your query, No. 686. For this purpose it is customary to multiple the call wires at all of the subscribers' or toll operators' positions. A call wire is frequently used between the chief operator's or information operator's desk and the switchboard position at which special trunks from the desk are terminated; also between the test set and a special position at the switchboard when the arrangement is such that lines are connected to the testing apparatus by means of special cords inserted in the multiple jacks. In every case the call wire is used as a means of direct communication between one employee of the telephone company and another, as a means of directing the movement of apparatus connected to other circuits.

50 STYLES SEND FOR CATALOGUE

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—6-100 pair and 11-50 pair Sterling Inside Terminal Heads complete with heat coils. Used very little and good as new. Address, Macon County Telephone Co., Decatur, Ill. 580

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

FOR SALE—CHEAP—Two carloads second-hand telephones and switchboards. Also transmitters, receivers and other parts. Address Box 590, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 590

FOR SALE—100 drop Imperial Sumter Switchboard in good working condition. Price $100.00, or $1.50 for drops. Address Arcadia Electric Light, Ice and Telephone Co., Arcadia, Fla. 591

FOR SALE—Cheap. One ¼ or ½ interest in one of the best paying telephone exchanges in Western Kansas. Write Thomas F. Poole, Grainfield, Kan. 596

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Ten first class cable splicers familiar with underground and aerial work. Must furnish references with application. Also two able cable foremen to supervise work of splicing gangs. Must be well recommended. Address, Box 586, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 586

WANTED—By a large telephone factory in Chicago, young men not over 22 years of age, preferably graduates of high schools or technical schools, to enter an apprenticeship course and be trained to install and operate modern central office equipment. Address, stating age, education and experience, Box 582, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 582

WANTED—Position as Exchange Manager. Fully competent to do all kinds of switchboard and telephone work. Five years' practical experience. Address Ernest Still, Lock Box No. 6, Creighton, Mo. 592

WANTED—Continued

THE point is just this! Are you dissatisfied with your present position—or have you an employee who is unsatisfactory—in either case, where could you turn better for relief than to a corps of trained employment experts? We have secured better positions for thousands of men, and have supplied thousands of employers with competent men. Why hesitate? Booklets can be secured for the asking. Hapgoods, Suite 511, 309 Broadway, New York City. 464

WANTED—Telephone men experienced in automatic switch work. State experience and salary expected. Address Supt. of Equipment, Home Telephone & Telegraph Co., Los Angeles, Cal. 581

WANTED—Position wanted by an all round telephone construction man who is thoroughly competent, sober and reliable. Best of references. Have completed course in telephone engineering. Address Box 587, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 587

WANTED—Reliable, ambitious young man to act as manager, troubleman and night operator in a small town. Good prospects for the future. References required as to character and capability. State salary. Year contract. Address Box 367, New Britain, Conn. 588

WANTED—Position as Manager in common battery exchange. Have had ten years' experience in various capacities. Have lately been Manager for Bell Company. Address Box 593, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 593

WANTED—Combination man for inside and outside work, must be good lineman, steady and sober, and capable of managing and working men to advantage. Good, steady position to right man. Address during balance of the month, stating salary expected, People's Telephone & Telegraph Company, Beaufort, S. C. 599

WANTED—Foreman for machine shop of telephone factory. Must have experience in telephone work, experience in handling men and must be accurate. Good pay and permanent position to right man. Don't answer without sending first class references. Address Box 310, Atlanta, Ga. 600

WANTED—First-class automatic telephone and switchboard man. Position permanent. Address, stating prior employment, with references, Home Telephone Co., Santa Monica, California. 594

WANTED—Position as Auditor for Independent telephone company. Experienced in telephone accounting during construction and operation. Best of references. Address Box 595, care THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 595

TELEPHONE PATENTS

TELEPHONE ATTACHMENT.

Joseph Silverman, San Francisco, Cal., patents (No. 815,753; dated March 20, 1906; filed November 23, 1905; serial No. 288,703) a telephone attachment.

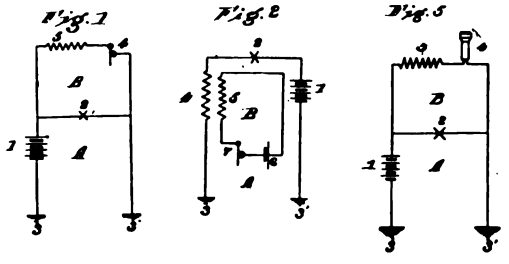
The object of this invention is to provide means for supporting the receiver of a telephone so that the hands may be left free. This the inventor accomplishes by means of a specially designed bracket supported on a rod and so adjusted as to be moved to either right or left of the transmitter. To this bracket the receiver is attached. In place of the usual receiver hook a lever is substituted which by means of suitable gear can be operated by hand to close the circuit, which remains in that condition until released by an opposite movement.

WIRELESS TELEPHONY.

A. F. Collins, New York, N. Y., patents (No. 814,942; dated March 13, 1906; filed August 21, 1905; serial No. 275,026) a system of wireless telephony.

The object of this invention is to provide a means whereby the transmitter and receiver of a wireless circuit can operate and be operated independently of the current traversing the earth or other medium.

To accomplish these results the inventor shows several circuits



of which some are suitable for transmitting and the others for receiving.

The method of transmitting substantially consists in modifying a current of sufficient force to produce an arc light, by means of either shunting the current as shown in Fig. 1 or superimposing a direct or alternating current on the circuit including the arc light as shown in Fig. 2. In Fig 1 *A* is what may be designated the heavy current circuit, and includes the arc lamp 2, source of current 1, and terminals 3, 3^1 forming connection with the earth or other medium. Circuit *B* is in parallel with the arc light, and includes a resistance 5 to protect transmitter 4. Any variation in the circuit *B* due to the action of the transmitter is impressed upon circuit *A*. The variation of the resistance of the arc produces electrical undulations in the earth circuit of much greater amplitude than those originated in circuit *B*. In Fig. 2 an alternating current is inductively created in the circuit *A* to accomplish the same results. Variations in circuit *B* are communicated to circuit *A* through the medium of the transformer coils 4, 5. The alternations thus set up in *B* serve to vary the resistance of the arc 2, with the final result that an alternating current having the same phase and frequency as that produced through the action of the transformer, but with greater amplitude, is made to pass through the earth or other medium in which the conductor terminals are imbedded.

The operation of receiving relies upon somewhat similar principles. Referring to Fig. 5, which shows the receiving circuit in its simplest form, the circuit *A* includes a source of electromotive force 1, and arc light 2, and conductor terminals 3, 3^1, imbedded in the earth. The circuit *B*, which is in parallel with the arc light, includes a receiver 4 and resistance 5. When in operation the function of this receiver is as follows: The electric pulsations received through the earth are superimposed upon the current flowing in the circuit *A*. These impulses vary the resistance of the arc 2 and increase the variations of the current from the generator 1 flowing through the circuits *A*, *B*. The receiver 4 in circuit *B* is protected from excessive voltage by resistance 5, but responds to changes in circuit *A* with augmented amplitude and intensity.

LIGHTNING ARRESTER.

Frank K. Singer, Wheeling, W. Va., patents (No. 814,482; dated March 6, 1906; filed April 17, 1905; serial No. 255,928) a lightning arrester.

This device is particularly designed for protecting telephone cables, but can be adapted for use elsewhere.

The essential feature consists of the insertion of a choke coil in series with the line fuse.

The fuse tube is made out of non-conducting material and around one end are wound about twenty turns of No. 22 insulated wire. One end of this wire connects to a line terminal; the other to a ribbon fuse which is enclosed within the tube. In conjunction with the fuse and choke coil a spark gap lightning arrester of conventional pattern is employed.

WIRE SPLICER.

Datus C. Smith, New York, N. Y., patents (No. 815,755; dated March 20, 1906; filed August 15, 1904; serial No. 220,838) a wire splicing tool.

The object of this invention is to provide improved means for splicing wires.

Referring to the illustrations *a* and *b* are two pivoted members, one of which *a* has a hook or bend *c*, and is provided with hooks or notches *d*. The other member *b* is so pivoted to *a* that its free end *e* can pass within the hook *c*. It is provided with a flange or stop *f* to limit the relative movement of the two members.

In operation the tool is opened, one of the wires *x* is placed within the hook *c* and locked by the closure of the member *b*,

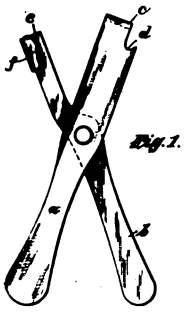


Fig. 1.

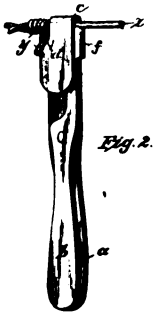

Fig. 2.

the end of the other wire *y* is then caught in one of the notches *d*. The portions of the wires towards *y* are then grasped by any suitable tool and the splicing device revolved, which causes the end of wire *y* to form a coil around *x*. The splice is completed by removing the tool and applying it to the wire *y* and free end of *x*.

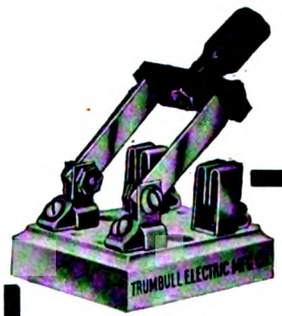
TOLEDO, O.



All Copper. Made in 4 Styles

BEWARE OF LIGHTNING

Summer time will soon be here. Adequate protection from electrical storms is of the greatest importance.

Trumbull Single Throw Switches

inserted in series with the line and instrument at the substation offer the best possible protection, because on the approach of a storm the lines can be opened and the instruments isolated from dangerous discharges. If you rely on the ordinary form of protection you are running the risk of burnt out ringer coils which cost from three to five times more to repair than the price of a switch.

TRUMBULL SWITCHES are particularly desirable for this purpose, as they always make positive contact, and cannot be put out of adjustment by ordinary usage. They can be had with either single or double contacts, for grounded or metallic circuits.

Write for prices, which are surprisingly low, and also for particulars respecting other uses for which they can be profitably employed.

TRUMBULL ELECTRIC MFG. CO.

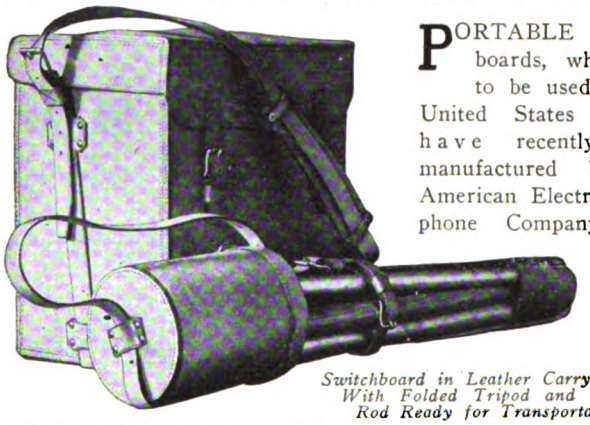
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

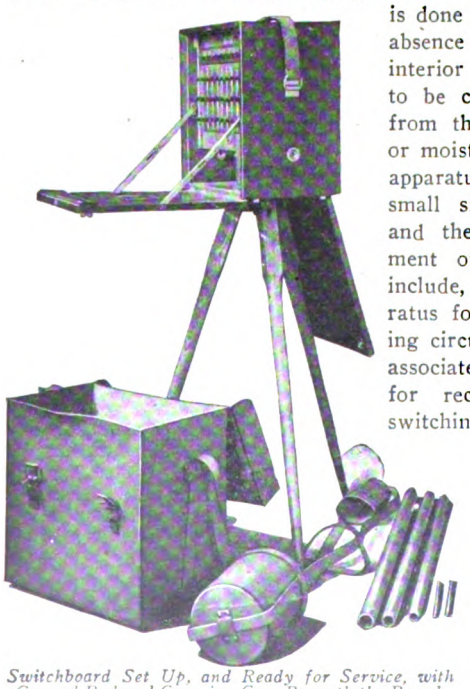
TELEPHONE SWITCHBOARDS FOR FIELD SERVICE.



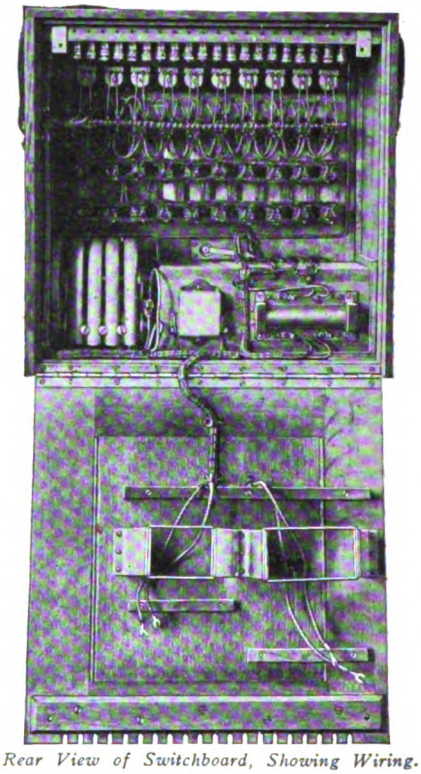
Switchboard in Leather Carrying Case, With Folded Tripod and Ground Rod Ready for Transportation.

PORTABLE switchboards, which are to be used by the United States Army have recently been manufactured by the American Electric Telephone Company, 64th and State streets, Chicago, Ill. That the exacting requirements of the Government for apparatus which shall fulfill in the highest degree the conditions for this difficult service, have been met by apparatus designed with much skill will be evident from the illustrations upon this page. The special nature of the work demanded of the switchboard makes it essential that it, and all of its apparatus, should possess to the utmost extent the qualities of durability, compactness, efficiency and reliability, and all this must be secured without the addition of the slightest weight beyond that essential for securing the necessary strength. These features have been combined in a special switchboard in a very interesting manner.

As a means for interconnecting lines, the designers found it advisable to use an arrangement of keys, with a special system of wiring, doing away completely with the use of cords. By this plan they secure the important advantage which comes from the ability to make a compact switchboard with no provision for the cord shelf; also the undesirable feature of cords which will be extremely difficult to keep in proper working order in the field is done away with; and the absence of jacks allows the interior of the switchboard to be completely protected from the entrance of dust or moisture, even when the apparatus is in use. The small size of the cabinet and the compact arrangement of its parts, which include, of course, apparatus for talking and ringing circuits, as well as that associated with each line for receiving calls and switching purposes, will be evident from an examination of the front and back views of the cabinet. It will be noted in the view of the face of the switchboard that there is a small opening in the lower left hand corner beneath the keys. This has been reserved for the operator's telephone set. The switchboard may be quickly unpacked from the neat and durable carrying case with which it is provided, and in a very few minutes it is ready for use at any desired location. A substantial tripod is used to elevate it to the height most convenient for manipulation. Where grounded lines are desirable, the sectional ground rod may have its parts screwed together, and be driven while the switchboard is being set up.

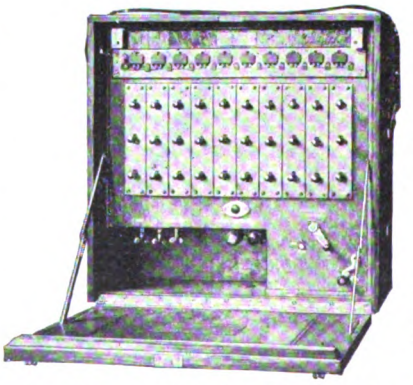


Switchboard Set Up, and Ready for Service, with Ground Rod and Carrying Case Beneath the Board.



Rear View of Switchboard, Showing Wiring.

It goes without saying that, in addition to the valuable features of general design, the individual pieces of apparatus which are included in this set conform to the highest standards, as they have successfully passed the rigid examination of the Government officials.



Front View of Switchboard Showing Keys and Drops.

THE AMERICAN AUTOMATIC TELEPHONE COMPANY, Rochester, N. Y., has leased 7,000 square feet in a new building and will begin the actual manufacturing of equipment about May 1st.

B. J. Williams, president of the Shelby, O., First National Bank, and treasurer of the company, has located in Rochester to take active participation in the company's progress. F. G. Dunham is factory superintendent. J. W. Lattig and C. L. Goodrum, the inventors of the apparatus, are taking an active interest in the development of the factory.

THE STAR ELECTRIC COMPANY, Niles, Ohio, is manufacturing a dry cell known as the Diamond S. This battery is designed for long life and has a guaranteed output of twelve amperes. Another type, the Diamond S S, is made in three sizes, 6, 7, 8, and is intended for use where higher amperage is necessary. The output

A RECORDING PAY STATION.

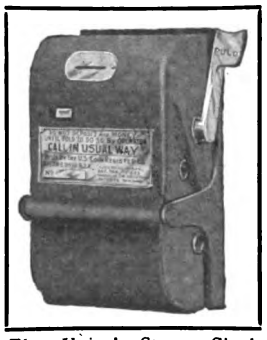
A PAY station which gives a positive and unmistakable signal to the operator, defies all attempts to beat its mechanism by plugging or working with strings or wires, and in addition prints a record of every coin received is what is claimed by the United States Coin Register Co. of Toledo, O.

The machines are provided with a chute which is constructed in a special manner designed to prevent the plugging up of the mechanism, or the working of it by means of a coin tied to a string, or a wire, or otherwise. When inserted into this chute the coin passes between a set of rollers, which are operated by the pulling of the lever. In this way the coin is forced through. During the operation a gong is struck to give the signal to the operator. The mechanism is so arranged that but one coin can pass through the rollers at a time, no matter how many may be inserted. In this way it is absolutely sure that the signal will be given to the operator for each coin.

In the three-slot machine there is provided a special slide which prevents the insertion of coins of more than one denomination at a time. When a five cent coin is put in the slot it is impossible at the same time to insert a ten cent coin, or a twenty-five cent coin, and this is true of all of the other slots. The signals are all given from one gong, one blow being struck for five cents, two for ten cents and five for twenty-five cents. In this way any possibility of the operators failing to distinguish between two different tones is avoided; all she need do is to count.

The entire mechanism is made in an extremely substantial manner. It is locked in a case apart from the money box, and cannot be tampered with by any unauthorized parties. The coin box is also separately locked, and cannot be opened by persons without the proper key. In this way absolute security against meddling with either the registering mechanism or the money compartment is assured.

Although the mechanism for receiving coins and giving signals presents many advantages of a most valuable and positive type, a feature which is designed to be of the greatest assistance in preventing annoyance and enabling telephone companies using this device to collect full returns for all messages, consists of a recording device which automatically registers the receipt of every deposit. This operates on the principle of making a mark upon an automatically unrolled tape for every five cent unit. As will be seen from the illustration, the tape is printed with figures numbered serially from 1 to 2,000, except that every tenth number is represented by a cross for convenience in counting. Also the number of the box is printed upon the tape at every twentieth number. This last feature prevents any juggling of tapes from different boxes by the collectors, with the object of defrauding the company. In operation each time the signal bell is struck the tape is unrolled, an amount corresponding to the space occupied by a single number passing into the cash box for each five cent coin deposited; at the same time a dash is printed, from a strip of carbonized paper, upon the back of the ticket immediately behind the number. When the collector visits the box and opens it to collect the money the tape is automatically cut off at the last number recorded, and dropped into the cash box. This piece of tape will show the amount of money which has been deposited, the total amount being equal to the highest number upon the tape multiplied by five. This furnishes an exact check, which should do away with any possibility of variation between the accounting and the receipts. The first piece of tape cut off is to be filed at the office, and held until the next collection. When the second piece is brought in its first number should be the one next above the highest number on the first tape, thus affording an absolutely infallible check on all receipts throughout the year. A single tape is good for the collection of $100.



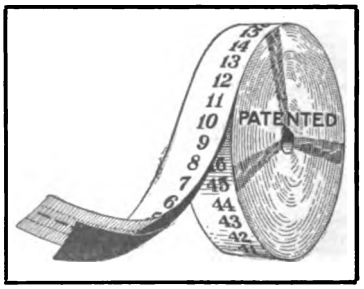
The United States Single Coin Pay Station.

A Complete and Convenient Recording Pay Station for Desks and Booths.

Aside from its use in preventing loss through the dishonesty of employees, or outsiders, the company offers the following suggestion to managers of exchanges which give measured service. In such places frequently complaints are received from subscribers, who claim that their bills call for payment for more conversations than they have actually had. By the use of this device the subscriber makes his own record every time he talks, and there can be no possibility of contesting the amount of the bill. The whole operation is practically automatic and infallibly correct. The U. S. Coin Registering Company believes it has solved the recording pay station problem in a manner which will be extremely satisfactory in operation, and invites every telephone manager to make the most careful investigation of its apparatus.

In the three slot instrument it is impossible to insert more than one coin at a time.

THE COLUMBIA ELECTRIC COMPANY, McCordsville, Ind., is developing a large business in its key and drop departments. These pieces of apparatus are made with the greatest care and are guaranteed to be satisfactory in every respect. All contacts are furnished with platinum points and the insulation employed is the best that can be procured. Its telephones are guaranteed for five years and it is claimed that they are able to withstand the hardest usage. All apparatus is carefully designed, made and inspected. Parties interested can secure further information by addressing the company.



Every Nickel Deposited is Recorded Upon This Tape.

After Thirty Years of Extensive Use

in Europe and America, **Avenarius Carbolineum has fully established its reputation as the most efficient wood preservative on the market.** From examinations of poles and ties set in the earth ten years ago, those treated with this preparation are in an excellent state of preservation; whilst those not so treated have nearly rotted away.

Avenarius Carbolineum effectually prevents dry and wet rot, or decay of any kind, and increases the life of poles at least three fold.

It is easily applied with a brush or by dipping, and penetrates deeply into the wood, preventing all external influences causing decay, while its peculiar antiseptic ingredients will permeate the wood throughout and neutralize all albuminous parts causing decay.

Its boiling point being high, the inflammability of the timber is not increased.

Avenarius Carbolineum is guaranteed to protect under all conditions, and will be found upon trial to be the most economical aid in line construction ever known. Write for booklet and copies of testimonials from men who have been convinced.

CARBOLINEUM WOOD PRESERVING CO., 126 REED STREET, MILWAUKEE, WIS.

JUST A MOMENT!

Do you realize what the use of good batteries means to your telephone system—even if you don't count the money they save?

HERE—

Good instruments, proper wiring, and good batteries make good service—good service means satisfied users and this means more subscribers.

Think it over. You'll lose ground if you use cheap batteries. Quality counts.

FINANCIAL.

NEW BRITAIN, CONN.—The Farmington Valley Telephone Company has declared a semi-annual dividend of 3 per cent. payable April 2.

ROUND KNOB, ILL.—The Massac County Telephone Company, Round Knob, has increased its capital stock from $2,490 to $4,980.

DANVILLE, IA.—The Mutual Telephone Company, of Danville, has increased its capital stock to $20,000.

FALL RIVER, MASS.—The Fall River Automatic Telephone Company has declared its quarterly dividend of 1 per cent.

MONROE CITY, MO.—The Farmers & Merchants' Telephone Company contemplates increasing its capital stock from $3,000 to $6,000.

HILTON, N. Y.—The Hilton Telephone Company has increased its capital stock from $8,000 to $15,000.

GRAND FORKS, N. D.—The Traill County Telephone Company is to increase its capital stock from $30,000 to $50,000.

FRANCHISES.

MARYSVILLE, CAL.—Frank W. Anderson, of Wheatland, has applied for a fifty year telephone franchise at Marysville.

FORT LAUDERDALE, FLA.—M. A. Marshall, of Fort Lauderdale, has been granted a franchise to construct a telephone line from Fort Lauderdale to Dania.

RUSSIAVILLE, IND.—Messrs. Evans and Jeter, Russiaville, have applied for a franchise to construct a telephone system in Honey Creek township.

HELENA, MONT.—W. H. Crumb has been granted a telephone franchise at Helena.

ASHLAND, N. H.—The Baker River Telephone Company has secured a franchise to construct a telephone system in Plymouth.

HASTINGS, OSWEGO CO., N. Y.—The Independent Telephone Company, of Syracuse, has applied for a franchise at Hastings.

COMBINATIONS.

DUNNELLON, FLA.—The East Florida Telephone Company has purchased the property of the Florida Tel. & Tel. Company, whose lines run from Dunnellon to Floral City.

MT. AUBURN, ILL.—The Mt. Auburn Independent Telephone Company, formerly owned by Messrs. Miller & Mulberry, has been acquired by J. H. Donaldson, of Taylorville.

WINCHESTER, IND.—The Branch Telephone Company has been taken over by the Eastern Independent Telephone Company, with headquarters in Winchester.

ACKLEY, IOWA.—The telephone exchange at Ackley, Iowa, has been sold by Bruening & Symington to a stock company, of which E. B. Smith, of Waterloo, is president, and F. J. Martin, of Ackley, is secretary.

LEWISTON, MICH.—The Montmorency Co. Telephone Company has acquired the telephone lines of Cauchon & Sons. The new company contemplates making many improvements in the system.

ELLENVILLE, N. Y.—The Beaverkill Telephone Company has been acquired by H. S. Wells, of Ellenville.

PRICE, UTAH.—The Eastern Utah Telephone Company is trying to obtain possession of the government telephone lines from Price to Myton.

ELECTIONS.

AUBURN, CAL.—The Placer County Telephone Company has elected the following officers: John A. Livingston, president; C. P. Huestis, vice president; G. Geraldson, secretary; A. R. Hall, treasurer.

BORDEN, IND.—The Overland Telephone Company, of Borden, has elected the following officers: Elmo Cauble, president; William Dietrich, secretary and treasurer.

CARLETON, MICH.—The People's Telephone Company, of Wayne, has elected the following officers: President, Joseph Waltz, of Waltz; vice-president, E. C. Maxwell, of Carleton; second vice-president, Jesse Butler, of Willow; secretary and treasurer, F. L. Edwards, of Carleton.

HUMBOLDT, NEB.—The Porter Mutual Telephone Company has elected the following officers: J. K. Cornelius, president; J. O. Shroyer, secretary; Peter Gergens, assistant.

CANDOR, N. Y.—The Candor Telephone Company has elected the following officers: President, C. P. Middaugh; vice-president, L. C. Burt; treasurer, H. D. Heath; secretary, E. D. Holly.

TRUXTON, N. Y.—The Truxton & Cuyler Telephone Company has elected the following officers: President, A. R. Bryant, Truxton; vice-president, J. B. Whitmarsh, of Cuyler; secretary and general manager, R. Hibbard, of Cortland; treasurer, P. D. Muller, of Truxton.

AVOCA, WIS.—The Avoca & Muscoda Telephone Company has elected the following officers: J. J. Hinkle, president; John Sikir, vice-president; B. W. Gillett, secretary; Homer Randall, treasurer.

NEW COMPANIES.

OAK GROVE, ALA.—The Oak Grove Telephone Company is to build a number of branch lines.

JUNCTION, ARK.—The Local Telephone Company, of Junction City, has been incorporated with a capital stock of $10,000. The incorporators are W. V. Brown, R. Y. Brown and D. K. Brown.

DAVIS, ILL.—The People's Mutual Telephone Company, of Davis, has been incorporated with a capital stock of $10,000. Incorporators are J. W. Johnson, William Arnsmeier and Fred Albertsett.

MARIETTA, ILL.—The Marietta & Seville Telephone Company has been organized.

OAKLAND, ILL.—The Embarrass Telephone & Telegraph Company, of Oakland, has been incorporated with a capital stock of $45,000. The incorporators are H. H. Knipe, E. N. Blair and J. D. Noel.

TAMAROA, ILL.—The Tamaroa Telephone Company, Tamaroa, has been incorporated with a capital stock of $2,500. The incorporators are C. O. Winthrop, C. R. Rice and J. T. Marlow.

IDA GROVE, IA.—The Farmers' Mutual Telephone Company has been organized at Ida Grove. James Walsh is chairman, and Robert H. Todd, secretary.

PARMA, MICH.—A new Independent Telephone Company has been organized by the majority of the former stockholders of the North Parma Telephone Company, which recently was purchased by the Bell Telephone Company. The new company will install a new exchange, and have direct connection with Jackson.

ADRIAN, MINN.—The German Telephone Company has been organized with the following officers: President, Al. Faragher; secretary, H. L. Prideaux; treasurer, H. Hennekes; directors, Gerhardt Lewis, Ed. Davis and John Schultz.

AKELY, MINN.—The Akely Telephone Company, Akely, has been incorporated with a capital stock of $15,000.

SPRINGFIELD, MO.—The Springfield Home Telephone Company has been incorporated with a capital stock of $2,000. The incorporators are W. B. Scruggs, R. W. Adams, J. L. White, of Harrisonville, and T. L. Dunlap, of Springfield.

DODGE, NEB.—The Bohemian Mutual Telephone Company has been incorporated with a capital stock of $600. John K. Vlack and others, incorporators.

SILVER CREEK, NEB.—The Silver Creek Telephone Company has been incorporated with a capital stock of $25,000.

WHY

Do All the Leading Telephone Manufacturers and Telephone Companies use

ROCK ISLAND

DRY CELLS?

BECAUSE

Every Test they have made has proven them fully 25 per cent. better than any battery they ever used.

Order a sample barrel and convince yourself.

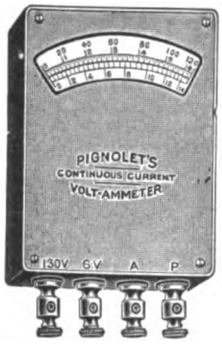
ROCK ISLAND BATTERY CO.
CINCINNATI, OHIO

WHAT A CALCULAGRAPH DOES

It prints the time of day a toll message commences.
It mechanically records the **elapsed time** in minutes and quarter minutes.
It works without any mental effort on the part of the operator.
It prevents doubt and leaves no room for argument.
It improves the efficiency of the service.
It will save its cost in a short while by increasing the revenue from over time charges.
IT MAKES NO CLERICAL ERRORS.
It is accurate to the second.
Write for booklet.

***The* CALCULAGRAPH CO.**
1437 Jewelers Building, NEW YORK, N. Y.

TO BE FOREWARNED IS TO BE FOREARMED



If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars? By buying one now you will save its cost many times over before you have had it a year.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

ENON VALLEY, PA.—An Independent Telephone Company has been organized at Enon Valley, Lawrence county, to cover four townships, two in Lawrence county and two in Beaver county. The company is capitalized at $10,000. The incorporators are O. I. Riddle, G. H. Dilworth, J. H. Russell, F. R. Wilson, B. F. Gealy, J. W. McGinnis, F. R. Robinson, M. E. Martin and others.

ROCHESTER, PA.—An Independent Telephone Company has been organized by the citizens of Raccoon township, Beaver county, Pa., for the purpose of building an independent telephone line to connect with the Beaver County Telephone Company's lines at Monaca. R. R. Ewing is president of the new company.

TYLERSVILLE, PA.—An Independent Telephone Company has been organized at Tylersville to build a line from Tylersville to Loganton.

LILY, S. D.—The York Troy Telephone Company has been incorporated with a capital stock of $1,750.

REE HEIGHTS, S. D.—The Ree Hills Telephone Company, of Ree Heights, has been incorporated with a capital stock of $2,000. The incorporators are B. S. Bell, John Hale, R. W. Speirs and others of Ree Heights.

VERDON, S. D.—The Farmers' & Merchants' Telephone Company, of Verdon, Brown County, S. D., has been incorporated with a capital stock of $10,000. The directors are Jos. C. Borwell, R. C. Kimmell and others.

HOHENWALD, TENN.—An Independent Telephone Company has been formed at Hohenwald, with the following officers: C. D. Loveless, president; J. F. Whitwell, secretary.

DALLAS, TEXAS.—The Northwestern Toll Line Company, of Dallas, has been incorporated. The company will construct lines from Dallas into Northwest Texas, New Mexico and Oklahoma.

MABANK, TEXAS.—The Rosenas Telephone Company, of Mabank, has been incorporated with a capital stock of $5,000. Incorporators: Will N. Wright, J. W. Wilkerson, S. M. Wilkerson, of Mabank, and C. W. Robinson, of Forney, Texas.

ROSENAS, TEXAS.—The Rosenas Telephone Company of Van Zandt County, has been incorporated with a capital stock of $5,000. Incorporators are Will N. Wright, J. W. Wilkerson and others.

YANTIS, TEXAS.—The Yantis Telephone Company, Yantis, has been incorporated with a capital stock of $10,000.

KELLER, WASH.—The Keller & San Poil Telephone & Telegraph Company is to be incorporated with a capital stock of $10,000. The company is to build lines to points on the reservation. The trustees of the company are P. Connery, W. L. Murphy, C. A. Gray, R. L. Boyle and H. A. Denton, all of Keller.

SPRINGDALE, WASH.—The Forest Center Telephone Company has been organized. The company will build a line from Springdale through Forest Center to Grays.

WINONA, WASH.—The Winona Telephone Company, of Winona, Whitman County, has been incorporated with a capital stock of $3,000. Incorporators are J. T. Billups, M. W. Fockler and F. J. Swan.

ARCADIA, WIS.—The Newcomb Valley Telephone Company, Arcadia, has been incorporated with a capital stock of $2,000. Incorporators are Edward Erickson, Samuel Hanson, L. E. Anderson, Albert Axness and J. F. Gilbertson.

PERSONAL.

H. M. COOPER has been appointed manager of the Central Union Telephone Company's exchange at Galena, Ill.

H. E. GILTNER, formerly equipment inspector for the Terre Haute district of the Central Union Telephone Company, has resigned to become manager of the Vermilion County Telephone Company's exchange at Danville, Ill.

WILL HARMON, who has for some time been auditor of the Delaware and Madison Counties Telephone Company of Muncie, Ind., has been elected general manager.

L. J. HOUSE has been appointed manager of its exchange at Fremont, O., by the Central Union Telephone Company.

FRED McKINNON has been appointed manager of the plant of the Home Telephone Company at Laurence, Kas.

O. A. RICE has recently been appointed manager of the Interurban Telephone Company's system at New London, Wis.

FREDERICK H. WHITTAKER has been appointed manager of the Central Union exchange at Seneca, Ill.

D. S. WRIGHT has been promoted by the Central Union Telephone Company to the position of General Foreman in the Indiana Equipment Department, with headquarters at Indianapolis.

MISCELLANEOUS.

NEOSHO FALLS, KAS.—O. B. Jones has purchased the telephone business of H. F. Frezel.

HATTIESBURG, MISS.—The Jones-Winters Telephone Syndicate, of which L. C. Leek is local manager, is to place its wires underground in Hattiesburg.

TOLEDO, O.—The board of public safety is to ask the city council for an appropriation of $30,000, to be used for the purpose of installing an independent telephone system for the official departments.

New Construction in the Field

BOISE, IDAHO.—The Idaho Independent Telephone Company, of Boise, Idaho, is to install at Weiser, a telephone system which will cost in the neighborhood of $10,000. A franchise has been granted, also, at Emmett, at which place a similar system will be installed.

KOKOMO, IND.—The Russiaville Telephone Company, of Russiaville, is to build a line to Kokomo.

KOKOMO, IND.—The Citizens' Telephone Company is to spend $15,000 in improving its system.

WABASH, IND.—The Wabash Home Telephone Company is to make many improvements in its system; among others may be noted the installation of a $10,000 switchboard.

HEBRON, ME.—The Hebron Home Telephone Company is making preparations to extend its lines, and improve its system generally.

HOUSATONIC, MASS.—The Farmers' Telephone Company, of State Line, is to extend its lines to Housatonic.

SPRINGPORT, MICH.—The Citizens' Telephone Company is constructing a line in the direction of Albion.

PALMYRA, MO.—The Electric Flash Telephone Company is to build a line from Palmyra to La Grange.

SPRINGFIELD, MO.—Springfield is to have an Independent telephone system to take the place of the exchange bought by the Bell last year. The Santa Fe Construction Company will invest $200,000 in a new plant.

HILTON, N. Y.—The Hilton Telephone Company is to build several new lines. It will also install a new exchange apparatus at Hilton.

EAST LIVERPOOL, O.—The Columbiana County Telephone Company is to build a line from East Liverpool to Williamsport.

BEAUMONT, TEXAS.—The Independent Telephone Company, of Beaumont, is building a line from Beaumont to Jennings, La.

FORT WORTH, TEXAS.—The Fort Worth Telephone Company is to expend $150,000 in improving its system.

WEST POINT, VA.—The West Point Telephone Company is extending its lines.

FOND DU LAC, WIS.—The Empire Telephone Company is to be connected with Dotyville, Johnsburg, Malone, Eden and Campbellsport.

KAUKAUNA, WIS.—The Fox River Valley Telephone & Tel. Company, of Appleton, is to install a telephone system at Kaukauna.

BYRON, ONT., CAN.—The Byron Telephone Company is to commence the construction of its system.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

"ALL WORKS OF QUALITY"

WESCO

Says RUSKIN,

"must bear a price in proportion to the skill, time, expense, and risk attending their invention and manufacture. Those things called dear are, when justly estimated, the cheapest; they are attended with much less profit to the artist than those things which everybody calls cheap. Beautiful forms and compositions are not made by chance, nor can they ever, in any material, be made at small expense. A composition for cheapness, and not for excellence of workmanship, is the most frequent and certain cause for the rapid decay and entire destruction of arts and manufactures."

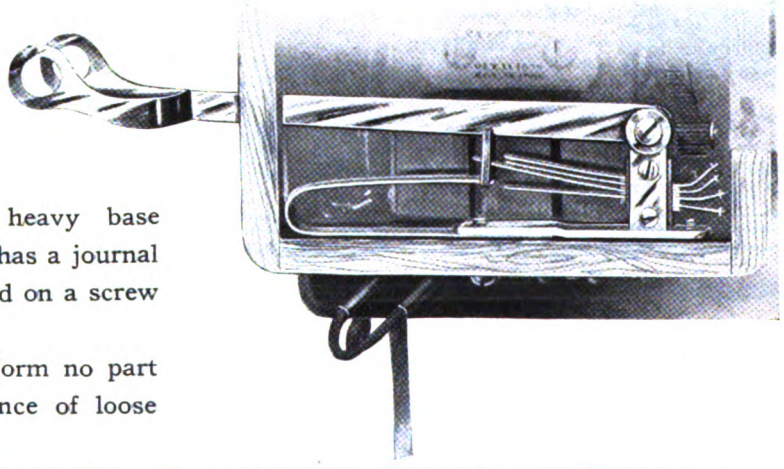
NORTH'S horizontal lever adjustable tension hook-switch is strong, simple, reliable—insuring perfect action—positive contacts.



Entirely self-contained—a heavy base made in one piece. The lever has a journal bearing hinge—does not depend on a screw to support it.

The lever, base and hinge form no part of the circuit—avoids all chance of loose contacts or accidental shocks.

The controlling spring is German Silver, long and flexible, and capable of adjustment.

The contact springs are German Silver—provided with pure platinum contact points (not platenoid or other alloy). They are made straight—to give maximum resiliency.

They are mounted in a slotted pure hard rubber block (not fibre) and held in place by a brass clamp and two long machine screws—no chance to work loose.

All contacts and terminals in plain view.

DEAN TELEPHONE APPARATUS

A Good Investment

The highest quality in any investment should be its permanency or the inherent ability to make it secure. The Dean Selective Party Line Equipment as security, represents the highest value and possesses that quality which enables it to grow stronger as it grows older.

At the time that the following clipping was taken from one of the Cleveland daily newspapers, the Cuyahoga Telephone Company had invested in and had installed over seven thousand (7,000) Dean Selective Harmonic Ringers, which has proved to them, as well as all other companies who have adopted it, a Good Investment.

KELLOGG PHILOSOPHY— —THE BEST IS THE CHEAPEST

KELLOGG

FREQUENCY POLE CHANGER

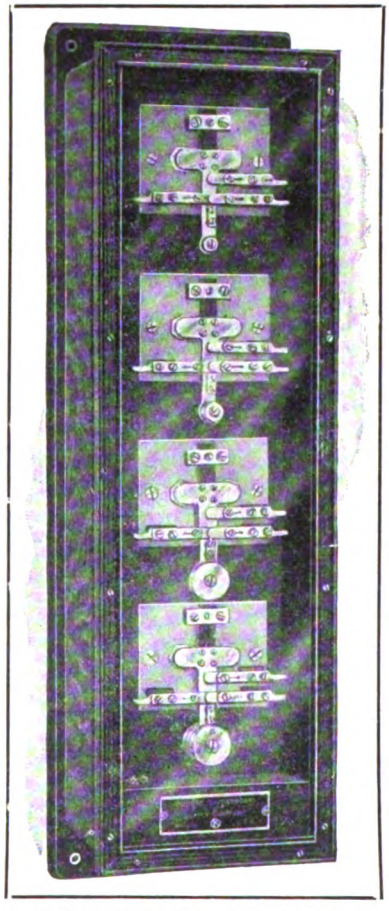
Utmost SIMPLICITY of Operation

THE EFFICIENCY

and beauty of the Selective Harmonic Ringing System of the Kellogg Company has been fully recognized by the entire Independent field, but the difficulty, heretofore, has been that the system required a generating device which involved a rather high first cost, and a relatively large consumption of energy.

The Frequency Pole Changer was designed to meet and overcome all these objections.

It is a very simple device, each unit only involving the use of a magnetic coil and three sets of springs.



"FRONT VIEW"—COVER ON.

ADVANTAGES

1. Requires no attention after once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from Primary or Storage Batteries.
4. Dry cells can be used for the ringing current.
5. They can be furnished to work successfully under any load.
6. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
7. Operates successfully within the limits of 17 to 28 volts.
8. Noiseless in operation.
9. Only three contacts on each vibrator.

This Pole Changer can be used on either Common Battery or Magneto Exchanges

If You are Looking for Honest Value

in telephones, we can supply your wants. Our new Edison telephone is built correctly all the way through. It sells at a price which enables us to make a fair profit, and yet is not as expensive as many other so-called high grade instruments.

We take the greatest care in its manufacture to see that every part is right before being assembled; and, after it is finished, we make every possible test to be sure that everything is in good order before it leaves the factory.

No one could do more; in fact, many are not half so particular. Let us quote you prices.

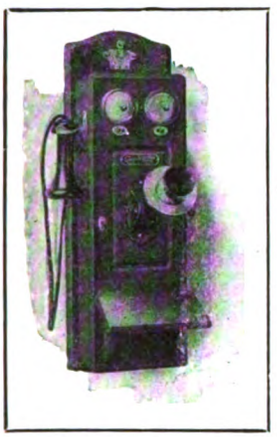
The Successful Man

is one who can distinguish good from bad, and selects for his business needs only that which has real merit. The successful men in the telephone business are using our New Beauty telephones, which proves our oft-repeated assertion that they are the best that brains can produce or that money can buy.



Back of this statement there is an interesting history. We always believed there was a demand for an instrument superior to any other. The trouble was to find it. This took time, but we persevered, and at last we discovered the real article. That our judgment was not at fault is amply proven by the steady stream of orders we are receiving. If you have not ordered, just write and we will do the rest.

EWING-MERKLE ELECTRIC CO., ST. LOUIS, MO., U. S. A.

AKRON, Ohio—
OAKLAND, California—
TACOMA and
BELLINGHAM, Washington

have all gone Automatic—Akron for 3,000 lines, Oakland for 5,000, Tacoma for 4,000 and Bellingham for 1,000.

Merit, absolute merit, was the reason why Automatic Telephone Equipment was selected by the Independent Companies in these cities.

They wanted the best, the very best, in telephone equipment.
They took their time and looked hard for it everywhere.
They found it in the Automatic.
That's where you will find it when you are ready to see it.
That's where the Independent Companies in all these cities found it—they adopted the Automatic:

Central Energy Telephones

Stromberg-Carlson

TELEPHONE MANUFACTURING CO.
ROCHESTER, NEW YORK

IF you use or contemplate using Central Energy Telephones it will pay you to get a copy of this new bulletin. There is sufficient evidence in it to prove that the telephones illustrated therein are without exception the most modern and nearest to perfection of any ever placed on the market. This statement is not based on the fact that our cabinets are better finished, that we have a better transmitter or a removable hookswitch, but the telephone taken as a whole.

There is not room enough on this whole page to explain all of their good points. By good points we mean the things that make your subscribers satisfied, eliminate troubles caused by accidents or carelessness on the part of users.

It will only cost you a two-cent stamp and a moment's time to get a copy. Just ask for Bulletin No. 15-B.

Shall we send one?

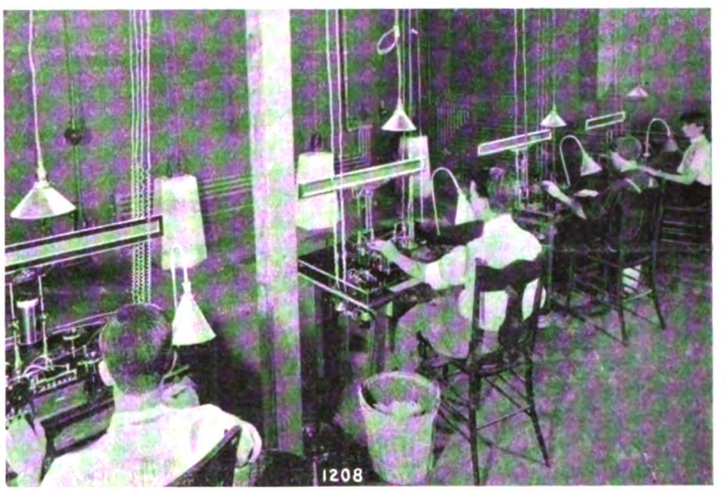
WE MAKE CABLE

MYSTERIES OF THE WIRE

Take two pieces of cable of the same size but manufactured at different factories. From all outward and visible signs there is no difference between the two. Suppose we install them under approximately similar conditions, and make a speaking test from instruments located at equal distances from the exchange. Talking from one station, the operator says she hears us splendidly, just as if we were speaking direct. When we converse with her from the other instrument, she claims our voices don't sound natural, in fact she doesn't hear us half as well.



DISCOVERING THE SECRETS OF THE CABLE

The reason for this is the difference between the electrostatic capacities, inductances, and resistances of the two circuits. Neither of these factors can be determined by a superficial examination and only manifest themselves when the cables are subjected to special tests.

They depend upon a plurality of conditions which arise during the course of manufacture and therefore the highest engineering and mechanical skill is required to insure that in the passage of the cable through the different stages of construction their correct relation to each other is maintained.

For instance, if the paper insulation is not wrapped regularly, or is too loose or too tight, or if the twists of each pair are not uniform, or if the lead sheathing is applied under varying pressure, the quality of transmission will be greatly impaired.

These are but a few of the details which must receive the closest attention; there are many others of equal importance, any of which, if not watched with the greatest care, will appreciably affect the working of the cable after it is erected.

Since it is not possible for every company to lay down a set of specifications which will insure its securing the desired quality, or to conduct the necessary tests to determine whether the specifications have been fulfilled or not, it is obvious that the order should be placed with that firm which has the highest reputation for its product, or, in other words,

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY.

We have, without a question of doubt, the best equipped cable plant in the country. The engineers in charge are experts and know the requirements of manufacture from A to Z. All the apparatus is new and of the latest type. The tests are the most exacting ever applied, and the standard of manufacture is based upon a set of specifications heretofore thought impossible of attainment for commercial purposes.

No matter whether you buy 100 feet of five pair, or several miles of 300 pair cable, you can rest assured that there isn't one iota of difference in quality.

Write for our cable book 79B, it will give you an insight into our methods of cable manufacture.

The Telephone Line*

By S. P. Grace, Chief Engineer, C. D. & P. Tel. Co.

THE great increase in the number of telephones during the past ten years has been widely commented on in both the public and technical press. It does not need a large imagination to conceive the magnitude of the system if the present rate of increase keeps up. To give service to all these telephones there has been splendid work done by the telephone engineers in the designing of telephones and switchboard apparatus which would furnish rapid and reliable service. As important as the telephone instruments and the switchboard apparatus are, a little consideration will make clear to us that the telephone lines connecting the subscribers to the exchange are of still greater importance. This is so because of the electrical and mechanical problems to be solved and because of the large sums of money required for building the lines to the subscribers' premises. In a modern plant it is safe to say that the switchboards, instruments and buildings represent not over 25 per cent. of the total plant cost, the remainder being expended in building the distributing lines. It is evident, therefore, that the economies of line distribution should be thoroughly understood in order that a plant may be built with the smallest annual charges, for the telephone being not a luxury but a necessity to the business and social interests of our cities, every effort should be made to furnish service at a reasonable cost. For this reason the most economical systems of line distribution must be earnestly sought for. It is to be regretted that in the past the same careful engineering study given to switchboard problems has not also been applied to the engineering and economic problems of line distribution. In considering the development of systems for distributing telephone lines it will not be amiss to look back and run over hastily the various methods which have been proposed and used for this purpose. Before the introduction of the telephone there already existed the lines of the various telegraph companies, and it was but natural that when the telephone came into the field the construction of its lines should follow the same general practice developed by the telegraph companies. It was soon found, however, that the number of telephone lines multiplied much more rapidly than did the telegraph wires, the result being poles of great height, equipped sometimes with as many as twenty cross arms, each arm carrying from ten to twenty wires. When these lines became overcrowded it was customary to relieve them for short distances with aerial cables made up of rubber covered wires. A little later the dry core lead sheathed paper cable was invented, and it was largely used to supplement the open wire leads. These heavy open wire leads were subjected to many disturbances because of sleet and wind storms, and, furthermore, they became such an "eye sore" that in many cities the wires were ordered underground in the business districts.

Fig. 1. Example of distribution of lines from aerial cable in residence district.

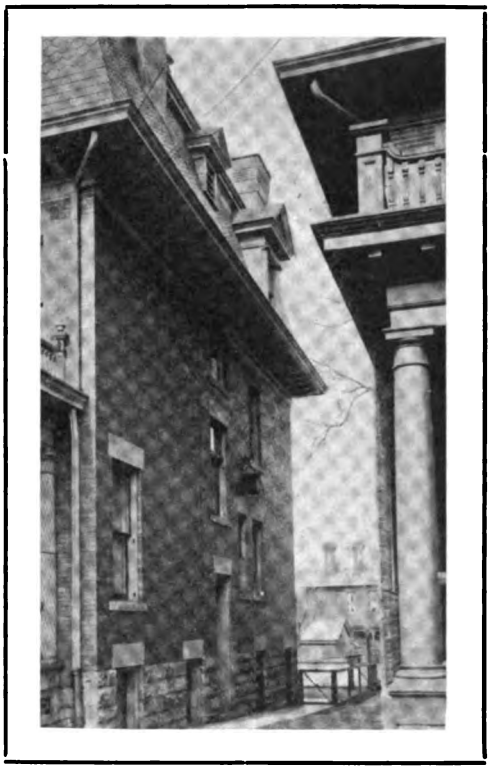

Fig. 2. Method of attaching paired wire loops to residences.

It is interesting to note that the first underground distributing conduit system for telephone wires was installed by Mr. Metzger and Mr. Paynter of the C. D. & P. Telephone Company, in Pittsburg, on 5th Avenue between Wood and Liberty Streets. The roof fixtures had become too heavy for the buildings supporting them, and as permits for poles on the streets could not be secured, it became imperative to place the wires underground. The cables were laid in the bottom of a wooden box and immediately over them were placed, at intervals, porcelain plates containing forty holes, through which were pulled distributing wires to be run into each basement along the route. After the cables and wires were in place the entire box was filled with pitch, and this construction gave fair service for a little while. It was only a short time, however, until all forms of "solid systems" in Pittsburg and in other cities were abandoned in favor of the "drawing in system," the standard

*Paper read before the members of the Pittsburg section of the American Institute of Electrical Engineers, March 13, 1906.

Digitized by Google

practice calling for vitrified clay ducts, into which the cables could be readily drawn as well as withdrawn from them at will.

The direct underground connection of subscribers' lines was abandoned practically everywhere on account of its cost, in favor of the distributing pole connected to the underground cables, from the top of which radiated wires to the various subscribers' premises. In the districts outside of the congested business district it continued to be the practice of most companies for many years to adhere to the tall, open wire leads, supplemented with aerial cables. However, the C. D. & P. Telephone Company early developed a system of distribution by means of aerial cable placed on low poles and provided with terminals every two or three hundred feet, which has given excellent satisfaction for a number of years and is now being extensively used. A more complete description of this system will be given later on in this paper.

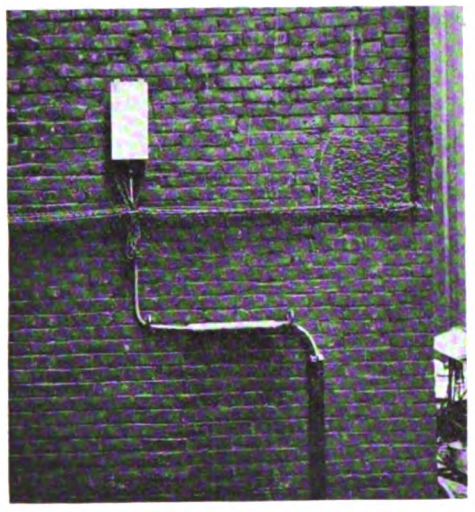

Fig. 3. Detail of wall wiring plan of distribution.

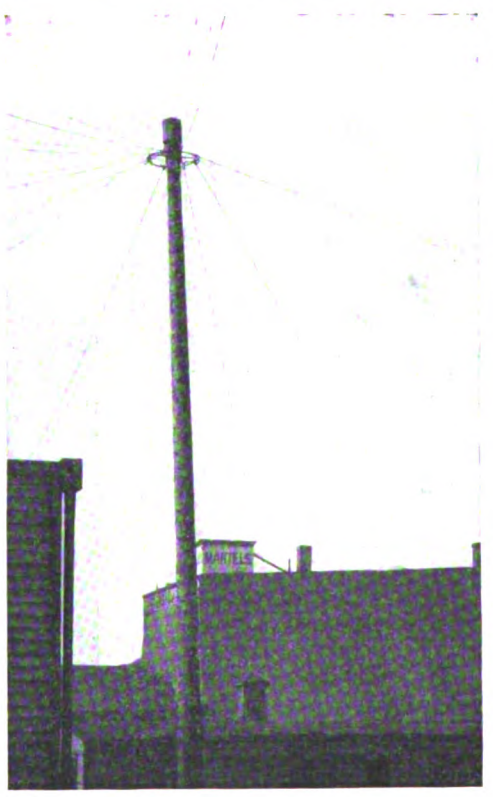

Fig. 4. Distributing pole, with loops to subscribers' stations radiating from high cable terminal.

The development of telephone line distribution having thus been briefly sketched, let us consider what, in the present knowledge of the art, can be considered the best practice of today for the distribution of the subscribers' telephone lines. It has been many times recommended and demanded by those not experienced in the art that all telephone wires should be placed completely underground, and these persons point to the water and gas systems as an example. There is, however, a fundamental difference between these systems, usually lost sight of. In the case of gas and water, one pipe is common for an entire street and may be tapped anywhere along its length. In the case of telephone distribution we must provide a separate pair of wires all the way from the exchange to each subscriber's premises, and no common line can be tapped as is done in the gas and water systems. This makes the difficulties and the expense of direct underground connection very great, and if enforced, would necessarily result in a large increase in the cost of service to the subscriber.

In modern engineering practice, before building the distributing routes in any city or district it is customary to prepare a development study which shows the number of subscribers to be expected at the end of definite periods for the next twenty years, and also to predict the probable routes and the number of ducts required for this distribution. From studies recently made it seems best to limit the number of wires carried in cables on pole lines to about 400 pairs, and that above this limit the distribution should be made underground. On this basis it will be seen that it is economical to extend the underground conduit system along what might be called "feeder routes" throughout the residence sections of the city. In districts where there are underground conduits it is to be recommended that direct underground connections be made to the various buildings, wherever the number of telephones in each building will justify the expense of such a connection. This is particularly true of office buildings, apartment houses, large stores, hotels, etc.

Where direct connection is not economical the vault system or the wall wiring system may be used. In the vault system a cable is run into one of the basements in the block, and from its terminal are carried distributing wires through the other vaults to the various telephones. This system is limited in its application, because of the irregularities and sometimes the absence of vaults, and because of the objections of property owners to having the telephone company's employes frequently passing through

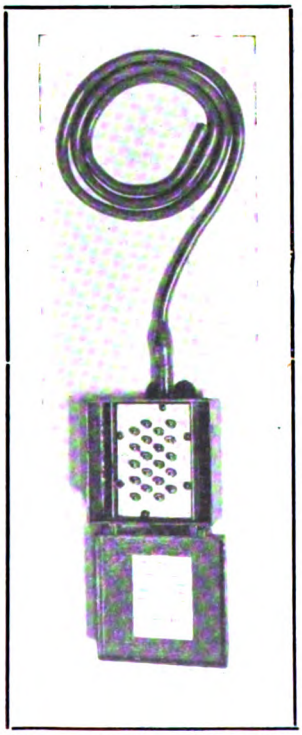

Fig. 6. Photograph of ten pair cable terminal.

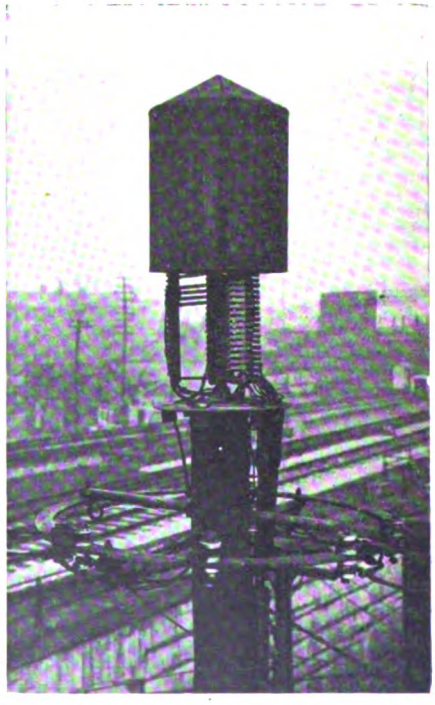

Fig. 5. Detail of terminal shown in Fig. 4, with cover partially removed. Circle top and method of leading off station loops shown below the terminal.

Digitized by Google

their basements. In the wall wiring system a small terminal is placed on the rear wall of one of the buildings, and from it are run through rings, twisted pair No. 18 B. & S. soft copper, rubber covered and braided wire to the different telephones. This type of distribution is very neat, economical in first cost, and the maintenance expense, because of the protected condition of the wires, is very small. It will be found that this style of distribution is particularly suited to second-class business districts and first-class residence districts in the vicinity of underground conduit routes where the buildings are built close enough together to prevent long spans of ring wiring. In Figure 3 is shown a typical example of this kind of wiring. Where the buildings are very much scattered and the lot and building lines irregular, it seems that some form of a distributing pole will furnish the best and most economical service pending the time that the block is so closely built up as to warrant direct connection or wall wiring. It is possible to design this type of pole with a small circle top and if the wires are strung from it in a neat manner without attempting to encompass too much territory, the effect, although not beautiful, is not displeasing. A typical example of distribution from a distributing pole is shown in Figure 4. In Figure 5 is shown the wiring of one of these poles at close range.

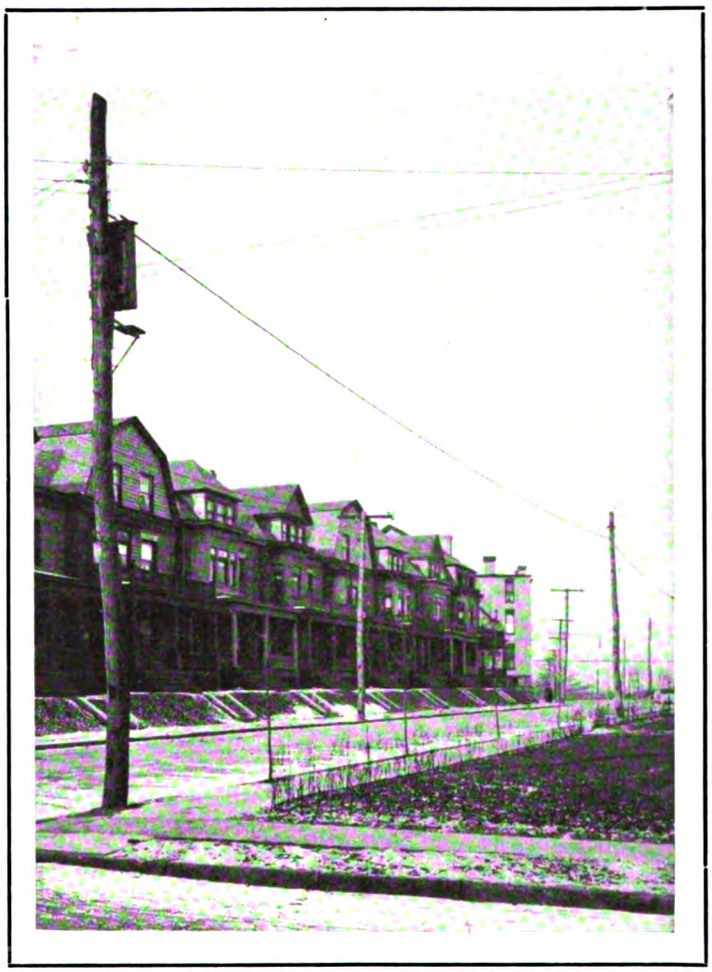

Fig. 7. Example of aerial cable terminal, with paired wires led off directly to nearby residences.

After agreeing that the main feeder routes should be underground and after providing for distribution in the immediate vicinity of these routes by means of direct connection, vault or wall wiring systems, as described above, there still remains the problem of distributing aerially the subscribers' lines on the many side streets. In the majority of our cities to attempt to make such distribution completely underground would either financially involve the telephone companies or else make the cost of service prohibitive to the subscribers. As explained earlier in this paper, the aerial distribution of telephone lines has in the past largely been done by means of tall open wire leads, supplemented with aerial cables. On account of the rugged character of the territory of the C. D. & P. Telephone Company the streets in the various towns are, as a rule, very narrow and crooked, which made extremely difficult the building of tall, open wire leads for distributing telephone lines.

Early in the year of 1898 it became apparent to the engineers of the C. D. & P. Telephone Company that some new form of construction must be developed if it was hoped to distribute aerially the thousands of wires being required by the rapid expansion of the business of the company. An aerial cable system of distribution was conceived by Mr. Bliss and Mr. Snyder of the Engineering Department, and they, in conjunction with Mr. Donaldson of the Construction Department, proceeded to prepare plans for its installation. It should be stated, however, that the Bell Telephone Company of Philadelphia independently installed, at this time, an aerial cable system in Germantown, Pa., although for several years they did not extend this type of construction. Since 1898 the aerial cable method of distribution has been followed exclusively in the territory of the C. D. & P. Telephone Company, wherever it was desired to distribute subscribers' lines aerially. Low poles of 30 to 35 feet in length have been used and aerial cable placed at the tops of the poles. On alternate poles and sometimes on every pole was placed a 10-pair junction box. Each pair usually appeared somewhere along the lead in from two to three separate terminals, so it was possible to make use of any particular pair at different points, and furthermore the multipleing was so arranged as to permit the economical grouping of party lines. From the lock nuts of the terminals No. 14 B. & S. gauge copper, rubber covered and braided twisted pair wire was strung direct to the protector at the subscriber's premises, no cross arms being used along the lead. On account of the short length of rubber insulated wire used in running the subscriber's loop, no protection is necessary at the cable

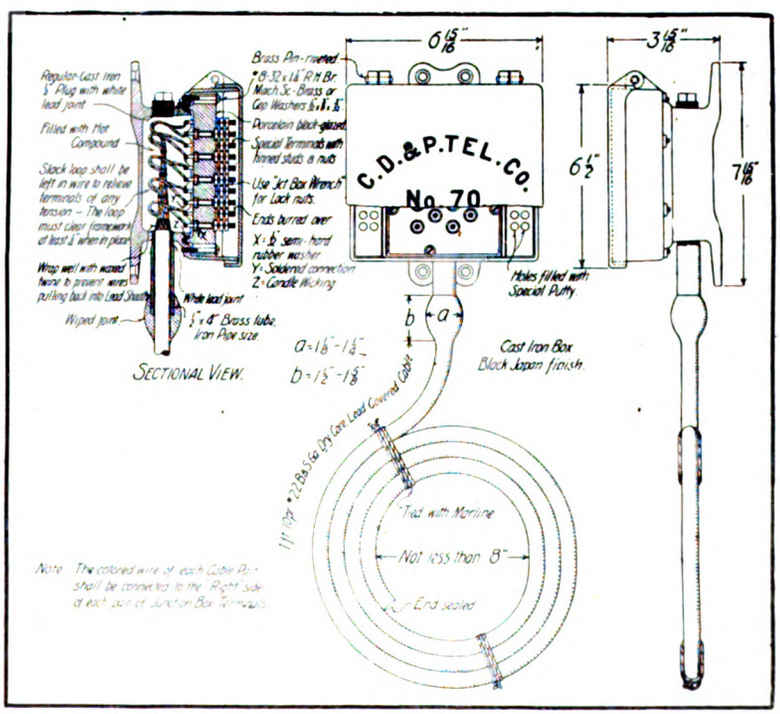

Fig. 8. Detail of cable terminal used for distribution as shown in Figs. 1 and 2.

Digitized by Google

terminal, but each line should be fused at the place where the aerial cable is connected to the underground cable. A cable system of this kind is highly useful for distribution at right angles to underground conduit base lines and along streets that will in the future be provided with underground subways. Construction of this kind is not an "eye sore," does not invite criticism, and the result is that underground legislation lies dormant for many years. An example of this style of construction is shown in Figs. 1, 2 and 7, and a detail of the construction in Fig. 9.

Because of the large number required, an important part of an aerial cable system is an efficient and economical terminal. About two years ago this matter was carefully investigated and a terminal designed which was low in first cost, low in maintenance, and possessing a long life. This terminal is built up of essentially two elements, a cast iron box and a porcelain block for mounting the lock nut terminals. In developing this terminal the first point insisted upon was the use of a dry core cable for the tapping cable, which form of cable is cheap and besides is easily handled and spliced by the cable splicers. A drawing of this terminal is shown in Fig. 8 and a photograph in Fig. 6. It can be used for vault wiring, wall wiring, and on poles for aerial cable lines. The cost of a 10-pair size is $2.45, and it is believed that the life will be at least fifteen years. The labor of placing and splicing is $1.70 when connected to a 50-pair cable, and the material used for splicing amounts to $1.15, which makes the cost of a complete 10-pair terminal $5.30. This type of terminal has been in service nearly two years, and tests in all kinds of weather have shown them to have a high insulation resistance.

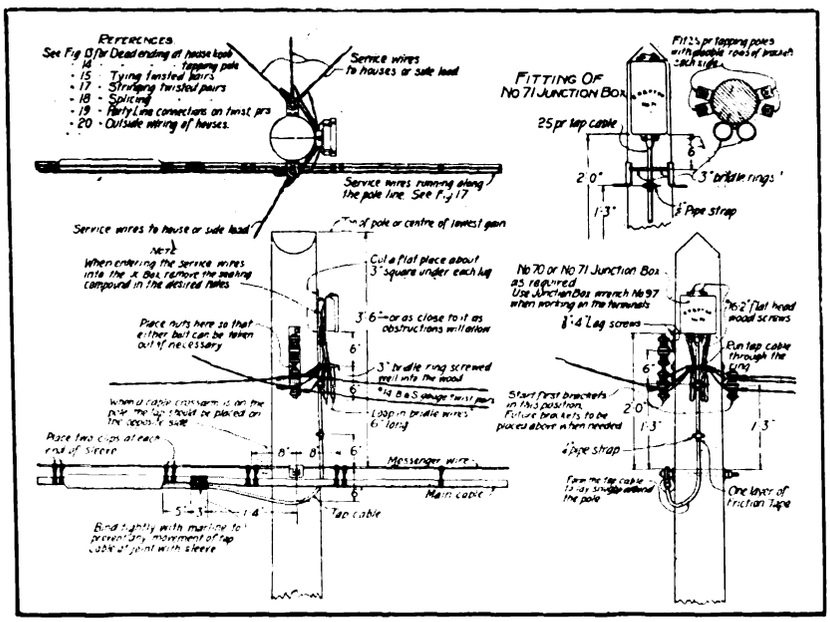

Fig. 9. Details of construction under distributing plan illustrated in Figs. 1, 2 and 3.

About two years ago a number of studies were made to determine the most economical system, or in other words the system having the lowest annual charges, for distributing telephone lines aerially. The annual charges is made up of interest, taxes, depreciation and maintenance, and it is apparent that the system having the lowest first cost may not be the most economical in the long run. Different groupings of subscribers were assumed and their distribution was effected by open wire systems, aerial cable systems, aerial cable with taps on every pole, aerial cable supplemented with bare wire, etc. It was found as a result of these studies that the aerial cable system with taps on alternate poles and with rubber covered wire, directly connected from the aerial cable terminals to the protector in the subscribers' premises was generally the most economical. This system, besides being the most economical, is by far the most sightly of any form of aerial distribution.

It is obvious that on many streets where there are but a few telephones it would not be economical to place an aerial cable at once, but the distribution must be initially effected either with bare wire or twisted pair rubber covered wire. A study of these cases showed that it was economical to distribute all telephone lines within a thousand feet of aerial cable routes with twisted pair wire strung on iron distributing backets, no cross-arms being used. Where the distance exceeded one thousand feet and where there were no obstructions in the way, it proved to be economical to distribute with No. 14 N. B. S. bare copper wire placed on cross-arms, the loop to the house, however, being run with twisted pair wire. It was further proved that it was desirable both from an economical standpoint and from the standpoint of appearance and service to replace the bare or covered distributing wire with an aerial cable when there was an average of about ten circuits on the line. The study also showed that when this cable was placed it was economy to remove the old distributing wire, and not attempt to use it by placing taps on the cable far apart. It may be taken as fundamental that it is not economical to parallel cable wires with outside distributing wires strung on cross-arms or brackets. The cable should be so tapped as to make the length of the subscribers' loops a minimum. This last point is very important and every effort should be made to extend the cable system and make the subscribers' loops of a minimum length. If this is done it is economy to construct them of high grade material, i. e., of first quality twisted pair rubber insulated and braided copper wire.

Summarizing, it would seem that the following rules for distributing telephone subscribers' lines may be followed with economical results:

First, that where the number of circuits will exceed 400, underground subways be built, and the distribution in the immediate vicinity of these feeder routes be effected by direct connection, vault systems, wall distributing systems, or circle top distributing poles, according to local conditions.

Second, that where aerial distribution is resorted to a cable be placed on low pole lines, in general not exceeding 35 feet in height, if the number of subscribers will justify the expense of placing the same. This cable is to be provided with 10 or 15-pair terminals without protection on alternate poles, from the lock nuts of which to the subscribers' premises the connection should be made with twisted pair No. 14 B. & S. gauge, hard drawn copper wires, insulated with a high grade of rubber compound and protected with heavy, separate braids. Where the distribution is very dense a tap may be placed on every pole, and in thinly settled districts through which the cable may pass, a tap should be placed wherever by so doing 300 feet of twisted pair cable can be saved.

Third, that on side leads at right angles to aerial cable lines, twisted pair wires strung on brackets should be used for distribution to subscribers located within a thousand feet of the cable line. If the subscribers are at a greater distance than one thousand feet, all distribution on these side leads should be effected by means of No. 14 N. B. S. bare copper wire, strung on standard cross-arms, provided there are no obstructions in the way, such as trees, foreign wires, etc., which would necessitate the use of high poles. If obstructions are met with a special study should be made to determine which is most economical setting of high poles, use of twisted wire on low poles, or the placing of a cable.

Fourth, that when the number of circuits on a pole line reaches ten to fifteen, a cable should replace them. This cable should be provided with terminals on alternate poles so that the bare wire or covered wire formerly strung along the lead for local distribution can be removed and returned to stock, since as before stated, it is not economical to parallel cable wires with bare or covered distributing wires.

Digitized by Google

It is certain that in the coming years the number of telephones is going to increase at a most rapid rate, and the engineer has before him a difficult problem in designing and constructing the lines necessary to connect these telephones to their exchange centres.

It is true that as the number and therefore the telephonic density increases, the line construction cost per telephone is very materially reduced, and it may be that some time in the future we can see the way clear for a complete underground distribution of all telephone lines on the most important streets of our cities. I believe, however, that this period is many years ahead, and it can well be asked, Why should the telephone companies, and therefore the public served by them, be burdened with the additional expense entailed by complete underground distribution as long as it is possible to economically distribute in a sightly manner from properly designed aerial cable lines?

Forcing Collections*

By F. V. Newman.

WHEN Independent telephone companies were first established, it was necessary, owing to conditions, to secure the largest number of subscribers available. Consequently, not enough attention could be given to the work of systematizing and forcing collections. In the rush for new subscribers, it often occurred that the financial liability of many of the subscribers secured was such that they were unable to promptly meet their rentals when due. The Citizen's Company has now made arrangements with the local credit company to furnish a report when in doubt concerning the financial standing of new applicants. This has proven a good investment. We have found it necessary to insist on payment of the first quarter's rental before any work is done toward the installation of the service.

It has been demonstrated that we have already saved enough money, by refusing to make installations to pay the cost of obtaining reports from the credit agency. If the credit company's report is unfavorable, and the subscriber does not pay the quarter's rental in advance, the application is cancelled. If one quarter's rental is paid promptly in advance, the information furnished by the credit company is filed for future reference, and is constantly reviewed to see that the subscribers' payments are promptly made. This has given us a mint of valuable information, and put us in a position where we are in constant touch with the financial conditions of our subscribers.

New companies, at the time of starting business, as a rule adopt the plan of allowing a discount for payments made at the office for rentals in advance. It might be interesting to know the cost of making collections in the Grand Rapids exchange of the Citizen's company, an exchange of 7,470 telephones. The total of the gross rental and toll service per annum was about $250,000.00 for the year of 1905, and the cost of collections was about two per cent. of the whole amount. If the Citizens' Telephone Company had in vogue the discount plan at the present time, with the present rates in force, it would cause a loss. Persons who avail themselves of the discount are the people who pay the bill on presentation by the collector. If the Citizens' Telephone Company were to allow a discount of only two per cent. the cost of making collections would be increased, as even with the discount plan it is necessary to engage a certain number of collectors to force the slow or delinquent subscribers to pay, as well as to collect amounts due after telephones have been discontinued, and to this must be added the cost of mailing and collecting of toll bills under the discount plan.

During the months of January, 1905, 53 per cent. of the whole amount of rental and toll earnings for the Grand Rapids exchange was collected. During the quarter, 85 per cent. of the whole amount was collected. During the month of January, 1906, the first month of the quarter one year later, 64 per cent. of the amount was collected, an increase for one year of 11 per cent. This was done through good systematic efforts on the part of the collection department, with the co-operation of the management of the company. We believe it is advisable, unless a special request is made to have them mailed, to have a collector deliver all bills. It is customary to have the bills arranged according to routes in the city, and before the collector leaves the office, a record is made of the amount due. If a settlement is made on presentation, the fact is noted. The object of this is to give the collector a complete record of all collections due in his own district. If any collector receives an appointment to receive a payment at a certain date a memorandum is made and filed in the office. The importance of the collector's calling on the date set is urged very strongly, in order that the subscriber may have no excuses. In the middle of the quarter subscribers who have not paid accounts due receive a written demand for settlement. This is followed a little later with a written request that payment be made on a certain date, in order to insure continuance of the service. During the year of 1905 there were discontinued 55 subscriber's telephones connected with the Grand Rapids exchange for non-payment. From Jan. 1, 1906, up to the present 11 telephones were discontinued.

In the collection department there is located a switchboard to which delinquent subscribers' lines are connected. If a subscriber does not pay his account his line is connected on this board and he is advised that the account must be settled before further outgoing service can be furnished. If within a reasonable length of time the account is not paid the instrument is removed from the subscriber's premises.

It is customary, after a subscriber's instrument has been discontinued, to present the bill for payment, and if immediate settlement can not be had the account is referred to the local credit company for collection. In this way we have been able to realize considerable on accounts where our regular collectors could not obtain settlement. The Citizens' company has charged off as uncollectable for the year 1905, at the Grand Rapids exchange, a little less than one-third of one per cent. of the total rentals and tolls charged, which we consider a very gratifying record.

Weekly review meetings are held, in which the collection department and active management of the company participate. The accounts due are gone over very carefully and notations made regarding the subscribers' promises, etc. We have found these meetings to be worth their weight in gold, as the collectors appreciate the courtesy of meeting with the management of the company, and it always gives them good encouragement to force collections. At one of the monthly evening meetings, the general manager of the company spent the evening in answering questions put to him by the collectors. These questions consisted of numerous inquiries made by subscribers regarding miscellaneous information desired by them.

As a rule, it is usually the same subscribers who are in arrears time after time. We decided some time ago to take up these special cases and force the prompt payment of rentals. The collectors were requested to hand in a list of those subscribers, who were notified that they would have to pay promptly. We have found this a good plan, as a large per cent. of the subscribers who formerly did not pay until the latter part of the quarter are now paying promptly in advance. This has all been accomplished without arousing any antagonistic feeling on the part of the subscriber toward the telephone company. Considering the 17 per cent. increase in business in the last year, to-day the amount of outstanding accounts of the Grand Rapids exchange is lower than it has ever been.

Many telephone companies do not consider carefully the im-

*Read before the convention of the Michigan Association.

Digitized by Google

portance of the collections. Schools for the education of operators and solicitors are maintained by certain companies; why not have a school for the education of the collector, who comes closer to the subscriber than the management of the company? If you expect good results, you must keep constantly in touch with the collections and offer encouragement in the way of a fair salary to collectors. Usually, when an employe makes a success in the collection department his services are considered valuable for this department only, and he is not given an opportunity to grow up in the electrical or mechanical end of the business.

Good results in forcing collections have been obtained in the outside exchanges by the Citizens' Telephone Company and a card record system is kept of the collections. These are compared by the general manager, and if any indication is shown that the collections are going behind the matter is immediately brought to the attention of the local manager. We have also tried the experiment of sending to the outside exchanges an experienced collector to take up delinquent accounts and have found this a good plan. The local manager, as a rule, is inclined to be lax in forcing collections, as there are numerous other duties that demand his attention, and also the deadly, dull routine of collections and making of reports are not very inviting duties. I recall where we had an exchange of about 75 telephones and a commissioned manager in charge. We impressed on him the importance of forcing collections and he would always respond by stating, "the subscribers did not care to pay in advance." Recently the management of this office was changed and a large number of subscribers added, and a salaried manager assumed charge of the office. The bills were presented promptly and about 95 per cent. of the collections were made during the first month of the quarter. Local managers are now asked, "What is the amount outstanding?" instead of, "how many subscribers has your exchange?"

This all has a tendency to show that if you have the tenacity to stick to it, you can force the collections. We all realize that it is a great deal easier to collect rental and toll charges when they are due than later, and this is especially true of toll bills. If allowed to accumulate, it is harder to force the collections, as the subscribers, as a rule, seem to consider that the telephone company has an abundance of capital and it not in great need of the money. We have spent some time in educating the collectors as to how the toll calls are recorded and forwarded to the line operators and the routine work, in order that they can easily discuss with the subscribers any question regarding a toll charge that may arise. Often the subscriber claims that the call did not originate at his telephone, or that he was positive that he had not talked overtime, as charged.

In the collection department is placed a blackboard, on which is noted the amount of money collected in the same period for the previous quarter, also the names of each collector. The amount collected each day by every individual collector is posted opposite his name and each morning the collectors know if the collections are up to the previous record for the corresponding day. It is surprising to know with what interest the collectors' eyes scan the board when the amounts are posted. This stimulates the activity of the collector to reduce the outstanding account and promotes a healthy competition between collectors that brings good results to the company.

HOW TO MAKE A MULE GO.

DID you ever drive a mule? If you have you know some things about perversity and also how to become resigned to fate. Since the very earliest times the mule has been recognized as the personification of stubbornness, and no means was ever discovered to overcome this peculiar brand of cussedness until just a week or so ago. Next time you look at a telephone see if you can note any particular part about it that looks as if it could come out first best in a contest with a mule. It does not look so, but nevertheless it's a fact that the means to fill a long felt want in the mind of the mule driver has been discovered to be the brand with a crank attached.

Down in West Virginia near Clarksburg two linemen were driving two excellent examples of the mule family along the country road when without a word of warning or even so much as a bat of a tail the wagon came to a dead stop, almost throwing the unsuspecting occupant over the dash board. A careful examination failed to unearth any reason for the mulelike action, and all pleadings were in vain. The mules intimated as plainly as they could that the exact spot upon which they stood suited them very well as a resting place, and they didn't intend to move. Then, while one kept his weather eye open for trouble and his hind legs in a particularly effective position to ward off any unseeming incivilities from the rear, Mr. Mule No. 2 dropped his head as far as he could and went off into a pleasant sleep, dreaming of a mule heaven. Meanwhile the two linemen who had been up against a similar state of affairs before were racking their brains to discover some means to get home before the shades of night should fall.

Suddenly an idea came to one of them. Without saying a word he cut two lengths of copper wire, and getting down from his seat, ran the wires along the mules' backs and sides under the harness and connected the two ends to a telephone in the wagon. Then he got a pail of water from a nearby homestead, explaining that the mules were thirsty and hot and needed a bath. Getting up into the wagon the water was carefully poured over the backs of the beasts, who all unsuspecting of the dire calamity that was to overtake them, dozed on. With a last admonition to the driver to sit tight and hold fast, he got into the body of the wagon and started to ring. Like a shot from a gun the two mules leaped forward, nearly breaking the harness, and fled from the spot at breakneck speed. Never before had they experienced the like, and what their feelings were can be left to the imagination. Mile after mile they sped till at last thoroughly exhausted they allowed the driver to bring them to a stop with the tongue of the wagon thrust into a bank. Ever since that time it has been found necessary to blindfold them when loading up so that they can't see any telephones being put in the wagon and all the driver has to do to get them going some is to say "telephone."

DOUBLE TAXATION.

THE Court of Appeals of Kentucky has held that where a telephone company is paying a franchise tax, a municipality cannot impose an occupation tax as a revenue measure for the transaction of business of such corporation. This decision was made in a suit brought by the Cumberland Telephone & Telegraph Company against the Police Judge of the city of Eminence, in which the company was operating a telephone exchange, to prohibit the enforcement of an occupation tax. The charter of the city conferred power "to impose and collect license fees and taxes . . . on all franchises, trades and occupations," but "not in conflict with the constitution or laws of this state or the United States." The city council enacted ordinances imposing a license fee of $50 per annum upon the business of handling for pay telephone messages in the city. Telephone companies are required to pay to the state a franchise tax as well as being required to pay a franchise tax to each county, city or town in which it may be exercised, if such municipality imposes an ad valorem tax. The court held that the franchise tax authorized by this state law is intended to cover all the intangible property of the corporation as represented by the earning value of its capital employed in the specific business in which it is engaged. The court held that the franchise taxed by the state covered the same property as the license fee attempted to be levied by the city, and that the city's license fee or occupation tax was intended as a revenue measure, and hence was void. This occupation tax was held to be a violation of the constitutional provision requiring uniformity of taxation. It was also double taxation. Although the general assembly may delegate to cities the power to impose license fees on franchises, the constitution does not contemplate that a city may be authorized to tax the same privilege twice for the same year as against the same owner.

QUERIES

CONNECTIONS FOR STARTING INDUCTION MOTORS. (688.)

Will you please explain the method of keeping the current in a General Electric induction motor at the proper value until the machine reaches its full speed at the time of starting? C. B. W.

Induction motors manufactured by the General Electric Company are built in two forms, known as Form K and Form L, signifying respectively the squirrel cage and the resistance in the armature types, both of which are familiar to the trade. In both forms the field or stationary element is the same, the difference being in the armatures, which are interchangeable.

Because of its electrical design a squirrel cage armature type motor, if thrown directly on the line, would take a very large current at starting and, therefore, for motors of 7½ horsepower and above, a device known as a starting compensator is used to reduce the initial rush of current. This consists essentially of an inductive winding with taps and a switch, by means of which a reduced potential is impressed on the motor to bring it up to speed. With the switch in the starting position the arrangement is equivalent to a step down transformer and the product of the potential by current on the line is approximately equal to the potential times the current on the motor circuit.

Starting compensators of this character for two-phase and three-phase Form K motors consist of a core and windings, a terminal board and switch assembled in cast iron case, with an external operating handle. Perfect insulation of the whole mechanism is assured by filling the case with oil. Figs. 688c and 688b show respectively the connnections for a three-phase and two-phase Form K motor.

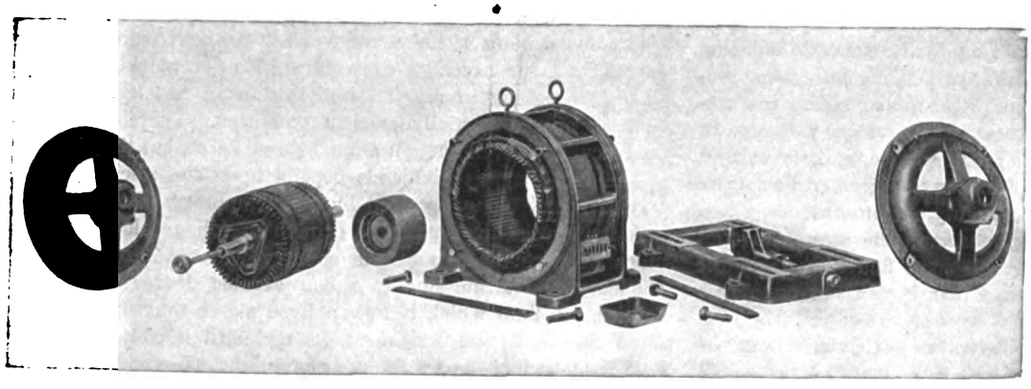

Fig. 688a. Parts of General Electric Company's form L induction motor.

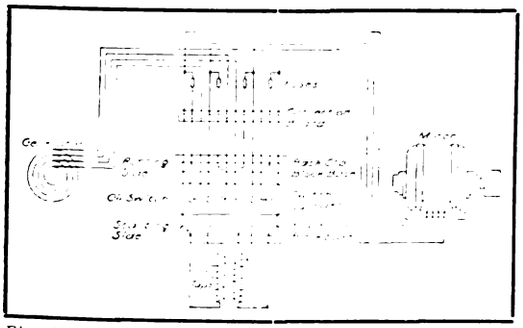

Fig. 688b. Connections for starting compensator for 2-phase form K. induction motor.

In the Form L motor the armature has a regular winding in which there is included a resistance to keep down the starting current. This resistance consists of a series of practically indestructible cast iron grids mounted within the armature edge in such a way that suitable contact fingers slide directly on each. This gives a large number of contact points with comparatively no sparking. The operating mechanism consists of a shank sliding in the hollow shaft of the motor and having a loosely mounted handle at the end so that the resistance may be cut in and out while starting the motor by pushing or pulling this handle. This makes a compact and efficient arrangement with no outside resistance boxes. The general arrangement of the parts of this type of induction motor is shown in Fig. 688a. On starting the motor all the resistance is in, and as the armature comes up to speed the handle is pushed in gradually, cutting out the resistance and allowing the motor to receive its rated current.

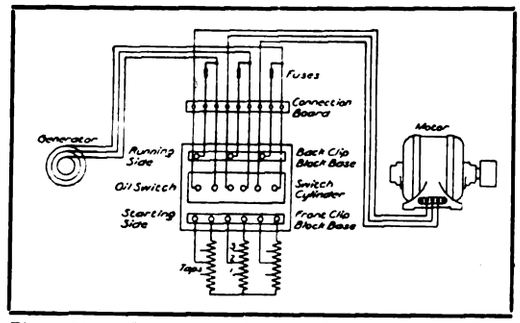

Fig. 688c. Connections for starting compensator for 3-phase form K. induction motor.

MOUNTING POWER MACHINERY. (689.)

Will you please tell me how the power apparatus for a telephone plant, such as generator, motor, and gas engine may be securely clamped to brick piers? R. G.

The iron bases of the machines are provided with drillings at each of the four corners to receive bolts projecting upwards from the brick piers. The proper method of procedure is to first locate the bolts in the appropriate places, then to lower the machines into position, allowing the bolts to slide into the holes provided for them.

To locate the bolts it is necessary to make an accurate layout of the positions which will be occupied by the machines upon the piers in order to secure correct alignment of belts or shafting.

In doing so it is better to transfer the dimensions directly from the bases of the machines themselves than to rely upon measurements, as even a slight error will make the work extremely difficult, or be liable to throw out the adjustment of running parts. This transfer may be made in the first place from the machine base to a large piece of paper, showing the entire outline of the base, with the location of the bolt holes. It is then an easy matter to mark on the base of the pier the correct positions of the bolts. They should be put in position, with the heads set in cement, and flanged washers, three or four inches in diameter slipped down to the heads, with flat side up. These washers are to distribute the pressure over a considerable surface of the brick when the nuts are turned down. After the bolts are in place the brickwork may be built up around them, holding them firmly in an upright position. This arrangement provides a firm foundation, larger in size than the base of the machine, and with bolts projecting upwards at places corresponding to the holes in the bases. Preparations of this nature, when accurately carried out, provide for the correct location of machines and for holding them firmly in position.

REMOVAL OF OFFICES.

CONTINUED progress and growth has forced THE AMERICAN TELEPHONE JOURNAL to increase the amount of office space at its headquarters in New York. At the same time that the necessity of securing more room was recognized it was determined to seek a more convenient location. The offices are now at 100 William street, New York City, where THE JOURNAL is in a position to more easily handle the work involved in the conducting of a periodical dealing with the features of a rapidly expanding industry.

THE LINE OF PROGRESS.

STATE conventions of the Independent Telephone Associations have been especially notable this year for the attention given to features of operation, in addition to hearty enthusiasm and the general recognition of the advantages of united effort. These latter features have been important in encouraging each individual to put forth his best efforts to acquire new business. Now the Independent companies, operating systems which in combination have a far greater number of telephones in service than their competitors, may well say that even their comparatively weaker members are started on a firm basis, and increase in size is certain to proceed rapidly. The result is that managers are beginning to regard the question of advancement as being pretty definitely settled, and a matter which demands consideration in detail rather than as a broad proposition. The main question now is that of striking the fastest pace that can be made in the matter of giving prompt and efficient service, and the cutting down of the cost to the telephone company of giving this service to the very lowest terms. It is thoroughly obvious that these two conditions lead in divergent directions, and the man who tries to follow both lines to the limit will soon find himself in the same predicament as the locomotive that is run out on a pair of spread rails.

If the limit is not attainable at the end of both, there is nevertheless somewhere a point where a justifiable balance may be obtained, and it is the determination of this point which represents the next great practical problem to the Independent telephone men. In fact this problem is presented in the same way to their rivals. The Bell companies, by means of a centralized organization, have been able to develop plans for systematic consideration of the subordinate problems in this main proposition.

It is obvious that the principal opportunities open to the Independent men at present lie in their meetings in conventions. In the State conventions points of view with regard to certain features of operation, maintenance and construction have reached a more or less definite form. Operating conditions in various parts of the country are so different that the opinions of many different sections do not by any means come into perfect agreement. Yet all these opinions, reached after careful consideration, careful experimenting and more or less discussion, must have considerable merit. The reason why they are not in perfect accord is rather on account of varying conditions of operation and partial lack of information which makes them differ through lack of completeness, rather than through essential errors.

The object of the consideration, which will be given to the operating features at the great convention which will be held in June, is primarily to enable each man to so round out his information as to make it easy for him to look at a proposition from all sides and judge it broadly. The benefits to be gained will not only be sufficient in themselves to make attendance worth while, but to justify the most careful consideration in advance. No man can afford to conduct experiments in all branches of the business. But there are few indeed who cannot carry one idea far enough to form opinions about its value. It is the exchanging of these experiences at the June convention of the National Interstate Telephone Association in Chicago which will help the Independent managers to meet their complex operating conditions with renewed activity and broader judgment.

MAINTENANCE OF LINES.

WITH the arrival of warmer weather opportunities for improving the condition of his open wire plant are being considered by every exchange manager. At this season the looseness of the soil causes many weak points in construction to be evident for the first time. An occasional pole is sure to lean in response to a pull which a few months ago caused no deviation from the proper and exactly upright position. A guy placed where it belongs to-day will be much more easily attached, and prove to be a far better investment than one run to the same pole later in the year when an unpleasant tendency has developed into a positive defect.

In some sections of the country disastrous sleet storms have occurred, and the necessity of restoring service quickly at a time when the making of repairs is most difficult has left many circuits in only a partially efficient condition. There is a strong tendency to let well enough alone in such cases, but the man alive to the fact that his dividends depend upon the efficiency of his service is not being deceived by any temporary safety.

A few weeks from now the growth of foliage along countless miles of wire throughout the country will tend to reduce the efficiency of transmission to a considerable degree in many localities. A limb which is now a little above the wires may sag from the additional weight of foliage until a contact is made, and the shunting effect of a number of leaf contacts is much greater than that of the bare limbs. Here, again, a little foresight will prevent the giving of business to a competitor who is able to give a service having a little higher transmission value. A swinging cross or ground which comes in on the line at all is far from unlikely to occur at a time when the most valuable subscriber is trying to talk over those wires to a town a hundred miles away.

Such troubles may not be on the lines now, but they are latent and their appearance is only a matter of time as long as the unpleasant conditions which produce them are not removed. They only await some period of unusually severe weather during the summer to make themselves felt. When they do come in, if they are not looked out for at present they are likely to appear in a group that will make the tax on the resources of the exchange rather severe. The consequent reaction upon the service and annoyance to subscribers is one of the most disagreeable of the minor difficulties with which an exchange manager has to contend. As testing by electrical methods can only deal with fixed conditions and established troubles, there seems to be but one remedy. This is inspection by a careful and experienced man. The companies which make a practice of going over their lines at this season and making thorough repairs find that it brings about results in the way of reduction of maintenance expense and improvement in the service which make its cost a negligible quantity.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

WAIVER OF WRITTEN NOTICE OF RENEWAL.

The contracts that we make with subscribers contain a provision for a written notice by the company before the telephone can be removed from the subscriber's residence or place of business. One of our subscribers fell in arrears for his rent, and we notified him over the telephone that the instrument would be removed from his premises unless he at once paid the amount due for its use. He answered that the company might do as it pleased, but when we sent a man to take the telephone out, he refused to let it be done. Is it necessary for us, under these circumstances, to give a written notice? We have already given the written notice to save time, but would like to know the law in the matter. F. M. S.

THE subscriber by stating that the company might do as it pleased waived the provision in the contract for a written notice of removal. It was therefore unnecessary to give him written notice, and the company had a right to take out his telephone. In case you had done so, and he had sued you for breach of the contract, you would have been fully protected. A case bearing on the subject is Malochee v. Great Southern Telephone & Telegraph Co., 22 S., 922, 491, La. Ann., 1690.

LICENSE FEE UNDER LAWS OF UTAH.

The city council has passed an ordinance levying a license fee of $5 on each telephone instrument operated by all telephone companies in the city. What we want to know is whether the company can tax us in this way, and whether any distinction should be made between telephones that are used entirely within the city and the instruments on our long distance lines that run out of the State. C. A. J.

UNDER sections 89 and 289 of the Compiled Laws of 1888, cities are authorized to collect a license fee on various occupations, etc. Under this section a city council is authorized to pass an ordinance to raise revenue, levying such a license fee as you describe upon each telephone instrument used exclusively within the limits of the city for local business, and for which a rental charge is made. The license fee would not be valid, however, upon instruments used for carrying on the interstate business of the company. City of Ogden v. Crossman, 53 Pac., 985.

ASSESSMENT OF TELEPHONE LINES IN IDAHO.

WM. J. McCONNELL brought suit in the Supreme Court of Idaho to inquire into the validity of the revenue laws of the state. He contended that sections 74 to 83, inclusive, of the revenue act of March 22, 1901, in so far as they attempt to authorize the state board of equalization to fix the valuation of telephones and their lines and property belonging thereto, are unconstitutional and void. The court held, however, that under the provisions of the revenue law, the state board of equalization was authorized to fix for taxation the value of telephone lines, etc., and property belonging thereto. The court also decided that it was not authorized in the suit to pass upon the constitutionality of an act upon the application of a private person to protect his private rights. This was due entirely to the form of the suit, which was a writ of review. McGonnell v. State Board of Equalization, 83 Pac., 494.

NEGLIGENCE IN LOCATING POLE IN HIGHWAY.

SOME time in 1903 a party of twenty-seven young ladies and gentlemen drove a distance of eight or nine miles in Butler County, Pa., to attend a social function at the latter place. The vehicle was a farmer's ordinary hay wagon, fitted up with a rack, and was drawn by two horses. On the way home the wagon came in contact with a telephone pole and one of the young ladies was struck by the pole, knocked from the wagon and injured. Alleging that the company was negligent in placing the pole upon the travelled portion of the road, she brought suit against the telephone company and recovered a verdict. The laws of the State granted telephone companies power to construct their lines along and upon the public highways, but its lines should not be so constructed, says the statute, as to incommode the public use of the road. The court held that the legislature did not intend by this legislation, to deprive the public of the use of the highways for any proper and reasonable means of travel, but intended that the franchise should so be exercised in subordination to the rights of the public on the roads in the State. The company contended that the driver of the wagon was guilty of contributory negligence which should be imputed to the plaintiff in the case. The driver of the conveyance was not employed by the plaintiff and it was therefore held that she was not responsible for his negligence and was therefore entitled to recover. Little v. Central District & Printing Telegraph Company, 62 Atl. 848.

QUESTIONING THE PLAN OF CONSTRUCTION.

AN electric company permitted a telephone company, for a consideration, to use one of its poles on which there were 11 cross-arms supporting 130 telephone wires. The cross-arms were supported by iron braces. The electric light wires were attached to the faces of the seventh and eighth cross-arms and extended across the lines of the telephone wires. They were held in place at the cross-arms by the use of porcelain knobs, and their insulation was by cotton covering, ordinarily used for inside wiring. The wires had been in use seven years and the covering of the wire on the seventh cross-arm was worn off at its point of contact with an iron pole which passed through a brace. Persons climbing the wires were accustomed to use the braces as supports in climbing. A young man in the employ of the telephone company was last seen alive when at about the fifth cross-arm. He was killed by an electric shock and his body was found on the wires supported by this cross-arm. There was no direct evidence that he was killed by coming in contact with the iron brace. In a suit by his mother for damages, the court held that direct evidence was not essential and that the cause of death might be inferred from the location of his body with relation to the dangers to which he was exposed. The electric company operated two lines of wires extending from its main line to the cross-arms of the pole. The court held that the placing of the wire on the cross-arm was a part of the plan of construction, and that testimony as to the construction was properly admitted. Morgan v. Westmoreland Electric Company, 62 A., 638.

INJURIES FROM COMPANY'S NEGLIGENCE.

IN the Circuit Court of Buchanan County, Mo., a boy by his next friend, brought suit against the Missouri & Kansas Telephone Company and recovered $1,500 damages on account of personal injuries sustained as a result of the company's negligence. The boy was on his way to school, when his attention was attracted by some linemen who were employed in making repairs for the telephone company upon some overhead wires. The boy asked and obtained permission from one of the workmen to take a piece of wire lying near the base of the pole upon which the workmen were busy. As he started to pick it up the workman attempted to throw a cleaver, a heavy edged tool, to a lineman who was near the top of the pole making repairs. The lineman failed to catch the implement, and it fell, striking the boy and inflicting serious injuries. The company asked for a reversal in the Kansas City Court of Appeals, because the plaintiff was permitted to show by testimony that it was customary to pass a tool from the ground by having it pulled up by a line. The court held that such evidence was proper, even though no custom was pleaded and affirmed the judgment. Brunke v. Mo. & K. Telephone Co., 90 S. W., 753.

IN THE OPERATING FIELD

INDEPENDENTS OF FIRST KANSAS DISTRICT HOLD MEETING.

ORGANIZATION of the exchange owners of the first Kansas district was given a substantial impetus as the result of a meeting recently held at Atchison. Members of this district operate exchanges in Nemaha, Brown, Doniphan, Jackson, Atchison, Jefferson, Leavenworth and Shawnee counties.

The house was called to order by C. E. Betts of Atchison, president of the district association, and Mr. J. A. Zimmerman of Valley Falls was made temporary secretary.

The first thing on the program was a talk by the chairman, who explained the object of the meeting, and also the result of the state meeting held in Wichita on Jan. 22 and 23.

Mr. Betts stated that the object of this association was to form a closer working agreement among the exchange owners of this territory, to better the conditions of the service, to arrange for additional toll lines throughout this territory, and many other things along the line of promoting the welfare of the Independents in the state of Kansas.

Next in order was a talk by the traveling secretary of the Missouri Independent Telephone Association, James F. Barnett, of Rutledge, Mo., in which he explained his methods of organizing and the gathering of statistics. He also explained the way in which he carries on his work among the farmers and makes them friends of Independent interests.

Dr. J. J. Newell, of St. Joseph, Mo., then spoke of the close relations existing between Independent operators, and the advantages which come from loyal co-operation.

Theodore Gary, of Macon, Mo., vice-president of the National Inter-State Telephone Association, outlined the policy of "What are we in the business for?" He demonstrated very nicely that the main thing in the telephone business was to receive proper compensation for the labor, brains and money invested in successfully building up the Independent systems. He said that while he believed there should be a neighborly feeling between all the operating companies, and closer relations, business should not be secured unless there was some money to be made out of the new business after it had been acquired.

O. M. Anderson, of Huron, Kan., gave a very interesting talk in regard to the relation of the Independent operators to their patrons.

J. A. Zimmerman, of Valley Falls, Kan., explained his feeling that no Independent operator could afford to sacrifice his principles in selling out to his competitors, thus withdrawing his support from the men who have been the means of aiding him in his position, and making him a successful telephone man.

The committee on by-laws and constitution made a report, and its recommendations were adopted.

At the afternoon session C. J. Myers, of Kansas City, spoke on the subject of "Toll Line Prospects, and Future Extensions."

At the time of adjournment the feeling was strong that the members had participated in a most helpful and interesting meeting.

HOME COMPANY OF ONEONTA, N. Y., EXPANDS.

WHEN the extensive improvements to the plant of the Home Telephone Company of Oneonta, N. Y., which are now under way are completed, there will be upwards of five thousand telephones in service. Numerous plants which have been receiving their long distance service over Bell lines have discontinued and will in future connect with the Home company. Among the towns benefitted are Richfield Springs, East Springfield, Cherry Valley, Cooperstown, Hartwick, Edmeston, New Berlin and Morris. Such places in Otsego county as have no Independent connections will be furnished service as soon as possible and a number of new exchanges will be built.

At present there are two thousand subscribers to the Home Telephone Company's service, and this number is being rapidly increased by secessions from the Bell lines.

INCREASED CAPITAL INSTEAD OF SELLING OUT TO BELL.

WHEN a proposition made by the Bell company to the Hilton (N. Y.) Telephone Company for the sale of its property was brought to the attention of the stockholders at a recent meeting, it was emphatically turned down. As a further evidence of the intention of the Hilton company to remain Independent, it was decided to increase the capital stock from $8,000 to $15,000, in order to provide funds to expand the plant to meet the ever-increasing demand for Independent service. The present capacity of the plant will be increased at once by additional switchboard facilities and new lines. During the coming summer all the territory within the vicinity of Hilton will be covered and new long distance and toll lines are to be built to connect with the other Independent systems in this part of New York State.

NEW EXCHANGE FOR GALESBURG, ILL.

RAPID development, added to a desire to give its patrons the best service possible, were the reasons for the construction and equipment of the new exchange of the Galesburg Union Telephone Company. The building is a two-story structure of brick and stone, with a spacious basement. On the lower floor are the offices of the company and the upper floor is occupied by the switchboard, which has an ultimate capacity for 10,000 lines, and the operator's quarters. The power equipment is in duplicate and every precaution has been taken to prevent a breakdown from any cause. The total cost of the building and equipment is in the neighborhood of $50,000, of which the switchboard cost $20,000.

AN EXCELLENT EXAMPLE OF PROSPERITY FURNISHED BY AN OHIO COMPANY.

FINANCIAL considerations furnish sure indications for judging whether a company's growth has been healthy and rapid.

An excellent document pointing to existence of this satisfactory state of affairs is the recently issued prospectus of the Newark Telephone Company of Newark, Ohio.

This company was organized in December, 1894, with an authorized capital of $20,000. The rapid growth of the business, however, soon necessitated an increased capitalization which has been added to from time to time until it at present amounts to $150,000. Of this amount $60,000 is common, $40,000 preferred stock redeemable and $50,000 preferred stock absolute. The entire issue of common stock has been sold for the past five years and is now listed on the Columbus Stock Exchange at 115. The redeemable preferred stock which draws 6 per cent. interest is to be taken up at the end of ten years. The absolute preferred stock is now being placed on the market and has already nearly all been sold. It draws a 6 per cent. dividend, is non-taxable, and the holder has the same voting privileges as the holder of common stock.

The plant has a bonded indebtedness of $40,000, but this is being reduced by a yearly payment of $5,000 from the sinking fund, the first payment having been made on April 1, 1905. There

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—By a large telephone factory in Chicago, young men not over 22 years of age, preferably graduates of high schools or technical schools, to enter an apprenticeship course and be trained to install and operate modern central office equipment. Address, stating age, education and experience, Box 582, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 582

WANTED—Position as Exchange Manager. Fully competent to do all kinds of switchboard and telephone work. Five years' practical experience. Address Ernest Still, Lock Box No. 6, Creighton, Mo. 592

WANTED—Position in auditing department. Capable of installing system of accounts. Also, position for experienced contract agent and adjuster. Address Box 601, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 601

WANTED—At once, two first-class Independent solicitors for work in Missouri. Salary at beginning depends upon references. Address Box 409, St. Joseph, Mo. 602

WANTED—Position as manager in exchange of 1,000 subscribers or less. Have had five years' experience in telephone business and am graduate of International Correspondence Schools. Best of references. Address Box 597, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 597

WANTED—Continued

THE point is just this! Are you dissatisfied with your present position—or have you an employee who is unsatisfactory—in either case, where could you turn better for relief than to a corps of trained employment experts? We have secured better positions for thousands of men, and have supplied thousands of employers with competent men. Why hesitate? Booklets can be secured for the asking. Hapgoods, Suite 511, 309 Broadway, New York City. 464

WANTED—Young traveling salesman by well known concern making high grade line of interior apparatus and supplies. Fair salary and traveling expenses to start. Give full particulars as to qualifications, experience, age, habits and references. Address Box 603, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 603

WANTED—Position wanted by an all round telephone construction man who is thoroughly competent, sober and reliable. Best of references. Have completed course in telephone engineering. Address Box 587, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 587

WANTED—Position as Auditor for Independent telephone company. Experienced in telephone accounting during construction and operation. Best of references. Address Box 595, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 595

WANTED—Position with telephone company by young man with automatic and manual experience. Best of references. Address Box 605, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 605

WANTED—Position as manager of common battery exchange by capable man with ten years' telephone experience. Address Box 606, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 606

WANTED—Manager for Independent operating company. One who is at present employed in a like capacity. State references in reply. Exchange of 2,000 subscribers. Address Box 607, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 607

WANTED--A few first class cable splicers with a large telephone company. Good chances for steady work. Good wages. No strike. Address Box No. 604, care The American Telephone Journal, 100 William St., N. Y. City. 604

A Secret Calling Device

Can be attached to any bridging generator. Will work on both metallic and grounded lines. No push button. No extra wiring. Complete device, 50 cents each

WILLIX & YOUNG, - - - Mt. Vernon, Iowa

Digitized by Google

is not a dollar's worth of watered stock in the entire capitalization; in fact a large proportion of the earnings have been reinvested in the plant, which is in a first-class condition.

The equipment is central energy and the major portion of the wire plant is cable, which reduces the maintenance charges to a minimum.

At the end of December, 1905, the company had 2,085 subscribers. For that month its gross earnings were $3,488.59, and net earnings $1,820.92.

It is worthy of mention that since 1902 the gross earnings have been per month increased by about $2,300; the expenses for a like period have only increased $1,000, so that the net gain is more than $1,300 per month.

The building up of this extremely satisfactory condition is due to the low charges for maintenance, and especially to the high point of efficiency which has been attained in operating, under the direction of C. E. Hollander, who has been manager of the exchange for nearly four years.

Present indications show that upwards of 1,000 new subscribers will be added during the coming year. New cable to the extent of 3,500 feet will be installed and other improvements made to keep up the high standard of service. The officers of the company are H. Swisher, president; Edward Kibler, treasurer; J. C. Brennan, vice-president; C. H. Spencer, secretary.

GOOD FINANCIAL SHOWING OF KEYSTONE CO.

FROM the February statement of the Keystone Company of Philadelphia (including the Keystone Telephone Company of New Jersey and the Keystone State Telephone and Telegraph Company of Pennsylvania), which has recently been issued, it is possible to show a comparison between the earnings and expenses for that month and the eight months previous, which portrays a healthy financial condition. The respective items are as follows:

	February.	Eight mos.
Gross	$67,533	$535,042
Net	30,897	242,703
Renewal reserve	6,611	49,361
Charges	16,667	138,193
Surplus	7,619	55,149

PIANO TUNED BY TELEPHONE.

WHEN it comes to novel feats of any kind Indiana always is found in the lead. It is said that the late ex-President, Benjamin Harrison, was the first to acknowledge the execution of a deed of conveyance over a telephone. Recently a man committed a misdemeanor in Terre Haute and fled to Illinois, where he was arrested. Rather than return to Indiana for trial he conducted his own defense over the wire, was found guilty and paid his fine, all by telephone.

The novel feat of tuning a piano by the use of this method of annihilating distance, however, remained for M. J. Archer, a piano tuner of Wabash, Ind., to accomplish. Some time ago Mr. Archer sold a piano to Mr. Thos. Pilkington at South Bend. Miss Pilkington called Mr. Archer up and advised him the piano needed a tuning. She was asked to sound the instrument, which was near the telephone. The tone was transmitted clearly to Wabash, and directions were given which enabled her to change the tension. These directions were carried out and the instrument repeatedly sounded until it was perfectly tuned and the tones all normal.

CONSOLIDATED OF PENNSYLVANIA LEASES SEVERAL SYSTEMS.

AT a recent meeting of the directors of the Consolidated Telephone Companies of Pennsylvania, it was decided to lease the Easton & Bethlehem Telephone Company, the Warren Telephone Company and the United States Long Distance Telephone Company, operating at Bethlehem, Easton, Phillipsburg, Alapha, N. J., and territory surrounding these towns in Northampton and Warren counties. These companies have 250 miles of open wire lines and 50 miles of cables, with about 1,000 telephones in operation. The Consolidated proposes to develop the properties rapidly and to have at least 3,000 subscribers within a year's time. Long distance facilities will be increased and good local service made a feature. It is also proposed to greatly extend the rural line service.

The lease is for 999 years. The Consolidated will pay rental and the companies will take care of their bonds. The plants are equipped with central energy selective systems of the latest type. The Consolidated Companies are making great strides in adding to their territory and connections to long-distance points.

MEETING OF INDIANA TELEPHONE MEN IN THE SECOND DISTRICT.

THE first meeting for members of the Indiana Independent Telephone Association in the Second District was held in Ft. Wayne on April 5. This district is composed of the ten northeastern Indiana counties in which Independent development has been rapid and substantial. Vice-president W. L. Mueller presided and Elmer Popp was elected secretary. Nine new companies were admitted to membership, making twenty-seven companies, all of which were represented in the meeting. President Mueller announced that he would appoint an executive committee consisting of one member from each county.

W. S. Vivian, president of the Independent Telephone Clearing House of Michigan, was present and addressed the meeting on the subject of "Clearing-house"methods. Mr. Vivian described in a minute and interesting manner the operations of the clearing-house, and pointed out the many advantages that had been derived from it in his State. The members were highly pleased with Mr. Vivian's talk, and exhibited their interest in the subject by asking numerous questions. It was then decided that the Second District would adopt the clearing-house method. A vote of thanks was given to Mr. Vivian for his attendance and instructive address.

A warm discussion was had on the proposition to cut off from all companies having any connection with the Central Union Telephone Company. Had it been put to vote it would have been carried almost unanimously, but it was finally decided to defer action on the matter until the State convention at Indianapolis on May 17 and 18.

A general exchange of views and experiences pertaining to operating telephone systems was had, and many interesting and instructive incidents were related. Although this was the last district to organize, the interest manifested and the attendance clearly demonstrates that northeast Indiana is alive to the interest of Independent telephony.

FARMERS' COMPANY IN WASHINGTON EARNS EIGHT PER CENT.

APPROXIMATELY eight per cent. interest was earned on the common stock of the Farmers' Telephone and Telegraph Company of Wenatchee, Wash., during the past year. At the annual meeting of the stockholders the treasurer's report showed a gross income of $6,775.56 with a surplus of $1,672.93. The outstanding common stock amounts to $19,200.

This company was organized in October, 1903, to give telephone service to the town and surrounding country. From the start the growth was very rapid, there being at present 406 telephones in use besides seventy-three miles of metallic circuits. To enable the plant to be extended the directors were authorized to increase the bonded indebtedness to $15,000. Up to the present term the plant has cost $29,843.39. The officers elected were Z. A. Lanham, president; S. W. Phillips, vice-president; Arthur Gunn, treasurer, and H. C. Littlefield, secretary.

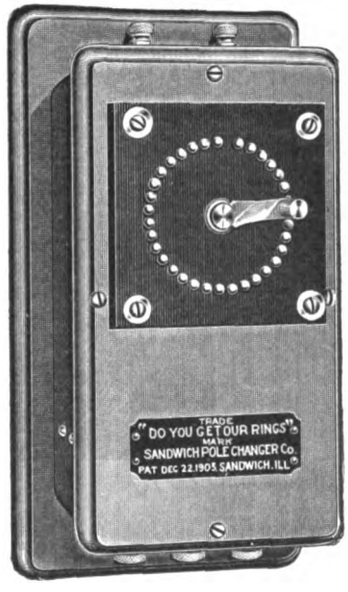
THE F. BISSELL COMPANY, TOLEDO, O.

TO GET THREE OUT OF TWO SEEMS IMPOSSIBLE

Yet the Illinois and Sandwich Duplexers easily make two metallic circuits into three



Just stop and think what this means to you in increased facilities without spending a cent for new line construction.

Here are the facts in the case: By connecting our duplexers to the two existing metallic circuits a new one is formed which utilizes each pair of wires as one side of an independent metallic line.

To eliminate all noise due to induction we provide a very simple and efficient balancing device which requires no skill in its manipulation and which will make the new circuit absolutely quiet.

Seems almost too good to be true. Let us prove it by sending a set on 30 days free trial.

We know you are interested; therefore don't delay, but write to-day

TELEPHONE PATENTS

WIRE SPLICER.

Datus C. Smith, New York, N. Y., patents (No. 815,754; dated March 20, 1906; filed August 15, 1904; serial No. 220,837) a wire splicing tool.

The object of this invention is to provide an improved means for splicing wires. To accomplish this result the inventor shows the different models embodying the same principle, one of which is shown herewith.

Referring to Figs. 1 and 2, a shank or handle is provided with

Fig. 1.

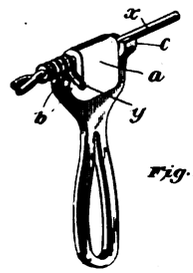

Fig. 2.

a flat part formed into a hook *a* and having notches or shoulders *b* formed on both sides of the hook. A notch *c* is provided at the other end of device.

In operation one wire *x* is placed in position beneath the hook *a* and over the hook *c*. The wire *y* to which it is to be spliced is then caught by one of the notches *b*. The two free ends in the direction of *b* are then grasped by any suitable tool and the splicer is revolved, which causes the wire *y* to coil around the wire *x*. To complete the splice the tool is disengaged and applied to the end of the wire *x* and the wire *y* in a similar manner.

TELEPHONE SYSTEM.

Elmer A. Terpening, Geneseo, Ill., patents (No. 814,571; dated March 6, 1906; filed September 6, 1904; serial No. 223,413), a telephone system.

The principal object of this invention is to provide a means whereby any party on a party line can call any other without signaling the exchange, or call the exchange without disturbing the bells of the other parties. Means are also disclosed whereby parties on one side of a divided circuit party line can call subscribers on the other.

To accomplish these results the inventor provides circuit changing switches in conjunction with a generator which can deliver either alternating or direct current at the sub-stations and a relay of a special and peculiar design at the exchange which responds only to direct current. This relay when actuated closes the local indicator circuit at the switchboard.

TELEPHONE SYSTEM.

Harold D. Stroud, Chicago, Ill., patents (No. 816,135; dated March 27, 1906; filed March 25, 1901; serial No. 52,788) and assigns by mesne assignments to the Stromberg-Carlson Telephone Manufacturing Company, of Chicago, Ill., a telephone exchange system.

In this invention means are disclosed for the inter-connection of subscribers' lines terminating at different switchboard sections. To accomplish this result the lines are terminated at two separate points, one the answering, the other the connecting position. Each substation is provided with a device which operates a selective instrument at the exchange to indicate to the answering operator the particular section in which the called for line is to be found.

As this patent is too complex to enable us to give a clear description in the space at our disposal, we would suggest that all parties interested procure a copy.

EXCHANGE SYSTEM.

Gustaf Lambert, Charlottenburg, Germany, patents (No. 813,560; dated Feb. 27, 1906; filed April 16, 1902; serial No. 103,123) a telephone exchange system.

This invention relates partly to those systems known as divided multiple and partly to the scheme of trunk interconnection between different exchanges.

The subscriber's instrument is provided with a back and front contact key adapted to close the metallic circuit of his line, or to make a ground connection on one side thereof. If he desires to talk with any subscriber whose line terminates at a different branch switchboard from his own or at a separate exchange he depresses the key according to a prearranged code and his line signal is displayed at the desired branch switchboard or at the trunk connecting position. This is accomplished by means of electro magnetic mechanism at the central office operating upon the step by step principle.

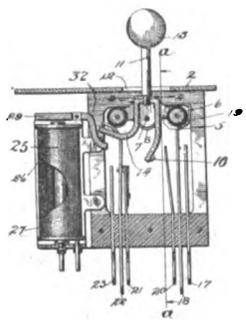
AUTOMATIC RINGING AND LISTENING KEY.

Albert Carliss, Chicago, Ill., patents (No. 815,405; dated March 20, 1906; filed June 20, 1901; serial No. 65,240) and assigns to the American Electric Telephone Company, Chicago, Ill., an automatic ringing and listening key.

This invention relates to that class of key in which the ringing movement is controlled by an electric magnet and which maintains the ringing circuit closed after the key lever has been released until the subscriber answers.

Referring to the illustrations 2 is a top plate to which are attached side plates 3 to support the key mechanism. Pivotally attached to the side frames is the rocking frame of the key, which carries, besides the spring actuated rollers 6, an irregularly shaped member 9.

Attached to one end of the key framework is magnet 25, which



is provided with an armature 29 having a downwardly and outwardly extending member 32 adapted to engage the projection 14 on the key lever.

In operation the key lever 13 would be moved in the direction to close the contacts 23, 22 thereby supplying ringing current to the line. At the same time the magnet 25 is energized and its projection 32 engages the projection 14 of member 9, thereby locking the key in position for continuous ringing. Upon the de-energization of the magnet 25 its armature releases the member 9, and the key returns to its normal position.

Perfect Switches

About 99 out of every hundred porcelain switch bases warp in baking, and an ordinary knife switch mounted on a warped base will give about as good service as a bent balance wheel in a watch.

Because, to make perfect contact between the blade and the front clip, the front and rear clips must be exactly in line, and perpendicular to the base.

But on a warped base, the rear clips lean one way, the front clips another.

Instead of the blade entering the front clip parallel to the sides and making contact over the entire surface, the blade slants, and when it enters the clip, springs the sides away, thus touching only at the top and bottom.

It is this poor contact, and the resulting dissatisfaction of the ordinary switch that has brought porcelain base switches into such disfavor.

In our new switch, we have overcome all the faults of ordinary porcelain base switches.

The porcelain is the highest grade produced, and is as nearly perfect as possible.

The clips are prevented from turning by being held into depressions in the base by heavy screws.

Perfect contact is permanently insured by making the front clips self-adjusting, as shown in the illustrations.

The bend allows each side of the clip to adjust itself to the position of the blade, and make contact over the entire surface.

For convenience in attaching the wires, the binding contacts are raised from the base.

Being held under the HEAD of the screws, the wires are not cut or scored, and so firmly are they secured that a No. 14 wire will stretch and break without pulling loose from the switch.

These switches are remarkably durable and satisfactory, and are used exclusively by a number of the largest telephone and gas engine manufacturers.

Order a standard package and give them a thorough test—they'll save you lots of bother.

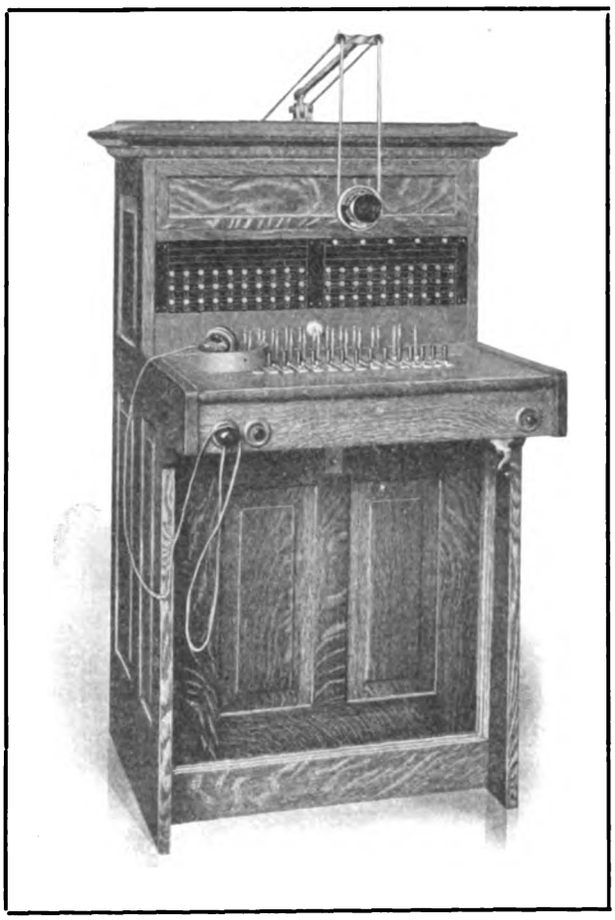
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A NEW BRANCH EXCHANGE CABINET.

IN many offices it is found desirable to have the switchboard operator act in other capacities, such as information clerk or door attendant. In such cases a low switchboard cabinet is found to be desirable as it permits the operator to look over the top without leaving her seat. The Stromberg Carlson Telephone Manufacturing Company of Rochester, New York, is manufacturing a cabinet having this characteristic feature, which is listed as No. A-2766, in bulletin No. 14. It occupies a floor space of 25¼ inches by 29½ inches and is 47 9-16 inches high. The key shelf is only 31 inches high, which makes it a very convenient board to operate. The finish is golden oak, which makes a pleasing appearance. The capacity is sixty-lamp line signals, five or ten main exchange trunks, ten central energy cord circuits, double lamp supervisory signals and one operator's equipment. The board is illustrated in the accompanying half tone, which gives a good idea of its general appearance. The company states that this type of cabinet is a standard for private branch exchanges of the class mentioned above, being much lower than the other designs of upright cabinets which it manufactures. Full information relative to this and other types of branch exchange switchboards can be secured by writing for bulletin No. 14.



New Branch Exchange Switchboard with Low Cabinet.

CHARLES A. BROWN, the well-known Chicago attorney, has recently announced that on the 1st of May he will move his office to 1550 Monadnock Block, where, with largely increased facilities, he will continue the practice of patent law in association with Lynn A. Williams, Charles J. Schmidt and Harvey L. Hanson.

THE CARBOLINEUM WOOD PRESERVING COMPANY, 126 Read street, Milwaukee, Wis., has recently received from the operating departments of the Utah Light and Railway Company the following: "CARBOLINEUM WOOD PRESERVING COMPANY:

"Gentlemen—Some six years ago we purchased from your company 5,000 or 6,000 ties treated with the 'Avenarius Carbolineum' process, and after being in the ground five years, we had occasion to see what the result of the treatment was, as they were placed in side by side with other ties. We found that the treated ties were in first-class condition, showing no signs of decay, while the untreated ties were two-thirds rotted.

"About two years ago the Consolidated Railway and Power Company consolidated with the Utah Light and Railway Company, and the engineer questioned the advisability of continuing the treating of these ties. After examining and seeing the results of the previous five years, he concluded that we should continue to have all new construction ties treated with Carbolineum; we have now somewhere near 30,000 or 40,000 ties in our road, and giving us entire satisfaction so far.

(Signed) W. P. READ, Supt. Railway Service."

LARGE TRANSFER BOARD AT CHEROKEE, IA.

THE New State Telephone Company of Sioux City, Iowa, has just placed an order with the Monarch Telephone Manufacturing Company of Chicago for a new switchboard for Cherokee, Ia. This switchboard is to have an ultimate capacity of 1,000 combined self-restoring drops and jacks, 100 cord equipments and five operators' sets. The board is to be made up in five sections, each having a capacity of 200 drops and jacks, twenty cord equipments and one operator's set. The Cherokee board is to be non-multiple, transfers being provided in all sections for connecting lines of one section to lines of the other sections. It will probably be the largest board of its kind in the State of Iowa and it shows that there are still strong advocates for magneto non-multiple exchanges for cities having less than 1,000 subscribers. The Monarch Telephone Manufacturing Company says that it is to furnish its most up-to-date and perfect equipment, and is to provide the finest board of this type that can be produced.

The cabinet is to be made in sections which are to match up with each other, so as to form a continuous unit when installed. The facilities for transfers, order wire circuits and other means of inter-communicating on the board, are to be of the most improved type. In the third operator's section are to be installed forty toll and farmer lines and in each of the other sections these toll and farmer lines are to be multipled. Any operator can secure a toll connection without connecting through a transfer circuit, which will facilitate the operation of the toll lines, and will make the service most efficient.

The New State Telephone Company owns and controls a number of exchanges in the vicinity of Sioux City in addition to the hundreds of miles of toll lines throughout the Northwest part of Iowa and the Eastern part of Nebraska. This Cherokee exchange will be designed for high grade service and the Monarch Telephone Manufacturing Company can be congratulated upon its success in securing the order for so important a switchboard.

With the board a complete lightning arrester and distributing frame is to be furnished. The equipment is to be installed in a new building which is now under construction.

THE STANDARD UNDERGROUND CABLE COMPANY announces that since the destruction of the Rialto Building in San Francisco its business which was conducted there is being carried on in the Bacon Block, Oakland, Cal.

How to Save Money on Poles

Within the past ten years more poles have been used than ever before. The demand is constantly increasing and within a short time will exceed the supply. Throughout the lumber districts of this country vast areas of denuded forest bear testimony to the rapid decrease of the available timber. So grave are the present conditions that the National Government, as well as many of the affected states, are considering prohibitive measures for the protection of the remaining forest areas.

From these facts it is not difficult to foresee that the cost of poles will rapidly increase and the problem of preservation, therefore, becomes one of immediate and serious consideration.

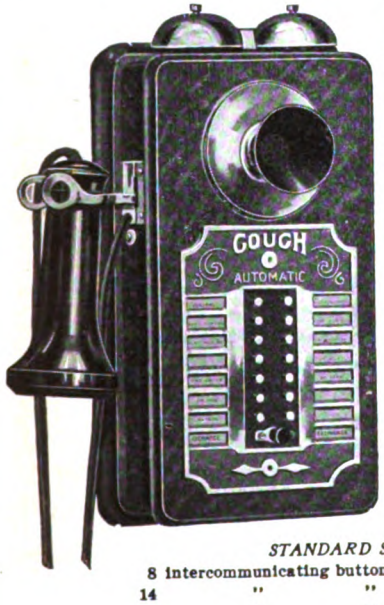
European countries were confronted with similar conditions more than thirty years ago. Investigations and experiments were conducted by a German chemist to discover a preparation which would prevent timber from rotting and yet not be expensive. The result of his labors was a product known as AVENARIUS CARBOLINEUM, which has received universal recognition as being THE BEST AND MOST PRACTICAL AND ECONOMICAL WOOD PRESERVATIVE ever placed on the market. It prevents DECAY of any sort and actually STRENGTHENS ANY WOOD to which it is applied.

It SINKS DEEPLY below the surface, expels and repels moisture, while its high contents of specific properties against putrefaction coagulate the albuminous parts of wood and prevent them to produce and continue decay. Owing to its high boiling point it does not increase the inflammability of the material treated. It DOES NOT DETERIORATE OR EVAPORATE. Its easy application (by brush or dipping) and LOW COST, added to the REMARKABLE PRESERVING QUALITIES, make AVENARIUS CARBOLINEUM an ABSOLUTE NECESSITY to all telephone companies which desire to practice economy.

Write for booklet showing dozens of testimonials from enthusiastic users.

CARBOLINEUM WOOD PRESERVING CO., 126 REED STREET, MILWAUKEE, WIS.

A Valuable Bi-Product



Where You Can Install
The Couch Automatic Interior System: in factories, offices, hotels, mines.

Why You Should Install It:
Because each instrument earns a yearly rental plus charges for exchange connections.

Why It Is Superior to a Branch Exchange:
Because it saves time, requires no special operator at one point and is always ready for service.

When You Should Install It:
Now, because every day there is some subscriber who wishes he had it and you are losing money if you don't get it to him.

Write for booklet.

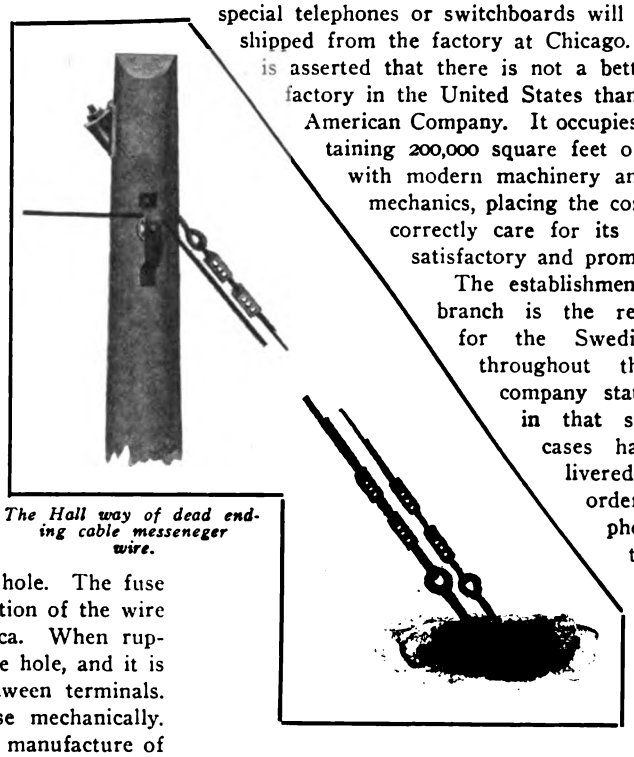
IN THE MANUFACTURING FIELD

MOUNTAIN STATE EQUIPMENT.

THE Mountain State Electrical Company, Wheeling, West Va., is calling attention to some of its specialties which are designed for high grade work and the reduction of maintenance expenses. One of the devices for which the company claims particular advantages is its apparatus used in connection with a special method of dead-ending cable messenger wires, designed by Frank B. Hall, president of the company. This method is illustrated by Fig. 1 upon this page. The messenger wires are carried from anchor to anchor by turning them down over cast metal sheave wheels bolted into the wrought iron frame with a 5/8 machine bolt through the pole. The eyebolt pulls against a cast angle washer, and the guy takes up the back strain caused by the angle in the messenger wire.



The Hall way of dead ending cable messeneger wire.

Mica fuses of a new type are also said to be giving very good satisfaction. Amongst the numerous companies which have used them are the Louisville Home Telephone Company, Louisville, Ky., and the Richmond Telephone Company, Richmond, Ind., which have both expressed their satisfaction. These fuses are made in a novel manner, which is designed to secure improved operating and maintenance features. They contain three pieces of mica, the middle piece being perforated with a single hole. The fuse wire is threaded through the hole, making a portion of the wire run along each side of the middle piece of mica. When ruptured the vapor caused by fusion is cut off at the hole, and it is made impossible for the arc to pass across between terminals. The outside pieces of mica strengthen the fuse mechanically. The company states that no solder is used in the manufacture of this apparatus, the fuse wire being placed in a cut made in the copper strip, and copper and fuse pressed into a solid piece. Those who wish to economize can renew the fuse after the break.

The company is also manufacturing a line of marlin cable hangers, made of a superior grade of stock, to represent the highest standard for this class of material. This, in fact, is the rule which the company has determined to apply to all of its appliances, as it is fully convinced from its wide experience that the best material is the most economical. Numerous other devices which are of much practical value to telephone managers have been originated by this company, and it will be pleased to send information concerning any of its products to interested inquirers.

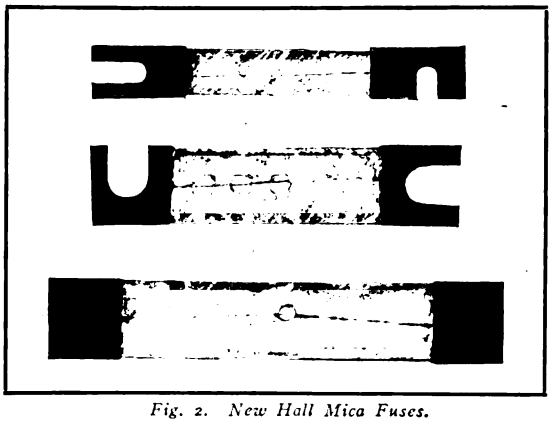


Fig. 2. New Hall Mica Fuses.

NEW PURCHASING OPPORTUNITY FOR KANSAS INDEPENDENTS.

THE Swedish-American Telephone Company has established a branch warehouse and salesroom at 115 West Sixth street, Kansas City, Mo., at which point it will carry a large stock of standard Swedish-American instruments, packed and ready for shipment on the same day that orders are received. It will also carry a stock of telephone and line supplies, such as cross arms, brackets, pins, wire, insulators, etc., etc. The many customers of the Swedish-American Company in the southwest will appreciate the establishment of the Kansas City branch, because of the convenience in obtaining goods quickly.

A telephone has been installed and orders may be placed by calling up over long distance lines Home Tel. No. 7176 Main. It is to be understood, of course, that only standard instruments and parts will be shipped from Kansas City, and any orders for special telephones or switchboards will necessarily have to be shipped from the factory at Chicago. In this connection it is asserted that there is not a better equipped telephone factory in the United States than that of the Swedish-American Company. It occupies a large structure containing 200,000 square feet of floor space equipped with modern machinery and operated by skilled mechanics, placing the company in a position to correctly care for its customers wants in a satisfactory and prompt manner.

The establishment of the Kansas City branch is the result of the demand for the Swedish-American product throughout the southwest. The company states that Independents in that section can in many cases have their goods delivered the next day after ordering, and all telephone men know that there are times when telephones are needed quickly to accomplish certain results. The affairs of the Kansas City branch will be in charge of W. O. Rhode, a practical and experienced telephone man, who with his able assistants will take pains to see that every order received will have careful, thorough and immediate attention.

THE BROWNLEE LUMBER COMPANY, of Chattanooga, Tenn., which manufactures telephone and telegraph cross arms, has made all arrangements for removing its plant to Shubuta, Miss., where it will be consolidated with another branch in order that the entire plant may be near a large quantity of timber owned by the company.

"PERFECT TELEPHONES" is the title of an attractive booklet recently issued by the telephone department of the Wesco Supply Company, of St. Louis. The illustrations, arrangement and text of the book are in keeping with the excellence of the telephones which this company is offering the trade. A copy will be sent to any telephone buyer for the asking.

G. M. GEST, subway contractor, has obtained control of the Rundle Patented Graphic Chart System for recording underground and overhead cable data. This system of charts has been adopted by the largest conduit users in the United States. A descriptive article was published some time ago in one of the technical papers. Further data regarding this cable chart and its uses can be had in writing by any one of G. M. Gest's several offices.

World's Best Battery

R·I BAT

Here's the trademark. It *means* a whole lot. On the

Rock Island New Patent Dry Cell

it's a warranty deed for more lasting worth than is loaded into *any other* dry battery. Every battery is *made by hand*. This mode of careful construction *insures* superiority. Competitive and exhaustive tests have proved that the Rock Island has 20 to 30 per cent. *greater efficiency* and

20 to 30 Per Cent. Longer Life Than Others

Our Standard No. 6 is the regular size most generally used for all purposes.

Our Standard No. 8 is 3½ by 8 inches and it is the battery that has won highest endorsement from leading Telephone Manufacturers and Telephone Companies. They find it just the sort of battery needed for their *best* work —*the* battery for reliably long service. Higher at first cost, it is *cheaper* in the long run.

Write Department D for prices.

Ninth and Sycamore Streets Cincinnati, O.

WHAT A CALCULAGRAPH DOES

It prints the time of day a toll message commences.

It mechanically records the elapsed time in minutes and quarter minutes.

It works without any mental effort on the part of the operator.

It prevents doubt and leaves no room for argument.

It improves the efficiency of the service.

It will save its cost in a short while by increasing the revenue from over time charges.

IT MAKES NO CLERICAL ERRORS.

It is accurate to the second.

Write for booklet.

BOTH MAGNETO AND CENTRAL ENERGY

Type P

They Speak For Themselves

All of our Products Manifest Their Own

QUALITY, EFFICIENCY, DURABILITY

We Guarantee Every One Of Them and Every Part

Type "P" Ringing and Listening Key is mechanically and electrically as near perfect as it is possible to make it. It has only four (4) wearing parts, and will last for years. When necessary to replace wearing parts, a screw driver and a pair of pliers are all that are needed. No disconnecting necessary.

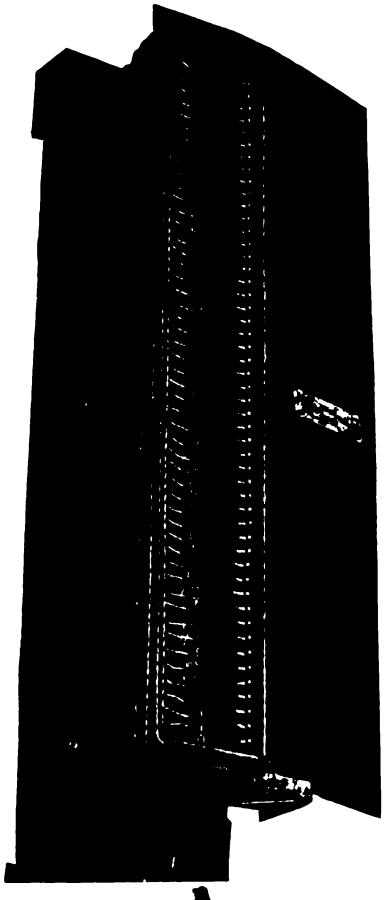
Frame is a solid piece with nickel-plated top and a lever with black or red rubber handle. Springs are all German silver of the right length and thickness to secure the best effects with pure hard rubber as an insulation. The key has a good action. Contact points are all pure platinum.

A postal will bring illustrations, samples and prices.

Western Telephone Manufacturing Co.

Pioneer Independent Telephone Factory

Established 1893 No. 58 West Jackson Blvd., Chicago



Cable Terminals by the Pound

The weight of our "Becker" Terminal is one-half that of any other, for we use $\frac{1}{8}$ inch pressed steel instead of cast iron. The saving in freight alone is quite an item, not to mention the ease with which the "Becker" can be put into place.

Pressed Steel "Becker" Terminals are water and air tight; furnished with self-soldering nozzle and fuses (plain if desired); have plenty of room for connections; have German silver fuse clips; have hard rubber insulation. Cable soldered to clip terminals; no loose contacts.

They last longer, look better, cause no trouble, cost less.

25 pair, wt. 20 lbs., price fused,	$12.50	plain,	$10.00
50 pair, wt. 30 lbs., price fused,	22.00	plain,	18.00
100 pair, wt. 50 lbs., price fused,	40.00	plain,	32.00

THE WEEK'S MESSAGES

VALPARAISO, NEB.—The Valparaiso Telephone Company has been incorporated with a capital stock of $25,000. The incorporators are A. C. Abbott and C. H. Wood.

BURLINGTON FLATS, N. Y.—The Burlington Flats Telephone Company has been organized.

PALERMO, N. Y.—The Palermo Telephone Company, organized by the citizens of Palermo, is about to be incorporated with a capital stock of $1,500. The company's line is to extend from Fulton to Vermillion. The directors are: G. D. Trimble, F. D. Stone, Glenn Trimble, F. A. Moore, E. A. Howard, G. W. Dennis, J. H. Mace, Ira Flint and F. A. McCullom.

STATESVILLE, N. C.—An Independent Telephone Company has been formed at Statesville with a capital of $10,000.

ALLIANCE, O.—The Sandy Valley Telephone and Electric Company of Alliance has been incorporated with a capital stock of $50,000. The company will operate in Stark, Tuscarawas and Carroll Counties. The incorporators are R. S. Kaylor, F. D. Miller, of Alliance; A. S. Hillhouse, W. M. Welker and Norton Purude, of Canton.

BIRMINGHAM, O.—The Riverside Telephone Company has been incorporated. C. S. Chisler is among the incorporators.

EAST TOWNSEND, O.—The Townsend Telephone Company, East Townsend, O., has been incorporated with a capital stock of $10,000. Incorporators are C. B. Canfield, C. L. Moore, Geo. W. Helling, A. D. Bargns and Geo. E. Stacy.

TAYLOR, PA.—An Independent Telephone Company has been formed at Taylor. John W. Wright, of Taylor, is one of the incorporators. The new company will form connections with the Citizens' Telephone Company, of New Castle.

ARCADIA, WIS.—The Tamarack Telephone Company has been organized at Arcadia, Trempealeau County, with a capital stock of $30,000. The incorporators are Calvin Gilbertson, Albert Syverson, Ole O. Olsen, Alexander Olsen and Thomas Thornson. The company will connect with the Winona Telephone Company and the La Crosse Telephone Company.

WEATHERFORD, TEXAS.—The Home Telephone Company of Weatherford will shortly be chartered with a capital of $50,000. The company has already been formed and taken over the Riddle Telephone Company. The company will spend $25,000 in improvements. J. A. Casier and J. A. Murray are among the organizers.

MISCELLANEOUS.

PORTLAND, ME.—The Northeastern Telephone Company is making a vigorous campaign for new subscribers. The company had a very good development before the canvass was started, but the new telephone directory will show an increase of over five hundred subscribers. It is proposed to keep up the work in Portland until a thousand subscribers have been added and then to take up the work at Lewiston, Auburn and other exchanges in Maine now owned by the Northeastern Telephone Company.

COUPEVILLE, WASH.—The Eclipse Telephone Company is soon to occupy a new office in the building being erected for the joint use of the telephone company and the Island County Record.

MONTREAL, QUEBEC, CANADA—The League of Quebec Municipalities has endorsed municipal ownership of telephones.

PERSONAL.

HOWARD S. BAKER has recently taken active charge of the management of the Sioux City (Ia.) Telephone Company, holding the offices of vice-president and general manager.

J. EPPS BROWN has been elected general manager of the Southern Bell Telephone and Telegraph Company.

COLONEL N. T. GENTRY, who has been vice-president and general manager of the Southern Bell Telephone and Telegraph Company will hereafter devote his time exclusively to executive duties as vice-president.

W. P. MARSILLIA has been appointed manager of its exchange at Fenton, Mich., by the Michigan State Telephone Company.

A. L. PIPER has been appointed special agent of the New York and Pennsylvania Telephone Company. His territory is Western New York and Northwestern Pennsylvania.

A. P. REYNOLDS has been appointed contract agent of the Johnstown (Pa.) Telephone Company.

CHARLES F. SPEED, of Texarkana, Ark., who has become so well known to the Independent telephone men of the southwest during his long connection with a prominent manufacturing house as representative and sales manager, has arranged to represent the Stromberg-Carlson Telephone Manufacturing Company in Arkansas, Louisiana and Texas.

H. H. WARREN has been appointed manager of the exchange of the Michigan State Telephone Company at Boyne City, Mich.

New Construction in the Field

SEWARD, ILL.—The Illinois Mutual Telephone Company, with headquarters at Seward, expects to make many extensions to its system.

CRISMAN, IND.—The Portage Home Telephone Company, of Crisman, which has recently increased its capital stock from $10,000 to $30,000, is to spend the additional capital in extending its lines.

ELKHART, IND.—The Home Telephone Company is to spend $7,000 in improving and extending its system.

MAJENICA, IND.—The Majenica Telephone Company is extending its lines south from Rock Creek Center and north from Brown's Corners.

MT. UNION, IA.—B. B. Lindley, D. Glass, Ed. Huston and J. A. Baxter, of Winfield, contemplate the installation of a telephone exchange at Mt. Union, establishing connections between Mt. Union, Winfield and Yarmouth.

RINGSTED, IA.—The Farmers' Mutual Telephone Company is building a rural line at Ringsted.

SLOAN, IA.—The Lossing Telephone Company expects to construct two new lines.

CLEMENTS, KAS.—The Clements & Cedar Point Telephone Company is overhauling its system and rebuilding its lines.

TESCOTT, KAS.—The Tescott Telephone Company is to build a line to Marydel.

TOPEKA, KAS.—The Independent Telephone Company is to spend $400,000 in the city of Topeka in improving its system.

CHAMBERS, KY.—The Chambers Telephone Company is to build a new line.

ARCO, MINN.—The Arco Telephone Company is to build several new lines.

HARTLAND, MINN.—The Hartland Telephone Company is to build a new line.

LERDAL, MINN.—The Lerdal Telephone Company is to make many changes in its system. The company will also build a line to Geneva.

MORRILL, MINN.—The Morrill Telephone Company is going to extend its lines in various directions.

CHAPMAN, NEB.—The Independent Telephone Company is extending its lines in Chapman.

YERINGTON, NEV.—The Independent Telephone Company is to extend its lines to Smith Valley, Gardnerville, Aurora and other points.

ASHLAND, N. H.—The Citizens' Telephone Company is to extend its lines to Plymouth.

SUPERIOR, N. M.—The Superior Telephone Company is to build a line from Superior to Florence.

CINCINNATUS, N. Y.—The Inter-Ocean Telephone Company of Buffalo is to build a line to Cincinnatus.

ONEONTA, N. Y.—The Home Telephone Company is to construct a line from Oneonta to Kingston, also to Andes.

DICKINSON, N. D.—Messrs. Hughes and Deiter, of Dickinson, N. D., are to build a telephone line to Glendive, Mont.

McCONNELSVILLE, O.—The Riverside Telephone Company is to spend $4,000 in improving its system.

SANDUSKY, O.—The Sandusky Telephone Company is to spend about $100,000 in extending and enlarging its system.

FRIEDENSBURG, PA.—The Friedensburg Rural Telephone Company is to extend its lines.

MONTROSE, PA.—The Montrose Telephone Company is to extend its lines in Montrose.

ROCK HILL, S. C.—The Rock Hill Telephone Company is to establish a new exchange at Rock Hill.

CARTHAGE, S. D.—Gunder Serns and D. D. Baldwin are to build a telephone line from Carthage to Howard.

FT. PIERRE, S. D.—The Great Western Telephone Company is to build an extension from Ft. Pierre to Rapid City.

HERMOSA, S. D.—The Hermosa Telephone Company is to build a line to Custer.

MARTIN, TENN.—The Weakley County Telephone Company is to spend $6,500 in putting in a new system.

ITASCA, TEX.—The Citizens' Telephone Company is building a line from Itaska to Bois d'Arc.

GUM SPRING, VA.—The Silvicola Farmers' Telephone Company is extending its lines in the direction of Mill Point.

TRUITT, VA.—The Camp Manufacturing Company is building a telephone line from Dewitt to Franklin.

TACOMA, WASH.—The Home Telephone Company will erect a new central building at Tacoma at a cost of $50,000.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

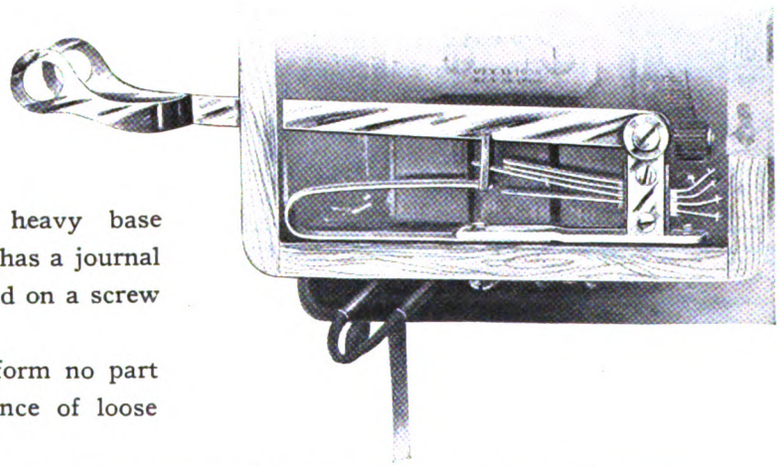
NORTH'S



NORTH'S horizontal lever adjustable tension hook-switch is strong, simple, reliable—insuring perfect action—positive contacts.

Entirely self-contained—a heavy base made in one piece. The lever has a journal bearing hinge—does not depend on a screw to support it.

The lever, base and hinge form no part of the circuit—avoids all chance of loose contacts or accidental shocks.

The controlling spring is German Silver, long and flexible, and capable of adjustment.

The contact springs are German Silver—provided with pure platinum contact points (not platenoid or other alloy). They are made straight—to give maximum resiliency.

They are mounted in a slotted pure hard rubber block (not fibre) and held in place by a brass clamp and two long machine screws—no chance to work loose.

All contacts and terminals in plain view.

MAGNETO TELEPHONES

for rural lines is our specialty. We have consistently developed a line of instruments especially for this class of service. The generators are extra powerful and the ringers are accurately wound so that a maximum number of telephones can be placed on a line and each will be able to signal the others clearly. The mechanism is substantial and well constructed to withstand hard usage.

Our prices are low. In fact, much lower than other reputable manufacturers ask for the same quality of apparatus. Write for our catalogue and learn how we are able to make the above statement and live up to it.

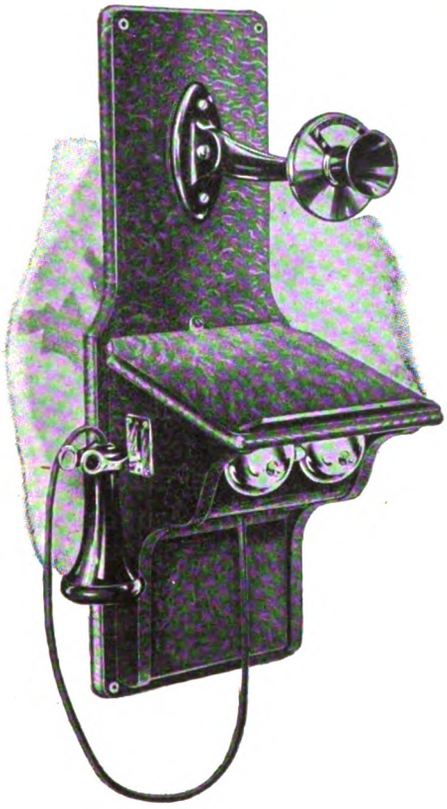
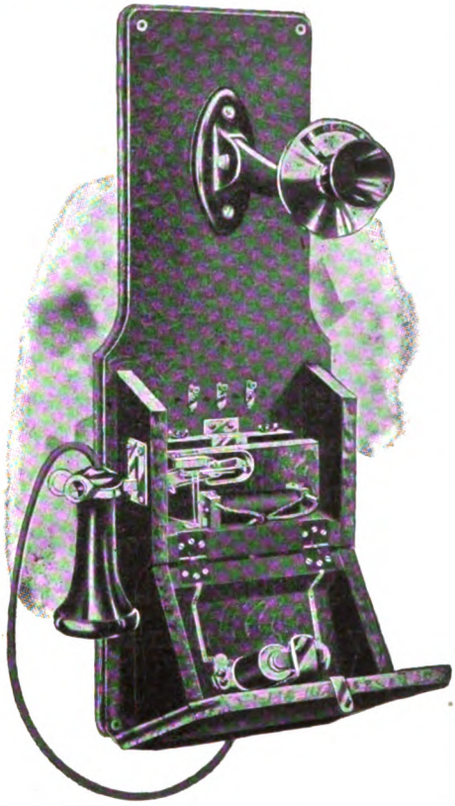
DEAN TELEPHONE APPARATUS



Common Battery Wall Telephones



The accompanying illustrations show one style of our common battery telephones which is fitted with the most efficient and simple circuit ever devised. It is direct acting, thereby avoids all losses inherent in other makes of circuits, eliminating losses being the most logical way of increasing efficiency. This circuit requires only one contact in the hook switch and only two connecting wires to the coil. The condenser does not enter into the talking circuit, therefore has only one function to perform—that of keeping the direct current from leaking through the ringer. The closed cabinet covers all working parts as well as all circuit connections so that there is no chance for trouble or for electrical shocks while the telephone is in use.

The shelf is made to unlock and allows the front part of the telephone to swing down on hinges, thereby fully exposing all of the working apparatus for inspection.

These telephones, as well as all the Dean wall type telephones, have our removable lever hook-switch.

We tell more about these telephones and show the circuits in our folder No. 3A, which will be gladly mailed to you on request.

KELLOGG PHILOSOPHY— —THE BEST IS THE CHEAPEST

KELLOGG

FREQUENCY POLE CHANGER

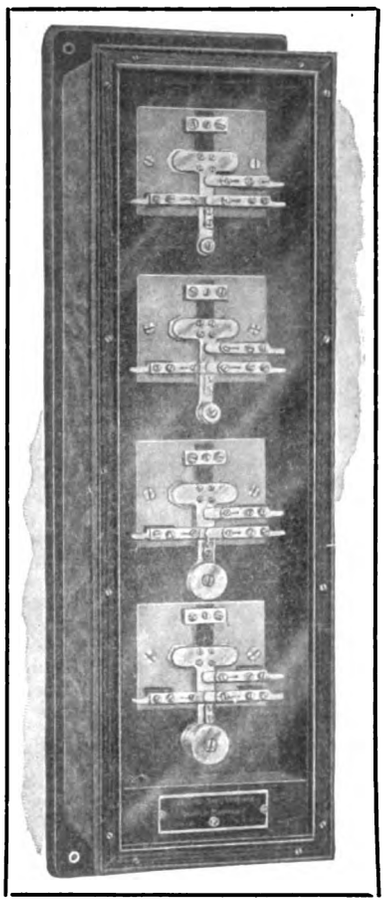
Utmost SIMPLICITY of Operation

THE EFFICIENCY

and beauty of the Selective Harmonic Ringing System of the Kellogg Company has been fully recognized by the entire Independent field, but the difficulty, heretofore, has been that the system required a generating device which involved a rather high first cost, and a relatively large consumption of energy.

The Frequency Pole Changer was designed to meet and overcome all these objections.

It is a very simple device, each unit only involving the use of a magnetic coil and three sets of springs.



"FRONT VIEW"—COVER ON.

ADVANTAGES

1. Requires no attention after once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from Primary or Storage Batteries.
4. Dry cells can be used for the ringing current.
5. They can be furnished to work successfully under any load.
6. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
7. Operates successfully within the limits of 17 to 28 volts.
8. Noiseless in operation.
9. Only three contacts on each vibrator.

This Pole Changer can be used on either Common Battery or Magneto Exchanges

WHAT'S WRONG

with that TELEPHONE INVESTMENT of yours?

Why doesn't it pay you as well as the best of your investments?

Is the reason bad management or bad equipment? More likely the latter.

Probably the company is trying to do a 20th Century business with 19th Century apparatus.

If that's the case, it is spending more and earning less than it might if it had our Automatic Telephone equipment.

This is the only really modern telephone system. It produces the ideal telephone service—quick, sure and secret—at half the operating expense of a manual equipment, and this service commands better rates.

It costs a fixed price per hundred lines to enlarge the automatic exchange, instead of an increased price per each hundred lines, as in the manual equipment.

The automatic exchange is never outgrown; it never has to be "scrapped" and replaced by a complete new one, as with the manual. You just add to it as you do to a sectional book-case.

All these points bear upon the stability and value of your telephone securities. They mean dividends to you.

Over ninety per cent. of all the large orders placed during the past few years, either for new installations or replacements, have been for our automatic system, and all the companies adopting it have, from the increased earnings, been able to pay the interest on their bonds and a good dividend on their stock.

Our Automatic System has been adopted in the following cities:

Aberdeen, S. D.	Clayton, Mo.	Hazleton, Pa.	New Bedford, Mass.	Sioux City, Ia.
Akron, Ohio.	Cleburne, Texas.	Hopkinsville, Ky.	Oakland, Cal.	South Bend, Ind.
Albuquerque, N. M.	Columbus, Ga.	Jonesboro, Ark.	Ocean Park, Cal.	St. Marys, Ohio.
Allentown, Pa.	Columbus, Ohio.	Lake Benton, Minn.	Pentwater, Mich.	Tacoma, Wash.
Auburn, Maine.	Dayton, Ohio.	Lewiston, Me.	Perry, N. Y.	Toronto Junction, Canada.
Auburn, N. Y.	El Paso, Texas.	Lincoln, Neb.	Portland, Me.	Traverse City, Mich.
Battle Creek, Mich.	Fall River, Mass.	Los Angeles, Cal.	Portland, Ore.	Van Wert, Ohio.
Bellingham, Wash.	Ferguson, Mo.	Manchester, Ia.	Princeton, N. J.	Watch Hill, R. I.
Berlin, Germany.	Florenceville, N. B., Can.	Marianao, Cuba.	Riverside, Cal.	Wausau, Wis.
Buxton, Iowa.	Grand Rapids, Mich.	Medford, Wis.	San Diego, Cal.	Westerly, R. I.

Central Energy Telephones

Stromberg-Carlson

TELEPHONE MANUFACTURING CO.
ROCHESTER, NEW YORK

IF you use or contemplate using Central Energy Telephones it will pay you to get a copy of this new bulletin. There is sufficient evidence in it to prove that the telephones illustrated therein are without exception the most modern and nearest to perfection of any ever placed on the market. This statement is not based on the fact that our cabinets are better finished, that we have a better transmitter or a removable hookswitch, but the telephone taken as a whole.

There is not room enough on this whole page to explain all of their good points. By good points we mean the things that make your subscribers satisfied, eliminate troubles caused by accidents or carelessness on the part of users.

It will only cost you a two-cent stamp and a moment's time to get a copy. Just ask for Bulletin No. 15-B.

Shall we send one?

WE MAKE CABLE

"A Message to Garcia"

created a sensation in the literary world when it appeared. We have a message to deliver that will create an even greater stir in the telephone field. Here it is:

The day of open wire construction for local service is past. Increased maintenance charges and the demands of subscribers for better service have sounded its death knell. Aerial and underground cable distribution are the only methods of construction which have stood the test of time. You must adopt them to satisfy your patrons and stockholders.

Read what men who know have to say upon this subject and profit by their experience.

MARTIN VAN BUREN, Manager of the plant of the Amsterdam Telephone Co., Amsterdam, N.Y., and a man who has been associated with the business since its infancy, writes as follows:

AMSTERDAM, N. Y., March 29, 1906.

Stromberg-Carlson Telephone Mfg. Company, Rochester, N. Y.

Gentlemen: My experience for the past twenty-five years in the telephone field has convinced me that the open line for heavy leads has seen its day. To give first-class service, have the rates within reach of every man who earns a moderate salary and still make the plant a paying investment which will encourage men with means to invest in the telephone field, it is necessary to have cable construction throughout. We are operating an all cable plant with *ten hundred and sixty lines* and have had but *two cases of line trouble since December* 1, 1905. One was unavoidable and the other we cannot account for, and that alone speaks for itself. Two years ago, we had an open line plant with 300 circuits. On leads where we had fifty to seventy-five pairs of open wires, after a heavy wind storm, it would take a trouble man from one to two days to remove all cases of trouble. When a comparison is made between the conditions as they then existed with only 325 subscribers working and the present all cable plant, which does not cost thirty per cent. as much to maintain clear of all cases of cable, line and instrument trouble, I am fully convinced that cable construction is the only salvation for the telephone field. It reduces maintenance expenses to the lowest figure, gives the subscribers the best possible service at a very low rate and still makes the telephone business a profitable investment.

Very truly yours, MARTIN VAN BUREN.

Martin Van Buren

Would you want a more convincing statement than that to show you which way the wind blows? We think not.

As you will need cable, and to get any other than the best is equivalent to jumping from the frying pan into the fire, you will be interested in our prices.

We have a cable book which will give you some pointers about our methods of manufacture and incidentally prove conclusively that Stromberg-Carlson Cable is the cable for you.

WRITE FOR BOOKLET 79-B

Note. You have now read the testimony of men who know. Why wait for further proof and put off the inevitable? Get busy and write to-day

Reports from forest experts throughout the country show that timber available for poles is rapidly decreasing. Hence the cost is bound to materially increase.

Avenarius Carbolineum

applied to poles bought now will double their life and increase their strength, thereby effecting a large saving in future re-construction.

It is used throughout the world, and is specified in all government contracts where timber is to be used. It prevents dry and wet rot, and is absolutely the only preservative which protects at the wind and water line. Unlike paint, it readily penetrates to the heart of the wood, and its antiseptic qualities neutralize all gum-producing organisms. Write for testimonials and further information.

Save Yourself Trouble and Expense

By using Double Throw Switches for your first switchboard. After you have got your bearings and know about how many lines you have in service, you can substitute a regular switchboard and the switches will be available for other purposes. The best switch for the purpose is

A Trumbull All Copper Switch

It makes positive connections and cannot get out of order. It is carefully made according to a new and exclusive design which overcomes all the troubles to which the ordinary switch is subject.

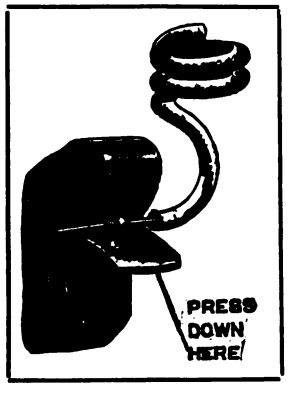
The switchboard employing these switches is the most economical form ever devised. It can be built and operated by a novice, and is absolutely free from all troubles requiring technical knowledge for their solution. If you will drop us a line to show you are interested, we will send you full particulars and quote prices that will convince you this is the type of board you need for a start.

TRUMBULL ELECTRIC MFG. CO.
618 Woodford Ave., PLAINVILLE, CONN.

YOUR DEALER NEEDS YOUR BUSINESS

Therefore you are in a position to tell him what you want and insist upon getting it.

The advantages of



The Fahnestock Spring Binding Post

have been very clearly set forth from all standpoints: mechanical, electrical and economical. It is, therefore, up to you to see that your battery orders are filled with cells equipped with this binding post. Any of the large battery manufacturers will furnish it without extra cost if it is specified in the order, so that instead of paying more, you actually save money which would otherwise be lost in maintenance charges.

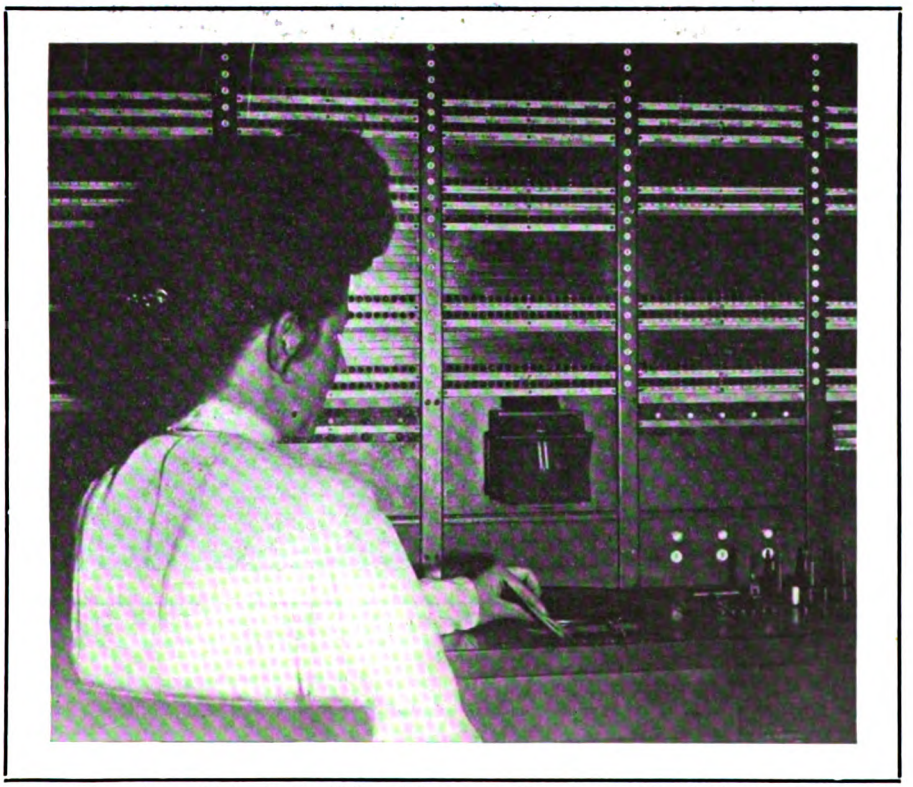
Care and Maintenance of a Pneumatic Ticket Distributing System

By E. A. Hawkins.

AFTER having reviewed in the previous article the most probable causes of trouble that may arise in the operation of a pneumatic ticket distributing system the fact will readily be appreciated that even with the most carefully handled and the best maintained plants trouble of one kind or of another will arise at some time. It will therefore be well to consider the method of locating and clearing such troubles.

These difficulties are naturally divided into several classes, of which one has to do with the motor and exhauster. The location of troubles that may arise in connection with these machines would be a simple matter for a machine attendant and therefore need not be considered further.



Operator Inserting a Ticket in the Valve of Pneumatic Tube Leading to Distributing Table. The Short Flap Points Upward.

Ticket troubles are, however, of a different and special nature. If an operator has not properly handled a ticket at the sending end of a tube, and has allowed the flap to open out while inserting the ticket, she will invariably be aware of this fact and will be on the alert to detect further symptoms of trouble with that ticket before inserting a second in the same tube. In case the ticket has unfolded, it will drop through the vertical portion of the tube leading from the top of the distributing or recording table and stop at the first bend or twist. When the unfolded ticket arrives at this point it will generally set up a noise due to its flapping on the sides of the tube. An unfolded ticket in any part of the tube will generally denote its position by means of this flapping. When such a ticket is so lodged that it does not flap under normal conditions it may sometimes be made to flap by temporarily shutting off the supply of air by placing a portion of the hand over the sending end of the tube and then quickly removing the hand. If the ticket cannot be made to flap by this means with the normal vacuum, it can invariably be made to so denote its location by an increased vacuum.

If a ticket with the flap properly folded has become stuck it will occupy a position across the tube and thus partially shut off the flow of air. The correspondingly reduced pull on a second ticket that is about to be inserted in the same tube will be detected by a trained operator in sufficient time to cause her to refrain from sending it.

In a system making use of a lamp that will automatically signal the arrival of a ticket to the sending operator a slow or stuck ticket would quickly be detected owing to illumination of the lamp.

Leaks are a frequent source of annoyance. In those exchanges that have a long exhaust pipe run from the operating room to the exhauster room it is customary to install a vacuum gauge at a convenient point in the operating room as well as on the power board in the exhauster room. Knowing the calibration constants of these two vacuum gauges it would be possible to take simultaneous readings at a time when there were no tickets being sent through the system and thus ascertain whether there were an excessive drop in the exhaust pipe between the two gauges. It would, of course, be necessary to take into consideration the normal drop due to friction of the moving air through the pipe. This could be ascertained by actual readings taken when the system was first installed and known to be free from leaks. It could also be computed from standard tables. After determining that there was a leak somewhere along this exhaust run, its exact location could be detected by the use of a candle or other flame placed near each of the joints in succession. Since the direction of flow of air would be into the tube the flame would be attracted to that point. If the leak were a bad one it would be evidenced by a whistling sound.

Digitized by Google

A leak in the seat of any sending valve would be indicated by the sluggish action of the tickets that were being inserted into the common tube run through other sending valves further out toward the end of the run. If a leak happened to be on the last sending valve of the run it would do no harm, since the tube is open at that valve. The existence of a leak in any receiving valve would be made known by the fact that a ticket would have a tendency to remain in the receiving chamber and not fall out when the valve was opened.

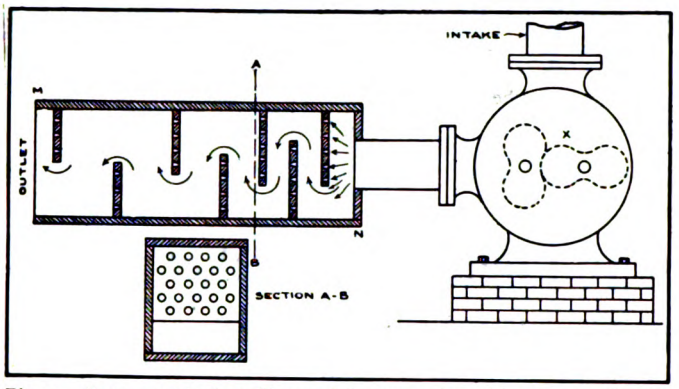


Fig. 1. Arrangement of muffler used in connection with exhauster for preventing noise in tubes.

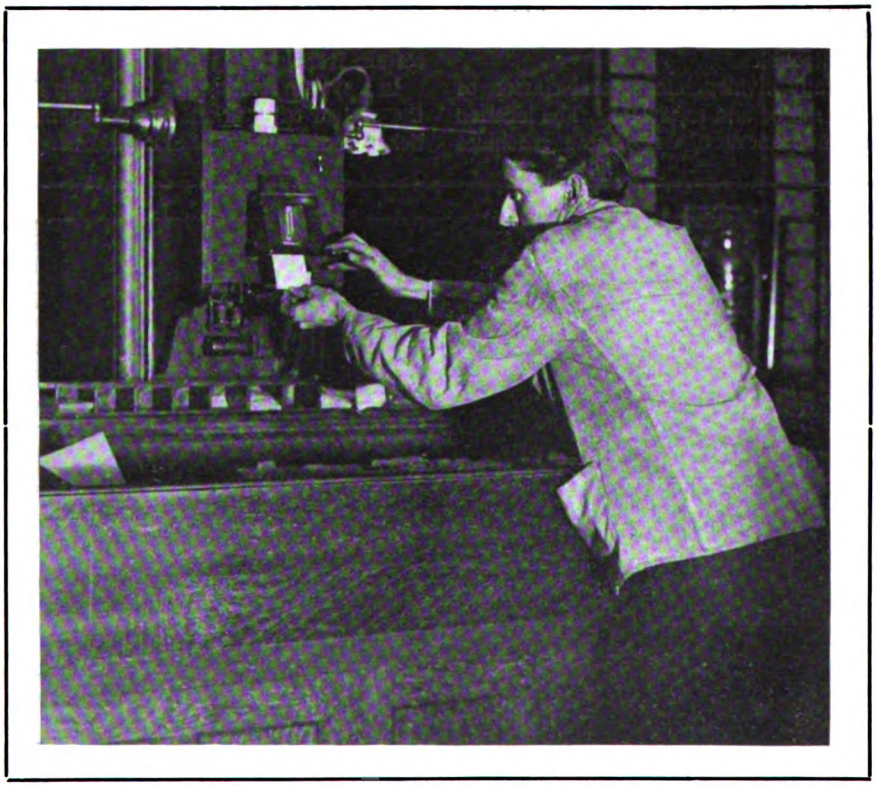
Any leaks in the ticket tubes or branch exhaust pipes, if of a serious nature would be indicated by the decrease of pressure at the sending ends of such tubes. The operator could easily detect such a leak by the slowness with which the ticket would leave her hand.

After the nature of the trouble is established the next step is directed toward its removal. Since the troubles that may arise in connection with the motor or exhauster are no different from those which machine attendants very frequently come in contact with, the clearing of the same need not be considered here. In this connection it may be well to mention the fact that an exhauster, when run at a speed necessary to produce the required vacuum on the system, sets up a noise that sometimes proves to be a serious source of trouble. This noise is inherent with this class of machinery. It is produced by the blades of the exhauster setting up vibrations in the air which is being driven through the outlet of the exhauster. This noise grows in volume and is raised in pitch as the speed of the exhauster is increased. In order to eliminate this noise it is necessary to break up the wave motions that have been produced in the air by the exhauster. The general principle of muffling this noise is illustrated in Fig. 1.

In the figure "X" represents the exhauster and M N the muffler. This muffler is more efficient when made of a more vibrating material, such as wood. By the passing of the air around the partitions and through the holes in the partitions, as indicated by the arrows in Fig. 1, the heads of the sound waves are taken off and the waves are superimposed upon one another and so the pitch of the noise is modulated and the volume decreased to an amount that is not objectionable.



Removal of Ticket from Receiving Valve. This is a Special Tube from a Trouble Operator's Position to the Testing Room for Carrying Tickets Bearing Information for the Wire Chief.

Ticket troubles may be divided into three general classes, being due respectively to open flaps, sticking in the tubes and slow passage.

After a case of trouble has been located the most expeditious manner of clearing it would be entirely dependent upon the character of each individual case. If the trouble is known to be an "open flap" ticket or a "stuck" ticket, and it has been found to be near the sending end of the tube, a "suction box" should first be tried. Such a box is illustrated in Fig. 2.

In the figure "M" represents the "suction box," which is of a suitable size to properly cover the ends of about six (6) tubes. "N" represents a spring fitted with a knob, and "X" and "Y" represent the sending ends of ticket tubes. Suppose, for example, that a ticket was stuck in tube "X." This box would be placed over the ends of the tubes "X" and "Y" in such a manner that the compartment containing the glass window in its top would be directly over the tube "X." The flow of air through the tube "X" should be reduced by means of the cut-off valve located in the exhaust at the receiving end of the tube. The partial vacuum produced in this box by the flow of air through these five tubes marked "Y" would in turn cause a flow of air through the tube "X" into the suction box and out through the tubes "Y," as indicated by the arrows. This reverse flow of air through the tube "X" may be sufficient to start the ticket and cause it to return to the box. Upon the return of the ticket to the box it can be seen through the glass window and can be held securely in its compartment by means of the spring "N," which can be operated through a hole in the end of the box.

If a ticket is so located in a tube that it cannot be removed by the suction box, a piece of heavy paper or card folded in the manner shown in Fig. 3 should be sent through the tube. This piece of card on heavy paper, shown at "R," is known as a "chaser."

The flaps "P" and "Q" rubbing along the inner sides of the

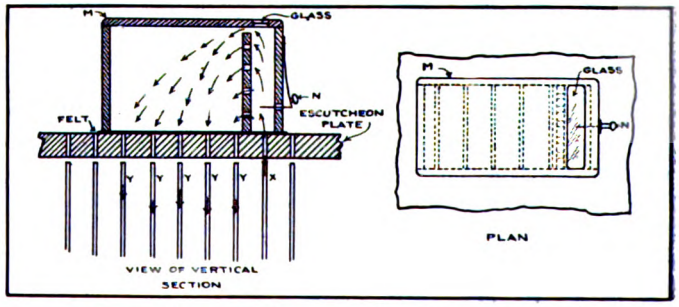


Fig. 2. Device used for removing ticket stuck in tube.

Digitized by Google

tube, would have a tendency to engage with a "stuck" or "open flap" ticket and carry it along through the tube. The "chaser" is more effective with the cut-off valve in the exhaust of the tube wide open, in order to get the benefit of the full pressure.

In case the "chaser" fails, the next step would be to increase the vacuum on the tube containing an "open flap" or "stuck" ticket. This can generally be done by opening wide the cut-off valve in the exhaust pipe of that tube. If, however, this tube happened to be the one of greatest resistance, which would of course be operated with its cut-off valve wide open, then it would be impossible to so increase the vacuum. This increase of pressure, when possible, will sometimes be sufficient to dislodge the ticket.

If the ticket has become lodged against some obstruction in the tube, it will readily be seen that a further increase of pressure may only tend to jam the ticket still harder against the obstruction. If the flow of air was stopped temporarily the ticket might then fall away from its obstruction and continue on its passage when the flow of air was resumed. This temporary stopping of the flow of air can be accomplished by snapping down the handle of the receiving valve, which would temporarily close the exhaust port. This could also be accomplished by rapidly closing and opening the cut-off valve. The manipulation of these valves in this manner or any one tube does not in any way interfere with the operation of the remainder of the system.

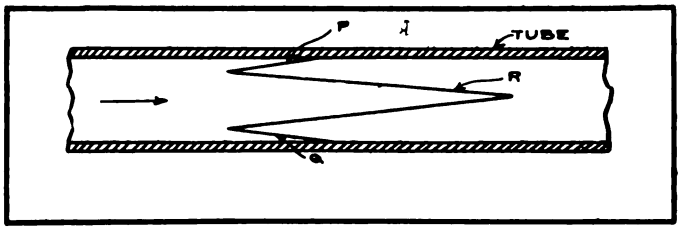

Fig. 3. Sectional view showing chaser in tube.

In case all of the above methods fail, it will be necessary to pull a chamois "cleaner" through the tube by means of a steel snake or a heavy line. The method of getting this steel snake or heavy line through the tube by means of a light line first drawn through by a "carrier" has been described in a previous article. A "cleaner," such as was illustrated in the same article, will invariably move the ticket, although it may take several passages of the "cleaner" to work the ticket entirely through the tube.

In case several succeeding "chasers" may likewise have become lodged in the tube, it would be impossible to get a "carrier" through the tube on account of the flow of air being reduced by the partial or total stoppage of the tube. Such a case of trouble can generally be cleaned by means of a steel snake shoved through the tube. In case the steel snake fails to dislodge the wad, it will be necessary to remove that section of the tube in which it is contained. The exact section which should be taken out can be determined by measuring off on the outside of the tube the distance that the steel snake was inserted.

In the case of failure to recover a "stuck" or "open flap" ticket by any or all of the above methods, it will be necessary to likewise remove the section of tubing containing that ticket. If it can not be determined in which section the ticket may be located by means of the flapping described above, the desired section must be located by a "cut and try" method.

In order to repair a leak in any pipe, an extremely hot pencil flame is essential. No soldering should be done on any of the ticket tubes while the vacuum is on the system, as the atmospheric pressure will tend to force the solder through the joint and it may then form a globule on the inside of the tube which might prove to be an obstruction to some future ticket.

A large amount of trouble is due to the accumulation of dust and moisture upon the inside of tubes, and this is a case where the old proverb about the ounce of prevention and the pound of cure particularly applies. The unclean condition of the tubes is due in a large degree to deposits from the air drawn in through the openings at the distributing table. In addition to keeping the room in which this has been located in an exceptionally clean condition, the erection of a suitably designed booth enclosing the table has been found to be an efficient means of preventing such troubles.

Instructions for the Distribution of Accounts of the United States Telephone Company

THE United States Telephone Company was the first Independent company to put in operation a comprehensive and successful system of long distance lines. The extremely efficient management and success of this company, both from the operating and financial points of view, give to all information concerning its methods an exceptional value and interest. Through the kindness of the general manager, Mr. C. Y. McVey, we are enabled to present the plan of distribution of its accounts, as follows:

REVENUE STATEMENT.

No. 1, Tolls.—This sub-division shall include all tolls and mileage, including that of other companies.

No. 2, Line Rentals.—This sub-division shall include all line rental, either telephone or telegraph.

No. 3, Miscellaneous.—This sub-division shall include all other earnings.

TOTAL REVENUE.

This shall be the total of tolls, line rentals and miscellaneous.

DEDUCTIONS FROM TOTAL REVENUE.

Other Companies' Revenue.—This sub-division shall include all mileage, commission of other companies and messenger service.

Discounts.—This sub-division shall be the discount on toll service contracts.

GROSS EARNINGS.

This account shall be the total revenue less other company's tolls, mileage and messenger service, also discount on toll service contracts.

OPERATING.

No. 1, Superintendence.—This sub-division shall include salaries of traffic manager and his assistants, also a portion of the salaries of district managers and a corresponding share of the salaries of clerks employed in the district manager's office, chargeable to operating as fixed by the general manager.

No. 2, Traveling.—This sub-division shall include expenses of traffic manager and all other employes while traveling on operating business.

No. 3, Toll Board Operators.—This sub-division shall include wages of toll board operators.

No. 4, Pay Station Expenses.—This sub-division shall include all expenses of operating this company's toll and pay stations, salaries of attendants, rent, light, heat and commissions on account of pay station.

No. 5, Stationery.—This sub-division shall include the cost of toll tickets supplied to agencies and all forms used by traffic department, the cost of preparing, printing and issuing tariff and routing books, together with their supplemental bulletins and transportation charges and postage on same.

No. 6, Office and Exchange Expense.—This sub-division shall include incidental supplies furnished for operating rooms and traffic department offices, other than furniture and fixtures, and shall include toilet supplies and towel service for such offices.

No. 7, Power.—This sub-division shall include all power used for operating toll boards and instruments, and devices for cooling operating rooms and charging storage batteries.

Digitized by Google

No. 8, *Morse.*—This sub-division shall include that portion of Wire Chief's salary chargeable to Morse operating; the amount of same to be decided by the general manager.

MAINTENANCE.

No. 1, *Superintendence.*—This sub-division shall include a portion of the salary of superintendent of maintenance, district managers and a corresponding share of the salaries of clerks in this department and their traveling expenses while on maintenance work. The amount of above salaries chargeable to this sub-division shall be determined by the general manager.

No. 2, *Stationery.*—This sub-division shall include the cost of stationery and postage used for maintenance purposes including time books, work reports and other blanks for the use of the maintenance department.

No. 3, *Wire Chiefs.*—This sub-division shall include that portion of the wire chief's salary not charged to operating. Residence telephones allowed wire chiefs and station linemen to be charged to this account.

No. 4, *Telegraph Equipment Repairs.*—This sub-division shall include all labor, material and supplies used in the repair of strictly telegraph equipment and transportation on same.

No. 5, *Telephone Equipment Repairs.*—This sub-division shall include all labor, material and supplies used in the repair of booths, telephones, pay stations, pay station signs, booth fans and booth furnishings, together with transportation on same.

No. 6, *Tool Repairs.*—This sub-division shall include the cost of repairs on tools used exclusively for maintenance work and carrying charges on same when shipped for repairs.

The cost of new tools shall be chargeable to tool account.

No. 7, *Transferring Equipment.*—This sub-division shall include the cost of labor and material used in transferring telephones, pay stations, telegraph instruments and booths; also transportation of same.

No. 8, *Renewal of Batterics.*—This sub-division shall include the cost of battery jars, zinc, coppers, carbons, sal ammoniac, blue vitriol and other supplies used in renewing telephone and telegraph batteries. Also labor and transportation charges on same.

No. 9, *Terminal Repairs.*—This sub-division shall include all material and supplies and labor for repairs to inside cables, terminal protection, power machinery and transportation charges on material and supplies.

No. 10, *Interior Wiring and Fittings.*—This sub-division shall include all material used for the maintenance of interior wiring or fittings; also labor and transportation charges on material.

No. 11, *Toll Board Repairs.*—This sub-division shall include the cost of labor and material for the repair of toll boards. Also transportation charges on material.

No. 12, *Line Repairs.*—This sub-division shall include labor and material used in the repair of pole lines, wire, and all outside cables, also transportation charges on material. This does not include cost of transferring of lines, covered by extraordinary maintenance.

No. 13, *Damages.*—This sub-division shall include amounts paid in settlement of claims for damages arising from line changes, tree trimming, etc., and expense of adjusting such claims, except expense incurred by the legal department.

No. 14, *Traveling Expenses of Linemen.*—This sub-division shall include all expenses allowed linemen while traveling on account of maintenance, no matter whether for inside or outside work. When a wagon either single or double is used on maintenance, the expense shall be charged to the sub-division covering the work being done. When maintenance linemen are engaged on new work, any expense allowed must be charged to the proper sub-division of construction.

No. 15, *Building Expense.*—This sub-division shall include the expense incurred for repairs to buildings or real estate owned or leased by this company. Expense incurred for permanent improvements shall be charged to the proper sub-division under construction.

No. 16, *Extraordinary Maintenance.*—This account shall include the cost of all labor and material together with the transportation charges used in moving pole lines and transferring circuits, by order of the courts, municipal, county or township officers, corporations or individuals. Authorization for doing this kind of work must be received from the general office, where a number will be assigned to each authorization, and all vouchers for that particular piece of work shall be marked with the number assigned, prefixing Ex. before the number. This will enable us to determine how much it is costing to do any work of this kind.

GENERAL EXPENSE.

No. 1, *Salaries of Officers.*—This sub-division shall include the salaries of all general officers, with the exception of the general counsel.

No. 2, *Salaries of Clerks.*—This sub-division shall include the salaries of all general office clerks, to wit: The office of the president, general manager, secretary, treasurer, auditor and toll accounting departments, but shall not include the salaries of clerks in the office of the general counsel. In case of clerks working on construction, the time shall be charged to the proper heading under construction.

No. 3, *Office Expense.*—This sub-division shall include car fare and meals of general officers and the clerks from the general office, when detained on company business. Also all other incidental office expenses which are not specified particularly in other sub-divisions of general expense, including all rentals paid for telephone for general office purposes.

No. 4, *Traveling Expenses.*—This sub-division shall include all traveling expenses pertaining to work of the general office, excepting that of the general counsel and traffic departments.

No. 5, *Legal.*—This sub-division shall include the cost of legal blanks, the service and return of legal documents and fees paid to attorneys specially employed. Also the salaries of the general counsel and the clerks employed in the legal department, and the office and traveling expenses of that department.

No. 6, *Rent, Light and Heat.*—This sub-division shall include rent, light and heat for all offices. Where the company rents an entire building and sub-lets a portion of it, such rental shall be credited to this sub-division. Rent received for property owned by the company shall be credited to a separate income account.

No. 7, *Warehouse.*—This sub-division shall include a portion of the salary paid warehouse men, also a portion of the rent, light and heat of warehouse, chargeable to general expense, as fixed by the general manager. Warehouses used for construction purposes should be charged to No. 12 under construction.

No. 8, *Stationery.*—This sub-division shall include the cost of all stationery, blanks and postage for general offices other than the office of the general counsel, traffic and maintenance departments. Also the cost of telegrams and toll messages pertaining to general office.

No. 9, *Accidents and Injuries.*—This sub-division shall include amounts paid in settlement of claims arising from personal accidents or injuries.

No. 10, *Advertising.*—This sub-division shall include the cost of all advertising, pamphlets, publications and newspaper insertions; also the salaries and expenses of advertising agents.

No. 11, *Insurance.*—This sub-division shall include the premiums on fire, indemnity and casualty insurance.

No. 12, *Franked Tolls.*—This sub-division shall include all toll bills franked on account of this company's business, or as a courtesy, or for advertising purposes. The latter shall include free coupons and card franks issued for the purpose of increasing the company's business.

NET EARNINGS.

This shall be the balance of gross earnings after deducting expenses.

FIXED CHARGES.

No. 1, *Taxes.*—This sub-division shall include all state, city and franchise tax.

No. 2, *Bond Interest.*—This sub-division shall include all interest paid on the mortgage bonds of this company.

No. 3, *Miscellaneous Interest.*—This sub-division shall include the interest or discount on all miscellaneous loans.

Digitized by Google

No. 4, Leased Lines and Contacts.—This sub-division shall include all rentals paid for leased lines and contact privileges.

No. 5, Reserve for Depreciation.—This sub-division shall include all reserves for depreciation.

No. 6, Reserve for Uncollectible Accounts.—This sub-division shall include all amounts reserved for bad debts.

Furniture and Fixtures.—This account shall include the cost of all desks, office chairs, cabinets, etc., costing $2.00 or over. Articles costing less than this shall be charged to office expenses. Shelving and temporary work of any kind shall be charged to whatever it is to be used for. Authorization must be received from the general manager before purchasing any furniture or fixtures.

Stock.—This account shall include the cost of all material and equipment purchased as a supply to be drawn from when needed. Material and equipment when purchased for some particular work, shall be charged directly to the account for which it is to be used. If the work is being done under an estimate the material or equipment shall be charged to the estimate number. Freight on the material purchased for stock shall also be charged to stock and credited to stock as the material is used.

Tools.—All new tools purchased shall be charged to this account and when tools are lost, broken or worn out, this account shall be credited with same and shall be charged either to depreciation or the particular work on which they were used as may be determined by the general office.

CONSTRUCTION.—GENERAL.

No. 1, Superintendence.—This sub-division shall include the salaries of the engineer and his assistants and their traveling and office expense when on construction work. The salaries of engineers when employed on maintenance work to be charged to the proper sub-division under maintenance.

No. 2, Stationery.—This sub-division shall include the cost of all postage and stationery used exclusively on construction work.

No. 3, Accidents and Injuries.—This sub-division shall include amounts paid in settlement of claims for damages to property or injury to persons arising from accident, when such damage or injury occurs during the construction of new work. Also the services and expenses of attorneys and others employed to effect a settlement.

INSIDE WORK.

No. 4, Labor.—This sub-division shall include the cost of all labor employed on new construction from the lightning protection in, except when same is covered by an estimate.

No. 5, Material.—This subdivision shall include the cost of all material together with transportation on same, used on construction from the lightning protection in, except when the work is covered by an estimate.

No. 6, Traveling Expense.—This sub-division shall include the cost of all traveling expenses other than those from the general office, in connection with the construction work from the lightning protection in, except when same is covered by an estimate.

No. 7, Tool Repairs.—This sub-division shall include the cost of repairs to all tools when used on construction work from the lightning protection in, except when same is covered by an estimate. The transportation on all tools shall also be charged to this account.

OUTSIDE WORK.

No. 8, Labor.—This sub-division shall include the cost of all labor employed on outside construction up to and including the lightning protection in the office, except when same is covered by an estimate.

No. 9, Material.—This sub-division shall include the cost of all material, together with transportation on same, used on outside construction work up to and including the lightning protection, except when same is covered by an estimate.

No. 10, Traveling Expenses.—This sub-division shall include the cost of all traveling expenses other than those from the general office in connection with outside construction work, up to and including the lightning protection, except when same is covered by an estimate.

No. 11, Tool Repairs.—This sub-division shall include the cost of repairs to all tools when used on outside construction work up to and including the lightning protection, except when same is covered by an estimate. Transportation on all tools shall also be charged to this account.

No. 12, Warehouse.—This sub-division shall include the salary of warehouse men, rent, light and heat of warerooms and pole yards in storing construction material, as fixed by the general manager.

RIGHT OF WAY.

All expenses in connection with right of way shall be charged to this account.

The Growth of an Independent Co-operative Company*

By H. H. Hutchins.

THE Saugatuck and Ganges Telephone Company, Ltd., was started in 1895 by a few fruit growers combining with local steamboat men for the erection of lines reaching into the fruit sections of the western part of Allegan county from shipping points. About two dozen telephones were first installed, each subscriber paying the entire cost of his connection. It soon became necessary that we associate ourselves and elect officers for the management of the little system, which was done in 1896. A provision in the by-laws was that each subscriber pay for all material required for the maintenance of the telephone, and that each should bear his pro rata share of the cost of the maintenance and operation of the system.

The management has since agreed that where several desire to connect to our centrals by party line the company will run the wire to the vicinity and allow the subscriber to connect thereto free of line charge.

All supplies and instruments are furnished at actual cost and the work is done by experts in the employ of the management at as low a rate as possible, looking forward to the benefits to be derived from the ability to reach as many as possible of the members of the community.

The system is purely co-operative and no dividends accrue, sufficient charges only being made for service to cover maintenance and operation.

Officers are elected from among the shareholders annually, which places control in the hands of people who have no object in the matter other than efficient service at as reasonable a figure as possible.

The growth and efficiency of the enterprise are too well known here to call for comment and to extend thanks to any one would be merely self-congratulation, since it is the outgrowth of an enterprising community who operate it according to their own liking, through managers elected annually from among their own number and who are residents of the community.

When the little plant was first started no one knew anything about telephone matters and but very few in the community had ever talked over a wire. Accordingly, the general impression was given out that there would be no cost after installation. Switchboards were placed in stores and business places at the five centers—Saugatuck, Douglas, Ganges, Fennville and Glenn. The attendants agreed to do the switching for nothing, as it would be fine sport, and the instruments were supposed to be as free from troubles as the piano in the parlor or the colt in the pasture. The first lot of telephones were installed by the aid of the local telegraph operator and an expert from the factory set up

*Read before the convention of the Michigan Association.

Digitized by Google

the switchboards. Things ran smoothly during the fall of 1895 and the following winter, but in the spring of 1896 a dark cloud, soon followed by a hurricane, filled with Old Cain, rolled up over old Lake Michigan, accompanied with a terrific electric storm. Well, our lines are mostly grounded and any telephone man knows the rest.

Before six months had passed our attendants began to think it better to answer telephone calls when they could not sell goods, so the subscribers grumbled because their calls were not properly attended to. At the same time the fellow who had been obliged to leave his business to "see if he could find the trouble with the phone" began to "sit up and take notice" also. Another matter developed, that of having a head and a tail to this thing. There was no one who had authority over it and it was running wild, so a meeting of those who had donated to the enterprise was called and it was decided to organize. Three bright fellows were chosen to draft a set of by-laws. This, being of minor importance, only delayed the meeting twenty or thirty minutes, but we appreciated the fact bv this time that there must be some expense attached, so a clause was inserted providing for a pro rata charge for maintenance and operation, as mentioned above. After the usual ordeal of criticism and changing—among which was a clause providing that all matters should be referred to the shareholders for final disposition—we all signed the articles of association which had been prepared by a local attorney and, after adopting the by-laws, the meeting proceeded to elect a board of five managers.

One of the first observations of the new board was that we would be under the necessity of paying our exchange attendants a stipulated sum and that we must employ an expert to look after trifling matters which seemed to creep in to disturb the perfect working of the instruments. So an assessment of $2.50 was levied on each member, as a sufficient amount to settle all accounts to date. Things ran on in a hit and miss way until January of 1898. By this time our assessments had amounted to about $9 per year for the two and a half years we had been running. This was considered exorbitant and there were rumblings of distrust to be heard from the members and, as the board of directors were serving gratuitously, they decided to let the honors of office fall upon other members, so at the annual meeting an entirely new management was elected. Just previous to this meeting, however, the manager had a new code of by-laws carefully drawn up and signed by three-fourths of the stock, to become operative at once, so that the new board might not be hampered as the old one was by having to refer every important transaction to the stockholders.

At this time there was a deficit of about $300 and it was decided to place the business on the basis of an annual rental of $12, payable quarterly. This sum was supposed to clear the indebtedness and allow the board sufficient funds with which to run the plant and clear up all accounts. It would doubtless have met all expectations had not the fact developed that many of the pole lines were already overloaded, and more wires waiting to be strung, so that much work had to be done, and expense for material had to be met, and at the end of the second year of the new management we were about $700 deeper in the hole than when they took the reins of government. They were all good business men in their own line and strictly honorable, so our little community settled down to the conclusion that it took money to run a telephone plant as well as any other enterprise, and they voted it to be the sense of the meeting of shareholders that the board place the rental at $15 per year, which was done immediately by the new board and we have dropped out of the fence corner gossip.

At the $15 annual rental we have practically cleared our indebtedness—that is, we have sufficient amounts now due to finish doing so—and have added many improvements in the meantime. Our expense account has been swelled in the work of correcting errors in first construction and in reconstruction made necessary by over growth; in other words, in getting experience in a new business.

Our principal advantage in co-operative ownership lies in our peculiar situation. This being a fruit-growing section, it is important that our subscribers, who are mostly fruit growers, have free access to all the local marketing points, since much of their output is sold at the surrounding stations, and telephone connection with but one of the stations would be of little advantage, while a toll rate would become burdensome. As our company is mostly made up of fruit growers we can, by this plan, allow ourselves the use of the entire system by paying a sufficient rental to maintain the plant, while an outside company would be obliged to charge toll between stations for interest on the investment.

In our five exchanges we have about 200 subscribers in winter and 250 in the summer months, or an average of about fifty to the exchange when all are working. Our rates are $2 per month for three months, $1.75 for six months, $1.50 for nine months and $1.25 for annual rental.

By the friendly toleration of the large Independent companies who control the long-distance lines passing our section we are enabled to reach outside points over their wires and at the same time maintain our local institution to our own liking.

Were it not for the peculiar conditions, our perishable crops and the consequent necessity for free access to our surrounding shipping points, both by rail and water, I could see no advantage in co-operative ownership and management.

PROGRESS OF MANITOBA LEGISLATION IN FAVOR OF MUNICIPAL SERVICE EAGERLY WATCHED.

THE Hon. Colin Campbell, Attorney General of Manitoba, introduced legislation during the recent session which he hopes will have the effect of cutting telephone tolls in two and equipping the average farmhouse in Manitoba with a telephone. The Government proposes to supplant the Bell telephone system and own the long distance lines, and it will ask power from the Dominion Government to expropriate Bell lines.

Municipalities will be allowed to take a vote as to whether they will construct their own systems, the Government undertaking to render the necessary financial aid. If the municipalities decline, the Government will step in and build the system.

Where systems are installed by the municipalities they must come up to a satisfactory standard. The Government will finance the scheme, endorsing the bonds of the municipalities, the tolls decreasing when the bonds are finally paid off. Hon. Mr. Campbell points out the success which has attended municipal telephones in England and in other parts of Canada. In Neepawa, Man., he says that the people pay $10.00 for residence and $20.00 for business telephones. In Port Arthur and Fort William, where there is municipal ownership, subscribers have increased from 200 to over 1,300 in about three years.

If Manitoba should succeed in getting permission from the Dominion Government to expropriate the Bell system, that company will evidently have to either considerably reduce its rates or fight for its life in every province in the Dominion. Cheap telephones would be an extraordinary boon to the people of the country districts of Nova Scotia, and they would be adopted eagerly. There are already one or two private lines, one of which at least, started by T. J. Sears, of Lochaber, in Antigonish County, is said to have proved to be very successful in operation.

NO TELEPHONE CONNECTION BETWEEN THE LONDON POLICE SYSTEM AND THE CITY EXCHANGES.

ENGLISH conservatism is proverbial, but it would appear to have reached the point of foolishness when it is known that the metropolitan police force of the city of London has no telephone connection with the local exchanges. The official reason given for this peculiar state of affairs is that "serious inconveniences and danger to the system would result if the general public were allowed to ring up Scotland Yard!"

The argument is also advanced that criminals would be enabled to secure information which they could not otherwise obtain.

A movement is now on foot to urge reform measures which will result in the private police system being connected with the city lines, so that any citizen can ring up the department when in need of assistance.

Why the Ohio Association Should be Maintained *

By Frank A. Davis.

IN the first place this association ought to be maintained because you ought to be proud of it. It has given to this state, and it has given to the telephone interests, as I am informed by people from outside of the state that are here now, the best Independent telephone convention that has ever been held, and I believe that it is true; not the largest, but there is a better feeling and better spirit here among you gentlemen now than there ever has been in any Independent telephone association that I ever saw. In the last year you have accomplished more in the way of advancement, in the way of growth, in the way of helping our material interests than any one and possibly than any two or three years before. It has been said here that the number of independent telephones has increased in the last twelve months from less than a hundred and ninety thousand to approximately two hundred and fifty thousand. It could be said, and possibly has been said to-day that the number of Independent stockholders in the state of Ohio in that time has increased from something less than eighteen to something more than twenty-one thousand. It can be truthfully said that at no time in the history, and nowhere has there been the growth and increase in every way that you have had in Ohio this last year.

More important than anything to us, our telephone securities have come to be regarded in quite a different light. In Columbus, in Toledo, in Cleveland, and in other places in this state people are now regarding the Independent telephone securities as a desirable investment; heretofore they have been looked upon with a great many questions. This association during this last winter has done magnificent work in this legislature, not in the way of lobbying, nor in any corrupt way, not in any immoral way, if you please, but it has conducted a campaign of education, it has shown the honorable members of the General Assembly that we have a large and important, a growing industry; that we are in this business on the right basis, that we only desire fair treatment, and we have insisted on that fair treatment; they have listened to our arguments, and there has not been a single law passed really obnoxious to the Independent telephone interests. We did not get all the legislation that we desired, but we have not been very seriously hurt.

I think this association should be maintained for the purpose of conducting the education of the people on these questions; there are going to be other legislatures, in fact this same legislature will be with us two years hence. We ought to get together, we ought to educate the people on this question of taxation. We ought to be able to show them the fallacy of Tom Johnson's or Senator Howe's so-called franchise tax; go to work now and educate the people on these propositions; show them that we are in a legitimate business, exercising and enjoying no peculiar privileges, and the same laws that apply to us ought to apply to other corporations and that there ought not to be any laws applying to telephone properties as corporations unless applied to other corporations making similar profits and under similar circumstances. Conduct a campaign of education as to the desirability of the telephone. In an article in the March number of *Success* there is advanced a theory which shows us that the economic value of the telephone is more than fifty dollars a year. It takes up a case in Rochester where a man started to have a telephone circuit and would not put in the Bell on account of the high rates. One grocery there, with an expenditure of eight hundred dollars a year for a wagon, could not accomplish as much as it was able to do with one telephone, at nothing like that. Taking into consideration the value of the telephone in the time it saves, in the purposes it accomplishes, it is easily worth more than fifty dollars a year. What does that amount to? With us in this county, because I am familiar with the figures here, we have something over ten thousand; if that is true we are adding five millions to the economic value of this county; saving that amount of money.

These matters can be brought to the attention of the people. Take this matter of Cincinnati that Judge Mathews speaks about; it has occurred to me since he was talking that this association can educate the people of Cincinnati so that they will no longer be opposing the Independent telephone, but will be very glad to get it. It may take weeks, may take months, but that education is bound to come. Cincinnati knows what it has suffered in southern trade by its policy as compared with St. Louis. Those cities are no longer rivals; Cincinnati is but a village, with all respect to Judge Mathews, as compared with St. Louis, on account of a different policy. The same idea would be brought home to Cincinnati in the telephone business. She is standing altogether in her own light, and the most desirable thing that could come to Cincinnati is a new telephone company, extending its lines of trade, extending the territory in which it is doing business.

Just by way of illustration; when we started the Independent company in Columbus we had considerable difficulty with the railroad freight offices, and in getting our telephones into the express offices. Our friends in Columbus took the time upon themselves to write innumerable letters. It would be the work of days to count them, but on these freight agents' desks every morning there would be thirty or forty or fifty letters from people receiving shipments, urging the necessity of communicating with the Independent telephone subscribers. It was not long before they were all very glad to come in and take our service, and did take it. If the men who have been here assembled to-day would, among their constituents, so to speak, start out on this campaign of education, Cincinnati could be flooded with letters of the sort indicated and the people would soon be convinced that they were not only losing thousands, but millions of dollars; they are losing a great deal of money to-day by not being connected telephonically. It could be brought to them where they would realize it at once, and no sort of political organization, with the busness men of Cincinnati could prevent that Independent service getting into Cincinnati. For these reasons and many others this association should be maintained; it gives me great pleasure to add that I believe your present president should be maintained in his office. The amount of work he has done is something wonderful; he fills the position better, I think, than almost any man ever filled a position. It has been through his efforts that very much of this has been accomplished and I am sure that you are glad he is president and give him most hearty cooperation. He has always been ready to extend to every telephone company, to every exchange, a helping hand; and speaking of helping hands I am reminded of a little squib I saw the other day, written by some novelist, I think, "With one hand he held her sweet pale face above the surging billows, and with the other he called loudly for help." Now, gentlemen, that has been Mr. Beam's attitude; with one hand he has held the struggling Independent above the water, and with the other called loudly for help—and contributions.

* Delivered at the banquet of the Ohio Independent Telephone Association.

AGITATION FOR CHEAPER RATES IN GREAT BRITAIN.

CHEAPER telephone rates is the urgent demand in England, and a struggle to secure probably the lowest rate on record is to be begun by John Henniker Heaton, M. P., who expects to begin his fight in the House of Commons in a few days. Mr. Heaton thinks that a shilling a week, equal to about 24 cents American money, is all that British householders ought to be asked to pay.

Mr. Heaton is the famous champion of cheap postage, and is confident of crowning his career with procuring cheap telephone rates. He has been in communication with the postmaster general of Australia, who thinks that the shilling rate for telephones is not unreasonable.

THE EDITOR'S PAGE

THE PNEUMATIC DISTRIBUTION OF TICKETS.

A PECULIAR tenderness and susceptibility to variation in external conditions have made the development of the pneumatic distributing system a much more difficult proposition than was probably suspected at the time the scheme was first suggested. Engineers who undertook the work were compelled to investigate a problem which was wholly new to telephone practice, and were without a precedent in their own experience to guide them. As soon as a start had been made it was found that a great number of special difficulties arose, and a course of experiments had to be conducted with the greatest care, in order to devise methods of surmounting the obstacles which were found to exist. It was necessary to provide a plan of operation which should secure the passage of tickets at a rate of speed which would enable the operating companies using the pneumatic tubes to effect a saving in time which would make the pneumatic system economical as compared with the existing plans of distribution by messengers then in use. It was found that the conditions occurring in actual practice were so variable that the most patient investigation was required, among other things, to determine the proper vacuum. This was complicated by the fact that the amount of pressure must be varied with the amount of business being transacted, as it will be readily recognized that the constant opening of a large number of valves has a greater effect upon the pressure than occurs when only a small number of tubes are in use. Consequently it was necessary to provide a system capable of being controlled in such a manner as to secure a proper working efficiency at all periods of the day, and through all possible variations of the exchange load.

Then again a further complication was introduced by the fact that a vacuum suitable for tickets of a certain weight is far from being capable of securing best results when tickets of another grade of paper are used. With these two variable quantities the proper dimensions for each could obviously be determined only by a long and careful series of experiments. Yet further, the length of the flap on the tickets was found to be a factor capable of exercising an appreciable influence upon the speed of passage, and upon the probability of its reaching its destination without being stopped in some more than usually difficult portion of the tube.

The inner surfaces of the tubes collect dust and moisture to a considerable extent when exposed directly to the air of an ordinary operating room, and a deposit of this sort results in a slowing down of the tickets, and is liable to cause an interruption, or the temporary loss of a ticket at a time when such delay can least be afforded. The nature of the paper used for the ticket was found to be very important in reducing its liability to be affected by these conditions. Then, of course, it was necessary to make the gathering of these deposits upon the inner surface of the tubes as difficult as possible, and various schemes for protecting the distributing tables, where the air is drawn into the tubes in a constant stream, have been put in operation. The final result has been that the operation of the tubes is reliable to an extent which approaches the security attained with any other telephone apparatus. The troubles which occur are now of such a nature as to be readily located, and the frequency of their occurrence is not unduly great. In view of the difficulties encountered, and their extremely annoying nature, combined with the fact that they were of a sort beyond the knowledge of the ordinary telephone engineer, the results attained reflect the highest credit upon the ability and versatility of the men who have adapted the pneumatic carrying system to the needs of a telephone exchange.

A CASE OF WASTED EFFORT.

IT'S a pity that some of our telephone patent seekers can't be taken off the job and put to good honest work digging on a pole line route. Those who are best informed tell us that there is no industry in which the actual course of development has been along lines more true to the requirements of pure science and of correct business reasoning than in the furnishing of telephone service. Yet nearly every week we see one or more government documents which prove that somebody has been wasting his time in an utterly misdirected effort to solve a problem that is too big for him. And when he has gone so far, and put his money into the purchase of a statement that the idea is his very own, for weeks and months thereafter we have alternating before us sad visions of the bored general manager and the again disappointed inventor.

This all comes from a man's tackling the main problem before he is ready. It is all right for a man who has been burying guy stubs to want to design an anchor that will hold just as firmly, and be capable of being set in a fraction of the time, and that without digging. And it's all right for him to try to make an anchor that will do the business, too. But before he goes ahead he should find out just what his anchor has to do. It is impossible to solve a problem completely without covering all the details. The man who makes the anchor that is used is likely to be the one who is not only familiar with the looks and feeling of various kinds of ground, but the one who knows the amount of pull in pounds that is exerted by a guy under the various practical conditions which come up. He will know, too, in definite terms the resistance to compression of the various kinds of earth, the force with which it resists withdrawal, the strength of materials of which his device can be made, and the effect produced by numerous different forms of blades. It takes time and thought and experiment to learn these things. Nevertheless they are conditions that must be met, and in these days it is unsafe to trust to an inspiration when one has to overcome physical difficulties.

This first illustration is mentioned because it deals with a type of apparatus which has led on many people through sheer enthusiasm. It looks so easy! Then there is another kind. Almost everyone who has an opportunity to observe telephone circuits in operation sees where human labor could be saved by the automatic accomplishment of certain functions. He reasons that a labor saver is a money maker, and sets out for the goal. No matter whether it be a selective lockout party line system or an automatic exchange, he gets a foundation scheme of some kind and starts to develop it. Then as difficulties arise part after part is added until there is not a spring, nor wheel, nor pawl left in the old alarm clock that is his base of supplies.

After a while it may get to a point where it will do a lot of things. The patent papers are drawn up, and they may get through the office. If they do he starts out to sell it, and he never realizes his position until the general manager puts his questions: "How much will it cost? How long will it last? If I buy a thousand, how many extra men will I have to hire to keep them working?" Then he sees.

In the telephone business, as in so many others, the unattached inventor has a hard row to hoe. If he starts in too early in the seasn he is likely to get tired before he has assured himself of a flourishing crop.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. MCMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

NOTICE OF PAINTING POLES.

The statutes of Vermont require persons owning or operating a line of wires in a city or village to cause the poles on which the wires are strung to be kept suitably painted to the satisfaction of the aldermen and to substitute straight poles for crooked ones. The law also provides that a failure to paint the poles or to make a substitution of straight ones for crooked ones within 20 days after notice shall cause the company to forfeit $100 to the city, to be recoverable in an action upon the statute. The city authorities gave us a notice, but did not say in it what poles should be taken out and replaced, nor what color our poles should be painted. Can they recover the $100 from us? S. C. S.

THE notice should have directed where a substitution of poles should be made and what color they should be painted. If the notice did not so state, the city cannot recover the penalty. The statute is a penal one and should be strictly construed. Village of Hardwick v. Vermont Tel. Co., 40 A. 169.

DULY AUTHORIZED TELEPHONE COMPANY IS NOT A NUISANCE.

The owner of a piece of property in the city sued our company for damages caused by our setting two telephone poles in front of his place, and the only verdict he got was for $1 and costs. This we paid. Now he sues over again and claims the location of our poles in front of his lot is what he calls a continuing nuisance for which he can sue as often as he wants to, if we don't move our poles. Can he keep suing us in this way? Our company has a franchise from the city and a charter from the State under the law. L. E. T.

IF the maintaining of the telephone line were a nuisance this troublesome citizen could sue as often as he desired. But where a telephone company erects its line in a street by the consent of the State and the city, and pays damages therefor, it is not a nuisance. For an injury resulting to plaintiff from the construction of a telephone line in front of plaintiff's residence, he can recover but once. The grievance is permanent in character and the damages first recovered pay for the whole injury. Brown v. Southwestern Teleg. & Teleph. Co., 44 S. W. 59.

INDEPENDENT FRANCHISE VETOED IN MILWAUKEE.

THE franchise granted by the common council of Milwaukee to the West Shore Telegraph and Telephone Company, an Independent concern, has been vetoed by Mayor Rose on the ground that any Independent company may build a system without a special ordinance, and that the city has no right to give a franchise to a telephone company under existing laws. The Mayor was also of the opinion that the clause fixing the rates, the right of the city to purchase, requiring the employees to submit differences with the company to arbitration and compelling them to continue in employment while arbitration proceedings are pending, and requiring all employees to carry a paid-up card in a labor union, could not be enforced because the city had no authority under its charter to make the conditions.

INJURY FROM SAGGING WIRES.

THE Citizens' Telephone Company maintained telephone wires in the city of St. Joseph, Mo. The city itself, maintained an electric light plant and the street railway company also maintained wires in the streets. In many places they were near together, either on the same or nearby poles. A woman was hurt while passing a point where the wires of each corporation are close together, and she brought action against all three, but dismissed as to all except the telephone company. The negligence charged was that the wires were not properly insulated and sagged down, and were constructed of poor, rotten material and that they broke and fell across the sidewalk where she came in contact with them. The plaintiff recovered a judgment from which the defendant appealed and secured a reversal in the Kansas City Court of Appeals. In its decision the court held that the question of whether the telephone company had noticed that the wires were down or not was not material. Politowitz v. Citizens' Telephone Co., 90 S. W. 1039.

THREATENED BOYCOTT OF BELL COMPANY.

AT New Castle, Pa., the city solicitor advised the public to boycott the use of Bell telephones for the purpose of forcing the obstreperous company to occupy the municipal conduit, and end the attempt to increase the rates in this city. The city solicitor is of the opinion that the police powers of the municipality will allow it to order the removal of the overhead wires of the company, on the ground that they are unsafe and against the public good. To prevent this removal, the company has secured an injunction restraining the city officials from cutting down its poles. If the court sustains the position of the city and dissolves the injunction, the company will thus be legally forced to use the municipal conduit. If this should fail, and in all events during the pendency of the suit, the people of the city can, by an effective boycott, drive the company into its discontinuing overhead wires and occupying the municipal conduit, which is ready and willing to receive them.

PERSONAL INJURY FROM LIGHTNING.

A FARMER near Portage, Wisconsin had installed on his farm a telephone, the ground connection of which originally was a three-foot rod of iron driven into the ground. This ground connection proved inadequate in the winters of 1898 and 1899, and the telephone company, at the farmer's request, connected with the ground wire another wire passing over a shed roof and into a pump house and thence to the floor and fastened around an iron pump. In the spring a longer iron rod was substituted for the first one, leaving the telephone supplied with two ground connections. Subsequently, by no act of the telephone company, the wire in the pump house was disconnected from the pump, the end of it coiled up and hung upon a nail inside the pump house, upon which hung a small looking glass used by the members of the family for toilet purposes. In May, 1903, in the midst of a violent electric storm, the farmer, after washing, stepped in front of the glass and began to comb his hair with a metallic comb. Suddenly there was a flash of lightning, apparently from the end of the wire, which struck the farmer's face, rendering him unconscious and causing serious injury. There was also evidence that about the same moment lightning struck a telephone pole not far from the house. The farmer brought suit against the company for damages, but judgment was rendered in favor of the defendant. The plaintiff appealed the case to the Supreme Court of Wisconsin, where the judgment was affirmed. The grounds of the judgment in the lower court were that the telephone company was not negligent in not disconnecting the pump house wire from the ground wire, and that the plaintiff failed to exercise ordinary care in his conduct. Owen v. Portage Telephone Co., 105 N. W. 924.

IN THE OPERATING FIELD

MISSISSIPPI VALLEY COMPANY ACTIVELY ENGAGED ON EXTENSIVE CONDUIT SYSTEM IN BURLINGTON, IA.

UNDERGROUND construction is being rapidly completed by the Mississippi Valley Telephone Company in Burlington, Ia. It is the intention of the engineers to have the major portion of the wires in the business part of the city placed in conduits by the end of the season. The company is also negotiating for a suitable site for a new exchange, and if this is secured in time the construction of a modern fireproof building will be started. The business of the company has been expanding very rapidly and to enable it to meet the demands for telephones, and also to improve the present system, these important reconstruction projects have been undertaken.

MEMBERS OF SOUTHEASTERN KANSAS ASSOCIATION HOLD MEETING.

IMPROVEMENTS and extensions were the principal subjects discussed at an enthusiastic meeting of the Southeastern Kansas Telephone Association, held recently at Mound Valley. The managers and operators of the various companies present gave very encouraging reports upon the development of the industry. At present the majority of the association are residents of Labette County, but it is the intention of the organization to expand so that all companies in this part of the state may become members. Among other matters which came up for discussion was the construction of a toll line to connect Mound Valley with Altamont, Edna, Bartlett and Chetopah. It was unanimously decided to build this line, which will enable nearly all the mutual companies to give extensive toll service to their patrons. It is expected that the line will be completed within the next six weeks.

WRIGHT COUNTY, IOWA, HAS NEW INDEPENDENT TELEPHONE ASSOCIATION.

REPRESENTATIVES of the various independent companies in Wright County, Ia., recently met at Clarion and formed an association. B. W. McElhinney, president of the Goldfield company, and F. C. Petersen, manager of the Clarion system were elected president and secretary, respectively, of the new association. A committee was appointed to draw up a constitution and a set of by-laws, which will be ratified at a meeting to be held in the near future. The following companies are at present members of the association. The Jameson Telephone Company, Dows; Sheffield company, Belmond; Woolstock company, Woolstock; Goldfield company, Goldfield; Rowan company, Rowan, and the Vernon Mutual Telephone Company, Dows.

The association expects by mutual agreements to greatly aid and extend the Independent movement throughout the country and also to increase the long distance and toll service of the various companies.

RECONSTRUCTION OF PLANT AT SCRANTON, PA. WILL PROVIDE FOR EXTENSION OF SERVICE.

IMPROVEMENTS to the Scranton, Pa., system of the Consolidated Telephone Company, which will entail an ultimate expenditure of $30,000, are now well under way. A new switchboard of the common battery type is being installed at a cost of approximately $12,000. The entire reconstruction will be completed by May 15 and the company will then be in a position to take care of a much larger number of subscribers than was heretofore possible. In the residence districts selective party line telephones are being installed, which will enable four parties to be placed on one line. It is estimated that by the first of October one thousand new subscribers will be receiving service which the company was unable to provide with its old equipments.

UNION PACIFIC TO BUILD TELEPHONE LINE.

CONSTRUCTION work upon the telephone system of the Union Pacific Railway, which is to extend from Chicago to San Francisco, has been started. James McReynolds, who has recently finished the building of a 2,000-mile telegraph line for the Postal Telegraph Company, has charge of the work. He will make his headquarters at Cheyenne, Wyo., from which point the work is to start. By the end of the year the line will have been built to Green River.

It has been decided to erect a separate pole line from the one employed for the telegraph wires. The poles are to be comparatively short and stout so as to be able to withstand the severe winter storms of the regions traversed by the railroad. The primary object of the system is to assist in the work of train dispatching and to provide a sure means of communication at all times along the entire route of the railway.

THE SUMMER SCHOOL FOR ARTISANS AT THE UNIVERSITY OF WISCONSIN.

THE attention of telephone employes and others interested in an opportunity to increase their technical knowledge is drawn to the summer school for artisans which is held at the University of Wisconsin in Madison. The sixth annual session begins on June 25 and ends on August 4., making a term of six weeks. The College of Engineering has charge of the various courses in which are given instruction covering engines and boilers, applied electricity, mechanical drawing and machine design, materials of construction, fuels and lubricants, shop work and manual training. The instruction force is taken from the regular faculty of the college and the entire laboratory and shop equipment belonging to the college is used by the students.

The requirements for admission do not extend beyond a working knowledge of English and arithmetic, but the policy is to allow a large amount of individual work so that the student may take advantage of all the preparation he has obtained. To those unable to take a regular four years' course, this school offers an opportunity of obtaining a working knowledge of the methods of testing and the use of instruments, together with such theoretical principles in each case as the nature of the subject and the preparation of the student may permit.

Correspondence students will find this school of great value in giving an opportunity for laboratory practice along the lines in which they have had theoretical instruction.

The course devoted to applied electricity is divided into nine sections, as follows: Dynamos and motors, electrical wiring, meters, transformers, lighting, telephone service, electric batteries, station records, and elementary theory of alternating currents and their applications. Instruction in each division includes lectures illustrated with apparatus and drawings and laboratory experiments.

The shop and laboratory equipment is very extensive and includes apparatus for the conducting of special as well as regular tests. As the students work as individuals rather than in classes, this school offers an opportunity for those so desiring, to pursue laboratory work along lines in which their training may have been incomplete. A fair estimate of the expense attached to the six weeks' term would be fifty dollars,

Digitized by Google

which will be found sufficient for one's needs. This figure includes cost of tuition and living expenses, but not transportation.

A bulletin describing the work of the school in detail may be secured by applying to Frederick E. Turneaure, Dean of the College of Engineering, Madison, Wis.

GROWTH OF BUSINESS IN TOPEKA CAUSES LARGE INCREASE IN CAPITAL OF INDEPENDENT COMPANY.

REORGANIZATION upon a larger scale is being undertaken by the Independent Telephone Company of Topeka, Kas. The capital stock of the company is to be increased from $150,000 to $1,000,000 and the bonded debt increased $390,000. From the money thus secured at least $400,000 will be expended in Topeka during the next six months. A new fire proof office building of the most approved type is to be erected and the wires in the business part of the city will be placed underground. At present there are upward of 5,000 telephones in operation and the switchboard and line facilities are crowded. To enable the system to expand at the rate demanded by the citizens who wish to obtain Independent service a new switchboard will be installed which will have an ultimate capacity of 15,000 telephones. It is the intention of the company to make Topeka the telephone centre of Kansas. Several new copper toll lines are to be built which, with those in use at present, will give ample toll and long distance service. When these improvements are completed the company will possess one of the best equipped systems in the country. An aggressive campaign against the Bell is to be inaugurated at once and as the public sentiment is with the Independent company its future success is amply assured.

In connection with the plan of reorganization Theodore Gary, of Macon, Mo., and Breckenridge Jones, vice-president of the Mississippi Trust Company, St. Louis, Mo., are interested parties. Mr. Gary is president and part owner of several independent plants, among which are the Home Company, Joplin, Mo., and the Atchison (Kas.) Telephone Company. Mr. Jones is well known in independent financial circles, being interested in several large systems. The officers of the company are B. F. Pankey, president and general manager, and W. P. Hemphill, secretary and treasurer.

LONDON POSTOFFICE SYSTEM CUT OVER IN THREE MINUTES.

AN exceptionally rapid cut over was recently made when the lines of the London postoffice telephone system were transferred to the new switchboard. A new fireproof exchange is to be erected on the site of one of the present buildings and temporary quarters were found for the installation of the equipment while building operations are being conducted.

The cut over took place at 3:30 in the afternoon. While the operators were moving from one building to the other strips of tape were placed behind the heat coils on the main frame. When the signal was received that all was in readiness the tapes were pulled and the operation removed the heat coils and disconnected the lines from the old exchange. In just eighty seconds the 40,000 coils connected with the 20,000 lines had been removed. Immediately after the last line was disconnected from the old board the operators at the new exchange were given orders to plug into the answering jacks. This operation caused the cut off relays to operate, which in turn released the line relays. These had been held back from contact by insulators, which fell out immediately after their circuits were opened and the armatures released.

Those lines on which calls were being made immediately thereafter displayed the line lamp signals and business was resumed as usual. All the other lines were tested in the usual way by ringing the subscriber.

In connection with the transfer every line had been tested and measured before the change and the reports filed on cards, so that when the operators failed to raise their parties the records of the lines were consulted for location of the trouble.

NEW COMPANY ORGANIZED IN OHIO WILL CONNECT WITH OTHER INDEPENDENT LINES.

A NEW independent telephone company to be known as the Sandy Valley Telephone and Electric Company was recently organized at Alliance, Ohio. The incorporators and officers are R. S. Kaylor, president; A. S. Hillhouse, vice president; Franze D. Miller, secretary and treasurer; Morton Purdue, general manager, and W. M. Welker, cashier.

This company is capitalized at $50,000 and will operate exchanges at Malvern, Waynesburg, Magnolia and other towns throughout Sandy Valley. It will connect with the Stark County system for toll and long distance service, but is otherwise a separate institution.

Applications for franchises are now being secured and the work of construction will start at an early date so that a considerable headway will be made before the winter sets in.

HOW THE INTER-OCEAN ATTRACTS BUSINESS.

BY the kindness of Mr. Wm. A. Wadsworth, of the Inter-Ocean Telephone & Telegraph Company, Buffalo, N. Y., we are enabled to present the accompanying terse statement issued for advertising purposes. It will be observed that the designer has succeeded in getting a pretty strong argument into the space available on a small card.

WE HAVE 75,000 INDEPENDENT TELEPHONE SUBSCRIBERS IN WESTERN NEW YORK WHOM YOU CAN REACH BY NO OTHER SYSTEM. OUR LINES REACH EVERY BUSINESS HOUSE IN THE CITIES AND VILLAGES IN THIS TERRITORY.

IT WILL BE TO YOUR ADVANTAGE TO USE THE SYSTEM WHICH GIVES BETTER RATES, BETTER SERVICE, BETTER TREATMENT, THAN YOU HAVE EVER BEFORE ENJOYED.

INTER-OCEAN TELEPHONE and TELEGRAPH CO.

TOLL COUPON SOLD AT A DISCOUNT.

UTAH COMPANY DECLARES SECOND QUARTERLY DIVIDEND.

FURTHER proof of Independent progress in Utah is shown by the second quarterly dividend of one per cent. which has been declared by the Utah Independent Telephone Company. The first dividend was declared last January, one year after the company started business. Since then the system has been greatly extended, several new exchanges having been placed in operation and an extensive system of toll lines has been built.

It is interesting to note that the majority of the stockholders are residents of Utah, many being identified with the business interests of Salt Lake City.

OBITUARY.

THE sudden death of Henry E. Hawley, general manager of the Hudson River Telephone Company, was a severe shock to the men connected with the interests which he has served for so long a time. Mr. Hawley was born in Troy, N. Y., August 16, 1861. After completing his education and working in various lines of business not connected with telephone work, he became associated with the Hudson River Telephone Company. On January 1, 1892, he was advanced to the position of general manager, and he has held that office since then. He was a man with many interests and numerous social connections, and his loss is mourned by the many people with whom he has been associated.

QUERIES

AUTOMATIC STARTING BOX.—(690.)

I should like to know why a starting box for motors which has to have its arm moved up a notch at a time by hand is called automatic. R. G.

You seem to be considering the matter from the wrong standpoint. It is true that the arm has to be moved across the coil terminals one at a time in order to gradually cut out the resistance which prevents a rush of heavy current through the armature at the time of starting. When full speed is attained, however, the arm is automatically held in place, and automatically released and returned to the starting position when the machine stops.

CABLING TO REPEATING COILS.—(691.)

Will you please explain how the cabling to repeating coils in the regular Bell cord circuit is arranged? R. N.

A single cable from the lugs in the rear of the switchboard carries wires for the tip and ring connections of both calling and answering divisions of each cord circuit to the repeating coils. The same cable also carries directly to the fuse board certain wires which provide a battery supply for various circuits in the switchboard; but these have nothing to do with the repeating coil wire. The arrangement of the repeating coil on the repeating coil rack, and the fuse board is shown in Fig. 691a. Although various methods of arrangement are in use, the one shown is a typical one, in which the wiring may be most readily traced. The wiring of the circuit and of the repeating coil itself is shown in Fig. 691b. It will be observed that there are four windings in the repeating coil. Two terminals are connected to the tip and ring of the answering cord respectively, and two to the tip and ring of the calling cord. There are two sets, of two terminals each, strapped together, and to each of these straps is connected one pole of the storage battery. The positive side

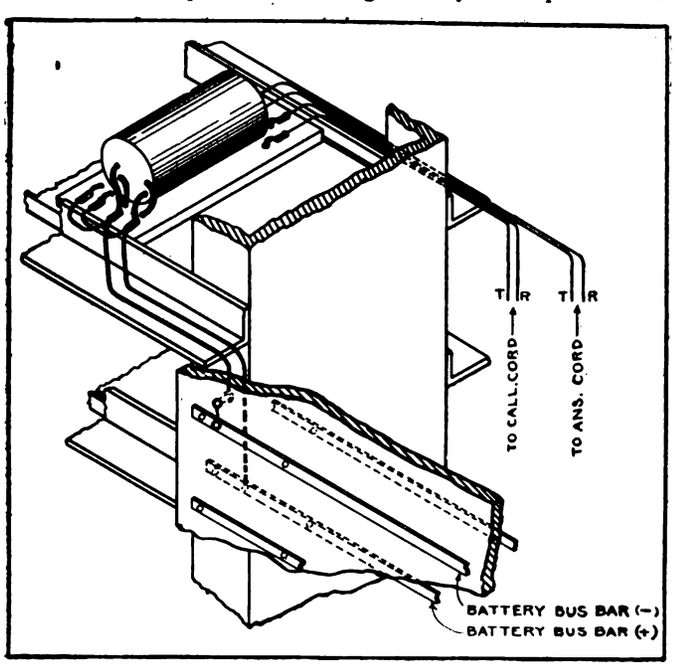

Fig. 691a.

is connected without the interposition of a fuse, while the negative side is fused. On the right of the figure is shown the arrangement of lugs on the repeating coil base, with connections brought out from the winding, and the wires to battery, as well as to switchboard cord strands indicated by letters. T and R represent the tip and ring strands of the calling cord, and T_1 and R_1 represent the tip and ring strands of the answering cord. These four wires are those which are carried directly to the switchboard, while the wires marked B— and B+ are carried directly to the fuse board. The method in which these wires are run in cable is indicated in Fig. 691a.

While this figure shows one set of cabling on the front and the other on the back of the repeating coil rack, another arrange-

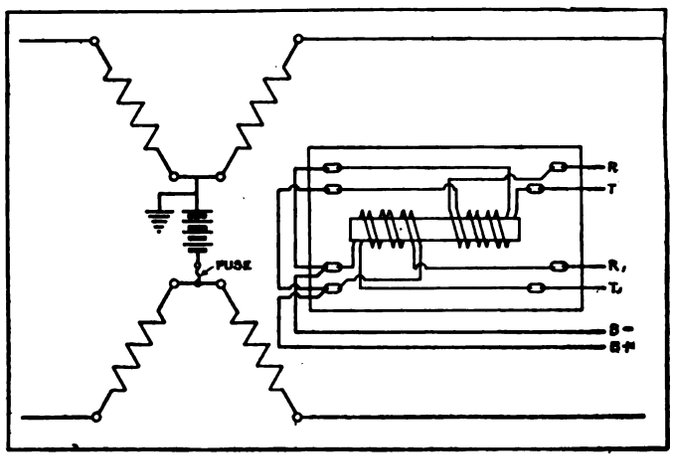

Fig. 691b.

ment is frequently used. In the second plan all lugs on the wooden base to which the repeating coil is attached are mounted at one end. Connections are brought out according to the same scheme of wiring, and the wires to the switchboard are connected to the proper lugs. In making up cable, however, it is customary to make an individual or jumper cable, for carrying the wires from the fuse board to repeating coils, and lay it in place. The cable from the switchboard to repeating coils is then formed with the wires which go beyond the repeating coil rack to the fuse board, and are used for various purposes as mentioned above left long enough to reach beyond the rack to their proper locations. This cable is also laid in place beside the first one, and by some installers the two are tied together in such a way as to have the effect of a single cable. It is possible that if you have had difficulty in tracing out the wiring it is due to the fact that a separate cable has been tied into the regular switchboard cable in such a way as to conceal the fact that the short wires between the fuse board and repeating coils have been run in.

STRAIGHT GROUND WIRES.—(692.)

Will you please explain if there are any electrical reasons for making a ground wire from substation protectors as short and straight as possible? G. J.

A ground wire should be as short and straight as possible in order to secure the most efficient protection against lightning. It is more important that it should be straight than that the length should be small. The reason for this is that a lightning discharge is oscillatory in character, and the direction of the discharge is reversed at such an extremely rapid rate that a bend or partial loop of the wire has extremely high inductance. This being the case its impedance, or effective resistance, to the passage of the current resulting from the lightning is excessively high, in fact much higher than that of a straight air gap. It is owing to this that when the discharge encounters such a high resistance path it will seek a line of less resistance for its passage to earth, and will jump the air space to the nearest ground connection. In doing so it is liable to take a course which will do considerable damage. A straight ground wire has the minimum inductance, and therefore offers the least resistance to the passage of the discharge.

TELEPHONE PATENTS

PROTECTIVE APPARATUS.

Frank B. Cook, Chicago, Ill., patents (No. 815,406; dated March 20, 1906; filed April 27, 1905; serial No. 257,669) an automatic electrical self-soldering reset for thermal protectors.

The object of this invention is to provide a means whereby thermal protective apparatus may be automatically tested and reset after it has operated. This the inventor accomplishes by means of a tool in conjunction with a thermal operating device of a special design. Referring to the accompanying illustrations *a*

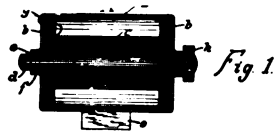

Fig. 1.

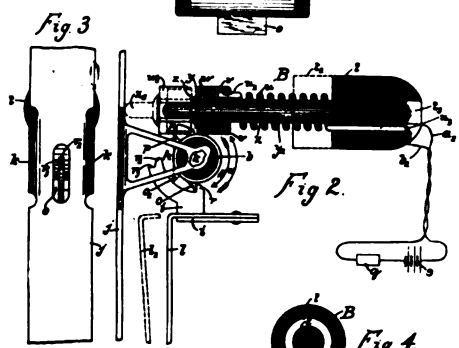

Fig. 3.

Fig. 2.

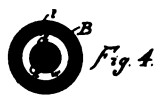

Fig. 4.

is a heat coil provided with a pin *d* secured to the tube *f* by an easily fusible solder. The heat producing winding is connected to the pin *d* and shell *a*. Attached to the shell are two teeth *o*, *p*. In its operative position the device *a* is held between ears *k k* of spring *j*, the flattened end *h* fitting into an indenture in one of the ears to hold the pin *d* in a fixed position. The spring *l* by means of the point *r* engages the tooth *o* and tends to turn the heat coil in the direction *m*.

The circuit of the apparatus is from spring *j* through ears *k*, *k*, pin *d*, tube *f*, winding *c*, shell *a*, tooth *o*, point *r*, to spring *l*. When an excessive current passes through the coil for a sufficient length of time the solder *e* is softened and the coil is turned under the tension of the spring *l* acting upon the tooth *o*. The new position of the coil is with tooth *o* at point o_2, tooth *p* at point p_2 and spring *i* disengaged from the coil as at l_2 leaving the circuit open. As soon as the solder *e* cools the tube *f* is resoldered to the pin *d* in this new relative position.

The resetting tool *b* consists of a pin *x* provided with an annular shoulder *z* and extends through an insulating sleeve y_2. An insulating washer *y* separates the shoulder *z* from the plunger *w*. A spiral spring *u* is placed on sleeve y_2 and conductively secured to the plunger *w*, one end passing through the insulating handle *t*. A battery circuit including a buzzer or other signaling device *q* is attached to the terminals of the spring and pin. To reset the coil the plunger *w* is placed against the tooth *p* in position p_2 and pressure is exerted upon the handle *t*. This causes the pin *x* to make contact with the spring *j* as at x_2. A circuit is then formed from the battery *s*, pin *x*, spring *j*, ears *k*, *k*, pin *d*, coil *c*, shell *a*, tooth *p*, plunger *w*, spring *u*, device *q*, back to battery. When the current from battery *s* has traversed the coil *c* long enough to soften the solder, the heat coil revolves upon the pin *d* in direction *n*, due to the tension exerted upon it by the spring *u* acting upon the plunger *w*. When the plunger *w* passes the point of contact with the tooth *p* the circuit is broken and the solder cools, leaving the coil in its original position. The point *r* of spring *l* may now be engaged with tooth *o* and the coil is ready for another operation.

TELEPHONE EXCHANGE.

Benno Salzmann, Berlin, Germany, patents (No. 815,042, dated March 13, 1906; filed November 16, 1905; serial No. 287,723) a telephone exchange system.

This patent relates to that class of systems which require the services of two operators for the completion of a call, one a distribution operator and the other a connecting operator. Its essential features consist in the employment of signals whereby a distributing operator is informed when the connecting operator with whom she wishes to co-operate is busy.

TRANSFER CIRCUIT.

Charles A. Simpson, Chicago, Ill., patents (No. 816,131; dated March 27, 1906; filed October 27, 1904; serial No. 230,206) and assigns to the Kellogg Switchboard and Supply Company, of Chicago, Ill., a transfer circuit.

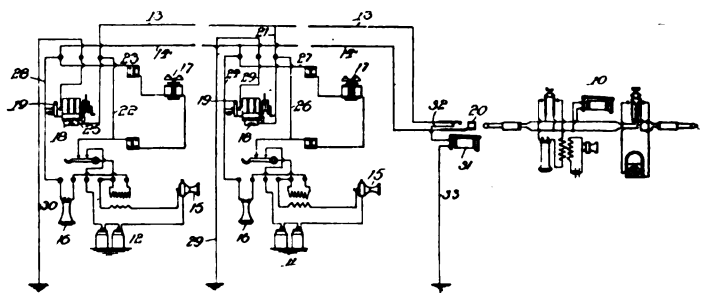
The object of this invention is to provide an improved transfer system of connections between subscribers' jacks located at different switchboard sections, which will facilitate the work of the operators in connecting and disconnecting the lines. The inventor claims that this circuit is suitable for use between two magneto positions, two magneto lamp positions, or between one magneto and one magneto lamp position, or between a common battery position and either of the above.

As it is impossible to completely describe the features of this patent in the space at our disposal we would suggest that parties interested procure a copy.

TELEPHONE SYSTEM.

Louis W. Carroll, Anamosa, Ia., patents (No. 814,830; dated March 13, 1906; filed March 24, 1903; serial No. 149,265) a telephone system.

This patent discloses means whereby persons on a party wire can signal each other without calling the exchange and vice versa. To accomplish this result a spring controlled switch 19 is installed at each instrument and so connected as to normally bridge the generator across the line. An alternative contact is provided which connects to ground and the drop at the exchange is



grounded. To signal a party on the same line the generator is operated and current passes over the line wires 13-14 to the bells of the different stations, but the drop is not actuated. If it is desired to call the operator, switch 19 is moved over to make connection with the ground contact and a circuit is completed over line wire 13, drop 31 and ground connections 33 and 30. The generator now being operated, the call is received at the exchange and the bells at the substations remain silent.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

SHIELD EMBLEMS.

IN order that all telephone companies may have the national Independent emblem in a convenient form for use upon their stationery, and for general advertising, the Edwards-Hine Company, 5-7 Pearl street, Grand Rapids, Mich., has arranged to issue a set of gummed national emblem stamps, which can be used in many different ways in an effective manner and at slight expense. These stamps are printed in two different styles, and in two separate sizes for each style. They are well gummed, and can be affixed not only to stationery, but to glass or wood work, and will stay put for weeks and months at a time.

For general advertising purposes they may be used for toll booth doors, instruments and signs. They are also suitable for telephone number cards to hang beside the telephone and for directories. By their use in this manner every piece of the telephone company's property which comes directly under the observation of subscribers or telephone users conveys all the benefits derived from the advertising value of this national emblem. If they are wisely and neatly placed the attractive features of the emblem make it a desirable ornament.

A box of stamps can be kept on the desk of the persons who forward mail, and used to attach to papers of different kinds which do not bear the printed shield. This would apply to contracts, bills, receipts, etc., and also to sealing envelopes.

The especial advantage in the use of these stamps for directories comes from the fact that many small exchanges have their books printed by local printers who are unable to do good two color work. In a very short time these stamps can be attached by the use of a sponge to a considerable issue, and very satisfactory results secured at a low cost. For decorating toll booths and telephone instruments this stamp furnishes a sure means of indicating an Independent instrument to all who are familiar with the emblem, and the manager who uses them need never fear that a Bell booth will be used through ignorance. "Look for the Shield" is now the recognized battle cry of the Independents, and people are beginning to look for the emblem whenever they wish to use a telephone. Every manager should get in line as soon as possible, and these stamps offer an economical and convenient method of securing the emblem for use in a great variety of ways. The company states that its prices upon quantities have been placed so low that any telephone company can afford to use them freely. It will be pleased to send further information and prices to all inquirers.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, of Buffalo, N. Y., is manufacturing a large common battery multiple lamp signal central office equipment for the Hornellsville Telephone Company, of Hornellsville, N. Y., and a similar equipment is also being manufactured for the Cortland County Telephone Company, of Cortland, N. Y. It is also completing the installation of common battery equipment of the lamp signal type for the Citizens' Telephone Company, of Bath, N. Y., and also for the Lancaster Telephone Company, of Lancaster, N. Y. Both of these equipments include a Century 4-party selective system.

SAN FRANCISCO CALLS FOR MEN TO REBUILD THE CITY.

IN response to the appeal of Mayor Schmitz of San Francisco for architects, draughtsmen and superintendents of building construction to assist in rebuilding the city, Hapgoods, the national organization of employment experts, has offered its services without charge either to employer or employee, and will work in close co-operation with the city authorities in finding suitable men to go there immediately. Immediately after the Mayor's appeal was received, Mr. H. J. Hapgood, president of Hapgoods, issued instructions to the twelve offices of the company throughout the country to institute a special search for the kind of men desired, and within a few hours lists of the names and addresses of a large number of experienced men who are available were telegraphed to San Francisco.

The number of men who have thus far signified their willingness to go to the stricken city is not large enough to meet the enormous demand which has been created by the announcement that the city will be at once rebuilt, and that within a few days over $20,000,000 worth of contracts will be awarded. Hapgoods has placed its services at the disposal of the people of San Francisco, and will be glad to hear at once from every competent architect, draughtsman or construction superintendent in this city or vicinity who would be willing to go to the coast. Full details concerning the opportunities offered will be supplied as soon as they are received from the San Francisco authorities, and as stated above, there will be absolutely no charge to either employer or employee.

NEW MODEL FIELD TELEPHONES FOR THE U. S. SIGNAL CORPS.

THE accompanying illustrations show a modern type of field telephones which the U. S. Signal Corps has recently adopted. The first order for 500 of these instruments shown in Fig. 2 was filled by the Dean Electric Company, Elyria, Ohio.

In designing a new type of telephone for field service, the Signal

Corps demanded great efficiency in transmission, durability, compactness and ability to withstand all conditions of weather. Fig. 1 shows one of these telephones with the micro-telephone in the foreground and the generator crank inserted ready for service. The micro-telephone set is made exceptionally heavy and strong. The handle is cast aluminum, while the receiver and transmitter casings are of finished cast brass. This hand set is provided with soft rubber gaskets at all of the joints and soft rubber diaphragms in the transmitter and in the hand switch opening. so as to make the interior mechanism moisture and water proof. The transmitter itself is of the very efficient standard Dean construction, and is admirably adapted to this kind of service.

The case of this telephone is made from the best quality of quarter sawed oak, substantially put together and finished with hand rubbed varnish. The box is not only dove-tailed together, but is re-enforced by heavy wood screws and metal corners, while the lid is swung on three long hinges, the lid being held closed by two metal clasps. A long reenforced shoulder strap is provided for carrying the instrument. Besides the micro telephone this field telephone contains an induction coil, ringer and generator and a space for cells of 2½" x 7" dry batteries. All of this apparatus is located in the bottom part of the set in compartments so that the extreme upper portion of the box is available for holding the micro telephone when not in use. The generator crank is also accommodated in this upper compartment. Several metal covers are used to close the line wire, cord and crank opening, so that when the telephone is ready for transporting the interior is completely protected.

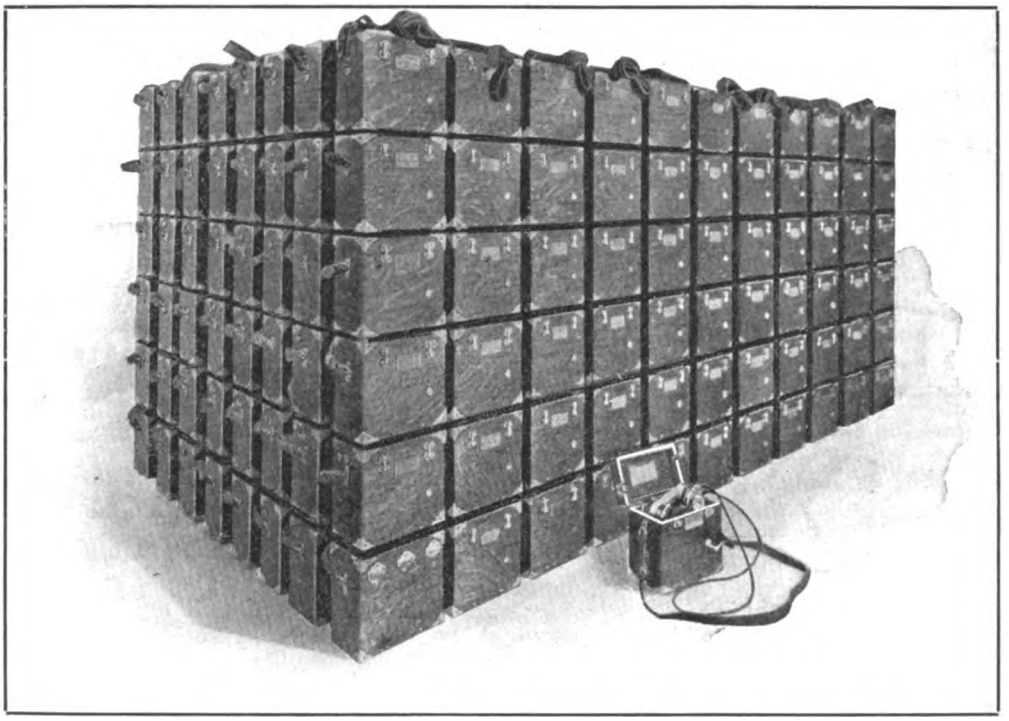

Fig. 2. Group of 500 field telephones, shipped as the first order by the Dean Electric Co.

All of the interior partitions of the telephone set are removable so each of the parts can be readily removed and inspected without disconnecting the wiring. The wiring is done with a special flexible conductor made from fine stranded copper wires and insulated with pure soft rubber and an outer braid. The flexible cord which extends to the micro telephone set is made from similar conductors with an outside covering of pure soft rubber and a braid.

The armature of the generator is treated with a special insulating varnish so as to be thoroughly moisture proof; the windings of the receiver, induction coil and ringer are similarly treated for the same purpose.

The ringer is self-contained, not depending on the woodwork for the adjustment of any of its parts. All metal parts, excepting those required for magnetic circuits, are made from non-corrosive material and finished with heavy nickel plate.

This new model field telephone is in complete keeping with the latest advances in telephone design, and is one of the many indications of the progressiveness of our government officials. The Dean Electric Company has also recently supplied the U. S. Signal Corps with some of its standard magneto telephones. One order called for 150 of the Dean bridging wall telephones housed in the popular common battery type cabinet known as the No. 1420 type instrument. The same order also included 50 standard Dean desk telephones.

PATENTS ON PROTECTIVE DEVICES.

IN our advertising columns appears copy of a document relating to the patents of Frank B. Cook. Mr. Cook claims that he owns and controls absolutely without a cloud on his title a large number of important patents on various protective devices. Among the thirty-four enumerated in the list are patents covering such well known types of Cook apparatus as No. 4, No. 44, No. 444, No. 8, No. 10, No. 14, and No. B-4 protectors, including test plugs, terminal transposition, or cross-over, sectional mounting plates, and numerous other detail patents.

An important patent which was issued only April 3, 1906, covers the new inventions which have been embodied in Cook's Type L iron frame distributing board.

Another very important patent was issued March 20th, 1906 This patent covers broadly the No. 10 protectors, which is Mr. Cook's latest improvement and is the type selected by the Kinloch Telephone Company of St. Louis for its new exchange which requires 15,756 pairs of protectors in the main exchange alone.

THE CARBOLINEUM WOOD PRESERVING COMPANY, Milwaukee, Wis., reports increasing sales for its wood preserving preparation, Avenarius Carbolineum. This material has been on the market for a number of years and the manufacturers claim has never been equalled for prolonging the life of timber exposed to the elements. It is easily applied by means of a brush and is found to be far superior to ordinary paint for protecting pole roofs, gains, cross-arms and the butts of poles where the greatest liability to decay occurs. Numerous practical tests have been made by users of this material in all parts of the country, and booklets giving the experience and testimony of many of the largest telephone, railroad and telegraph companies in the country will be sent to all interested parties upon request.

THE WEEK'S MESSAGES

FINANCIAL.

FT. WAYNE, IND.—The Home Telephone Company, of Ft. Wayne, Ind., has declared a semi-annual dividend of 1½ per cent. on its capital stock.

SOUTH BEND, IND.—The South Bend Telephone Company, South Bend, Ind., has declared a semi-annual dividend of 1 per cent.

CLEVELAND, O.—The Cuyahoga Telephone Company has decided to pay a 4 per cent. dividend, payable May 1.

SALT LAKE CITY, UTAH.—A second dividend of 1 per cent. on the capital stock of $1,000,000 has been declared by the Utah Independent Telephone Company.

WHEELING, WEST VA.—The National Telephone Company has declared a 6 per cent. dividend out of the earnings of the company during the past twelve months. This is the third annual dividend declared by the company.

FRANCHISES.

MARSEILLES, ILL.—The Marseilles Telephone Company has been granted a franchise at Marseilles. The company is to make many improvements in its system at that city.

WARE, MASS.—The Citizens' Independent Telephone Company of Northampton is to apply for a telephone franchise at Ware.

HILLSBORO, TEXAS.—The Independent Telephone Company has applied to the City Council of Hillsboro for a franchise to establish a telephone exchange at that city.

CHARLOTTETOWN, P. E. I.—The franchise of the Island Telephone Company has been extended ten years. The company now proposes to expend $20,000 in improving its system.

COMBINATIONS.

BUFFALO, N. Y.—The Inter-Ocean Telephone Company has acquired the Phelps Telephone Company. The Inter-Ocean Company will enlarge the system and connect it with its trunk lines.

SNYDER, OKLA.—The Snyder Telephone Company has purchased the property of the Topeka and El Reno Telephone Company in the town of Snyder.

FAIRMONT, W. VA.—The Consolidated Telephone Company, which controls all the Independent lines in northern West Virginia, has become the owner of the Parsons Telephone Company.

ELECTIONS.

SALEM, ILL.—The Woodlawn Telephone Company has elected the following officers: N. Howe, president; Ora Bradley, vice-president; Emmus Loefel, secretary; Luther Howe, treasurer; A. L. Waring, Ora Bradley and Charles Swalley, directors.

FALL RIVER, MASS.—The Fall River Automatic Telephone Company has elected the following officers: Clerk and treasurer, Bradford D. Davol; directors, Edward B. Jennings, Edmund W. Wakelee, John T. Swift, P. A. Mathewson, Joseph Watters, Martin Feeney and Bradford D. Davol.

WARWICK, N. Y.—The Warwick Valley Telephone Company has elected the following trustees: John W. Sanford, Fred C. Carey and George F. Ketchum.

ALPENA, MICH.—The Alpena Mutual Benefit Telephone Company has elected the following officers: President, C. H. Reynolds; secretary and treasurer, W. H. Johnson.

ALLIANCE, O.—The Sandy Valley Telephone & Electric Company has elected the following officers: R. S. Kayler, president; A. S. Hillhouse, Canton, vice president; F. D. Miller, secretary and treasurer; M. W. Welker, of Canton, auditor, and Martin Morton Perdue, of Canton, general manager.

ORWELL, PA.—The Orwell Telephone Company has elected the following directors: E. D. Chaffee, N. A. Chaffee, H. G. Newell, J. E. Eastman and C. H. Allis.

NEW COMPANIES.

ADAMS, ILL.—The West Union Telephone Company, Adams, has been incorporated with a capital stock of $9,000. The incorporators are P. J. Doge, E. Ahlers and F. J. Grubb.

CHADWICK, ILL.—The Mutual Telephone Company has been organized at Chadwick. James Taylor is president of the company.

EAST ST. LOUIS, ILL.—The Dupue Telephone Company, of East St. Louis, has been incorporated with a capital stock of $10,000. Incorporators are Levis Beauman, I. O. Whitnel and W. H. Garlan.

LENZBURG, ILL.—The Risdon Telephone Company, Lenzburg, has been incorporated with a capital stock of $500. Incorporators are Henry Kirchoefer, Henry Gruenewald and Fred W. Wasem.

MILLSTADT, ILL.—The St. Clair Farmers' Mutual Telephone Company, Millstadt, has been incorporated with a capital stock of $2,000. The incorporators are Richard Rohr, Daniel A. Haas and Conrad Keck.

JEFFERSONVILLE, IND.—The Jeffersonville Home Telephone Company has been organized with a capital stock of $10,000. The incorporators are Jacob Eberts, Froman Coots, Floyd Parks, William Varble and Albert E. White. The company will install and operate exchanges within the county of Clark and State of Indiana.

PENDLETON, IND.—The Citizens' Mutual Telephone Company, of Madison and Hancock counties, has been incorporated with a capital stock of $2,500. The incorporators are William Rogers, John Henry, William Franklin, Clavin F. Davis and Flavius Pritchard.

ROME, IA.—An Independent Telephone Company has been organized at Rome. The company will establish an exchange in the postoffice, and will build lines to Glasgow, Lockridge and other points.

EDMOND, KAS.—The Edmond Mutual Telephone Association has been incorporated with a capital stock of $5,000.

BELT, MONT.—The Belt Valley Telephone Company, Belt, Montana, has been incorporated with a capital stock of $25,000. The incorporators are C. E. K. Vidal, J. K. Castner and A. P. McAnelly, all of Belt.

WILBER, NEB.—The Wilber Telephone Company has been incorporated with a capital stock of $2,820. The company will build lines in Wayne and Dixon Counties.

SARGENT, NEB.—The Sargent Independent Telephone Company has been incorporated with a capital stock of $4,900. The incorporators are J. R. Sutton and others.

IREDELL, N. C.—The Iredell Telephone Company has been organized. Those interested in the new project are R. V. Brawley, H. P. Grier and Eugene Morrison.

JERUSALEM, N. Y.—The Lake Valley Telephone Company has been incorporated with a capital stock of $300.00. The incorporators are William H. Van Nalton, Edward L. Mitchell, Alton C. Mosher, Jerusalem, N. Y.

WAKEMAN, O.—The Todd Corners Telephone Company has been organized at Wakeman.

ALINE, OKLA.—The Aline Telephone Company has been incorporated with a capital stock of $5,000. The incorporators are George W. Graham, of Chicago; H. A. Noah, of Alva; John Hartshorne, of Aline.

SENTINEL, OKLA.—The Sentinel Rural Telephone Company has been incorporated with a capital stock of $500. The directors are William Tidball, T. J. Bryan and I. M. Wright, all of Sentinel.

HOWARD, PA.—The Bald Eagle Telephone Company, Howard, has been incorporated with a capital stock of $15,000.

LONGSWAMP, PA.—An Independent Telephone Company has been formed at Longswamp. It will connect with the Mountain Line at Fredericksville, where an exchange will be established.

BRITTON, S. D.—The Social Telephone Company is being formed by the Commercial Club of Britton, S. D.

VERGENNES, VT.—The citizens of Vergennes, in public committee,

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

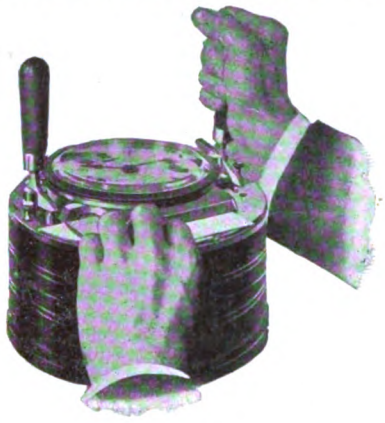
IF TIME IS MONEY

Don't you think it is worth while to be accurate?



THE CALCULAGRAPH

is a mechanical time keeper which enables you to get full value for your toll service. By the simple movement of two handles, one when a conversation starts, the other when it is finished, you secure a printed record of the elapsed time in minutes and quarter minutes upon which to base the charge.

The Calculagraph makes no clerical errors, expedites the service and will pay for itself in a short time by saving the excess charges which are ordinarily lost.

Write for booklet.

The CALCULAGRAPH CO.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

THE WEEK'S MESSAGES

have voted to establish a municipal telephone system. Committees have been appointed to obtain cost of construction, etc.

GREENBRIER, W. VA.—The Greenbrier Mutual Telephone Company has been organized at Greenbrier. C. G. Rader is president and Thomas W. Shields, secretary and treasurer.

ATTICA, WIS.—The Attica Mutual Telephone Company, Attica, Green County, Wis., has been incorporated with a capital stock of $10,000. The incorporators are Oliver S. Jones, Herbert E. Ludington and Chauncey T. Bartlett.

BEAVER, WIS.—The Unity Western Telephone Company, Beaver, has been incorporated with a capital stock of $650. The incorporators are George H. Stone and others.

HIGHLAND, WIS.—The Individual Telephone Company, Highland, Wis., has been incorporated with a capital stock of $800. Incorporators are John J. Yerke, Joseph Richter and J. F. Lohrs.

MUSCODA, WIS.—The Pulaski Telephone Company, Muscoda, has been incorporated with a capital stock of $800. The incorporators are H. Roseneau, A. C. Kroesche, Henry Schneider and Thomas Seifert.

PERSONAL.

H. H. BRATT, who for the past two years has been superintendent of the Davenport office of the Union Electric Telephone and Telegraph Company, has been made general superintendent of all the lines and exchanges of the company He will continue his headquarters in Davenport, Ia.

OWEN M. BURGESS, of Nashville, Ill., has been appointed district manager of the Central Union Telephone Company, with headquarters at Centralia. His district embraces all of Illinois south of Decatur, and is the largest in the State. Previous to his promotion Mr. Burgess was chief purchasing agent.

R. C. ALLEN, who has, during the past year, been wire chief for the Mississippi Valley Telephone Company at Burlington, Ia., has accepted the position of manager of the Jones County Telephone Company at Anamosa, Ia.

O. R. BARNES, formerly an engineer in the distribution division of the Bell Telephone Company of Philadelphia, and for eleven years with the various Bell Companies, is now in the employ of the Keystone Telephone Company of Philadelphia as an assistant engineer on distribution work.

D. E. CAMP, formerly of Perry, has been appointed manager of the Pioneer Telephone Company's exchange at Shawnee, Okla.

F. B. CLYDE, formerly manager of the Tyler office of the Southwestern Telephone and Telegraph Company at Tyler, Texas, has taken a position as manager of the business of the Independent Telephone Company at that place.

S. E. McKENNAN, of Springfield, has been appointed manager of the Bell exchange at Taylorville, Ill.

U. L. McLAUGHLIN, who has been managing the De Pere exchange of the Wisconsin Telephone Company, has been promoted to a position in the maintenance department at Oshkosh.

WM. L. McNERNEY has been appointed manager of the De Pere exchange of the Wisconsin Telephone Company.

F. L. MARTIN, formerly advertising manager for the Stromberg-Carlson Telephone Manufacturing Company, will hereafter be associated with the White's Class Advertising Company, Caxton Building, Chicago, Ill. Mr. Martin will continue to devote much time to telephone advertising, in which he has had a wide and valuable experience.

MISCELLANEOUS.

MORRISTOWN, IND.—The Ripley County Telephone Company has recently installed a new 100 drop switchboard.

CANTON, MO.—The directors of the Northeast Missouri Telephone Company have elected W. G. Stephens general manager. Mr. Stephens won this promotion through valuable work at La Grange, where he has had charge of the company's business for the past year.

KANSAS CITY, MO.—The Missouri Pacific Railway is installing a private telephone system on its line between St. Louis and this city. The line is for the transaction of official business.

ST. JOSEPH, MO.—R. S. Hamilton, of Morristown, Ind., is compiling a system of accounts for a trans-state toll line company. This is to be made up of various Independent companies who will turn their long distance business over to the toll line company. Interested persons may obtain information by writing to Mr. Hamilton, P. O. Box 409, St. Joseph.

COLUMBUS, O.—The Columbus Citizens' Telephone Company has installed lines to nearly the full capacity of its 8,000 line main switchboard. The company now operates over 11,000 telephones in Columbus and Franklin county.

New Construction in the Field

MOBILE, ALA.—The Home Telephone Company is to spend $350,000 in extending its system.

ALACHUA, FLA.—The Alachua Telephone Company is to extend its lines to Worthington Springs.

COLUMBUS, GA.—The Hamilton Telephone Company is building a number of farmers' lines.

MIDDLETOWN, IND.—The Middletown Telephone Company is to establish connections with Sulphur Springs, Cadiz and possibly Mechanicsburg.

ARDMORE, INDIAN TERRITORY.—The Chickasaw Telephone Company is to spend several thousand dollars in installing a new central energy exchange.

COLO, IA.—The Boone County Telephone Company is making many improvements in its system.

DECORAH, IOWA.—The Standard Telephone Company is to make extensive improvements in its exchange at Decorah, including the installation of a new switchboard.

HARTFORD, IA.—The Hawkeye Telephone Company is to extend its lines from Hartford to Carlisle.

SALINA, KANS.—The Salina Telephone Company is to make improvements and additions to its Kipp exchange.

SAVONA, N. Y.—The Savona, Hammondsport and Bath Telephone Company expects to build lines to Watkins and Dundee.

SCHUYLERVILLE, N. Y.—The Commercial Union Telephone Company is extending its lines in Schuylerville.

PINGREE, N. D.—The Pingree Telephone Company is making preparations for the extension of its lines.

BARLOW, KY.—An Independent telephone exchange has been established at Barlow, and exchanges will be established at Kevil, La Center and Bandana. All will be under the control of the Paducah Home Telephone Company at Paducah.

THREE RIVERS, MICH.—The Three Rivers Telephone Company is building a line to Parkville.

MANCHESTER, MINN.—The Manchester Farmers' Telephone Company is improving its system.

BLAIRSTOWN, N. J.—The West Jersey Toll Line, operating between Blairstown and Belvidere, which has been purchased by New York capitalists, is to be reconstructed.

LIBERTY, N. Y.—The Liberty Mutual Telephone Company is building a line from Liberty to Hoytville, Pa.

COLUMBUS, O.—The Columbus Citizens' Telephone Company is to establish an exchange at Linden Heights.

McARTHUR, O.—The McArthur Telephone Company is improving its system.

MORNING SUN, O.—The Morning Sun Telephone Company contemplates doubling the capacity of its system.

ORWELL, PA.—The Orwell Telephone Company is to establish long distance connections with the York State Independent Company.

PITTSTON, PA.—The Commonwealth Telephone Company, with connections at Harvey's Lake, Bernice and Meshoppen, is to build several new lines.

SCRANTON, PA.—The Consolidated Telephone Company is making extensive improvements in its system, at an expenditure of over $30,000.

WASHINGTON, PA.—The Washington Mutual Telephone Company is rebuilding its line in Warren County.

VERMILLION, S. D.—The Twilight Club of Vermillion is considering the proposition of putting in a local telephone system.

CLARKSVILLE, TENN.—The Clarksville Home Telephone Company is rebuilding its lines from Clarksville to Memphis. The company will rebuild its system at Erin, and install a new switchboard.

BELTON, TEXAS.—The Independent Telephone Company, of Belton, is to undertake some extensive improvements and additions to its system.

FREDERICKSBURG, TEX.—The Texas Telephone Company is extending its lines to Mecklinburg.

NEWVILLE, VA.—James Hargrave, of Newville, is constructing a line to connect with Petersburg.

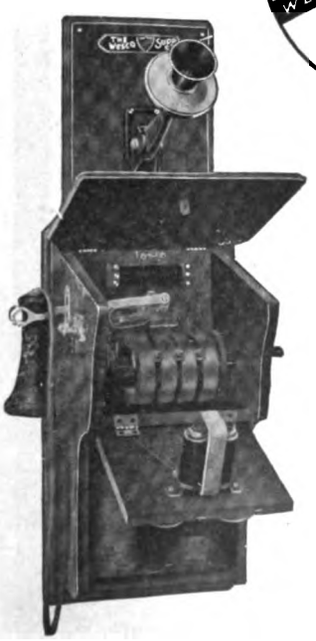
"ALL WORKS OF QUALITY"



The Wesco "Ideal."

Says RUSKIN,

"must bear a price in proportion to the skill, time, expense, and risk attending their invention and manufacture. Those things called dear are, when justly estimated, the cheapest; they are attended with much less profit to the artist than those things which everybody calls cheap. Beautiful forms and compositions are not made by chance, nor can they ever, in any material, be made at small expense. A composition for cheapness, and not for excellence of workmanship, is the most frequent and certain cause for the rapid decay and entire destruction of arts and manufactures."

Our Booklet. "PERFECT TELEPHONES"

will interest all who appreciate the economy of buying THE BEST. Write for it.

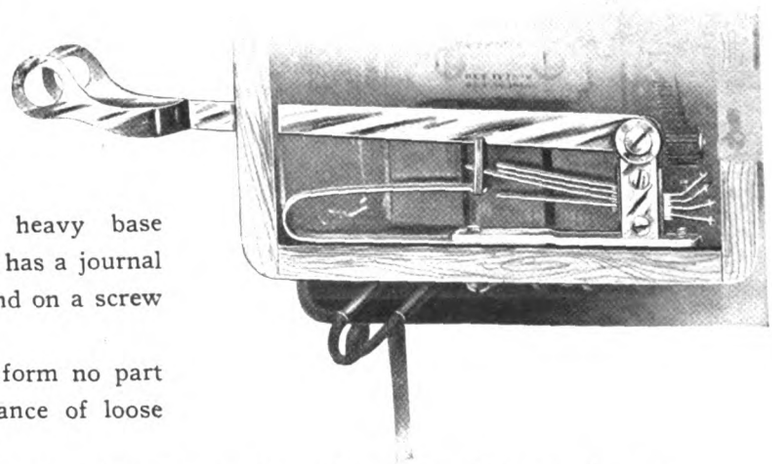
NORTH'S



NORTH'S horizontal lever adjustable tension hook-switch is strong, simple, reliable—insuring perfect action—positive contacts.

Entirely self-contained—a heavy base made in one piece. The lever has a journal bearing hinge—does not depend on a screw to support it.

The lever, base and hinge form no part of the circuit—avoids all chance of loose contacts or accidental shocks.

The controlling spring is German Silver, long and flexible, and capable of adjustment.

The contact springs are German Silver—provided with pure platinum contact points (not platenoid or other alloy). They are made straight—to give maximum resiliency.

They are mounted in a slotted pure hard rubber block (not fibre) and held in place by a brass clamp and two long machine screws—no chance to work loose.

All contacts and terminals in plain view.

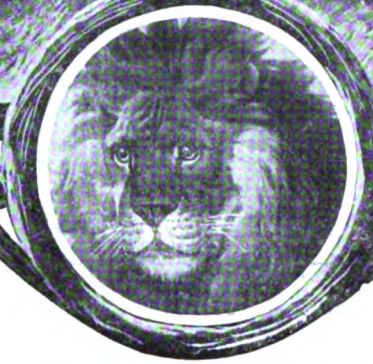
MONARCH



THE varying conditions of bridging lines make it necessary to have an adjustment on bridging drops if it is desired that a distinct signal be given the operator. On a short light line a drop receives a large amount of current and without some adjustment feature the armature will pull up and stick without giving a distinct buzz. The operator is then unable to determine whether the call is for central or for another subscriber on the same line unless she plugs in. In all Monarch bridging drops a spring adjustment is provided which makes it possible to bring a slight or great tension to bear against the armature. By referring to the illustration it will be seen that the core of the drop coil is bored out and that a light coil spring is placed within. At the front end this spring presses against the armature, while at the rear end a plunger is engaged. A set screw passing through a split metal bushing in the head of the coil comes into contact with this plunger. On short light lines this screw is tightened so that the spring presses against the armature and causes it to respond quickly to the ringing impulses. On long heavily loaded lines the screw is loosened so that little or no pressure is brought to bear. By this means every drop can be adjusted for its particular line. ¶ Many other valuable features are illustrated and described in the switchboard catalogue. A copy will be sent upon request.

DEAN TELEPHONE APPARATUS

METAL BOX
COMMON BATTERY WALL TELEPHONES

This metal box telephone is the most efficient, compact telephone made which is fitted with standard Dean circuits and apparatus—features which at once stamp it as perfectly reliable and practical. It is more substantial than the ordinary wood constructed telephone, while the transmission qualities are exactly the same.

The retaining case is made from heavy sheet steel, drawn into shape without seams and finished with a tough enamel in any desired color, black being the standard.

No woodwork to become marred, therefore will always look good.

Write for folder 3-A, which gives circuits and full description.

KELLOGG PHILOSOPHY— —THE BEST IS THE CHEAPEST

KELLOGG

FREQUENCY POLE CHANGER

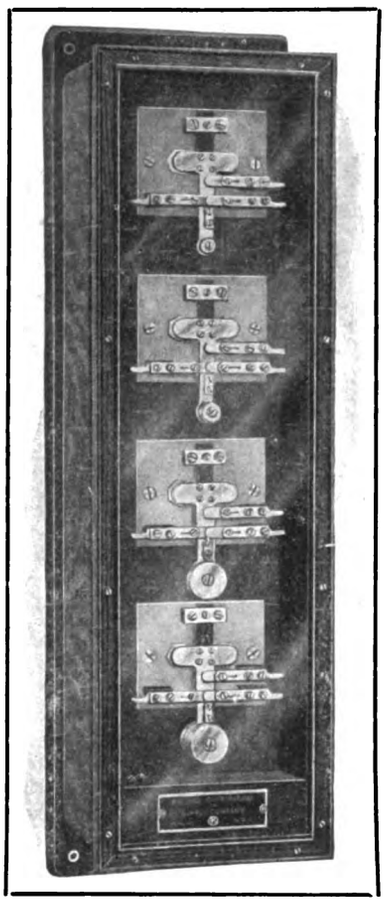
Utmost SIMPLICITY of Operation

THE EFFICIENCY

and beauty of the Selective Harmonic Ringing System of the Kellogg Company has been fully recognized by the entire Independent field, but the difficulty, heretofore, has been that the system required a generating device which involved a rather high first cost, and a relatively large consumption of energy.

The Frequency Pole Changer was designed to meet and overcome all these objections.

It is a very simple device, each unit only involving the use of a magnetic coil and three sets of springs.



"FRONT VIEW"—COVER ON.

ADVANTAGES

1. Requires no attention after once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from Primary or Storage Batteries.
4. Dry cells can be used for the ringing current.
5. They can be furnished to work successfully under any load.
6. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
7. Operates successfully within the limits of 17 to 28 volts.
8. Noiseless in operation.
9. Only three contacts on each vibrator.

This Pole Changer can be used on either Common Battery or Magneto Exchanges

WHAT'S WRONG

with that TELEPHONE INVESTMENT of yours?

Why doesn't it pay you as well as the best of your investments?

Is the reason bad management or bad equipment? More likely the latter.

Probably the company is trying to do a 20th Century business with 19th Century apparatus.

If that's the case, it is spending more and earning less than it might if it had our Automatic Telephone equipment.

This is the only really modern telephone system. It produces the ideal telephone service—quick, sure and secret—at half the operating expense of a manual equipment, and this service commands better rates.

It costs a fixed price per hundred lines to enlarge the automatic exchange, instead of an increased price per each hundred lines, as in the manual equipment.

The automatic exchange is never outgrown; it never has to be "scrapped" and replaced by a complete new one, as with the manual. You just add to it as you do to a sectional book-case.

All these points bear upon the stability and value of your telephone securities. They mean dividends to you.

Over ninety per cent. of all the large orders placed during the past few years, either for new installations or replacements, have been for our automatic system, and all the companies adopting it have, from the increased earnings, been able to pay the interest on their bonds and a good dividend on their stock.

Our Automatic System has been adopted in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Albuquerque, N. M.
Allentown, Pa.
Auburn, Maine.
Auburn, N. Y.
Battle Creek, Mich.
Bellingham, Wash.

Central Energy Telephones

Stromberg-Carlson

TELEPHONE MANUFACTURING CO.
ROCHESTER, NEW YORK

IF you use or contemplate using Central Energy Telephones it will pay you to get a copy of this new bulletin. There is sufficient evidence in it to prove that the telephones illustrated therein are without exception the most modern and nearest to perfection of any ever placed on the market. This statement is not based on the fact that our cabinets are better finished, that we have a better transmitter or a removable hookswitch, but the telephone taken as a whole.

There is not room enough on this whole page to explain all of their good points. By good points we mean the things that make your subscribers satisfied, eliminate troubles caused by accidents or carelessness on the part of users.

It will only cost you a two-cent stamp and a moment's time to get a copy. Just ask for Bulletin No. 15-B.

Shall we send one?

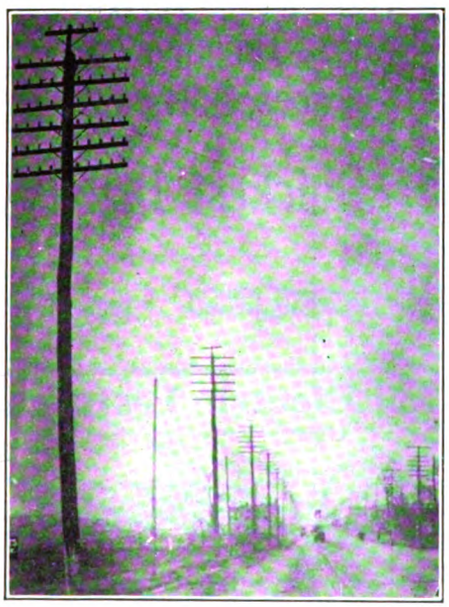
WE MAKE CABLE

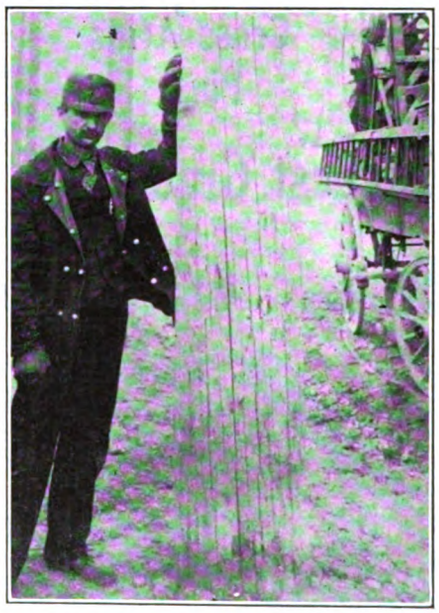
Construction Is Costly

The matter of line construction is of perhaps more importance to a small company than a large one. With the latter there is generally no difficulty in securing funds for improvements or reconstruction; whereas the small concern is limited in its expenditures. For this reason it is most important that its construction work shall be done economically; durability and future growth being given due consideration.

Open wire lines put up to stay and designed to reduce to a minimum the costs of maintenance and depreciation are excessively expensive. As the number of cross arms increase so does the size of the poles and every item in the bill for construction is increased proportionately. But after every precaution has been



An open wire line expensive to maintain, fifty foot poles, 8" tops, 20" diameter, four feet from ground.



Base of pole shown opposite. Note the comparison between it and the man.

taken, the continuity of open wire circuits is most uncertain. No matter how well the wires are installed, a sudden drop in temperature will cause them to snap and in one night sufficient damage can occur to eat up profits for six months to come.

In the spring it is necessary to have all the slack pulled out of spans. This takes time and labor, yet if not done crosses will surely occur and the continued expense for maintenance under these conditions to say nothing of the faulty service given, will prove a heavy drain upon the resources of any company.

The only way you can be saved these troubles and expenses is by either putting up cable in the first place or substituting it for your present open wire lines.

Stromberg-Carlson cable represents the highest degree of excellency in manufacture and efficiency in electrical properties. It is standard in every respect and for that reason you should use it and no other.

Telephone System of French Steamer La Provence

By Edward A. Tyler.

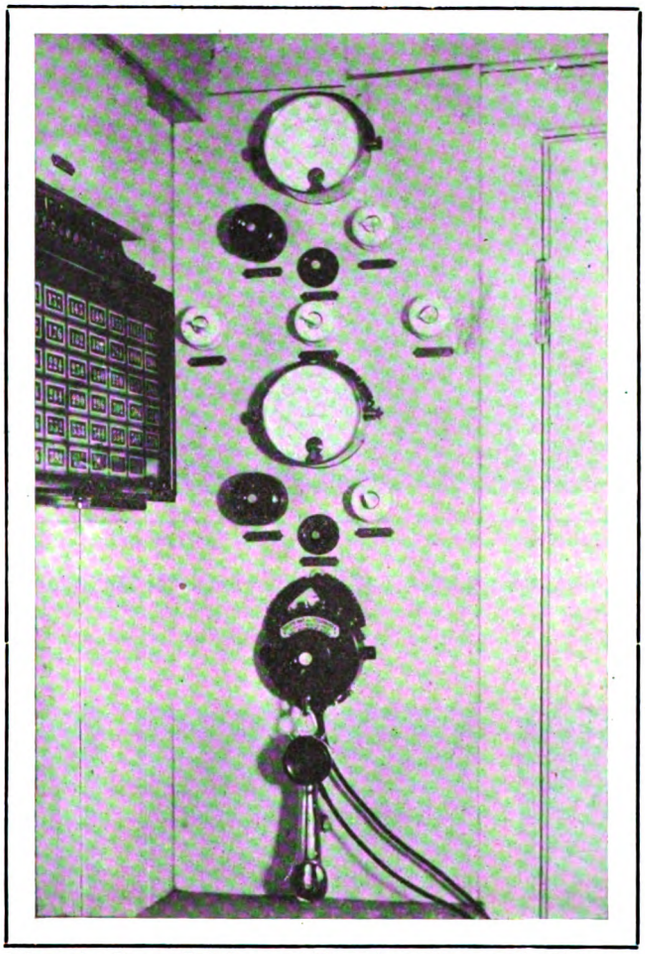
SAVING of time was the great object sought by the company which operates the new steamboat La Provence. She was built as a record breaker for the Compagnie Generale Transatlantique, more commonly known on this side as the French Line. On her first run, which has just been completed, she traversed the distance from Havre to Sandy Hook in five days, 23 hours and 40 minutes. The previous record was six days, 9 hours and 20 minutes. That is one way in which she saves time for her passengers.

Details, however, are important, and it is by the use of the telephone, among other things, that the company succeeds in securing to its passengers the fullest benefit of the period spent in crossing the ocean.

Not only is the attempt made by the use of powerful engines to make the trip from continent to continent as rapid as possible, but every device which will enable the passenger in the fullest measure to employ the time spent on board for his own ends is installed and intelligently operated.

In modern ocean travel the mere function of transportation is far from the only one which is accomplished by the steamship company. Stress of competition has made it necessary for each line to devote as much care to the development of the features of personal service as does the manager of a modern hotel. Indeed, the resemblance between the two is marked in many ways.

Of late years the tendency in constructing the Atlantic liner has been to constantly increase the size. Several of these vessels are over 600 feet long, two or three are slightly in excess of 700 feet, and there are two in course of construction which will be more than 800 feet over all. The number of decks for passenger accommodation varies from four to six. These figures will convey a slight idea of the size of the modern Atlantic ferry which in truth forms a temporary home during a period of from five to six days duration for a population averaging in the neighborhood of 3,000 persons.



Information Bureau Telephone and Measuring Instruments for Telephone and Annunciator Systems.

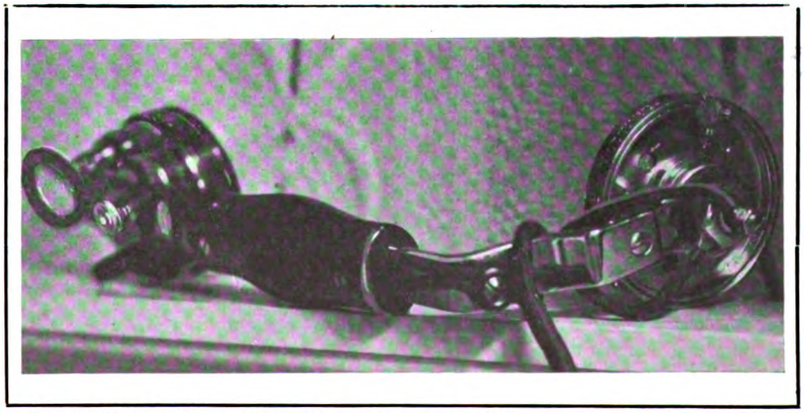
As on shore, so on shipboard the telephone has played a most important part, and by its use the passengers are enabled to travel with ease and comfort and live just as luxuriously as if they were residing in one of the finest hotels of a metropolitan city.

The S.S. *La Provence,* which is the largest passenger vessel which has been built in France, has a telephone equipment which differs in several features from American practice.

In all there are four distinct systems, as follows:

The navigating or marine system, the executive system, the cabin system, and several direct circuits used for intercommunication between the navigating and engine stations within the interior of the vessel.

Taking each system in the order named the marine service will first receive attention. There are six instruments employed for intercommunication between the navigating bridge and the engine room and after bridge. The instruments on the bridge are of the familiar watertight, loud speaking type previously described in an article on the equipment of the S.S. *America.* Only two instruments are placed on a line, and each circuit is entirely independent of the others. The forward bridge might be called the exchange, and



French Micro-telephone. Note Form of Grip and Skeleton Combination of Transmitter.

Digitized by Google

here three of the lines terminate. The connecting stations are located one each in the port and starboard engineroom and on the after bridge. Signalling is accomplished by loud ringing vibrating bells. In the engine rooms the instruments are placed in booths on account of the noise and each is provided with a flexible ear piece fitted with a rubber cushion to further aid in the exclusion of the noise created by the heavy machinery. Attention is drawn to the illustration of the instruments on the bridge. The telephone equipment is mounted in a circular case which can be given three-quarters of a revolution so that the operator can adjust the position of the instrument to suit the requirements of the occasion.

The circuits of the executive system terminate at a switchboard located in the information bureau. This is used to place the heads of the various departments in connection with each other and also to enable the stateroom passengers to communicate with any of the officials. There are ten circuits which terminate at drops of the usual type. Connection between the lines is made by means of keys. Thus if a passenger desires to talk to the purser, the surgeon or the captain he can do so without leaving his bed, the instrument being hung on a hook within reach of his pillow.

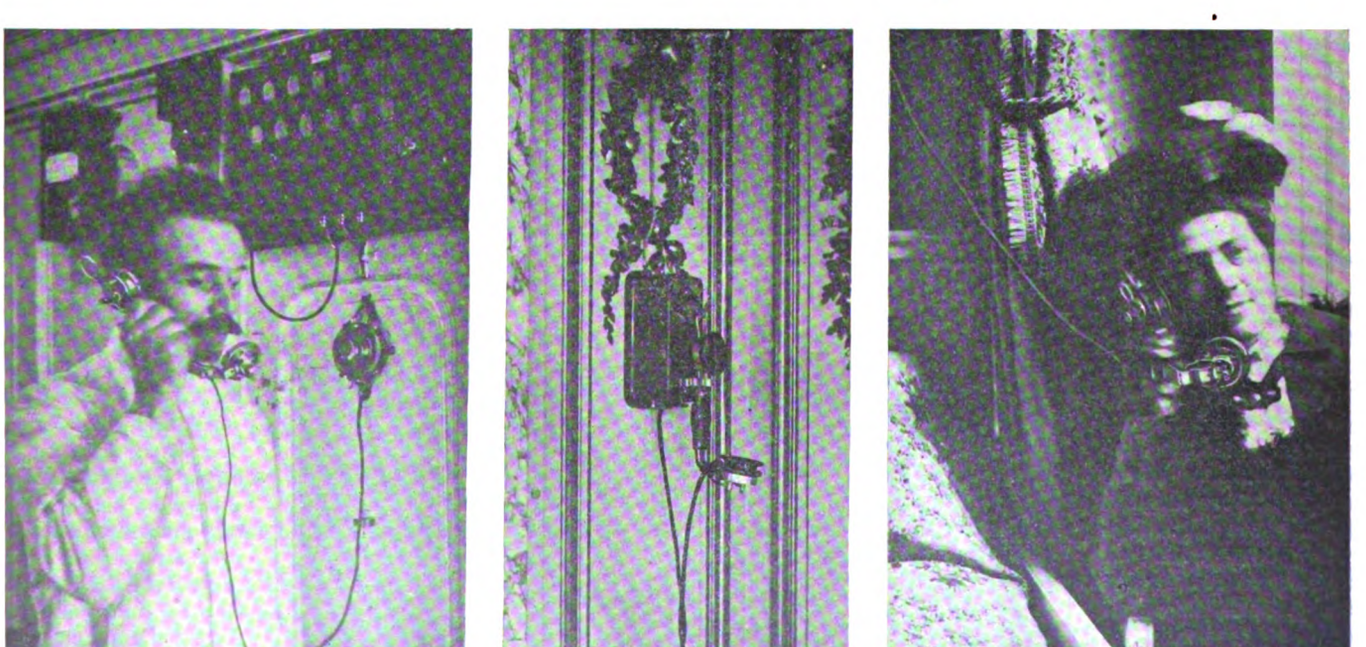
Every stateroom passenger also has direct connection with another switchboard in charge of a steward. This equipment, known as the cabin system, enables the user to call for any service performed by the steward's department. Thus meals can be ordered or messages delivered to other travellers; in fact from the time a passenger enters his stateroom he can remain in perfect seclusion and yet by means of the telephone secure all the comforts which are enjoyed by his more active fellow travellers.

Telephone station in wheel house connecting with wireless operator.

There are connected with the steward's system thirteen circuits which terminate at drops and jacks at the switchboard. A single contact plug is employed to connect the operator's instrument with the various lines. This board together with a cabin instrument in use and a photograph of a station in the grand saloon are reproduced in the illustrations which accompany this article.

The telephone circuits which comprise the fourth system connect the engineers and navigating officer's cabins with their operating stations. Thus the chief engineer has direct communication with the engineroom, the electricians with the dynamo plant and the wireless operator with the chart room.

The instruments employed for this service, although of the combined hand type, differ considerably in design from the usual type seen in this country. Transmitter and receiver are mounted back to back in the same case. Attached to the transmitter is a crescent shaped horn which serves as a handle and also as the mouthpiece. When in use the opening of the horn is at one side of the lips of the person speaking, but on account of the sensitiveness of the transmitter the spoken sounds are reproduced clearly and distinctly and

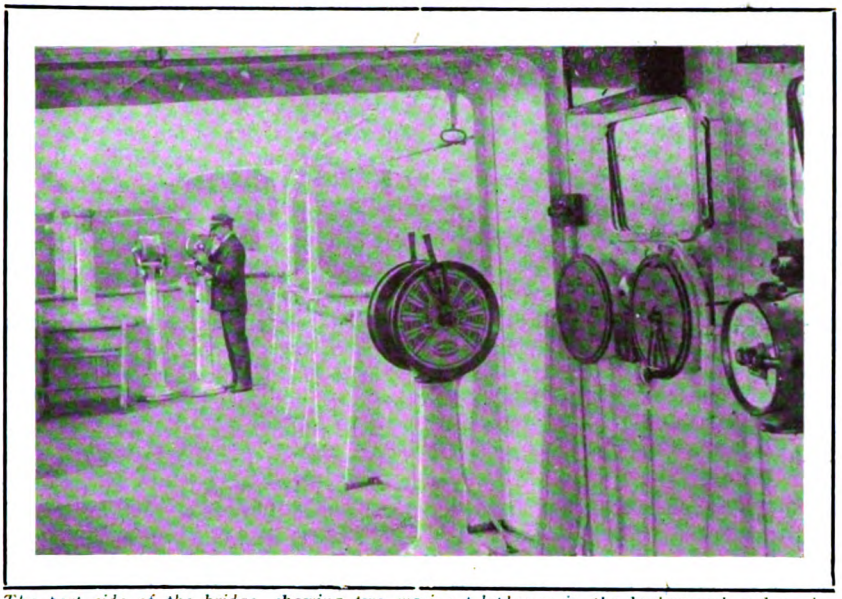


Cabin de luxe telephone equipment; switchboard, with drops and jack on left in use connecting with cabin instrument on right. The latter telephone is mounted adjacent to the bed in a convenient position for the user. The central picture shows the mounting, including the switch and bell box and also the retaining clip to hold the telephone on the hook.

Digitized by Google

sufficiently loud to give this type of instrument the distinguishing title of loud speaking.

The receivers of the cabin telephones are provided with a stem which slides in a groove in the handle so that the user can adjust the instrument to meet his or her convenience. This feature is brought out in one of the accompanying illustrations, which also shows the peculiar construction of the back of the transmitter. Here one sees one of the unmistakable features of European practice, the usual rear casing employed to enclose the entire mechanism being absent. Instead of this a perforated back is employed to protect the rear of the diaphragm and to hold it and the button in position.



The port side of the bridge, showing two marine telephones in the background and engine room telegraph and speed indicators to the right.

The batteries for the system for communicating between the cabins and the offices center at the Information Bureau, where the switchboard is located. Here is not only the switchboard for interconnecting various lines, but also the measuring instruments which are used to determine the condition of the batteries which supply the current for talking and ringing. These measuring instruments, and the telephone which is used by the person in charge of the Information Bureau are shown in the illustration at the head of the first page. The voltmeter, ammeter and controlling switches were installed primarily for use in connection with a small storage battery, which operates an annunciator system employing lamps. Arrangements were made, however, for switching the instruments to the circuit of the telephone batteries in order that their condition might be observed. The telephone battery comprises five dry cells, each cell enclosed in a wooden case. The five are set into a compartment of a small cabinet below the apparatus shown in the illustration. This compartment is of such a size that the cells fit into it closely, and no movement is possible. The switches enable the attendant to place the ammeter and voltmeter in connection with either the telephone batteries or the storage cells. This apparatus is set near a corner, with the switchboard mounted upon the wall at the left, which runs at right angles to the one shown, in such a position that the attendant may easily operate it while using the telephone which hangs below the instrument switching apparatus. As this is a long cord no inconvenience is caused by the telephone being separated from the small switchboard with which it connects.

The instruments, including the switchboards and special switches used in connection with the battery system, are manufactured by the Societe Industrielle de Telephone, Rue 4 Septembre, Paris.

Report of John Hesketh

SPEAKING generally, it is found that the highest development is to be found in those cities giving the best of services, at rates varying with the extent to which the service is used. A cheap service is not necessarily one with a high development, and it is almost invariably inefficient.

On the other hand (although there are not lacking notable instances of high rates being accompanied by a most inefficiene service), while high rates enable a high efficiency to be obtained, it is usually accompanied by a low development. Between low rates and inefficient service, and high rates with a low development, there is a mean where the highest commercial efficiency and soundest development go together.

The question of development is inevitably connected with that of telephone charges.

It is no exaggeration to say that there are very few, if any, telephone engineers or administrators in the world who do not admit that telephone charges should be on the measured service plan; *i. e.*, the payment should vary with the extent to which the service is used.

This principle is carried into practice in various centres in the United States, Germany, Austria, Sweden and Switzerland.

It is noticeable that even where the measured service has not yet been introduced, provision is being made in modern equipments for metering each subscriber's calls separately. It is now a recognized feature in new equipments. Although the metering is not automatic, but usually effected manually by the operator, no serious trouble arises with subscribers through their accounts being questioned.

It is beyond argument that to provide separate lines for each subscriber is generally more costly than to provide apparatus to enable two or more people to use the same line. Therefore, however low the rates for separate lines may be, the rates for party lines might be lower, and would enable a larger development to be obtained.

There are several kinds of party-line services, each possessing certain advantages, and giving good service. In the United States lines serving two, four, eight, ten, or even twenty different stations have been used with every success, depending only upon the standard of service desired.

The various different systems in use the world over have been carefully studied, and I would recommend for use in Australia the following:—

On all Exchanges worked by suitable systems,

1. Two-party lines with selective ringing.

On branch Exchanges for residences,

1. Two-party lines with selective ringing.
2. Four-party lines with semi-selective ringing.

For country district service only, in addition to 1 and 2,

3. Lines up to twenty-parties, code ringing.

Each user on a two-party line should be restricted to an average of not more than ten outward calls a day, and each user of a four-party line to an average of not more than five. All inward calls (*from* other subscribers *to* party-line subscribers) are free.

Party-line calls should be restricted to not more than five minutes' duration.

These two provisions are necessary for the preservation of the privileges of the other parties on the line.

It would also be necessary to make certain stipulations as to

Digitized by Google

the locality of party-line subscribers. That is to say, the subscribers to a four-party line should be required to be within a circle of a certain prescribed radius, or, in the case of a city, so located that the connecting wires need not cross streets.

Any revised scheme should, in my opinion, include varying charges for exchanges of different sizes. The estimated ultimate size of the exchange is that to be kept in view when fixing the charges. It is, however, well to have in view, first, a scale showing the main charges for differing services in the largest exchanges.

It is first necessary to lay down the number of calls to be included in the fixed annual charge. In laying down this number, care should be taken that it is not placed too high, or the minimum charge will prove also the maximum revenue per subscriber, as measured service users will cut down the use to a minimum. It is best to allow a minimum which is found to meet the requirements of the smaller users, larger users paying for the additional service. I, therefore, suggest two calls a working day, or 600 per annum as a fair allowance. This is about the average number of conversations per subscriber in Switzerland Additional calls should be charged for at as low a rate as will be remunerative.

Party lines should produce a revenue equal to that from a separate line, plus the cost of providing the necessary extra instrument and additional wire, and attending to all extra calls.

In my opinion, however, by far the greater proportion of our telephone users of the future will be those who use the instruments from three to five times a day, and it is by the attraction of such users that the best development of the system is attained. It is for the large majority of the so far unreached public that any new scheme should be drafted.

Large users must have the service. They know its value, and need no attractions offered to them. Smaller users must be attracted by rates in conformity with their use of the service, and by special facilities to meet their special needs.

As indicating the effect of local conditions, Stockholm may be instanced. Here operators receive 50 kr. a month, or, say, £36 per annum, as compared with £110 in Australia. The tariff being arranged on a measured service basis, the calls per subscriber are reduced, and each operator is enabled to attend to 250 subscribers; two and a half times as many as in Sydney, or over three times as many as in Melbourne.

The net effect of this is, that the cost *of operating alone* in Australia is about £2 per annum per subscriber higher than in Stockholm.

The costs of labor on construction are in a ratio equally unfavorable to similar low rates in Australia, laborers receiving the equivalent of 3s. 6d. to 4s. 6d. a day.

Add to this the fact that the cheap rate subscribers in Stockholm are connected to separate old pattern boards where they are given an admittedly inferior service, and the exceptional rates are explained.

The Swiss figures are, if anything, more misleading, for the fee indicated is the minimum, and includes no calls. Five centimes is charged for every call. Further, in the administration report for 1903, the following conclusion appears in connection with a report called for as to the ways and means to be adopted to establish a better equilibrium between the receipts and expenditure of the Telegraph and Telephone Department.

"The telephone rates do not bear a just relation to the cost of construction and maintenance."

It is worthy of note also that in 1903 (see Swiss Departmental Report) the average charge for telephone service throughout Switzerland was £3 14s. for under 600 calls for each subscriber. Yet, at the Swiss rates, if the service, instead of being used only twice a day, had been used twelve times a day, a lower average than that in Melbourne or Sydney, the average charge would have been £9 12s., or a higher rate than in Melbourne or Sydney for a less service. This takes no account of the lower pay for operators in Switzerland, £50 as against £110 in Australia.

Briefly stated, the lessons to be learnt as to rates are that a service can be given at almost any rate that is fixed, but that for a good service a good price must be paid. A bad telephone service is dear at any price.

Call offices* play a prominent part in the development of any American telephone system. They are situated in every block, and are largely used, not only by non-subscribers, but by subscribers.

In one large city the revenue for one month from prepayment instruments alone (nickel in the slot) was over £10,000. This will give some idea of the extent to which such services are used. These were not all necessarily call offices, but could be used as such if subscribers desired.

It appears to be desirable in forming a policy of telephone development, to be as liberal as possible with such call offices. It seems advisable to open them, not only where any small shopkeeper is prepared to guarantee a minimum party-line revenue, but also where the departmental officers estimate that such a minimum revenue will be obtained.

It also is desirable that the installation should be made in advance, on the assumption that the instruments will be used, instead of waiting for a weighty request for the installation.

It is just as important that the Department should seek out desirable places in which to fix instruments as call offices, as it is that possible subscribers should be sought and obtained as clients.

Call offices tend to assist in the full development of any scheme. They can be opened on a party-line if there is any doubt that a separate line would not be remunerative; and, in fact, can be graded in service just as can subscribers' instruments.

The Independent telephone movement in the United States, in my opinion, owes its success to the manner in which it has dealt with the problem of country district lines; and where it fails to obtain the desired hold upon the public, it is by reason of the failure to establish a good toll line service.

Where the Bell company, or its licensees, first appear to have invited opposition is in those places where they adopted conservative methods, confining their attention to comparatively large centres, and neglecting the outlying districts. They appear to have thought that, because their hold upon a city was strong, they could neglect the country districts. This has proved to be a most mistaken idea.

To briefly condense the conclusion, it is impossible to avoid after a close study of American conditions, I believe that to establish any telephone system upon secure lines—lines which will induce the greatest number of people to partake in its privileges, is not to leave the outside districts until the large centres are fully provided for, but to build from the outside districts in towards the large centres, or, at the very least, to give the outside districts an equal share of attention.

It were better to leave the cities to press their requirements and to go out offering the advantages to the country districts, than to do the reverse. The business men in cities know the use and convenience of a good telephone system; the farmer may not. Therefore special care should be taken that the advantages are pointed out to him, and that he is given every facility for sharing them.

By reason of their length and small number, such lines may appear costly to construct, but they can be so arranged as to serve 10 to 20 points, so that the cost *per station connected* may be reasonably low. It is useless trying to develop a country district scheme on a "one line, one instrument" basis, or upon the class of construction adopted in cities. Ten, or even twenty, instruments can work well on a line up to 20 miles long, or even longer, and the line itself may be of cheap construction. Trees should be used wherever possible, or, failing them, short poles (erected so as to be clear of traffic), bracket pins and glass insulators, or "screwed stem" insulators, with iron or steel wire, is a class of construction quite adequate for such lines.

The instruments *must* be of the best, with high-grade transmitters, high-resistance bell coils (branching system), and strong generators; but with such instruments and care, even cheap line construction will allow the users to speak over trunk lines connected thereto up to 500 or 600 miles, or even further.

*Another name for pay stations.

Digitized by Google

But, as such country district lines usually connect to small towns, it is necessary to connect these small towns by trunk lines to the nearest large centre.

Here, again, it is found good commercial practice to build feeder lines cheaply, and to be liberal in providing them. From the experience gained on this tour of inspection, there would appear to be every justification for being far more liberal in the future in preparing estimates of the revenue to be derived from the opening of trunk lines to small country townships.

It is reasonably possible further to lay down general lines upon which an approximate estimate of the earning capacity of any proposed line may be made. For instance, there are definite known relations between the population and the trunk line revenue, and also between the construction cost and revenue necessary to make that cost commercially remunerative. Similar figures, which must be governed largely by local conditions, should shortly be obtainable in Australia, and form the basis for a similar policy of trunk line development.

It seems desirable that a special study be made of existing trunk lines, to obtain constants for future guidance.

While, however, cheap methods of construction are adopted for feeder lines, the greatest care is taken in the States that this cheap construction is not carried to the point where it imports inefficiency. Each case should be considered upon its merits, and designed so as to afford the convenience ultimately to be required, at a minimum cost.

But, while it is the practice to provide such lines freely in America, the use of them is not given free. There is a definite, and not very wide, area, within which any annual subscription entitles a subscriber to communicate from a given Exchange. Beyond this area all conversations are taxed.

The usual charge for the use of trunk lines in America is $0.006, six-tenths of a cent per mile for three minutes, That is to say, 3 minutes' conversation over a line 100 miles long costs 2s. 6d. It is an axiom in most American telephone systems that toll lines pay the dividends.

In some countries in Europe, the policy adopted in New South Wales of allowing subscribers the free use of lines joining two Exchanges far apart, and not properly to be regarded as within the same area, has been followed, but in every instance it is regarded as bad policy, to be discontinued as soon as possible.

(To be Continued.)

The Building of an Exchange

By A. H. Harris.

Distributing Pole in Business District.

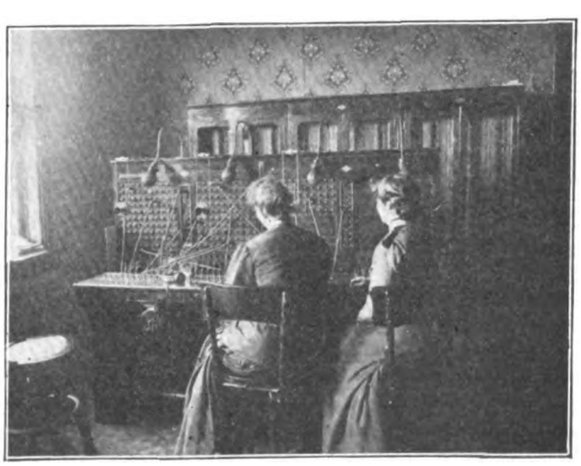
DOWN in Menard County, Illinois, is located the old town of Petersburg, with about 3,500 inhabitants, who for many years allowed the Bell company to enjoy an uninterrupted monopoly, dealing out to the citizens of the community poor service in utter indifference to their wants. Early in 1905 a few of the people asked themselves why they should not enjoy all the advantages of an up-to-date Independent exchange. The result is that at this time Petersburg has one of the most progressive and successful companies in the United States.

The first instrument was installed on July 4, 1905, emphasizing the spirit of Independence of the citizens who had arisen to overthrow the yoke of monopoly. The Petersburg Company considered that the best was not too good for them, and determined to build a system of the highest type. An important feature of their construction that is deserving of special mention is that the wires in the business and central part of town are underground. Ordinarily, such construction is not thought of except in cities of considerable size. This feature simply goes to show that the Petersburg Telephone Company sought the best and did not let cost interfere with its determination to give the citizens of Petersburg and Menard County the very best telephone service.

That they have succeeded is evidenced by their rapid and substantial growth. Toll lines have been built to all towns in the county, connecting them with the exchange at Petersburg. Farm lines have also been built, giving the farmer telephone service and at a reasonable charge. The Petersburg Company is rapidly covering the entire county, and at this time has exchanges in Athens, Greenview and Oakford, all in Menard County. In addition to this a metallic line connects its exchanges with long distance lines at Springfield.

For switchboard equipment the company has in use one four-hundred-line board at Petersburg, with a board of one hundred line capacity at each of the other exchanges. These switchboards as well as the instruments at subscribers' stations were furnished by the Swedish-American Telephone Company. Each telephone is equipped with a five-bar generator, push button and condenser in order to provide an efficient service on the long party lines under the severe conditions which sometimes arise. As the outside construction is of the highest grade, and wiring in the central offices as well as at the subscribers' stations has been very carefully done, the company has had to expend up to the present time a comparatively small amount of money for maintenance. As a consequence such money as can be expended is put where the best results to subscribers in the way of an improved and extended service may be secured.

Junction of Cable with Open Wire Lines.



The Central Office at Petersburg, Illinois.

The company is under the management of W. C. Scott, who receives the support in the community of a considerable number of local stockholders. Owing to this participation of the leading citizens of the community in its enterprise the company enjoys the full confidence of its subscribers. The company is a typical example of what can be done in a small community by the officers of an organization determined to reach the highest standard.

Campaigning for Contracts

By R. S. Hamilton.

THE first duty of the contract agent is to familiarize himself with the general conditions of his company and that of the opposition as far as possible. Upon the result of this investigation depends the success of the canvass about to be started, and if the service of the opposition is better than his he must have some reason which will in a measure satisfy the people he desires to reach. I say in a measure, because the public, however much in sympathy with his company, will not for sympathy's sake tolerate deficient service very long if it is possible to secure it elsewhere. The second consideration is to learn the name and business of everyone who is receiving a lower rate than those in general effect and the reason for his receiving this special concession. Where extension telephones or bells are given free or at a large reduction it will be cheaper in the long run to put them on a paying basis even though it causes the loss of a few subscribers. Otherwise these instances will be continually coming up before the solicitor, and, being unexplainable, make it impossible for him to secure business he would otherwise reach. It is a fact that about 99 per cent of those who are favored with concessions consider the story too good to keep and 99 per cent plus one of those who hear of it want the same favor or nothing.

After securing the rates for the various classes of service for both companies, the next thing in order is to make a map of his lines showing the present number of instruments and the number which may be connected to the existing plant. In doing this it is well to plot each lead from the exchange, showing the number of good pairs and the street or alley where the several cut outs are made. The map should also show the number of party lines and those not filled. If the map is large enough it is well to show each drop and mark for each house in the square which is not receiving service. A similar map of the opposing lines, which is as accurate as possible, should be obtained.

When the contract agent has accomplished this he is ready to secure and instruct his solicitors. The first is by far the greater task, for it is impossible to judge by appearances to any great extent just what a man will develop. There are about three classes of solicitors. One approaches the prospect in a timid sort of way, presenting his arguments in a manner that sounds like an apology for having intruded. He backs down and out at the first "No," or perhaps at a storm of abuse for some real or imaginary wrong which is claimed to have been received at the hands of the company in the past. Another goes in with his hat on the back of his head, dressed loud, cigarette in his mouth and starts to talk in a fast and loud tone, repeating the same story to the sport and the merchant. The latter may hear him through, but the company he represents has gained nothing by the interview. The third does not go in timidly nor as though he were storming a fortress, but just happens in, possibly to buy a cigar or some small article, for he does not want to make the impression that "I've come to get you." As a prophet is without honor in his own country, so usually a local solicitor is without contracts in his own town and it is well for the contract agent to select solicitors who are entire strangers. Even though a local man may have the advantage of being familiar with the streets, places of business, and the attitude of the people generally toward his company, yet the strange solicitor is given a hearing more readily. His propositions receive a greater amount of consideration and are therefore more quickly accepted. The contract agent should never let a solicitor start out until he has all the information necessary so that it will not be necessary to say in answer to some proposition, "I'll let you know later." It is due him to give the public to understand that he is representing the company, otherwise they will say, "I haven't time to talk now, but will see Mr. So-and-So." To avoid this it is well to give each solicitor a duplicate of a general letter of instructions.

Two years ago six solicitors were put in one of our large Middle West cities, three ex-Bell men and three inexperienced ones, and the results were in favor of the inexperienced men. They did as they were instructed, while the others went about their work as they had been in the habit of doing while with the Bell Company. At the end of twelve months 73 per cent of the business brought in by the inexperienced men was still good, as compared with 32 per cent of the business secured by the experienced fellows. Of course it takes quite a while longer to get an inexperienced man ready for business and increases the contract agent's troubles at the beginning, but all things being equal I believe it is worth the while, although there are some notable exceptions to this rule.

There should also be a definite territory assigned to each man. By close application to the map the contract agent can tell just about what each man has done during the day and what he can do, as well as have before him the exact portions of the work not yet covered. If the daily reports show a reason for not getting a contract from each person interviewed who does not sign up it will aid very much in reaching those people later. It should not be necessary, however, to burden the solicitor with giving a detailed statement of these excuses, as the contract agent can secure all the information necessary verbally at the informal meeting which it is well to have each evening in order to go over the day's work and offer suggestions. In order to get the best results he must not allow the slightest rivalry to exist, and must give each to understand that all are on an equal footing regardless of the number of contracts received by each. One man may be located in a poor territory, another in one which has been recently covered or is unfriendly to his company, while another with no great ability may be placed in a locality where the people are anxious for the service.

I have in mind a man working with ten or twelve others who did not secure over 20 per cent. of the number of contracts closed by the other fellows and the reason was due to the fact that he could not close the deal after reaching the time for signing up. In his quiet unaggressive way he could explain away any complaint or flaw advanced against the service, and leave the parties with a good impression of himself and a more friendly feeling toward the company which he represented, but he could not close a contract. The writer has been with him on several occasions when up to the last minute his arguments were perfect, but it was at that particular place he seemed to go to pieces.

For these and other reasons it is a problem of no small difficulty to select solicitors. Nevertheless if the contract agent will keep in touch with the individual work every day he will soon learn the value of each man, based upon the condition surrounding him, and the systematic canvass carried out along these lines should not only increase the number of subscribers, but what is equally as important, gain the good will of the people in a locality upon which the future growth of his company depends.

MEETING OF THE TEXAS INDEPENDENT TELEPHONE ASSOCIATION.

WACO, Tex., was chosen at the last meeting of the Texas Independent Telephone Association for its second annual meeting, April 25 and 26, and now the Independent Exchange men acknowledge that the choice was a wise one because of a hearty welcome by the Hon. James B. Baker, the Texas Telephone Company, the Business Men's Club and the citizens in general, who have given a most whole hearted support to the Independent telephone movement. Delegates were first welcomed in convention by the president of the Business Men's Association and then by the Hon. James B. Baker, Mayor of Waco, who is also a stockholder in the Texas Telephone Company. Mr. Baker spoke of the rapid development of Texas as a State and of Waco in particular, and the way he handled the sub-

Digitized by Google

ject indicated clearly that he was familiar with every condition.

A letter from Mr. James B. Hoge, president of the National-Interstate Telephone Association, was read, calling attention to the coming national convention to be held in Chicago, June 26, 27 and 28, and requesting a good attendance from Texas. Attention was called to the importance of the shield sign to advertise the Independent toll stations. This letter was ordered published.

The election of officers resulted in the choice of J. C. Casler, Fort Worth, president; C. H. Shock, Sherman, secretary and treasurer; C. W. Roberts, Abilene, first vice-president; C. A. Willison, Granger, second vice-president; Thomas O'Rourke, Shreveport, La., third vice-president.

J. B. Earle of Waco was elected delegate to the National Convention. This choice was approved by all the men at the convention, as Mr. Earle is one of the men whom the Bell hirelings most fear to meet in either a telephone subscription or franchise fight. Up to the present time these Bell men are said to have never crossed Mr. Earle's path without regretting it.

Mr. Casler, the new president, appointed a committee to audit the books of the outgoing officers. This committee reported that the books were in good condition and that the funds had been well disbursed.

The finance committee recommended establishing a clearing house association and that the sum of $500 be appropriated for the necessary printing, and recommended that the offer of Mr. Earle to establish a Clearing House in Waco without compensation except for the necessary clerical assistance and stationery be accepted. On motion a recess was taken to effect the necessary organization. The companies which reached an agreement and will operate a Clearing House, taking in others as they may care to join, are: The South Texas Telephone Company, Brazos Valley Telephone Company, North Texas Telephone Company, Texas Telephone Company, Ellis County Telephone Company, Texas Consolidated, L. D. Telephone Company, Fort Worth L. D. Telephone Company and the Granger Telephone Company. This Clearing House began business in Waco with J. B. Earle auditor.

The following committees were appointed:

Executive committee, Thomas O'Rourke, E. W. Donaway, C. W. Roberts, C. A. Willison; programme committee, Aaron Smith, J. A. Murry, C. L. Simpson; membership committee, Charles F. Speed, chairman; Aaron Smith, G. D. Woodson, M. E. Martin, A. A. Marrs.

On a motion of Mr. Shaffer the next convention will be held in Fort Worth.

The following men were shown to be present on the roll call of the secretary: T. O. O'Rourke, Shreveport Telephone Company; J. H. Murry, Weatherford Telephone Company; J. C. Casler, Fort Worth Telephone Company; A. E. Shaffer, Ellis County Telephone Company; H. H. Davenport, Hillsboro Telephone Company; O. Moore, Abbott; W. A. Logan, West; J. B. Earle, Waco; J. L. Jones, McGregor; L. Sparks, Giddens; A. L. Burge, Moody; O. S. Smith, Clifton; A. J. Hooder, Killen; H. C. Cooke, Granger; M. S. Sweet, Georgetown; C. S. St. Clair, Elgin; C. W. Roberts, Abilene; E. Graham, Harris; E. W. Gorom, Denison; Grayson County Telephone; Ward Templeman, Navasota. Others present were G. D. Woodson, St. Louis; C. L. Martin, Dallas; Charles F. Speed, Texarkana; M. E. Martin, A. A. Marrs, Dallas; J. P. Crarast, Chicago; Aaron Smith, Weatherford, N. C. Shellinger, A. R. Lawrence and C. A. Willison, Granger.

After a discussion of the toll line situation advertising and other matters in which many interesting points were brought out the meeting was adjourned subject to a call of the Executive Committee.

HOW THE OTHER FELLOW LOST.

MR. J. G. NOLEN, formerly a salesman and well known in the telephone field, tells the following anecdote in the *Telephone World*:

"A salesman sometimes has to resort to tricks that are not strictly legitimate, but when you know that your rival will stick the knife into you with cheerful alacrity if the opportunity offers, there is no difficulty with your conscience if you succeed in putting the kibosh onto him and handing him '23.'

"Once, years ago, when Independent telephony was still young and struggling with all sorts of adverse conditions, while traveling through the Middle West I stopped off at a town of considerable size with the hope rather than the expectation of selling something, for my 'hated rival' had already sold them a switchboard and most of their telephones, but still I thought it just as well to make a call and get better acquainted. The system was constructed on the common return wire plan, and when I saw that no wire in the office was larger than No. 18, I knew at once that they surely must have all kinds of cross talk, and inquiry showed that my surmise was correct.

"Judge of my chagrin, however, when I discovered that my rival was in town in company with the purchasing committee from another town whom he had brought there for the purpose of showing them the switchboard he had installed. For a few minutes I did some hard thinking. Well, it devolved upon me to get acquainted with that committee, if possible, but before doing so I slipped around to a livery stable and hired a boy to take the receiver off the hook and yell fire as loud as he could every half minute for the balance of the afternoon. Pretty soon I got two of the committee separated from my competitor and induced them to take down a receiver and listen for the cross talk in that board. They did so and heard my confederate yelling fire. 'Where is the fire?' they asked excitedly of the hotel clerk, but he assured them that a fire was nowhere in sight, but suggested their calling central, which they did, but central was ignorant of any fire, but said there had been a fire in the town about three weeks previously. Would you believe it? I actually convinced them that the board was defective in construction because the cross talk had got stored up in it during the excitement of three weeks before and that a switchboard which would store up cross talk for three weeks was not the kind for them to buy.

"I got an order a few days later and I don't think the other fellow ever did find out just why that committee got cold feet so suddenly."

TRI-STATE AND TWIN CITY COMPANIES CONSOLIDATE.

A FORMAL consolidation of the Twin City Telephone Company of Minneapolis and St. Paul, Minn., with the Tri-State Telephone and Telegraph Company of Minneapolis has recently taken place. The Twin City Company, which was a purely local concern, has now become a part of the Tri-State, which operates long distance lines and exchanges in Wisconsin, Minnesota and the Dakotas.

Originally the holders of the common stock of the Twin City Company organized a long distance company called "The Tri-State." This Tri-State company was organized under the laws of the State of Maine, and its charter allows it not only to buy and build toll lines and exchanges, but to purchase and hold stocks of other exchanges and toll lines.

In order to bring about economy of administration it was long ago deemed advisable to amalgamate the two companies, and this has now been accomplished. This action is merely one of bookkeeping, as the two companies for the past two years have really been one and the same.

The amalgamation was submitted to a vote of the stockholders, and out of $1,500,000 worth of stock $1,240,000 voted for the transfer, while not even one share voted in the negative. The capital stock of the Twin City Company is $1,500,000, with $1,000,000 worth of bonds outstanding. The capital stock of the Tri-State Company is $6,000,000. It is estimated by one of the officials of the company that fully $25,000 annually will be saved to the corporation by the deal. Under the old system separate accounts in every department of the two companies were kept, entailing an exceptionally large force in the auditors' offices of the companies.

THE EDITOR'S PAGE

AN OCCASION FOR DISTRUST.

A REQUEST for information from a Press Bureau of any sort has come to be viewed with suspicion by all Independent companies. The business of such companies has become so large that the giving out of facts concerning it is far more likely to create a favorable impression than otherwise. Nearly all Independent companies are on a sound basis financially, and their rate of growth compares most favorably with that of rival systems. In spite of this the constant effort of the Bell companies is to belittle the danger which confronts them. While the higher officers fully realize the inroads made by the united attacks of their competitors, which are giving connections through new plants constructed from the highest grade of material, and giving good service, it is their desire to create the impression in the public mind that the Independent telephone movement is based on unsound business principles and insufficient engineering knowledge. As a conspicuous instance of this attitude of the officials of the Bell Company, we quote the following from the annual report of President Fish: "It seems clear, however, that within the last three years the general situation, in so far as competition is concerned, has become distinctly more favorable to our interests." The purpose of this statement is quite evident, but it would be interesting to learn the facts which President Fish would use to support it.

With the object in view of spreading all information which will assist in this policy of creating a false opinion of the strength of their opponents, a continual search is being carried on by the Press Bureaus in the hope of discovering a weaker member of the Independent organization. When such a one is found, an analysis of its condition is made by a skillful juggler in facts and figures. The report which he makes is spread far and wide in the newspapers. Although the entire course of a year furnishes but few examples which can be used in this way, this small number of cases serves as a basis for articles which are repeatedly published throughout the entire country; and in this way the few incomplete successes furnish a means for keeping the word "Independent" before the public in connection with articles intended to damage the cause, which appear to be genuine news, but are, in fact, simply the perverted reports furnished by the hired press agencies.

It is a familiar statement that nothing can be made to lie so easily as statistics. Therefore, it is just as well for all Independent companies to refrain from giving figures to persons of whose purpose they have no knowledge. The National-Interstate Telephone Association is collecting facts relating to Independent development, which will be used in such a way as to be of the greatest value to the movement. In the meantime all companies, even though they feel that the giving out of information can do them no possible harm, would do well to refrain from gratifying their opponents by passing over the facts which they desire. When a Press Agency asks for information it is not wanted for the benefit of the Independent companies.

DEMAND FOR MEN ON THE PACIFIC COAST.

ALONG the Pacific Coast the extremely rapid development of Independent telephone systems has produced a demand for good telephone men, which is perhaps extraordinary even at this time of general activity. The Independent companies in California are advancing rapidly, and a great deal of construction work is being done. As soon as a new plant is in place men are required to operate it. The companies find it necessary not only to have men for the present needs, but to maintain a larger force than is absolutely necessary for the work in hand, in order that their men may be trained in their methods in a suitable way to meet the requirements of the future. The coming Independent plant in San Francisco alone, according to the requirements of the franchise, will involve an expenditure of $4,000,000; and it is evident that not only the number of untrained men, but those skilled in the construction of telephone exchanges required for this extremely large plant will not be small. Farther north, in Portland and other important towns in its vicinity, the building and enlargement of Independent exchanges is proceeding at an extremely rapid rate. Large city systems are in operation or being constructed, and lines into the surrounding country are being extended as fast as the work can be done. In Seattle, at a recent public meeting, the people condemned the Bell system, and many citizens prepared to throw out the Bell telephones.

These people must have telephone service, and are anxious to have connection with the Independent system at the earliest possible moment. The result is that the Independent telephone company is having far greater difficulty in meeting the demands of the citizens who are urging it to give them connections than many companies have to secure business. Mr. C. H. Judson, who is the chief engineer of the company, in a recent letter stated that it was very easy for him to find poor men, but the sort of men he wants, men with experience, genuine knowledge of the business, and energy, are very hard to find, and the demand for them is far in excess of the supply.

CONCLUSIONS FROM THE WORLD'S TELEPHONE PRACTICE.

ON another page of this issue we present abstracts from a report to the Australian Government by John Hesketh, who is the electrical engineer of the Postmaster General's Department, which controls the telephone service. Mr. Hesketh was given the commission of visiting the important cities of the entire world to study the various telephone systems which were in use. He was to take up not only their electrical features, but also line construction, the various methods of charging for service, and the handling of business, and, in fact, to acquire as complete information upon all points as it was possible for him to do. On his return it was designed that the information so collected should be used in the laying out of a system for the Commonwealth of Australia, which should be as nearly in accordance with the lines which are considered to be the best practice not only for the present, but for a considerable number of years to come. Mr. Hesketh has made a report which briefly covers a great many matters, as he gives a general outline of the conditions which he found in various parts of the world, and makes applications to the local requirements which exist in his own land.

Many of his observations are of great interest to telephone men outside of his own country, and some of these statements we have abstracted from the report and are reprinting. They represent the true opinions of a trained engineer who has had unusual opportunities not only for observation but for gathering the opinions of other engineers of high reputation throughout the world. The conclusions which he has selected as fit to embody in a report to his government deserve the careful consideration of those connected with all the systems which he visited.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. MCMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

DESIGNATION OF STREETS FOR LOCAL LINES.

Under our State laws (New Jersey) the municipal authorities are required to designate streets on which a telephone line may be constructed. Our company is building a local line to do business within the city and has asked the council to indicate what streets we may use. This they neglect to do, as they are trying to hinder us all they can in the interests of the Bell monopoly. Can we force them in some way, as by mandamus, to make a proper and speedy designation? R. C. A.

THE law to which you refer must be act April 27, 1888, which applies only to lines through the municipality. It does not apply to a local system of lines maintained within the municipality and consequently not to your company, as you state the facts. If you have a charter from the State you are authorized to conduct a telephone business without regard to permission from local authorities and do not need a designation of streets by the council. Neither has the council power to make a designation in the case of a company like yours. New Home Telep. Co. v. Common Council of City of New Brunswick, 40 A. 628.

AUTHORITY TO USE CONDUIT.

The city franchise gives us permission to run and maintain wires "over and through" the streets. We wish to lay conduits and change from an overhead to an underground system. Can we do this without getting additional authority? A. C. C.

THE words "through the streets" do not mean "through the ground beneath the streets" nor anything equivalent to it. Your present grant would therefore not include authority to lay conduits and additional authority is needed. Commonwealth v. Warwick, 40 A. 93, 185 Pa. St. 623.

CONSTITUTIONALITY OF ORDINANCE FIXING RATES IN KENTUCKY.

AS a test of an ordinance passed by the city council of Frankfort, Ky., on February 22, 1901, an action petitioning for an injunction against the city to prevent the enforcement of the ordinance, on the ground that it is unconstitutional, has been filed by the Frankfort Telephone Company. The ordinance in question provides that the "lowest scale of prices now fixed by any telephone company as compensation for such services on or after July 1, 1901, shall remain stationary and in full force for the term of ten years."

MUNICIPAL LIABILITY FOR INJURY CAUSED BY FALLEN TELEPHONE WIRES.

A PEDESTRIAN in Manchester, N. Y., crossing the street about 8:30 in the evening seized hold of, or came in contact with, a piece of wire that hung down from a tree to the ditch between the sidewalk and the carriage way of a cemetery and received an electric shock by which he was immediately killed. An examination the next morning showed that the telephone wire lay across some electric light wires and that the insulation on the wires had worn away and that the hanging wire was a part of the telephone line. How long this piece of wire had been hanging down was a matter of controversy on the trial. The administratrix of the deceased, in suing the electric and the telephone companies and the village of Manchester, charged that the light company was negligent in permitting its wires to remain in a dangerous and unprotected condition, and that the village was negligent in allowing that condition to remain by which the safety of travellers on the highway was imperilled. The New York Court of Appeals held that it was not necessarily negligence upon the part of the deceased in having seized hold of the wire, as he might have seized it to remove it from his way. The court held that the city was not liable unless it had notice of the obstruction and the danger was obvious. The plaintiff, to show evidence on the part of the trustees of the village, read the evidence of the trustees at the coroner's inquest. This was held to be an error. It was also held to be a mistake to permit the plaintiff to prove that several months before the accident, at a place nearly a quarter of a mile away, a piece of telephone wire hung down from a pole and several people received shocks therefrom. Judgment for the plaintiff was reversed because of these errors in admitting testimony. Fox v. Village of Manchester (N. Y.), 75 N. E., 1116, 91 N. Y. S. 1094, 100 App. Div. 512.

WHEN JUDGMENT AGAINST A CITY RELEASES A TELEPHONE COMPANY.

A GARBAGE collector in the city of Chicago was killed by taking hold of a live wire which hung down from some other wires. Upon the trial there was a sharp conflict of evidence as to whether the city of Chicago or the Chicago Telephone Company was the owner of the wire which caused the death of the deceased. A judgment for $3,500 upon an appeal to the Appellate Court was reversed and a finding of fact made to the effect that the fallen wire was owned and controlled by the city, and not by the telephone company. At the time of granting the company the right to erect its poles in the alley the city of Chicago reserved the right to the top cross arm of each of the poles free of charge, for the use of the city telegraph and telephone wires. It was contended that the telephone company was liable because it had granted this right to the city, thereby permitting it to use a portion of its chartered power, and that the company was liable for any negligence on the part of the city. The court held, however, that the judgment in favor of the city of Chicago was a complete bar to an action against the telephone company. Hayes v. Chicago Telephone Company, 218 Ill. 414, 75 N. E. 1003.

RULE THAT EVERY LIGHT WIRE IS A LIVE WIRE DOES NOT ENABLE COMPANY TO AVOID LIABILITY.

AN electric company established a rule that its linemen should treat every light wire as a live wire, and that the company provided rubber gloves for men to use in handling dangerous wires. A lineman in the employ of the company was at work putting a cross arm on a pole when an electric current passed through his body causing death. His administrator, in suing the company, contended that the current came from the contact of the trolley wire of a street railway company with the wire of the electric company, and that there were no guard wires above the trolley wire as there should have been to prevent an accident. The defendant contended that the rule above referred to made the conduct of the lineman, in mounting the pole without gloves, negligent. The court held that the violation of this rule by the lineman was not conclusive evidence of negligence, but only a circumstance to be considered with others. The court held also that evidence as to the existence of an appliance known as a "guard wire" in common use for the purpose of preventing trolley wires from coming in contact with other wires, was properly considered by the jury in support of the plaintiff's case. A recovery by the administrator of the deceased was therefore sustained. Mahan v. Newton & B. Street Railway Co., 75 N. E. 59 (Mass.).

IN THE OPERATING FIELD

ANOTHER EVIDENCE OF THE GROWTH OF THE INDEPENDENT TELEPHONE BUSINESS IN PENNSYLVANIA..

AMONG the many evidences of the growth of Independent telephony, there is none which illustrates the exact state of affairs better than the directories of the various companies. Comparison between present and past issues invariably shows a marked increase, not only in the number of subscribers, but also in the list of toll and long distance points. In some cases it is even necessary to add loose leaves giving the names of parties who have been connected up since the directory went to press. As an illustration of this rapid growth, the latest issue of the directory of the Huntingdon and Clearfield (Pa.) Telephone Company is an excellent example. In it are listed 227 subscribers, who were secured too late for classification. These are distributed throughout fifteen different towns and villages connected with the system.

This company has in operation seventeen exchanges, which furnish service to sixty-six towns and villages, besides connecting with nine rural telephone companies.

The list of toll and long distance points which can be reached numbers 414 cities and towns in Pennsylvania, Maryland, West Virginia and Ohio, and includes many of the principal cities in those States. In the territory covered by them there are said to be four Independent telephones to every Bell instrument, and this proportion is constantly increasing.

At the foot of every page of their directory are notes which show the advantages of the service furnished, particular attention being called to the excellence of the toll system.

The officers of the company are: Ellis L. Orvis, president; A. W. Lee, vice-president; G. H. Lichtenthaler, treasurer, and W. L. Malin, general superintendent.

GOVERNMENT ACQUIRES COMPLETE CONTROL OF TELEPHONE BUSINESS IN SWEDEN.

By Noleye.

THE Stockholm Allmänna Telephone Company, which was founded by Director Cedergren and the Ericssons, who are now the principal figures in the Independent company which is building an extensive plant in Mexico, has closed a contract of sale with the Swedish Government on March 8th, whereby that Government takes over its business for the sum of 16,541,000 Swedish crowns, plus 80,000 crowns for inventory and furniture. The Allmänna (General) Telephone Company had bought up the Bell company in Stockholm many years ago, and had at the time of the transfer over 42,000 subscribers. Immediately after the Bell company was bought out the Government started a telephone system of its own in opposition to the General company, but in spite of the greater facilities which the Government could offer its subscribers in the way of long distance communication, by utilizing existing telegraph poles for long distance lines and thus connecting up about 82,000 instruments all over the country, they found it a rather hard proposition to combat the lively Allmänna, the pioneers of the telephone in the country. After some years of pourparlers they at last succeeded in coming to an arrangement which now gives the Government full control of the telephone business in Sweden.

The arrangement has been well received on all sides; the Government has become possessor of one of the finest telephone systems in the world, and can now develop its business indefinitely without opposition of any private company; the subscribers will be enabled to use the Government long distance lines at an extremely low rate (for instance, from Stockholm to Goteburg, about 300 miles, for 13 cents for 5 minutes); and the shareholders of the Allmänna ought not to be unhappy over the $4,500,00 in cold cash and good Government bonds which they receive.

INDEPENDENT DEVELOPMENT IN THE COAL AND COKE INDUSTRIAL CENTRES.

THERE are few cities in the State of Pennsylvania where there are better telephone facilities or more efficient service and reasonable rates than at Uniontown. This is due to the Maryland, Pennsylvania and West Virginia Telephone and Telegraph Company, or as it is better known, the Tri-State Telephone Company. The history of the inception and development of this company is an interesting one and is based solely on the desire on the part of prominent men to give Fayette county first class telephone service. The first telephone connection between Fayette county and Pittsburg was made by the Bell Company in 1889 and they occupied the territory exclusively until 1898 when the Tri-State entered the field. It covered only Uniontown, Connellsville, Dunbar, Masontown and a few minor places, operating less than 600 telephones. The opposition to the old company caused a material lowering of prices for service, but this only held for a year when the controlling interest was secured by New York parties and the service was allowed to fall off. So unsatisfactory did conditions become that a number of leading business men of Fayette county, headed by the late Ira E. Partridge, organized and bought the line and proceeded to make it a benefit to the people. There are now thirteen exchanges, more than 3,000 local subscribers in the county and a long distance service connecting with several thousand Independent telephones in Pennsylvania and surrounding States. The Tri-State Company is not waging a rate war against any opposing company, but is giving the people of Fayette county the best service at most reasonable rates. All of the stockholders and officers are men closely identified with the best interests of Fayette county. The Tri-State rates are $24 for offices and places of business, $18 for single line for residences, and $12 for residences on four party line per year. This includes service throughout the county where the Tri-State lines extend and to Scottdale and is not limited merely to the patrons of a single exchange. The officers of the company are Hon. R. E. Umbel, president; Robert F. Hopwood, vice-president; John M. Core, secretary; F. H. Rosboro, treasurer; Charles A. Berg, general manager and superintendent.

INDEPENDENT COMPANY IN WABASH, INDIANA, ERECTS NEW BUILDING.

THE Home Telephone Company at Wabash, Ind., is arranging to erect a new business block for its own use, and to install a $10,000 central energy multiple switchboard. The company has 1,200 telephones in service, and additional facilities are greatly needed. The Central Union Telephone Company has but twenty telephones in service, and it proposed to abandon the local field if the Home Company would handle its toll business. The offer was refused in order that the company might be in a position to retain its connection with other Independent lines, which it considers will offer a more valuable service.

HOME COMPANY BUYS FRANCHISE FOR SAN FRANCISCO.

INDICATIVE of the faith of the people of California in the future of San Francisco, is the action of the Home Telephone Company, which, five days after the appalling disaster which placed six square miles of the city in ruins, paid $100,000 for an Independent franchise and filed a bond for $250,000, which guar-

Digitized by Google

antees to the city the expenditure of $2,000,000 within the next year, and another $2,000,000 during the year following.

It is interesting to note that of the $100,000 paid for the franchise, $75,000 was in the nature of a donation to assist in the upbuilding of the city, as the amount bid was only $25,000. Preliminary work upon the construction of the system will be started at once, and it is expected that as the new buildings are completed to take the place of the ones destroyed the company will be enabled to furnish service to the occupants.

CENTRAL ILLINOIS ASSOCIATION HOLDS ANNUAL CONVENTION.

THE Central Illinois Independent Telephone Association held its fourth annual convention in Peoria on Monday, May 7, at the Fey Hotel. The programme included papers on "Toll Accounting," J. S. Daily, Chillicothe; "Construction," Jno. H. Sullivan, Havana, presented during the morning session.

In the afternoon an interesting address was delivered by G. H. Glass, Pekin, and papers were read as follows: "What is the Bell Company Up To?" J. C. Kelsey, Chicago; "Our Duties to the Public," Hon. C. B. Cheadle, Joliet; "Maintenance of Central Energy and Magneto Switchboards," G. O. Baker, Peoria.

The convention was well attended and many interesting discussions which were very useful to those in attendance.

DEPUTATION VISITS PREMIER LAURIER TO CONFER REGARDING MUNICIPAL TELEPHONES.

A LARGE and influential deputation waited on Sir Wilfred Laurier, Premier of Canada, a few days ago asking for legislation to enable provincial governments to expropriate the Bell lines. Delegates were present from every province and many strong statements were made regarding the excessive rates charged by the Bell Company. Sir Wilfred appeared greatly surprised at the number of delegates present and promised to give his consideration to any measure brought before Parliament. It is expected a bill will be introduced at the present session permitting provincial governments and municipalities to expropriate any lines they desire to own, and conduct under municipal ownership projects. Many people of Canada are convinced that such an act would reduce the telephone rates by more than 50 per cent. So far the Bell Company has made no open move in the matter.

COMPARISON OF BUSINESS TELEPHONES

TAKEN FROM THE DIRECTORIES OF

CUMBERLAND TELEPHONE CO. AND THE LOUISVILLE HOME TELEPHONE CO

LOUISVILLE, KY., FEBRUARY ISSUE, 1906.

BUSINESS TELEPHONES	TOTAL NUMBER USING TELEPHONE	NUMBER USING BOTH HOME AND CUMBERLAND	NUMBER USING HOME ONLY	NUMBER USING CUMBERLAND ONLY

Total	6,096	2,662	2,484	949

The relative value of Bell and Independent service in Louisville, Ky., is indicated by the figures in this table.

PLANS FOR IMPORTANT MERGER OF INDEPENDENT COMPANIES APPROACH COMPLETION.

A MEETING of the stockholders of the Home Telephone Company of Fort Wayne, Ind., was held on April 30 when the final steps to complete the merger of the Home and the National Telephone companies were brought up for consideration.

It is said that the capital stock of the merged company, to be hereafter known as the Home Telephone Company, is to be $600,000. The new issue of stock is $350,000, preferred 6 per cent. cumulative, of which $250,000 goes to the owners of the National at 90, and the other $100,000 is to be placed on the market to raise funds for extensions of the toll lines. One of the extensions is to be a direct line to Indianapolis to relieve the congested condition of the circuits now in use. Applications have been filed for more than $25,000 of the new issue of preferred stock at par. The Home company directors paid a semi-annual dividend of 1½ per cent. last week. The stock of the expiring National reached its high mark of 87½ for four shares, showing the favor in which the merger is held by the telephone investors of Fort Wayne.

The owners of the South Bend Telephone Company, most of whom live in Fort Wayne, are reported to have received an offer from the St. Louis Independent syndicate to take over the South Bend plant, the payment to be made in securities of the new company. The South Bend plant is new, and is one of the moost prosperous in Indiana. The directors, at their meeting a few days ago, declared a semi-annual dividend of 1 per cent.

MICHIGAN BELL COMPANY MAKES OUT A POOR CASE.

THE Michigan State Telephone Company publishes each month a Gazette for distribution amongst its agents and employees. In the issue which followed the convention of the Independent men of the state the company took occasion to publish in this Gazette a hit at the Independent people entitled "Jollying Themselves Along." It referred to a card which was said to have carried the words "Keep on Smiling" as being worn by every delegate to the convention, and its purpose was to convey the idea that the Independents were in a pretty tight fix, and had to resort to artificial means to keep up their courage.

Of course every man who was at the convention is willing that the Bell company should have its little joke, because he knows that it assumes both a condition and a sentiment which does not exist. And it looks, too, as if the title "Jollying Themselves Along" would afford an interesting suggestion for the object of the article in the Michigan Gazette. As will be seen from a reproduction of the actual card, the article not only misstated such wording as was used, but omitted the words, "With Cass, Nagel Electric Co.'s Man."

As a matter of fact these cards were distributed by one of the jovial and popular representatives of the Nagel Electric Company, of Toledo. If the Michigan State Telephone Company is going to jolly its employees, it really ought to look for a text which it can state in full without missing the point.

NEW INDEPENDENT COMPANY APPLIES FOR FRANCHISE IN MONTANA.

APPLICATION for an Independent franchise in Anaconda, Montana, was recently made to the city council. The company is to be known as the Montana Independent Telephone Company and it proposes to operate exchanges in Anaconda, Butte, Helena and other towns throughout the State. Amongst the men interested in this project are Elmer B. Jones, T. Augustus Heinz, Charles J. Kelley, H. A. Gallway, Henry Mueller and Herbert B. Brown.

TELEPHONE COMPANY AT VINCENNES, INDIANA, PASSES TO NEW CONTROL.

A CONTROLLING interest of the Knox County Home Telephone Company, of Vincennes, Indiana, which is owned by W. R. Gardner, William Morrison and A. H. Yoder, of Toledo, Ohio, has been secured by the Central Home Telephone Company, of Louisville, Ky. W. H. Moore, the present superintendent, will remain in office and the directors will be retained.

The Home Company has 1,300 telephones in use in Vincennes while the Bell Company has only 600. The Home Company also connects with almost every other exchange in Knox county and gives free service over the whole of Lawrence county, Illinois, which lies just across the Wabash River.

QUERIES

CLASSIFICATION OF CONNECTIONS.—(693.)

Will you kindly explain just the difference between the different kind of switched connections? That is, how does a trunk or toll connection differ from a regular connection from subscriber to subscriber? How can a connection be trunked when both subscribers are in the same exchange? A. B.

The simplest form of connection is that in which both the plug which is inserted in the jack of the line connected directly with the line of the calling subscriber, and the plug which is similarly inserted in the jack connected with the line of the called subscriber are handled by the same operator. Such an operator is called an A operator or subscriber's operator. The connection is a direct connection, employing a single pair of cords. A simplified circuit through which the call is transmitted is shown in the upper part of Fig. 693a, where A is the subscriber's station, wired directly to a jack in the switchboard. The operator inserts in this one plug of the pair, the other plug of the same pair being inserted in the multiple jack of the called subscriber. This jack is directly in front of the operator, and no apparatus not capable of being brought into the connection by her without assistance is used.

A trunk connection brings another element into the circuit. For example, if the trunk is operated by a call wire, the operator who receives the call notifies over the call wire a second operator, who assists in making the connection. In this case, when the connection is established, it goes through a circuit similar to that represented in the greatly simplified diagram shown in the lower part of Fig. 693a. Here the subscriber A is connected to answering jack *a*, in which is inserted one plug connected to cord *c*. One plug of this cord is inserted into jack *b*, which is located in an outgoing trunk multiple in front of the operator receiving the call. This jack *b* is connected by means of a pair of wires to plug *d*, contained in a special circuit known as the incoming trunk circuit. This plug may be located at an incoming trunk position in either the same office as the one to which the calling subscriber's line connects, or another office. The plug connected to the trunk circuit is connected to the jack *e*, which is tapped to the line of subscriber B. It will be seen that in this case the connection is under the control of two operators.

The third class of connection is a toll connection, which is

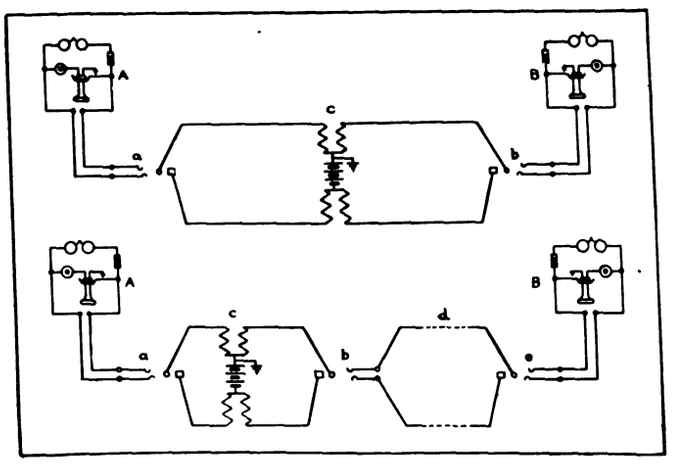

Fig. 693a.

made in various ways according to the type of switchboard in use. The most complicated connection which arises on this class of service is illustrated by diagram in Fig. 693b. In this case the subscriber's operator connects the subscriber with a special operator, and allows him to state his call. The connection is then discontinued, and when the desired line can be obtained the toll operator calls back to the subscriber's operator through an incoming trunk position. The way in which the connection is established in a typical case is by the insertion of plug of cord *d* into the jack *c* which is connected with a plug at an incoming trunk position in the same or a distant office. This plug of the incoming trunk circuit is in turn inserted in jack *a* of the desired subscriber's line, putting him in connection with the toll operator. The other plug of toll operator's cord *d* is inserted in jack connected to line *c'*. This jack leads to an in-

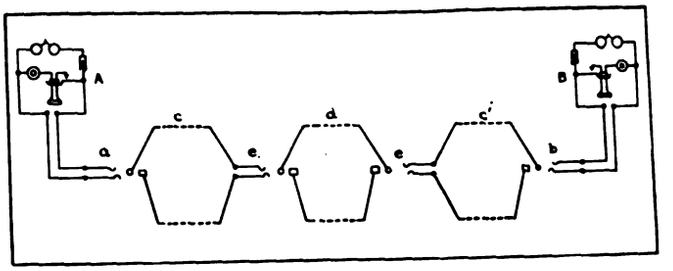

Fig. 693b.

coming trunk in a distant office, which is connected with line *b* attached to the instrument of the desired subscriber B. In the case of a connection built up through several offices, the jack *c'*, instead of being connected directly to the plug of incoming trunk, will be connected to another jack in a distant office, and a cord similar to that shown at *d* would be used to connect the jack of the incoming line to that connected with the incoming trunk terminating in the desired exchange. It will be seen in this way that a connection may be built up by switching through a considerable number of offices without altering the essential features of the diagram.

Answering your second question, a trunked connection refers rather to the method of handling the call than to the location of the subscribers at whose instruments the connection terminates. There are some offices where it has been found economical not to carry multiples of all lines in front of all operators at the subscribers' board. Here it will be evident that the call must be trunked, as described above.

NOISE FROM ELECTRIC LIGHT CIRCUITS.—(694.)

In this city the light people have a Fort Wayne system A. C. 2,300 volts primary. The leads for the lights in some instances are right under us, in some cases we are on the same poles. My trouble is a pretty heavy induction when they run, which is only at night. I have a good ground on all of my cables, which are overhead. Will a bond from each one of my cables to the ground side of the Light Company's machine do any good? I have been in other cities where the same conditions exist as here, but they don't get induction, but their cables are underground. C. F. L.

It is unusual to run high potential alternating light systems with a permanent ground at the power house. Whenever one of these systems becomes grounded the inductive effects on telephone lines are greatly enhanced, due to the reason that one of the wires no longer neutralizes the other in the electrostatic inductive effect on the telephone lines.

It is very improbable that bonding cables to the ground side of the machine, assuming that it is grounded, would be beneficial. The bonding is usually resorted to in direct current systems to preserve cable sheaths from electrolysis and would not apply in this case.

The remedies for this trouble consist in having the cable sheaths well grounded and keeping the electric light systems free from ground.

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE, CHEAP—600 pairs self-soldering protectors. Also one 300 pair and one 500 pair main distributing frame, used less than two months. Will sell separately or together. Address Virden Telephone Exchange, Virden, Ill., or Girard Telephone Exchange, Girard, Ill. 420

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Capable wire chief, one with experience, for testing cable trouble, etc., in an exchange of about 1,500 subscribers. State age and experience. Address, Box 610, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 610

WANTED—Experienced and competent switchboard wire men for telephone factory located in Chicago. Write, stating experience and where last employed. Address, Box 611, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 611

WANTED—Position as Exchange Manager. Fully competent to do all kinds of switchboard and telephone work. Five years' practical experience. Address Ernest Still, Lock Box No. 6, Creighton, Mo. 592

WANTED—Position in auditing department. Capable of installing system of accounts. Also, position for experienced contract agent and adjuster. Address Box 601, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 601

WANTED—At once, two first-class Independent solicitors for work in Missouri. Salary at beginning depends upon references. Address Box 409, St. Joseph, Mo. 602

WANTED—Position as manager. Can furnish best of references. Am at present manager of an exchange of 1,000 subscribers. Would take some stock. Address, Box 609, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 609

THE FOUNDATION of our business lies in the fact that we are successful in placing men speedily and satisfactorily. Our trained experts know just which men to select for each particular position. Investigate to-day the advantages and facilities we offer. Hapgoods, suite 511, 309 Broadway, New York City. 464

WANTED—Position wanted by an all round telephone construction man who is thoroughly competent, sober and reliable. Best of references. Have completed course in telephone engineering. Address Box 587, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 587

WANTED—Position as manager in exchange of 1,000 subscribers or less. Have had five years' experience in telephone business and am graduate of International Correspondence Schools. Best of references. Address Box 597, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 597

You Know Some Things About Telephones

So do we---and we learned them by experience as did you. We have profited by our experience. Have you? We make the very best instrument it is possible to manufacture, and we know it. Not simply because it is ours, but because we have compared it with all others. If you don't know it, write us for a sample before you make a decision.

TELEPHONE PATENTS

AUTOMATIC TELEPHONE SELECTOR SWITCH.

A. E. Keith, John Erickson and Charles J. Erickson, Chicago, Ill., patent (No. 815,321; dated March 13, 1906; filed May 2, 1905; serial No. 258,509) and assign to the Automatic Electric Company, Chicago, Ill., an automatic telephone selector switch.

This invention relates to the step by step switching mechanism employed in automatic systems and particularly to devices known as "selectors." As the patent requires 54 drawings for a clear elucidation of the claims involved it will be impossible to furnish a description in the space at our disposal, and we therefore suggest that all parties interested procure a copy.

TELEPHONE BOOTH.

Edythe Prudence Garney, Scranton, Pa., patents (No. 811,140; dated Jan. 30, 1906; filed April 1, 1905; serial No. 253,253) a telephone booth.

The essential feature of this invention lies in the use of a ventilating fan placed in the roof of the booth which, while producing a circulation of air, serves to break and dissociate the sound waves or vibrations as they pass through the ventilating opening. As a further means of making the booth sound-proof a valve is provided which automatically seals the booth when the fan is not at work.

TELEPHONIC RELAY.

John Trowbridge, Cambridge, Mass., patents (No. 814,411; dated March 6, 1906; filed July 14, 1905; serial No. 269,628) a telephonic relay.

This invention relates to the transmission of electric undulations and discloses a method for reinforcing them by means of a relay which is so constructed as to secure the desired result without impairing the clearness of the transmitted sound. The inventor states that heretofore a great deal of difficulty has been experienced in the operation of relays for similar purposes because the practice has been to place the transmitter in direct contact with the receiver diaphragm, thus loading the diaphragm at a point where loading has the most detrimental effect upon it. This he overcomes by means of independent adjustment of the parts, the communicating medium being an air chamber.

Illustrating the principle of this invention the inventor exhibits three different methods of construction, one of which, Fig. 2, is herewith reproduced. D represents the usual receiver diaphragm, and D^1 is a supplemental diaphragm attached to the front electrode of the transmitter T. D^1 is formed with a flange or rim turned towards the diaphragm D. It will be evident from an examination of this arrangement that the transmitting and receiving members can be adjusted independently of each other and yet any electromagnetic vibrations which actuate the receiver D

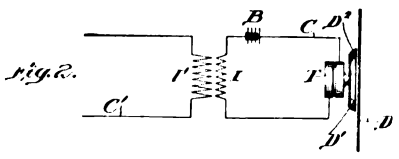

Fig. 2.

will be communicated to the transmitter T through the medium of the gaseous material between. An even balance is maintained between the two because the atmosphere has free access to the space separating the diaphragms.

In connection with this invention the inventor refers to patents Nos. 756,436 and 756,437, and specifically to the latter, in describing the application of the air chamber to the mechanical construction of a relay, claims for which are contained therein. Fig. 4 illustrates the principles involved. M_1 M are permanent magnets suspended between the poles of which is the armature A supported by the rods P, P^1. To the rod P^1 is atttached the diaphragm D referred to in connection with Fig. 2. D^2 is a sustaining diaphragm solely employed to hold armature A in position by means of the rod P in conjunction with rod P^1.

In operation current traversing the circuit C^2 passes around the coils of the armature, causing it to oscillate between the poles of the magnets. These oscillations are conveyed to the diaphragm D

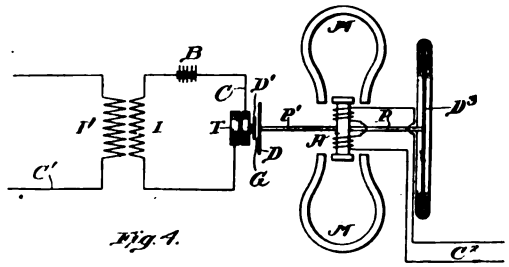

Fig. 4.

through rod P^1 and thence by means of the gaseous intermediary G to the supplementary diaphragm D^1 and the transmitter T. The transmitter performs its usual functions and through the operation of the induction coil I the reinforced electrical vibrations are transferred to the circuit C^1.

EARTH AUGER.

Ira D. Kemmerer, Lincoln, Neb., patents (No. 814,850; dated March 13, 1906; filed December 23, 1905; serial No. 293,128) a tool for digging holes.

The object of this invention is to provide a means whereby a hole for the reception of a pole can be quickly excavated. This the inventor accomplishes by means of a crescent shaped blade of suitable length, which has its longitudinal edges sharpened. The base of the blade is tapered to a point to facilitate its entrance into the earth and the upper part is extended to a shank or handle to which a cross bar can be attached. In operation a cone shaped hollow is first excavated and then filled with water. The point of the blade is then forced into the earth at the edge of this hole and by vibrating the handle by means of the crossbar the tool is sunk to the proper depth. It is then given one and a half or more turns and withdrawn. The cone of earth is supposed to adhere to the blade and be removed at the same time. The use of water is for the purpose of facilitating the entrance of the tool and to make the cone sticky enough to adhere to it when withdrawn.

TRANSMITTER.

John Z. Miller of Erie, Pa., patents (No. 809,831; dated Jan. 9, 1906; filed Oct. 19, 1904; serial No. 229,171) a transmitter.

To a circular rear plate, fitting the interior of a casing is attached an electrode, which forms the rear contact member. Surrounding this is a felt ring, which forms a containing cup for the variable resistance material. The front electrode is attached to the diaphragm and is small enough in size to fit into the interior of the felt ring. The upper surface of the felt presses evenly against the diaphragm and thus acts as a dampening device. The diaphragm is insulated from the frame, a conducting member being carried to an insulated part on the rear plate. The inventor claims by this construction to secure moisture-proof construction, durability and uniformity of operation.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A NEW HEAT COIL PROTECTOR.

ON March 20, 1906, Frank B. Cook had issued to him a very broad patent on an entirely new type of heat coil protector. This patent is numbered 815,406 and is entitled "Automatic Electrical Self-Soldering Reset for Thermal Protectors."

There are forty claims in the patent, many of which are very broad, and in prosecuting this patent before the Patent Office not a single reference was cited which showed a device anything like this new Cook protector. This goes to show what a radical change from existing ideas has been made by Mr. Cook, and how far he departed from the present design of protective apparatus.

The protector covered by patent No. 815,406 is not a self-soldering protector, but it had all the advantages of the self-soldering feature combined with other brand new and exceedingly important features. One of the novel points about the protector is that in resetting a coil which has operated a test of the protector is made. Should the coil be burned out or short circuited, the operation of resetting it indicates at once, automatically, that the coil is imperfect and it simply cannot be reset. This is a very strong point of advantage over the self-soldering protectors, for in any of the existing types a coil may be burned out, or short circuited, by an abnormally strong current, and can still be reset, because the solder has hardened. If the coil is not carefully tested after each operation of a self-soldering protector, a defective coil might cause a great deal of damage, because a short circuited coil is no longer efficient. This is impossible with Cook's new device, as a heating current is closed through the heat coil after operation to reheat and automatically reset the coil to operative position.

The feature of reheating and resetting the device for another operation, is broadly covered in the claims.

This can readily be seen by reference to one of the claims, which reads:

"An electrical-circuit protector comprising means operable upon an excess of current, means for supplying heat to the device after operation, and means for resetting the device for another operation when thus heated."

The resetting of the protector is accomplished by an ingenious little device which is applied to the protector (1) to supply current thereto for heating; (2) to reset the protector to operative position when sufficiently heated; (3) to automatically cut off the heating current when the protector is reset, and (4) to hold the protector in its reset position until the solder cools.

The mere fact that, as stated above, the Patent Office was unable to find anything similar leaves this patent free from interference of any kind, and the manufacturers state that it is therefore free from danger of litigation.

THE GENERAL STORAGE BATTERY COMPANY, 42 Broadway, New York City, is to make two important exhibitions of its batteries and supplies during the month of June. One of these will be at the meeting of the National Electric Light Association at Young's Pier, Atlantic City, N. J., on the 5th, 6th, 7th and 8th of June, 1906, and the other at the Master Car Builders and Master Mechanics' Convention at the steel pier at Atlantic City from the 13th to the 20th of June, 1906. On each of these occasions the company will have a display of the same nature as the one at the Electrical Trades Exposition in Chicago, which attracted so much attention. The company manufactures cells not only for heavy work, but of types suitable for the various classes of telephone work and others particularly adapted to special systems, such as railway signalling and yacht lighting—all coming under the general classification which distinguishes the Bijur "High Duty" batteries from those of other manufacturers.

One of the valuable features of these exhibitions will be the No. 1 switchboard, for use in connection with fluctuating loads, such as electric elevators, electric hoists, etc. The company states that by closing the large solenoid switch on the front of the board instantaneous loads of 2000 amperes are drawn from a cell whose normal capacity is 84 amperes. In order to keep the heavy rushes of current from the generator, a Bijur Booster System is used, with such regulation that, of this 2000 ampere jerk, only 9 amperes or less than ½ of 1 per cent reach the generator. The No. 4 charging booster consists of a constant speed motor, driving a separately excited generator. When charging a Bijur "High-Duty" storage battery, the armature of the separately excited generator is connected in series with the station bus bars and the combined voltage of the two sending current into the battery. As the battery charge proceeds, its voltage increases and the excitation of the separately excited machine is increased accordingly to maintain a constant charging current to the battery.

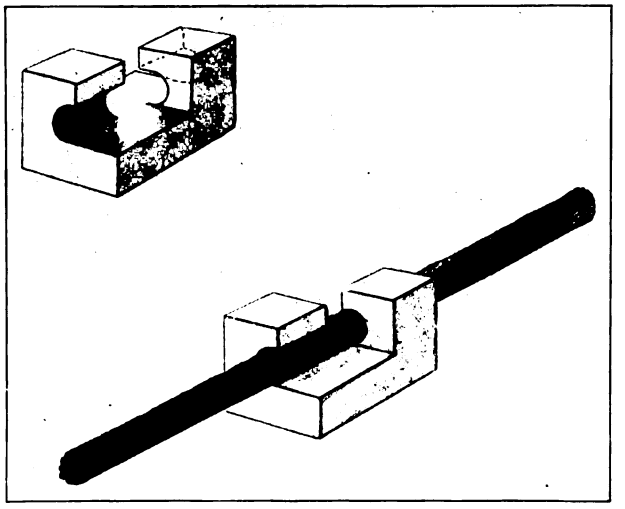

Fig. 1. Porcelain bridgework used for carrying the cables in the new system of installation.

At these exhibitions the company will have a staff thoroughly competent to convey much valuable information concerning its batteries and other apparatus, and will be pleased to see any telephone men or other persons interested who may be able to visit Atlantic City at that time.

A NOVEL SYSTEM OF INSTALLATION FOR UNDERGROUND CONDUCTORS.

A NEW method of installing underground conductors for electric light, power, telephone and telegraph systems, whose economy and efficiency are claimed to make it superior to the duct system, is being introduced by the Electric Cable Company of 42 Broadway, New York City. This method is an improved form of the wooden conduit system, and is being largely employed by cable engineers in Germany. Extensive use is made of Voltax, the new insulating compound manufactured by the above concern, whose high potential and insulation resistance capacity, officially established by a series of exhaustive tests made by the Electrical Testing Laboratories of New York City, have demonstrated its value in the insulation of high and low tension conductors.

In making the installation according to the above method, there is dug a trench about 18 inches deep in which a wooden trough is laid. Porcelain carriers are placed in this trough at intervals of four or five feet, acting as bridge work for support-

TO GET THREE OUT OF TWO SEEMS IMPOSSIBLE

Yet the Illinois and Sandwich Duplexers easily make two metallic circuits into three

Just stop and think what this means to you in increased facilities without spending a cent for new line construction.

Here are the facts in the case: By connecting our duplexers to the two existing metallic circuits a new one is formed which utilizes each pair of wires as one side of an independent metallic line.

To eliminate all noise due to induction we provide a very simple and efficient balancing device which requires no skill in its manipulation and which will make the new circuit absolutely quiet.

Seems almost too good to be true. Let us prove it by sending a set on 30 days free trial.

We know you are interested; therefore don't delay, but write to-day

Digitized by Google

ing the conductors. As shown in the perspective sketch, Fig. 2, the bridge work rests on and is surrounded by Voltax impregnated felt or similar material, the space between the carriers after the conductors have been placed in position on them being filled with Voltax which rapidly hardens, thus creating a solid system of insulation throughout the entire conduit.

Connections are easily made by opening the trench at any desired point and melting the Voltax off the conductors by means of a blow torch. After the connection has been made the trough where it had been opened is again filled with the insulating material and the continuity of the insulation of the system thus re-established, perfect connections being secured by this means.

The tests referred to indicate among other things that conductors insulated with Voltax cannot be punctured by currents generated for commercial use, and that they are impervious to atmospheric conditions, water, acid and alkali, thus making this new insulating material particularly desirable for use in connection with the installation of underground conductors. It is noteworthy that with this method the possibilities of conductors attracting stray outside currents is eliminated.

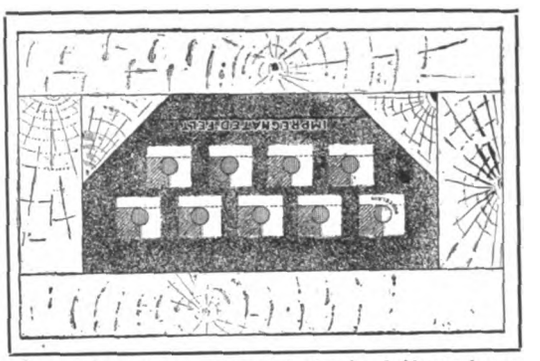

Fig. 3. Cross section of conduit showing bridgework surrounded by Voltax impregnated felt.

Installations made according to the system outlined above are said to involve an outlay of 33 1-3 per cent. less than those which are made according to the duct system, and, it is claimed, will show a greatly superior efficiency in service. The objections still existing in some quarters against the solid system of insulation, based on the ground that it is not possible to increase its capacity as rapidly as that of a system in which the idle duct can be laid, are met by the designers of the system with the argument that a solid system embodying two or three groups of conductors is less expensive to install than a duct system with its cost for annual maintenance and extra ducts.

"Battery Sparks" is the striking title of a 16-page pamphlet describing the Edison primary battery and spark coil for sparking gas engines. The subject is gone into very extensively and figures are given showing the comparative cost of sparking an engine with Edison cells, dry cells and other classes of batteries. The Edison spark coil differs from most of those on the market in being wound with shorter and heavier wire and in transferring a larger proportion of the battery energy to the gas-engine cylinder. It is stated that it is the heat of the spark that fires the engine and not the voltage of the spark, and that the arc drawn out by the contacts of the break and make sparking device is more effective than the thin, high-voltage spark of the jump spark arrangement, besides which there is a great saving in the complication of the apparatus employed.

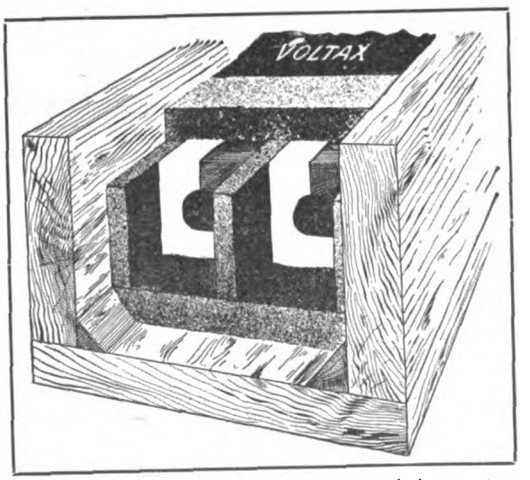

Fig. 2. Perspective view of the transmission system showing layers of impregnated felt surrounding the bridgework, and Voltax backing.

The Century Telephone Construction Company, Buffalo, N. Y., has recently shipped complete material for selective systems to the Williamsville Telephone Company, Williamsville, N. Y.; Bolivar Telephone Company, Bolivar, N. Y.; Killawog Telephone Co., Marathon, N. Y.; Citizens Telephone Company, Allegheny, N. Y., and the Livingstone County Telephone Company, Livonia, N. Y.

The Oliver Manufacturing Company has recently moved its offices to larger and more convenient quarters at 420 Sansom street, Philadelphia, Pa. All inquiries relating to the well-known "Equipoise" telephone arm and other office specialties manufactured by this company should be mailed to the new address.

The French Battery Company has recently removed its entire plant and offices from Chicago to Madison, Wis. It will be pleased to answer all inquiries concerning its new type of high efficiency dry batteries which are received at the new address.

NEXT YEAR'S ELECTRICAL SHOW FOR CHICAGO ALREADY WELL UNDER WAY.

THE coming Independent Telephone Convention, to be held in Chicago, June 27-28-29, at the Auditorium, will find the Electrical Trades Exposition Company well represented. The management intends to promote the interests of this company and its exhibitors in a way that will be appreciated and of much benefit to both. Out of 166 spaces available in the Coliseum, 97 have already been sold.

The 1906 electrical show was the biggest trade show ever held in the Coliseum and exceeded in attendance any affair ever held in the building. Out-of-town attendance was extraordinary and included Independent telephone men from every State in the Union. The second annual show, January 14-26, 1907, will be still larger and better than the first.

The company desires that those who intend to be represented at the next show shall write for a contract at as early a date as possible, in order that their names may appear in printed and other matter to be used at the June convention.

W. H. Crumb & Company, engineers and contractors, of Chicago, Ill., have recently removed their offices to Suite 1041, in the First National Bank Building.

The United States Coin Register Co., Toledo, O., urges that telephone managers give special attention to its pay station, which records all calls. At the same time that the signal bell is struck a mark is printed on the back of a tape numbered from 1 to 2,000. For each division of the tape marked with a number which is not a multiple of ten a dash is printed. Every tenth division is marked with a cross instead of a dash, for convenience in counting, while at every twentieth division the number of the box replaces the dash, in order that a check may be had upon all collections.

The Edwards-Hine Company, 5 and 7 Pearl street, Grand Rapids, Mich., has made arrangements for the preparation of very attractive business cards for Independent telephone men. They bear in the upper left hand corner a shield of just the right size. The live manager who is looking for every possible way to advertise his business would do well to look up this opportunity.

THE CALCULAGRAPH

enables a telephone company to charge for ALL THE EXCESS MINUTES of every toll conversation. It is the only way to do it accurately.

It relieves the service of one of its most serious drags —the work of calculating the time by reference to a clock. Consequently, the efficiency of the service is greatly increased.

The excess minutes are the profits of your toll line. The Calculagraph makes the profit for you. An operator's eye and pencil and a clock won't do it.

The Calculagraph Makes no Clerical Errors

Send for our booklets---they give valuable data about excess minutes on toll lines

Gilgen Fuses, copper tipped, per 100, $1.25.

"In my judgment, comparing your fuse block with all others on the market, I can say this much, that I have had such tests with it that I am confident it will protect all telephones, where the block is properly installed, from lightning or any foreign currents that the telephone circuit is liable to come in contact with, and at the same time give the least trouble on that circuit.

I surely would not have placed an order with you for 2,000 of your fuse blocks had I thought there was anything in the market that was equal to it, regardless of what the block might cost."

CHEAP VS. EFFICIENT SERVICE

The cheapest telephone service in the world is dear at any price if it is not efficient.

When a man installs a telephone he wants to be able to use it and not to abuse it.

A grounded line nine times out of ten is noisy, and foreign noise on a telephone line will arouse a feeling of anger in the heart of the user that isn't good for the company. You can keep your lines free from grounds and other troubles by periodic tests with a Pignolet voltmeter, and when they do occur, you can locate them with this instrument, and get them cleared often before the subscriber knew his line was in trouble.

If you need your subscribers' good will, you need my voltmeter to get it.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

Standard Construction

requires the use of standard line hardware.

The Norton specialties conform with the most up to date ideas of design and are Standard.

It will cost you nothing to secure a copy of our catalogue and it will be worth a whole lot to you to know just what is considered the best in this particular line.

Patent Combination Messenger Hanger

If you are putting up cable, our **Patent Combination** Messenger Hanger is just the thing. Made from solid forged steel in three sizes for light, medium or heavy work, it is the best on the market. Always in stock either galvanized or japanned.

PERSONAL.

H. W. MILLER, of Harrisburg, Pa., has been appointed general auditor of the Union Electric Telephone and Telegraph Company,

SPENCER B. MOSELEY, who was engaged in the construction of the Home Telephone plants at Toledo and Kansas City, is to take charge of the construction of the Home Telephone Company's plant in Detroit, Mich., under the supervision of W. C. Polk, consulting engineer.

J. A. RICHMOND, formerly agent at Vicksburg, Miss., has been appointed local agent for the Southwestern Telegraph and Telephone Company at Beaumont, Tex.

FRANK TURLEY, who has been in charge of the local office of the Pioneer Telephone Company at Shawnee, Okla., in addition to the district having its headquarters at that place, will hereafter devote his entire time to the duties of district manager.

ALBERT W. WOODS, treasurer of the South McAlester-Eufaula Telephone Company, has been appointed district manager, and will have charge of the Bell Telephone exchanges at South McAlester, Wilburton, Eufaula and Tishomingo, I. T.

MISCELLANEOUS.

CAMBRIDGE CITY, IND.—The Citizens' Telephone Company has passed into the possession of J. A. Boyd & Son.

ROCK VALLEY, IA.—Donald McKellar, formerly of Sioux Falls, has taken possession of the Independent Telephone Company at Rock Valley, which he has lately acquired.

CLYDE, Okla.—The incorporators of the Lyle and Clyde Local Telephone Company are E. P. Peters, P. W. Robbins, John Clark, W. A. Devoe, R. E. Conrady, James Salmon and F. P. Privett.

New Construction in the Field

GADSDEN, ALA.—The Independent Telephone Company, which was recently granted a franchise at Gadsden, is to commence the construction of its system in that city. The central and business offices will be located in the Woodliff-Dunlap Building, on the corner of Broad and Fifth streets.

WHITENER, ARK.—The Rural Co-operative Telephone Company, of Whitener, is to construct 226 miles of new line.

BURNSIDE, ILL.—Manning and Steel are putting up a telephone line from Burnside to Webster.

BRAZIL, IND.—The Citizens' Telephone Company has decided to greatly enlarge its plant at Brazil.

LOGANSPORT, IND.—The Logansport Home Telephone Company contemplates installing an exchange at Waverly.

OSGOOD, IND.—The Osgood Telephone Company is to make many improvements in its system.

CEDAR FALLS, IA.—The Hudson Mutual Telephone Company anticipates making many improvements in its system at Cedar Falls.

CORRECTIONVILLE, IA.—The New State Telephone Company, of Odebolt, is to build a line from Correctionville to Carroll, via Ida Grove and Odebolt.

COUNCIL BLUFFS, IA.—The Independent Telephone Company, which has recently installed a new exchange, will spend $50,000 in completing its system.

HEATH, MASS.—The Heath Telephone Company is to build a line to West Hawley.

NEWAYGO, MICH.—The Citizens Telephone Company is to build a line from Newaygo to Croton.

BIRCH LAKE, MINN.—The St. Croix Lumber Company will construct a telephone line to Slate Lake.

DULUTH, MINN.—The Zenith Telephone Company will spend $75,000 in improving its system.

GRANITE FALLS, MINN.—The Granite Falls Telephone Company is to extend its lines to the Yellow Medicine River and to Palmer Creek.

SEDAN, MINN.—The Sedan Telephone Company will soon commence work on its new line.

WEBB CITY, MO.—The Home Telephone Company is to install a new exchange at Webb City.

HELENA, MONTANA.—W. H. Crumb & Company, of Chicago, is to construct an Independent telephone system in Helena.

MISSOULA, MONT.—F. M. Taylor and others contemplate the construction of a telephone line into the Rattlesnake section.

BEATRICE, NEB.—The New Home Telephone Company has under contemplation many improvements in its system.

ITHACA, NEB.—The Golden Rod Telephone Company is building new farm lines in and about Ithaca.

RULO, NEB.—The Farmers' Mutual Telephone Company, Rulo, is to establish an exchange at Falls City.

MILFORD, N. J.—The Delaware Valley Telephone Company is to build a line from Milford to Frenchtown.

ARTESIA, N. M.—The Artesia Telephone Company is to extend its lines to Roswell, Lincoln, Torrance, Willard, Santa Fe and Albuquerque.

DUANESBURG, N. Y.—The Duanesburg & Florida Telephone Association is building a line to connect Delanson with Burtonville.

TRUMBULL CORNERS, N. Y.—The Trumbull Telephone Company is extending its lines into the region of Applegate.

VALOIS, N. Y.—The Valois, Lodi and Caywood Co-operative Telephone Company is building a line from Kidders to Watkins.

CRESTLINE, O.—The United States Long Distance Telephone Company is to establish a switching station at Crestline. This station will be a feeding station for all towns in Central Ohio.

NEWARK, O.—The Newark Telephone Company is to make many improvements in its system, including the providing for 1,000 new telephones.

AVONDALE, PA.—The United Telephone Company, of West Chester, is building a line from Avondale to Landenberg.

FREDERICKSVILLE, PA.—The Mountain Telephone Company will build a telephone line from Fredericksville to Shamrock via Henningsville.

OHIOPYLE, PA.—The Tri-State Telephone Company, of Scranton, is to build a line from Ohiopyle to Somerfield.

PHILADELPHIA, PA.—The Keystone Telephone and Telegraph Company is rebuilding its lines in the vicinity of Trowbridge.

HOPE VALLEY, R. I.—The Hope Valley Telephone Company is to extend its lines to Canonchet.

CANTON, S. D.—The Canton Co-Operative Telephone Company is to make many improvements in its city system, and is also to build a line to Klondike, Iowa.

ELKHORN, WIS.—The County Telephone Company, of Elkhorn, is to build a line between Springfield and Elkhorn and from Spring Prairie to Elkhorn.

FORT WILLIAM, ONT., CAN.—Superintendent Jones has been instructed to prepare plans for a new municipal telephone building. The station will have a capacity of 5,000 lines. Several extensions of lines will also be made.

PETERBORO, ONT., CAN.—The Machine Telephone Company is to build long distance lines to Smith, Duoro, North Monaghan and Otonabee municipalities, and to build connecting rural lines.

PORT ARTHUR, ONT., CAN.—The council is considering the building of a long distance line to Hymers, connecting it with the town's municipal system. Address Mayor Clavet.

SASKATOON, SASK., CAN.—The Saskatchewan and Electrical Supply Company of Saskatoon will extend its switchboard by 300 lines and in other ways improve its system.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

Less time used in installing them.

All the tools needed are:
1 screwdriver,
2 screws, and
3 minutes time.

That's how these condensers shown in the cuts are put in, also our No. 186.

On party lines they are as essential to perfect service as the current itself.
No trouble from other receivers being off the hooks if you use a condenser.
You can talk just the same.
No one but the party you are speaking with can hear you.

Just to show you how they improve the service, we'll equip your line with our condensers *Free of Charge*. Use them 30 days. If they are all we claim send us the price, or, if you don't like them send them back—we'll pay the freight.

Better send for our new circular.
The prices in it are lower than in the old ones.

ANNOUNCEMENT

Owing to the great growth of our business in the Central West and the increasing demand from our customers for a nearby base of supply, we have opened a warehouse and salesrooms at

KANSAS CITY, MO., 317-319 South West Boulevard

Our Standard Instruments will be shipped from our factory in car load lots. We will carry a full line of our equipment, and will be in position to fill orders much more quickly than if shipped from Cleveland direct.

We will also carry a complete stock of construction material and tools.

Our Kansas City branch will be open for business on and after May 12th.

You are cordially invited to call and inspect our apparatus.

The North Electric Company

KANSAS CITY CLEVELAND DALLAS

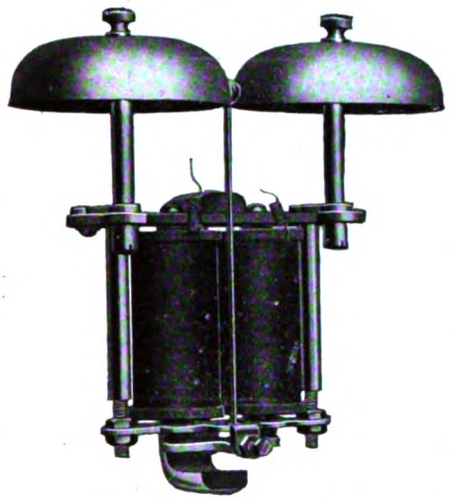
CENTURY
100 % GOOD



No. 56 Ringer Movement

This ringer is of the self-contained type, in which the gongs attach to posts fastened direct to the ringer frame instead of fastening to the cabinet. These posts are adjustable either with use of screw-driver or wrench.

Gongs are always in adjustment --- a small guard protects the tapper from being injured.

The ringer armature is adjustable and will not freeze or stick to the pole pieces.

The coils are wound with silk insulated copper wire on soft Norway iron cores and carefully insulated therefrom.

Ringer coils are long so as to give high retardation and permit the use of large wire preventing injury from lightning.

This ringer is perfectly balanced and exceedingly sensitive.

Used on all CENTURY Telephones.

We make local and common battery telephone apparatus.

DEPARTMENT OF THE INTERIOR
UNITED STATES PATENT OFFICE
WASHINGTON, D. C.

April 18, 1906.

FRANK B. COOK, 240 West Lake street, Chicago, Ill.

Dear Sir:—Replying to your favor of the 8th inst. An examination of the U. S. Patent Office records show that you are the owner of the entire right, title and interest in each and every one of the following 34 patents.

There is no record of your having assigned any of these patents, nor is there any record of an injunction or any other court proceedings which affects your absolute right and title to same.

Very respectfully,

Jos. T. Allen

Explanation in parenthesis ( ) not in original letter.

AUTOMATIC INTERCOMMUNICATING 'PHONE for EXCHANGE CONNECTION

For factories, business houses, residences, hospitals, etc. A complete non-interfering, inter-communicating system with trunk button for direct exchange connection at each station. Instantaneous connection with city central from any station by pushing down trunk button. Can be equipped with one, two three or more exchange buttons. Absolutely reliable. Used and endorsed by the largest exchanges.

Much cheaper and more satisfactory than a small branch switchboard. Write for particulars and prices.

Send for Bulletin "T"

CONNECTICUT TELEPHONE & ELECTRIC CO., Inc., Meriden, Conn. U. S. A.

Over 12 years' experience

BATTERY TROUBLE IN A TELEPHONE—

Like the notorious straw that broke the camel's back, is a little thing by itself, but it kills and renders useless the whole system.

And it is just one's luck for the break down to come at an important moment when delay is costly.

The "1900" dry battery is "tailor-made" to ring bells—telephone and door. It is as near perfection as it is possible to make it. It is inspected at every stage of its making.

The "1900" represents 18 years of dry battery experiment and experience.

DEAN TELEPHONE APPARATUS

OUR PORTABLE DESK STAND

is a radical departure from the time-honored and inefficient method of construction. It is made in the most substantial manner possible, the inner framework being pressed and drawn from heavy sheet steel instead of the usual castings. The external design is along graceful and simple lines, while the finish is beautiful and lasting.

The upright is covered with a thick and highly polished hard rubber tube, and all of the remaining exposed portions are heavily nickel plated.

The contact springs of the hook switch are mounted edgewise within the base so that the platinum contact points are open for inspection by simply removing the base cover, the latter being fastened by a simple lock.

One of the new features incorporated in our desk stand which makes the instrument of double value is the interchangeable plate.

All of the talking circuit apparatus excepting the transmitter and receiver is mounted on a metal plate and completely wired so as to form a unit.

These units are interchangeable and are arranged for local and common battery circuits.

Thus an exchange using our local battery desk sets, and wishing to change their system to a common battery require only the changing of the circuit plate.

Ask for our Folder No. 2A, which gives full description and circuits.

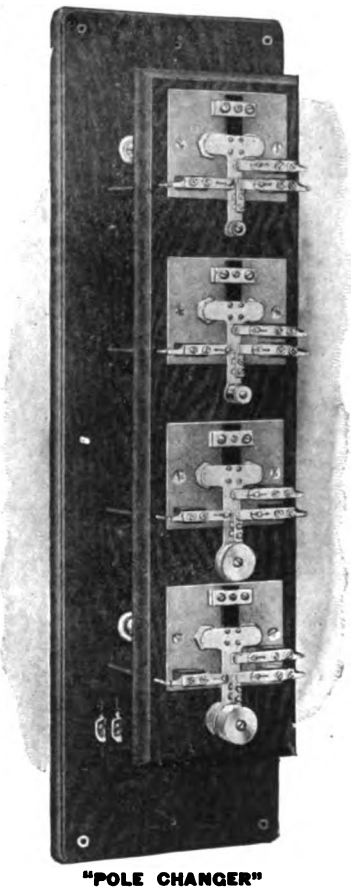
KELLOGG PHILOSOPHY ——— THE BEST IS THE CHEAPEST

KELLOGG

FREQUENCY POLE CHANGER

Utmost SIMPLICITY of operation

THIS POLE CHANGER can be used on common battery or magneto exchanges.



"POLE CHANGER" COVER REMOVED

Advantages:

1. Requires no attention once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from primary or storage batteries.
4. Dry cells can be used for the ringing current.
5. They can be used to work successfully under any load.
6. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
7. Operates successfully within the limits of 19 to 27 volts.
8. Practically wireless in operation.
9. Only three contacts on each Vibrator.

THE TRANSFORMER CABINET contains all necessary Switches, Fuses, etc.
Pole changer cabinet and transformer cabinet separate.
Can be put in different rooms if desired.
Sold separately or complete.
No additional apparatus needed on power board already installed.

WHAT'S WRONG
with that TELEPHONE INVESTMENT of yours?

Why doesn't it pay you as well as the best of your investments?

Is the reason bad management or bad equipment? More likely the latter.

Probably the company is trying to do a 20th Century business with 19th Century apparatus.

If that's the case, it is spending more and earning less than it might if it had our Automatic Telephone equipment.

This is the only really modern telephone system. It produces the ideal telephone service—quick, sure and secret—at half the operating expense of a manual equipment, and this service commands better rates.

It costs a fixed price per hundred lines to enlarge the automatic exchange, instead of an increased price per each hundred lines, as in the manual equipment.

The automatic exchange is never outgrown; it never has to be "scrapped" and replaced by a complete new one, as with the manual. You just add to it as you do to a sectional book-case.

All these points bear upon the stability and value of your telephone securities. They mean dividends to you.

Over ninety per cent. of all the large orders placed during the past few years, either for new installations or replacements, have been for our automatic system, and all the companies adopting it have, from the increased earnings, been able to pay the interest on their bonds and a good dividend on their stock.

Our Automatic System has been adopted in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Albuquerque, N. M.
Allentown, Pa.
Auburn, Maine.
Auburn, N. Y.
Battle Creek, Mich.
Bellingham, Wash.
Berlin, Germany.
Buxton, Iowa.
Cadillac, Mich.
Chicago, Ill.
Clayton, Mo.
Cleburne, Texas.
Columbus, Ga.
Columbus, Ohio.
Dayton, Ohio.
El Paso, Texas.
Fall River, Mass.
Ferguson, Mo.
Florenceville, N. B., Can.

Central Energy Telephones

Stromberg-Carlson

TELEPHONE MANUFACTURING CO.
ROCHESTER, NEW YORK

IF you use or contemplate using Central Energy Telephones it will pay you to get a copy of this new bulletin. There is sufficient evidence in it to prove that the telephones illustrated therein are without exception the most modern and nearest to perfection of any ever placed on the market. This statement is not based on the fact that our cabinets are better finished, that we have a better transmitter or a removable hookswitch, but the telephone taken as a whole.

There is not room enough on this whole page to explain all of their good points. By good points we mean the things that make your subscribers satisfied, eliminate troubles caused by accidents or carelessness on the part of users.

It will only cost you a two-cent stamp and a moment's time to get a copy. Just ask for Bulletin No. 15-B.

Shall we send one?

WE MAKE CABLE

Presently You Will Realize

that our cable talks have been founded on solid facts and then you will wish you had followed our advice earlier. When we laid out our cable factory, we foresaw the passing of open line construction and built accordingly. To-day we are running to our full capacity, because our product has been recognized as The Standard of the World. We know that when you decide to use cable you will write to us for prices, and we expect you will buy; but in the meantime we wish to impress upon you the folly of putting off the inevitable.

Figures may perhaps interest you because they tell their story briefly and to the point. Those below were furnished by one of the best known construction men in the business, Mr. Frank B. Hall, of Wheeling, W. Va. Mr. Hall knows the cable construction business from A to Z and back again. He has laid out and superintended the construction of some of the largest and most successful systems in the country, notably those of the National Telephone Company of Wheeling, W. Va., and the Utah Independent Company at Salt Lake City. Besides this work he has had charge of the cable construction for thirty-one different Independent systems. The figures were taken from the trouble records of the National Telephone Company of Wheeling.

RECORD OF LINE TROUBLES
WHEELING (W. A.), MAIN AND SUB-EXCHANGES, FOR 6 MONTHS
ENDING FEBRUARY 28th, 1903.
WITH 2140 PAIRS OF LINES IN USE.

OPEN AT FUSES	LINES GROUNDED	OPEN IN DROP WIRES	LOOSE CONNECTIONS AT FUSES	TOTALS
Sept. 16	2	1		19
Oct. 13	1	4	4	22
Nov. 15		7		22
Dec. 22	1	5	1	29
Jan. 27	3	5	1	46
Feb. 24		3		27
Total 127	7	25	6	165

FRANK B. HALL

Seems to us there ought to be some pretty good food for reflection in those figures. The open line plant that would make as good a showing as that hasn't been built and never will. Therefore don't imagine that you can rebuild with open wire and give as good service as if cable were employed.

Write for cable booklet 79B.

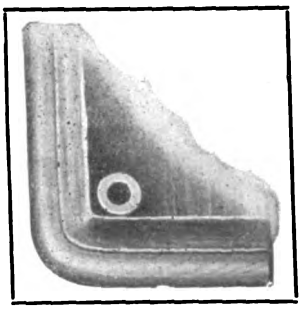
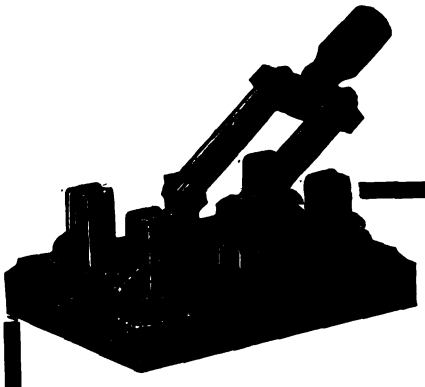
Little Things That Count



The cabinets of all MONARCH TELEPHONES are equipped with bushings placed in the holes at the corners. This little feature adds a finished appearance to the instrument, and protects the woodwork which otherwise would be marred by the mounting screws.

MONARCH TELEPHONE MFG. CO., - - CHICAGO, U. S. A.



All Copper. Made in 4 Styles

A Cordless Out-Of-Order-Less Switchboard

can be made by employing

TRUMBULL ALL COPPER SWITCHES

Sounds nice, doesn't it? Well, it will work equally as well. Just think, no drops or jacks to get out of adjustment, no plugs or cords to wear out, no technical experience necessary for its care; in fact, it is the only practical sort of a board for rural telephone lines. Don't be prejudiced; don't say you won't believe it, but write us for facts.

Incidentally, this type of a switchboard costs much less than the cheapest grade employing the regular equipment and it works better than the best.

Trumbull All Copper, Self Adjusting switches can be put to hundreds of uses in a telephone plant. They're the best made.

Order from your dealer, or write us.

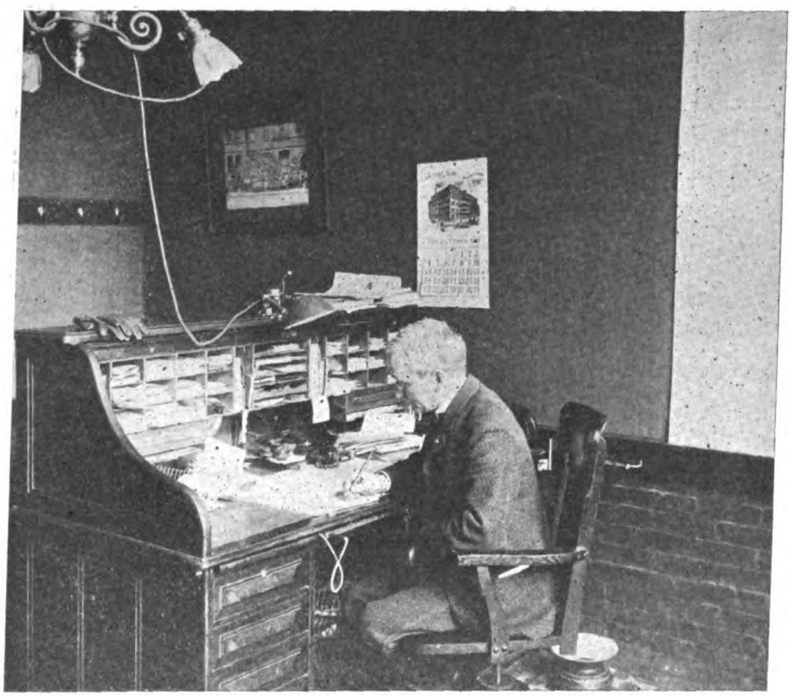
Organization in Telephone Work

By P. Kerr Higgins.

THERE can be but "one best way" in which to do anything. Nevertheless, it is apparent to all that no definite set of rules nor methods will apply to all conditions. The best which can be accomplished then is the establishment of some standard method which each individual may be enabled to use as a skeleton for the particular system which will satisfy his necessities.

It is a true saying, and good common sense, that the only way in which we can fully apprehend anything is by getting in and doing it. It is often said: "If you want anything done, ask someone to do it, but if you want it done right, do it yourself." These simple, homely statements furnish the whole key to the method of building up an organization capable of actively and economically conducting a telephone system.

The basic principles must be understood before one can hope to apply them; one must enter prepared with these before he can hope to improve them. The conditions which govern the purpose and control the form of the average organization seem to be about as follows: Facts and figures are necessary to show results; means for comparison of co-ordinate departments must be provided; interchecking must be arranged for in such a way as to indicate both the presence and means for avoiding all leaks and losses; complex, scattered units of work must be accomplished with the least drain upon the combined energy of the entire body. These business requirements are fundamental and it is because it enables them to be fulfilled to as near completion, and with as little waste as possible, that the following has come to be an approved form of organization.



George R. Fuller, General Manager of the Rochester (N. Y.) Telephone Company, Who is at the Head of a Large and Extremely Efficient Group of Telephone Men.

The stockholders who are the owners of the property, and to whom all responsibility is due, elect a board of directors. They also sometimes choose by direct vote, and sometimes indirectly through the directors who are their representatives, a president, vice-president, a secretary and a treasurer. The board of directors defines the policy of the company and elects an executive committee (with the president as chairman), who act as an advisory committee on the policy of the company. The directors also choose an auditor, who audits the books of the company. The function of the executive committee is principally operative, that of the auditor financial. In touch with both of these is the general manager. The treasurer has access at all times to, and is in direct touch with, the accounting department. The secretary has access to all records of any department. Both of these officers report directly to the board of directors and represent them in a checking capacity, as does also the auditor. It will be seen from the chart presented with this article that the positions of general manager and assistant general manager derive their great importance from the fact that these officials are practically at the head of each and every department, so that in case of removal, sickness, death or other causes they should be qualified to fill the vacancy.

If one of the divisions under the assistant general manager should lose its head for any reason, then the assistant general manager would step in until a new chief could be appointed. This means that the assistant must combine in himself all the powers and qualifications of those looking to him for instructions.

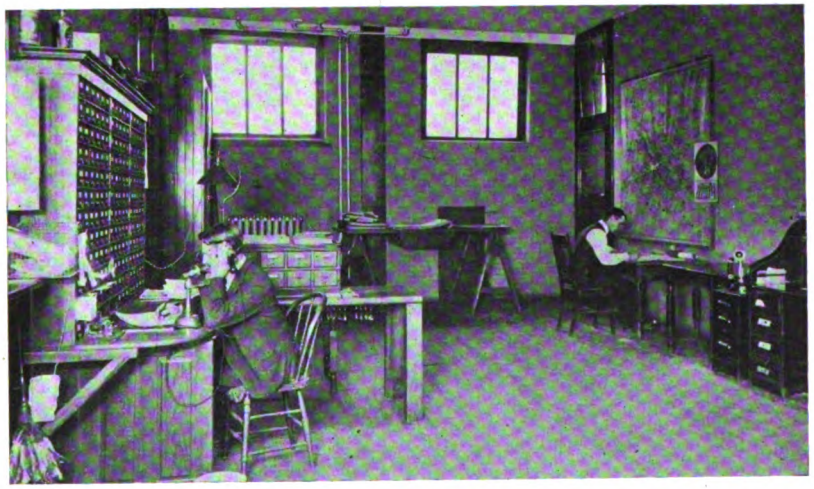
In the same way the general manager must be the superior of the assistant and all other officials, although not of necessity knowing all the technical detail at the command of the assistant, he must know enough of it to be able to intelligently examine and correctly pass upon the reports of his subordinates. He must, however, be an organizer, an expert accountant and a financier.

The weakness of an organization can be easily discovered at any time by the board of directors through the employment of a technical telephone expert and an expert accountant to inspect and review the plant with a view to determining its valuation in case the plant were to be sold. The amount represented by the original cost less the depreciation should equal its present valuation. The report of the experts should correspond closely on these figures, without any previous knowledge on their part of its probable amount. Any variation beyond the normal possibilities of error in estimation would show loss or gain, and good or poor judgment on the part of the administration.

Digitized by Google

It will be acknowledged that any plant, large or small, must be run scientifically in order to accomplish results, and every subordinate or employee in the organization must do his or her work on a scientific basis. Every move must be directed and guided by a master hand and each moment properly accounted for. It has been the writer's experience that some telephone managers, like the electricity they use and sell, seek a path along the line of least resistance; but think for a moment what would become of the telephone business, or any electrical business, if such were permitted in every day practice. The one thing we aim at is to direct and confine the electric current into useful channels and prevent its leaking to ground until its work is fully and completely finished In the same way must every scientific manager direct the forces under him into useful and profitable channels, permitting no leak in his well insulated system.

The combining of departments may be advantageous, and even necessary, in smaller exchanges, but in no case must the head be overloaded. Heads of departments, and especially foremen, make the great mistake of trying to do too much of the work themselves and using too cheap labor for the remainder. This often appears to be an indication of lack of executive ability. The chief must be in a position at all times to take in the whole field under his charge in an unprejudiced manner and free to direct and instruct its units. While the directors or executive committee outline the plan of campaign, they must have enough confidence in the ability of the one they place in charge to permit him to get the results in his own way. If the results expected are not forthcoming then it is time enough for them to interfere; if done previously they take from the manager his individuality and his initiative and so paralyze his best efforts.



Typical Arrangement for an Installation Office, Showing Quarters for the Department Head and the Stock Clerk.

As an example of what can be done along this line of following up the work of the departments without any special effort, an actual incident is worth relating. The writer knows of an exchange where there is on its system over 25,000 feet of insulated duplex wire not now in use and likely to never be in service. Some of it is outside, but the greater portion is inside of buildings. He has seen complete cross-arms, bolts, half keys of insulators, etc., lying in out of the way places where they have been for at least a year and evidently the fact was not known to any high official of the company. This suggests the advisability of having a material inspector.

The requirements of a general plan of organization involve two elements of primary importance. These are the definite fixing of responsibility upon the members of the force and the division of the work according to some classification based upon the nature of the work itself. It was for a long time a rather general practice to give the direction of many unrelated things at the same time to a trustworthy and intelligent subordinate. A good man was loaded according to his capacity, and if not enough work of the sort to which he was most accustomed could be found on the instant, a new line was laid upon him.

While this may work fairly well in a small company, with a man of extraordinary capability, it has a most demoralizing influence in a large field. The man who is given the direction of work in numerous departments will almost invariably carry out to a lesser degree the principle which is forced upon him from above, and take to the extraordinary work some of the men usually engaged upon the routine of his regular department.

When this practice is applied to the less efficient members of an organization, it usually causes a considerable amount of confusion. There is a certain inertia which must be overcome whenever a new task is commenced, and it takes time for the person engaged upon the work to acquire a knowledge of the means for handling it to the best advantage. Even after the general method is acquired, he is still far away from attaining the maximum of efficiency. It is the same in almost any line of work that it is in handling small pieces of material in a machine shop; it is the practised hand which accomplishes the most in the course of a day.

In so far as this reasoning is generally applicable, it also points to the advantages to be attained from the concentration of the thought of even the most capable members of the organization on the upbuliding of at least closely related lines of the business. While a change from one class of work to another will enable more energy to be expended without unduly wearing upon the official it should always be borne in mind that whatever variation is introduced should be, to a considerable degree, systematic. Even when the present affords an interval of comparative freedom from routine in some department the future must always be cared for. There are always minor improvements to be made in every branch, and plans laid for enlargement which can be best conceived by those who are thoroughly familiar with all the conditions which will probably be effective when the plans are put in operation.

For these reasons a careful adherence to departmental lines has been found to work out to the ultimate advantage of the company, even when exceptional men were present. Observance of the boundaries established gives a definite form to all endeavor, which enables the individuals in a lower place to have exact and permanent ideas of the progress which can be made by them individually; and up to a certain point this is agreeable to the average man. In a measure it aids the person who needs to be led.

The accompanying chart represents what have come to be acknowledged as the broad divisions into which the elements of a successful force for conducting the affairs of a telephone company must be organized. While all of the various departments report to the general manager, each one concerns itself with a class of work in which all knowledge is closely related, and each day's experience is likely to be of direct and immediate value in increasing the efficiency of the work done in the future.

It will be observed that the broadest distinction is made between the business and technical branches of the work, corresponding to the great differences in temperament and experience which exist in the types of employees competent to obtain employment in these respective branches. Such an organization promotes economy of management to a high degree.

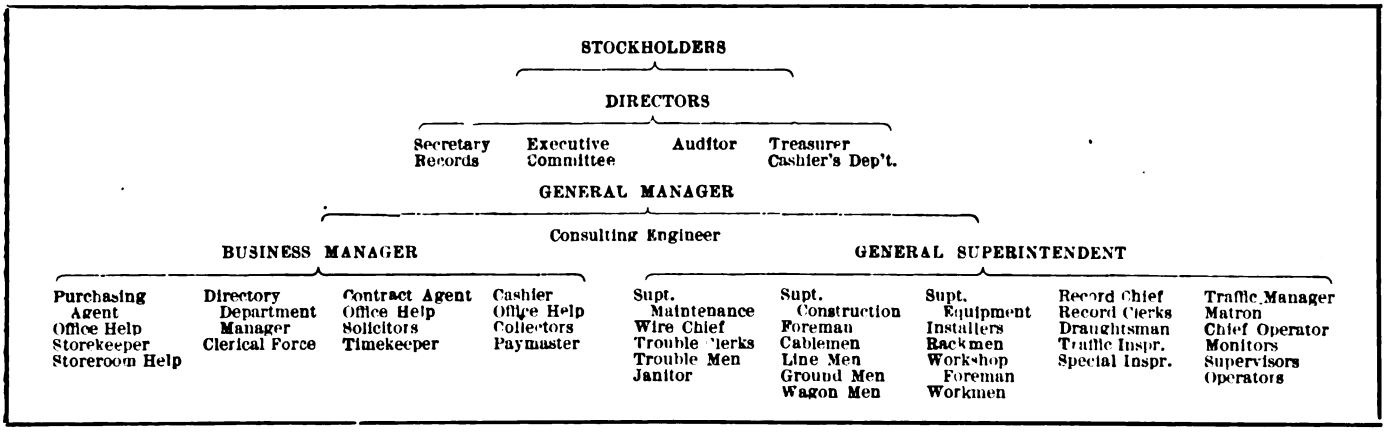
The chief of each division has under his direction a force competent to handle all business of the class which is directly under his control. As the work of one day differs only in detail from that of the next, as far as the subordinate members of the organization are concerned, everything goes along smoothly. When any task comes up to a man he knows just how to handle it, without spending a great amount of time in looking about to

Digitized by Google

see how it was done the last time, perhaps by a man who is nowhere to be found.

Moreover, while each has the advantage of knowledge concerning many matters which come up, owing to their being of a nature which permits him to bring his past experience directly to bear on present problems, he has the still further advantage of knowing exactly what to do with matters which are beyond his experience, or which require to be considered in connection with figures or data which are not within his immediate reach. Although he may not know exactly where the information he desires may be obtained, he does know in what class it lies. This is sufficient to show him to what department he must put his questions, and if that department is efficient the mere reference to its head causes the matter to be as good as settled, and without any loss of valuable time.

While these matters are perfectly familiar to many who have contemplated them it is a fact that there is a continual shifting about which tends to interrupt the strictness of routine and bring about more or less of confusion, and this is not capable of being completely avoided in any company. It would therefore appear that the success or failure of an organization largely depends upon its systematic construction. Precautionary methods should be adopted, and possible difficulties that may arise in the future anticipated, and in a measure provided for.



Typical Chart Showing the Organization of the Forces of a Large Telephone Company. Authority on all Matters is Definitely Fixed in the Official Who Should be Best Qualified to Handle Them Under Such a Settled Plan.

Report of John Hesketh*

EFFICIENT management in telephone systems is as essential as good engineering. It is impossible to lay down details of practice which shall apply to every case, but the following are the chief methods of attaining satisfactory service:—

1. Allot such loads to operators that they are neither over-loaded, nor allowed to get "slack" through under-loading.
2. Provide adequate junction lines for work between any two Exchanges.
3. Work such lines on the Order-wire system as soon as ever the traffic is found to justify it.

It has become too usual for the load of an operator to be stated in the number of subscribers she is supposed to answer. This standard is very misleading. Not only do some subscribers use the service more than others, but different classes of lines throw more or less work upon the operator. To attend to a call office line takes more time than to attend to an ordinary subscriber, because the operator must, in addition to doing all the usual work in connection with a call, see that the proper call office fees are paid or accounted for.

If an operator is over-loaded, she cannot give a good service to all the subscribers. On the other hand, if she is under-loaded, she gets "slack," and gives an inefficient service.

Between these two extremes of over and under-load there is an efficient mean, varying with the class of service.

The local conditions must largely govern the decision as to the efficient load, but taken as an average on "Flat Rate" services and boards such as those at Brisbane or Sydney (but not at Melbourne or Adelaide), the efficient load is about 200 calls per operator in the busiest hour. If this load is, for any reason, exceeded, the service suffers.

It is interesting to note the effect the class of service has upon the use made of it. When an unlimited service is given (at flat rates), the subscribers use their instruments from 12 to 15 times a day, while if they have to pay according to the use made of the service, 3 or 4 calls a day is the average. It will be readily seen that it costs more to provide a flat rate service than to provide a measured service upon this basis, for, as before stated, the load upon an operator is measured, not by the number of subscribers she has to attend to, but by the number of calls they make in the hour, and the class of service.

The practice of making systematic and continuous service tests is one to be strongly recommended for adoption in every large Exchange. By this means a continuous check is kept upon the operating, and upon the service generally, and a more efficient operation results. Details of the methods of applying the tests will form the subject of a later memorandum.

In all large Exchanges in the United States operators are trained in fully-equipped schools, where they are instructed in all the branches of operating before even they enter the Exchange proper. The expenditure in equipping such schools, and maintaining them with the necessary staff of efficient teachers, though great, is found to be fully justified by the results.

In every telephone undertaking operated by companies in America it is especially noticeable that excellent accommodation is provided for the operators in the shape of meal, retiring, reading, and bath rooms. Companies find that a liberal policy in this regard is a good one.

One of the most impressive facts in modern telephone work is the extent to which real engineering has taken the place of the "rule of thumb" methods. In modern work, estimates are carefully made, not only for the coming year's work, but of the development to which the system will attain in, say, fifteen, or even, in some cases, twenty years; and all work done to-day is so proportioned that it will eventually take its proper place in the ultimate scheme. In laying down each section of the work, the ultimate scheme is kept well in view, and maximum efficiency and economy in every part is obtained.

No better example of the importance of this design can be

*Continued from the issue of May 12th.

Digitized by Google

given than that of the wire plant of a large telephone underground system. Lack of design here may involve an unnecessary expenditure of many thousands of pounds, while careful engineering will save this amount, and not lessen the commercial efficiency of the system in the slightest degree.

I have been most strongly impressed with the fact that in every successful modern telephone undertaking there has been special attention paid to staff. Not only is the staff noticeably large from our Australian point of view, but the officers are individually men of high capacity. Telephony requires engineering, and engineering cannot be carried out without trained engineers. Modern systems require, even in the workmen, a higher grade of intelligence than hitherto. In one large system the chief engineer informed me that he was unable to obtain a sufficient supply, even from such technical institutions as Harvard.

ABSTRACT FROM REPORT UPON THE QUESTION OF INJURIOUS AFFECTION OF TELEGRAPH AND TELEPHONE LINES BY STRONG CURRENT WORKS.

It is first to be noted that in all modern telephone work there is as little as possible open aerial work. All the main cables are underground, and much of the distribution is by cable arranged within building blocks. In such cities as London and New York, not to mention those much smaller, it is a rare thing to see new work include aerial wires. In London the post-office alone has the right to put wires underground, therefore for a time the National Telephone Company's old aerial wires remain, but they are admitted to be bad practice.

It may, perhaps, be well to summarize the practice and opinions of each of the countries visited.

America.—Where telephone lines are erected aerially, the onus of protection rests with the telephone companies. Each party is supposed to look after himself. It is common to see wires of all sorts erected on the same poles or crossing in what we would consider a dangerous manner. Guard wires are practically unknown. Accidents are common. In cases of loss of life or injury to a third person, the law appears to throw the responsibility on both parties (telephone and power). The fact standing out most prominently is that the Telephone Company has no right to require the power companies to take any steps to protect the telephone lines or works. The tendency at the present time is to get the question reopened, as present practice is based on what is thought to be a wrong decision.

The precedent which is now found to be detrimental is that created by the decision given when the right of the telephone companies to protection against trolley systems when the telephone companies were using the earth as a return, was first under consideration. It was then ruled that the Telephone Company could not claim the exclusive right to the use of the earth, and that they must, therefore, protect themselves (from induction) by the use of metallic circuits or common returns.

This decision has now been taken as throwing the onus of self-protection upon everybody using a common property, and as applying also to the use of the earth by gas and water companies.

The cases are not at all parallel. At the present day no effort would be made to obtain protection from induction if single-wire circuits were being used, but it is thought that more protection against electrolysis should be given.

England.—The Board of Trade regulations indicate the present requirements. A gentleman with whom I fully discussed the matter considers that there is a tendency in England to overdo protection. Guard wires are undoubtedly a nuisance, and may be avoided to a great extent by proper telephone construction.

Where, however, protection is necessary, cradles are preferable to guard wires. The Board of Trade, while requiring guard wires in the interests of public safety, does not touch the question of cost, nor of the legal responsibility in the event of damage to a third party. This latter question is now being considered in legal quarters. No decision has yet been arrived at.

ABSTRACT FROM MEMORANDUM *re* THE MESSAGE RATE (MEASURED SERVICE), OR TOLL SYSTEM OF CHARGING FOR TELEPHONE SERVICES.

When telephone exchanges were first started about 1876, no information was available as to the extent and effect of traffic. Flat rates on an arbitrary scale were charged for all services. This continued until about 1896, at which time the American Bell Telephone Company was required by stress of competition to introduce every possible means of popularizing its service. It was at this time that the features which have since dominated telephone practice were introduced. These features were the common battery system, a measured service, and party lines.

Analysis of traffic under a flat rate gives the following leading characteristics:—

In exchanges from about 100 telephone subscribers the calls average about five per subscriber per diem; in the larger exchanges of from 6,000 to 7,000 subscribers the calls per diem average about seventeen in some exchanges. I believe that the averages in Melbourne and Sydney have exceeded fourteen calls per subscriber per day on occasions.

This large number of calls may be divided among those which are necessary and covered by the subscription paid; those which, though covered by the subscription paid, might be avoided, being frivolous and unnecessary; and those which are made by persons who are not subscribers, but use the instruments of their neighbors, and thus pay nothing for the service.

The first point which it is necessary to emphasize in considering this question is that the number of operators to be provided depends, not upon the number of subscribers connected, but upon the number of calls these subscribers make. Therefore, if we can reduce the number of calls, we can proportionately reduce the number of operators, or if we do not care to do this we can increase the efficiency of the service with the same number of operators.

Not only must the number of operators be increased when the calls are increased, but the equipment at the central Exchange must also be increased—that is to say, a switchboard for 10,000 subscribers, each of whom made twenty calls a day, would cost very much more than a switchboard for the same number of subscribers who made half the number of calls a day.

Nor are these (the operating and switchboard) the only sections of the work on which the cost is increased. In every large system utilizing more than one exchange in a given network these several exchanges are connected by junction lines.* The number of these junction lines must be increased as the traffic over them is increased, so that, with subscribers who make twenty calls a day between two exchanges, the cost for the junction lines would be twice as much as that if the subscribers made but ten calls per day.

The proportion which the cost of junction lines bears to the total first cost of the service varies with the circumstances of each case; but it is no infrequent case when the flat rate system of charging is in force, for the length and the cost of the junction lines to a particular exchange to far exceed the length and cost of the subscribers' lines on that exchange. Instances of this kind exist in the Commonwealth service.

In addition to these disadvantages, unnecessary and illegitimate calls increase the wear and tear of all the equipment, without any accruing revenue. Further, the anomaly is created that, however much the service is improved, the calls will automatically still further increase, and cause still further wear and tear and expense for operating, and this without any increase of revenue.

The foregoing deals with the question of the cost of construction and operating, which from the departmental point of view are most important. From the subscriber's point of view there is the additional disadvantage that with the increased traffic the number of times a particular line is found to be engaged is largely increased.

With an increase in the number of free calls on all lines, the disadvantages enumerated increase, until at length it is impossible to give a satisfactory service at a reasonable cost with the flat rate method of charging.

The introduction of a measured service would have the effect of at once removing all unnecessary and illegitimate calls.

*Another name for trunk lines.

The Development of the Telephone Cable*

By Thomas Stanley.

CONTINUING the discussion of the submarine cable, there are two more types which deserve attention. One of these is the double sheath cable shown in Fig. 13.

This submarine cable has a capacity of 50 pairs. The outer sheath is shown at *a*, the inner one at *b*, the serving at *c* and the conductors with their paper insulation at *d*, *d'*, *d''*, etc. In Fig. 14 (P. 329) is shown a single lead sheath, iron armored cable also of 50 pairs capacity. The armor wires are shown at *a*, the two wrappings of hemp at *b* and *c* respectively. The sheath is shown at *d* with the three jute wrappings at *e*, *e'*, *e''*. One of the bands is shown at *m*.

The method of constructing lead sheath and iron armored cables as carried on in the factory is as follows: The conductors are fed up through a table upon which are placed numerous spools containing the paper ribbon to be used for insulation. These spools are made to revolve, half the number in one direction and half in the other. Upon each conductor is wound a ribbon from one spool in each of these two groups so that two layers of paper are wrapped about each conductor in reversed directions. After the conductors have received their insulating coating, they are twisted together in pairs. These pairs are then taken through a machine which lays them up in reversed layers; after which the now formed core is passed through a tank containing bituminous compound. The core is then brought out and passed through the machine when it receives its wrapping of twine. The core is now ready for the lead sheath, and it is accordingly passed through a die of the proper size, where the lead sheath is forced upon it. The core covered with the lead sheath is then passed through a second wrapping machine, where it receives three layers of tarred jute. It is now ready for the armor machine from which it emerges with the armor in place. The armored cable is then passed through a third wrapping machine, in which it receives the two reversed layers of hemp, which have been previously saturated with a mineral pitch compound. It then passes through the whitewash bath, from which it emerges ready to be placed on the reel.

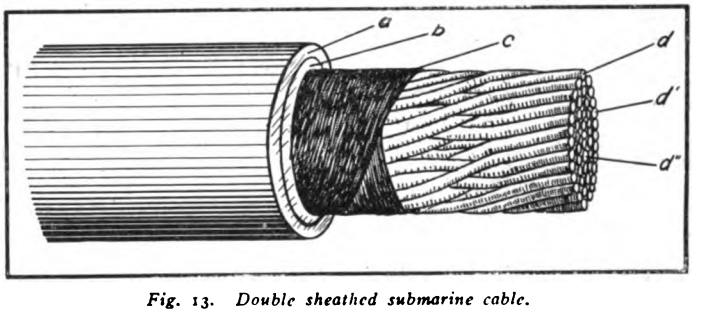

Fig. 13. Double sheathed submarine cable.

The switchboard cable is one which plays a very important part in the make-up of telephone lines. This cable runs from the distributing board to and through the switchboard. It is also used for runs to points about the exchange. Since this cable is always placed in protected places, there is no necessity for rigid protection. As space is of the utmost importance, it must be made as small as possible, and of such a shape as to be neatly laid up in racks. These cables are usually made up in sizes of 20 pairs each, though this is often varied to accommodate special circuits. To economize space, and also to allow the cables to be placed in groups, they are usually made of an elliptical cross section, of greater or less eccentricity. Both on account of the space requirements, and also to make the cables easy to form, No. 22 B. & S. gauge wire was selected as the size best suited. Larger wire would render the cable too stiff, and smaller wire would increase the resistance of the line beyond the allowable limit. The insulation is either wool, or a double covering; the inside one of silk and the outside one of cotton thread. Over the conductors is wrapped a layer of cotton threads, then one of lead foil, to exclude moisture, and the whole is covered with a cotton braid closely woven and saturated with soapstone. The construction of switchboard cables originated as follows: With the development of switchboard wiring, and the consequent multiplicity of the circuits needed, came the necessity of combining the wires for each circuit into a cable form. The number of circuits required was ascertained, the location of the terminals at each end and the distance between them. Ordinary annunciator wire was employed and a number of runs made between the terminating points marked off by nails driven in a flat board, corresponding with the number of circuits. This bunch of wire was sewed together by means of Irish flax thread. The cable so formed was then boiled in paraffine to expel moisture and shellaced ready for use. In order to avoid this labor it was necessary to build a regular cable which would have higher insulation and be better protected from mechanical injury. At the same time it was remembered that the conductors would have to be exposed in the proper manner at the points where the terminals occurred, so that it was necessary to provide covering that could be easily removed by the force of men who were doing the work of installation. This consideration precluded the use of lead or other hard substance as a covering; so that closely woven cotton braid was adopted. Since this form of braid gave little or no protection from the entrance of moisture, it was determined to wrap the wires with a layer of lead foil. This cable readily provided terminals on stripping the ends. The use of factory-made cable of this type prevented the increasing or reducing the number of pairs of which it was composed by the installing force at will in order to meet whatever special requirements might present themselves as the work progressed. These cables are made up in different sizes to meet all the possible contingencies that may arise. Arrangement of the different classes of circuits used in a central office was then determined upon. The terminals themselves are arranged into groups, each having special features as to shape and spacing.

Cables are made of different sizes to furnish the most economical and convenient arrangements for connecting these different groups. For example, subscribers' multiple jacks are arranged in groups of 20. The subscribers' answering jacks are usually arranged in groups of 10, although groups of 20 are sometimes employed. The toll line answering jacks are usually arranged 5 in a group. Wherever a signal, either busy or answering, is used in connection with the jacks, the grouping is the same as that of the jacks with which they are associated. In many forms of switchboard wiring, each jack is equipped with 3 lugs, two for the use of the talking wires and a third one for the operation of the busy test or signal. As a result of the above considerations, it will be apparent that amongst the many classes of cable required those on the subscriber multiple should contain 20 pairs of conductors for talking wires, and 20 single wires for the busy test. On the other hand, the cable used for the subscriber answering jacks, must contain 10 pairs for talking, 10 single wires for the busy test, and an additional 10 wires for the answering signal. As a matter of fact, since the answering jacks and their corresponding signals are sometimes arranged in groups of 20, the cable used for this purpose is made up of 20 pairs for talking, 20 single conductors for the busy test, and the same number of single wires for the answering signals. Under these conditions when the answering jacks are arranged in groups of 10, the cable is split between two rows of jacks and signals. With the toll line answering jacks, it has been said that they are arranged in groups of 5, so that in order to meet the requirements ex-

TOLL service bills may be made out in a form similar to that shown in Fig. 14, which illustrates a standard ruling. This form, No. G-82, is designed for large exchanges which have automatic billing machines with endless roll carbon, or typewriters with a tabulating attachment. The duplicate is blank. The loose leaf method of filing is proving most satisfactory for this form. In large exchanges provided with adding machines, toll bills can be posted directly to the

subscribers' lease ledger accounts from the carbon office copy and the totals of bills added on the machine, this amount to be credited to "toll earnings" for the month.

One good operator can do the entire billing in a general office of a large system having six thousand to eight thousand local subscribers.

In Fig. 15 is shown a rental blil, form G-85. Three bills are printed on one sheet and have a collector's coupon attached. These forms are for large exchanges which use a billing machine or special typewriters. Each month or quarterly term is printed in to save time and labor. The size of sheet is 8½ x 11.

Form G-87, Fig. 16, is the same as form G-85, except that the term of rental is left out. This form is printed singly and padded, and is to be used for balance rendered, duplicate bills, office receipts, or small exchanges. The size of sheets is 3½ x 8½ inches.

A special rental billing system for large exchanges is shown in form No. G-87-B, Fig. 17. By the perfected automatic addressing process, which is very rapid, there may be finished ready for the collection or mailing department, from two thousand to three thousand rental bills per hour. No checking or comparing is necessary. Amounts are correct beyond question. Bills made in this way are as neat and attractive in appearance as if made by expert typewriters. Three operations date and make the complete bill with the collector's and cashier's coupons, giving the telephone number, name, address, district and amount of rental. A city can be laid out in districts for collectors, and the districts indicated by either letters or figures shown on each bill. When bills are completed they can be rapidly sorted into districts and turned over to collectors who do not have to list the bills in separate records, the top coupon giving them all necessary information in case they leave a bill for a later call. They simply tear off the collector's coupon, make their memorandum when to call and follow up the collection by a little pocket "Tickler system" made up of the coupons.

*Editor's Note.—Mr. Wilmot is manager of the Telephone Systems Department of the Edwards & Hine Company, Grand Rapids, Mich.

DEVELOPMENT INCREASING IN SOUTHERN VIRGINIA.

By Wm. R. Tyree.

IN southside Virginia there has, up to the present time, been little or no progress toward industrialism. But, now that the tide of capital from the North is pausing on its onward march toward the far South, giving the Old Dominion her share of the "world's goods," on every side one may see the effects of the dawning of a new business era. And in this new awakening to what her real position should be among her sister States, there has been no more potent factor in the great progress of Virginia than the telephone.

In Charlotte County, one of the oldest and most historical of the many historical counties of the State, one may communicate by telephone from the old town of Smithville (the county seat, now known as Charlotte C. H.), where Patrick Henry made his first speech, which knew the early and later life of John Randolph, and through whose village streets the French marched to fight the battles for American independence, to all the larger cities of Virginia, many of the smaller ones, and not a few of the towns and villages in Southern Virginia.

In this work and as an educational medium, the Central Telephone Company, whose home office is located at Charlotte C. H., is forging ahead as a factor in the business and home life of those who have availed themselves of the opportunity presented to them.

In 1887 it was known as the Smithville and Drakes Branch Telephone Company; in 1904 the charter was amended to read,

"The Central Telephone Company," with W. H. Smith, President, Jno. B. Faris, secretary and treasurer, and W. G. Williams, general manager; with an increased authorized capital stock of $20,000—actual stock sold $11,000. It has 252 miles of telephones and 240 metallic circuits. Its lines connect with all the Independent telephones in the several towns and villages of the immediate counties, such as those reached by the Southside Telephone Company, the Lunenburg Telephone Company and others, giv-

Digitized by Google

ing a possibility of connections extending over 500 miles of territory, and with telephones in the counties of Charlotte, Appomatox, Campbell, Lunenburg, Prince Edward, Buckingham and Notaway. In the territory reached by its subscribers are many important cities and towns, such as Lynchburg, Farmville, Blackstone, Burkeville, Keysville, Meherren, Drakes Branch, as well as every voting precinct in the county of Charlotte, and nine-tenths of all the post offices.

From the above showing it is easy to observe that not only the immediate county of Charlotte is ably and efficiently served with the Central's system, but almost all of the adjoining counties equally as effectively. It is only a short while in the future when the Independent companies of Virginia will be as plentiful as they have heretofore been scarce.

IOWA MUTUAL COMPANIES REPRESENTED IN STATE ASSOCIATION.

REPRESENTATIVES of mutual telephone companies throughout the State of Iowa recently held a meeting at Jessup for the purpose of securing representation in the State Association. The meeting was called by Dr. E. W. Harradon, president of the Jessup company. As a result of the interchange of ideas and experiences a set of resolutions were adopted, which it is believed will greatly aid and strengthen the Independent movement among the smaller companies. C. A. Hollis, president of the Farmers' Mutual Telephone Company of Hudson, was selected to represent the companies in the State Association.

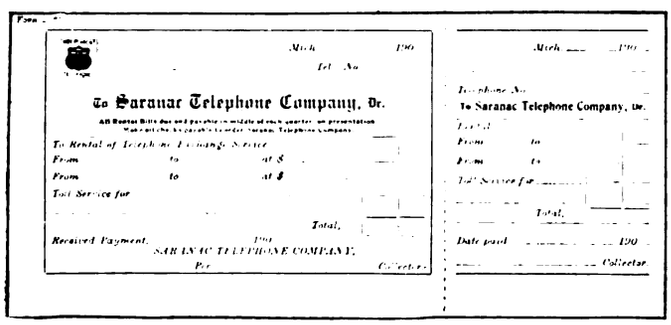
THE TELEPHONE IN THE COUNTRY STORE.

"THE past two years have seen a revolution in the methods of country storekeeping," says a writer in the *Michigan State Gazette*. "No longer can the city visitor, temporarily sojourning in rural districts, scoff at the rusty and time-worn wares he encounters if he wishes to make a purchase at the village store. If the storekeeper's stock is not up to the urban standard, it is his own fault.

"'We used to be six months or a year behind the city in stock,' said the proprietor of a general store in a small town 60 miles from Detroit. 'Now we are only a few days behind at the most. It seems like a miracle to some of us old-timers when we think of it, but really its is simple enough. Here's the secret:

"'He went over to the telephone and tapped it significantly.

"'This and modern railroad methods do the trick for us,' he continued. 'If I want anything I simply call up "Central," and in less than a minute I am connected with my jobber in the city. I tell him what I need and get my order the next day. That is



To Saranac Telephone Company, Dr.
To Saranac Telephone Company, Dr.

Fig. 16. This bill for telephone service is similar to the one shown in Fig. 15, on the opposite page, except that the term is omitted.

one of the great advantages of having the service. It allows me to talk to any of the people anywhere who deal in my lines of goods, and I can get just as good prices and just as up-to-date merchandise as if I took a train and spent three or four days buying each month.

"'In old times communication with the jobber was a tedious business, and most of us bought stock twice a year only. In the early fall we laid in goods for the whole winter, and so on. Now we buy almost from day to day; we have to keep up with the times.

"'You see,' he went on with a quiet smile, 'It's a big saving to us to do business by telephone this way. We let the mills carry our stock for us instead of tying up a lot of capital—which most of us have none too much to tie up, anyway. When we want a thing that we don't sell often enough to make it profitable to carry all the time, we can get it as quickly as the customer can, and a good deal more easily because we know how to go about it. And we don't lose our profit either.

"'As a matter of fact, our profits never were so fair as they are now. I can remember—and it wasn't so very long ago—when I would buy a bill of goods one week and find out from the newspapers the next that prices were fluctuating so I might have saved myself and my customers a good large sum if I hadn't been so

rash about placing my order. At that time, of course, there was no way of following the fluctuations in prices, and no convenient way of reordering. With the telephone, though, I can find out in five minutes how the prices are any morning or every morning, and I can buy as little as I choose without being afraid of getting left high and dry by a sudden run on a line I am short in.

"'I tell you,' the rural merchant said as he came back from answering a call of a customer six or eight miles away who telephoned down so his order would be all put up for him when he went by in the afternoon; 'I tell you, since I took the instrument there into partnership'—and he pointed with a satisfied air to the telephone through which he had just been talking—'I've begun to find out what it is to do business. If there is anything that is worth more to me than my credit and my insurance policy, it's my telephone.'"

PORTSMOUTH, OHIO, SYSTEM TO BE RECONSTRUCTED AND ENLARGED.

CONSTANT increase on the demand for Independent service in Portsmouth, Ohio, has led the directors to authorize an expenditure of $80,000 for extensions and improvements. The present switchboard, which is loaded to its utmost capacity with 1,640 subscribers, is to be supplanted with a new one having a capacity for 3,000 telephones. New quarters have been secured and are being remodelled to meet the requirements of the system. Upwards of $20,000 is to be spent for new underground and aerial cables and $15,000 for new telephones. When the process of reconstruction is completed, the company will have one of the finest plants in the State.

THE EDITOR'S PAGE

DEMAND FOR EARLY NUMBERS OF THE AMERICAN TELEPHONE JOURNAL.

A SUBSCRIBER'S offer for a considerable number of past issues of THE AMERICAN TELEPHONE JOURNAL, as referred to on page 10 of the advertising section is a most gratifying evidence of the value attached to the treatment of the subjects handled in these papers. In any industry which is making progress at a rate equal to that of the telephone business, the record of advancement must necessarily be largely contained in the papers devoted to the industry. Moreover, all progress depends upon knowledge of that which is past, and it is for this reason that the columns of a technical paper have a permanent value.

Coming to the direct application, which has been brought home so very pleasantly, it appears that THE AMERICAN TELEPHONE JOURNAL is believed to fulfill these requirements and to have a thoroughly substantial worth.

BRING THE FINANCIAL MEN!

OPPORTUNITIES for becoming familiar with the advances made by Independent telephone companies throughout the entire country will be offered at the Chicago convention on June 26, 27 and 28. During the past year scattered reports have come in from various sections, showing the increase of business; and direct and indirect evidence has been presented by members of the various State associations that the features of construction, maintenance, operating and accounting are receiving consideration which enables nearly all companies to at least know in what direction lies genuine progress. The enthusiastic and earnest spirit shown in the State assemblages gives the firmest assurance that, rapid as has been the development during the past, the future is likely to show even greater progress along the same lines.

The public is becoming more and more enlightened with regard to telephone matters as time goes on. The advantages of articles in the daily press are being appreciated by officers of telephone companies, and more people are becoming alive to the uses of the telephone which make it indispensable. Go where you will, you will find it hard to discover a person who does not admit that the service would be useful to him; and it only remains for the telephone solicitors to convince people who can afford it that the conveniences offered will be worth the price which it is necessary to pay.

The Independent movement has been getting both bigger and stronger with great rapidity during the past year. It has been going ahead; like all other moving bodies, it has gathered momentum, and unless retarded by some outside influence, even the same force behind it during the coming year will cause it to advance at an even greater rate. It is imperative that nothing shall retard it. Development in the past has been due to the efforts of men of two classes; the telephone men who have done the actual building, and the financial men who have provided the materials with which the work might be done. It sometimes seems to those who are familiar with the extraordinary efforts which have been put forth in the past that the resources of the builders are unlimited; but, however that may be, the statement is never true of financial men. When heavy, repeated demands are made, each of these individuals always reaches a limit which he cannot exceed. When the resources of one man are fully employed, he must call upon his neighbors to assist in forwarding the project he has undertaken.

These neighbors, however, unless they have the most implicit confidence in his ability and sound judgment, and perfect information, will not go in until they learn for themselves the details of the enterprise. A business man wishes to know the people who are to have the spending of the money he invests for profit; he wishes to see for himself whether they are intelligent, trustworthy and earnest. This is especially true in a great affair like the telephone industry, where the advancement of one unit depends in the most intimate way upon the progress of numerous associates, both near and remote.

In view of the fact that Independent growth during the coming year will be extremely rapid, great amounts of money will be needed to prepare a plant to meet the extraordinary demand for service which is certain to exist; and it remains to all interested persons to take the fullest advantage of the opportunity which will be afforded by this Chicago convention. Let every Independent manager bring those who can be interested in the movement from a financial standpoint. The bankers are building the telephone business as much as the operators, and have a rightful place in the convention; they will do good to the cause by being there. Once on the ground they will have an opportunity to talk with the men who have built the systems, and know how to operate them, and know how fast the growth has been in the past, and exactly what the prospects are for its continuance. They will appreciate more than they ever can be induced to by any other means the fact that the Independent movement is a National movement of interests which are closely united, and that its strength and its prospects are tremendous.

SPECIAL SUBSTATION INSPECTIONS.

WHEN a dangerous current passes over a telephone line to a subscriber's premises, and does more or less damage the telephone company sends out one of its best men to make a thorough investigation. Unfortunately, however, it is usually true that he arrives too late to find anything to investigate. The protective apparatus is not in the same condition that it was before the accident, and he is far behind the sudden electrical current which caused the destruction. The only thing left for him to do is to try to work out a plausible theory which will take the responsibility off the company.

These investigations are rather expensive, and the occasions which bring them about create more or less distrust in the minds of the subscriber and those who wish to secure telephone service.

Of course there is no way to absolutely eliminate the possibility of the passage of a dangerous current, from lightning or other causes through material which was not put in place for such a purpose. The proper maintenance of protective devices and wiring, however, will go far toward destroying the liability of the occurrence of such accidents. This seems to imply the desirability of occasional inspection by an especially competent man.

Writers on the value of telephone securities frequently call attention to the fact that telephone company's equipment is of a sort which is less likely to cause injury to property and life than is that of many other public service corporations. This desirable condition can be reduced to the minimum by proper maintenance of the protective apparatus, so that the expenses during a year need not bear an undue surplus for unforeseen contingencies due to accidents. Moreover this practice of special inspection by skilled men has an obvious effect in reducing the rate of depreciation, and insuring that the insulation of the lines throughout the entire system shall be sufficiently high to enable the best standards of talking and ringing to be maintained.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

TEXAS COMPANIES HAVE RIGHT OF EMINENT DOMAIN.

Have Texas telephone companies the right of Eminent Domain?
W. H. S.

REV. ST. 1895, tit. 21, c. 7, giving "telegraph companies" power to exercise the right of eminent domain is held to apply equally to "telephone companies." Gulf C. & S. E. Ry. Co. vs. Southwestern Teleg. & Telep. Co., 45 S. W. 151. Telephone companies in Texas therefore have the right in question.

RUNNING WIRES ACROSS PUBLIC STREETS.

At one place our line crosses the public streets of the city. The poles themselves are not in the streets, but are located upon private property with the consent of the owners. The wires crossing the street are suspended at an elevation which does not interfere with public travel. Nevertheless, the municipal authorities have started a suit for a preliminary injunction restraining the further erection of poles or supension of wires across the street, and to force us to move the wires already erected over the highway. The authorities claim that our company has no right to suspend its wires over the street without the consent of the city, and that this consent has not been given. What are our rights under the New Jersey laws?
B. M. R.

UNDER the circumstances it is the editor's opinion that your company has the right to suspend its wires over the street in question. The general laws of the State provide that telephone companies may use streets subject to such regulations and restrictions as the corporate authorities may impose. This is held not to warrant a regulation which imposes new conditions on the exercise of the corporate franchise. It does not appear that the city has passed any ordinance prohibiting the stretching of wires across the street. Even if it had been so, such a provision would not have been a "regulation and restriction" which the municipality under the law has power to impose. The right of regulation does not include the right to prohibit. A telephone company has authority to conduct a telephone business under certain conditions and with certain privileges in the State, and this right cannot be restricted by the city in the way it attempts to do. Inhabitants of Summit Twp. v. N. Y. & N. J. Tel. Co., 41 A. 146.

KNOWLEDGE OF FALLEN WIRE IN PERSONAL INJURY CASE.

WHERE an electric company negligently fails to insulate its wires so that an adjacent fallen telephone wire becomes charged with a deadly current, and causes death, the electric company is liable, without regard to its actual knowledge of the fallen wire, or its diligence in discovering it. Parsons v. Charleston, Etc., Elec. Co., 48 S. F. 284, 69 S. C. 305.

TEXARKANA OFFICIALS PERPETUALLY ENJOINED FROM MOLESTING TELEPHONE COMPANY.

THE city of Texarkana, Tex., and the Southwestern Telegraph & Telephone Company have been contesting for some time over the question of agreeing upon a franchise. The city claimed that the company was operating without a franchise, whereupon the company promptly applied for a charter from the city. The city attempted to impose conditions that were unacceptable to the company and its demands were flatly refused. The city then commenced suit asking that the company be ousted from the city. The contention of the attorneys for the company was that the general statutory law adopted nearly thirty years ago granting the telegraph companies throughout Texas the right to establish and maintain their lines along the highways, waterways, etc., of the State, applied with equal force to telephone companies. The city claimed that this general statute was superseded shortly afterward by a special provision granting all cities "exclusive control over the streets, alleys," etc. throughout the State of Texas. The decision of the judge sustains the contention of the telephone company.

JOINT USE OF POLES BY ELECTRIC COMPANIES IN CONNECTICUT.

Our company is being sued for damages by a man who was injured in handling a wire that touched a guy wire and became charged with electricity by reason of a defective circuit breaker. A street railway company and ourselves were using the same poles at the time. He charges that we had no right to use the same poles and that the accident would not have happened if we had not been doing so. We had a contract covering the joint use and it was also done at the request of the city authorities. Were we not right in our use of the poles?
L. O. R.

THERE seems to be no doubt of the correctness of your position so far as the joint use of the poles was concerned. Full control of the use of wires and poles is given in Connecticut to the local authorities by section 3,946 of the General Statutes and section 3 of chapter 169 of the Public Acts of 1893. It does not appear that the joint use of the poles increased the danger. In fact by reducing the number of poles the highway could be used with greater convenience. The case seems to be within the ruling of Bergin v. Southern New England Tel. Co., 38 A. 888.

EMINENT DOMAIN AS APPLIED TO NEW YORK TELEPHONE COMPANIES.

THE transportation law of New York, authorizing a telephone company to erect and maintain its lines over the streets and highways and declaring that, if it cannot agree with the owner on the compensation to be paid therefor, the compensation shall be ascertained in condemnation proceedings, empowers a telephone company to take proceedings to condemn the right to place its poles and lines in a street in front of an owner's property. The exercise of this power is called the right of emiment domain. A telephone company seeking to condemn the right to erect poles and lines in a street in front of an owner's property should only be permitted to acquire an easement for its poles and wires in the street. New Union Telephone Co. v. Marsh, 89 N. Y. S., 79, 96 App. Div. 122.

INJURIES FROM CONTACT OF TELEPHONE WITH ELECTRIC WIRE.

WHERE a person using a highway was injured by coming in contact with a telephone wire which had fallen on the wires of an electric railway company which used the same support for its wires as did the telephone company, and such detached wire became heavily charged with electricity, in an action for the injuries received it was a question for the jury whether the telephone company was negligent in failing to properly guard its wires, and it was proper to deny a motion to take the case from the jury and render a judgment for the telephone company. Burton Tel. Co. v. Gordon, 25 O. Cir. Ct. R. 641.

IN THE OPERATING FIELD

INDEPENDENT WINS IN MICHIGAN.

TELEPHONE men throughout the state of Michigan are watching with interest the attempts of the Bell Company to buy up or otherwise control the rural situation. A small exchange at Parma, owned by a man named Frank Hubert, recently passed into the hands of the Bell. An attempt was then made to get control of the North Parma company which operates a system of 225 telephones on rural lines that terminated at the Parma exchange. At the annual meeting of the company it was decided not to sell, but to build an exchange and erect new lines to connect with those of the Citizens' Company at Jackson.

GOOD SHOWING OF LOUISVILLE COMPANY.

A RECENT financial statement issued by the Louisville Home Company for the month of March gives the gross earnings as $29,204.98. After deducting operating expenses and fixed charges there remains the amount of $8,675.95.

The total assets of the company amount to $3,106,230.81, of which the plant and equipment represents $2,796,456.72, and building and real estate $50,763.40.

The company is now operating exchanges in Louisville, Ky.; New Albany and Sellersville, Ind., and is building two more at Anchorage, Ky., and Pewee Valley, Ky.

NEW INDEPENDENT COMPANY AT MIDDLETOWN, N. Y., ALREADY GIVES ITS SUBSCRIBERS EXTENSIVE SERVICE.

INDEPENDENT service has again been resumed in Middletown, N. Y. Some time since the local system consolidated with the Bell. The Middletown Telephone Company was immediately organized and started business on March 10th with a considerable number of stations in operation. Toll line service is given in connection with numerous other Independent lines, including those of the Colonial Telephone Company, Newburgh; Dutchess County Telephone Company, Poughkeepsie; Farmers' Union Telephone Company, Sussex, N. J.; Highland Telephone Company, Highland Mills, connecting Middletown with Monroe, Goshen, Campbell Hall and many other places; Port Jervis Telephone Company, Port Jervis; Sussex Telephone Company, Newton, N. J.; Warwick Valley Telephone Company, Warwick; West Shore Home Telephone Company, Catskill; Chester Telephone Company, Chester, and Citizens' Standard Tel. Co., Kingston.

INDEPENDENT COMPANY IN BALTIMORE MAKING STEADY PROGRESS.

INDEPENDENT development in Maryland is keeping pace with the growth in other States. In Baltimore it has been exceptionally rapid, the most recent number of the Maryland Telephone Company's directory being much larger than any previous issue. This company was one of the first to operate in any of the larger cities. It has always been progressive, and in the face of many obstacles has built up a large and creditable business.

Inasmuch as the directory of this company represents this development, an analysis of its contents and make up may prove of interest. In all there are 530 pages, which are contained within attractive red covers, making it easily distinguishable from other volumes. Twenty-four pages in the fore part of the book are devoted to a list of toll and long distance points in Delaware, Maryland, New Jersey, Pennsylvania, Virginia and West Virginia. Each point is accompanied with the day and night rate. Following this is the alphabetical list of subscribers in Baltimore, which takes up 271 pages, and then a business directory, in which the various firms are arranged according to an alphabetical classification. An interesting feature of the book is the advertising at the top and bottom of every page. At intervals entire pages are devoted to advertising cards of the most prominent firms in the city. Almost every business or trade is represented, and the directory, therefore, has an increased value to the average subscriber. The outer vertical margins are reserved by the Maryland company for its publicity department, and here in terse paragraphs it draws attention to the value of its telephone service as well as the electric light and power supplied from its central stations. The company's book, as well as its service, is capable of standing on its own merits in the face of the most vigorous competition.

BOOK REVIEWS.

Electric Wiring Diagrams and Switchboards. By Newton Harrison. Publishers: The Norman W. Henley Publishing Company, New York. 258 pp. Price $1 50.

INFORMATION which should be very useful to those who have occasion to do wiring for electric lighting and motor work is contained in this recently published volume. The book presents practical problems in wiring, such as are encountered in everyday work, and gives methods of solution, including tables and diagrams, which are thoroughly explicit and easily understood. The principal of drop of potential in circuits, and the methods of figuring out the wiring for different conditions, with a fixed allowable drop, are included.

In the section devoted to switchboards a special treatment is adopted, in which the reader is led from the elementary principles to the building up of the more complicated panel boards. Especially valuable is the treatment of alternating current wiring, which includes simple methods of obtaining the sizes of wire for single phase, two phase and three phase circuits. An interesting and useful feature of the author's method of handling this subject is the fact that the methods of calculation employ no mathematics other than arithmetic.

This should be a satisfactory text book for those who wish to have at hand a manual containing the essential information required by a practical wireman.

STANDARD TELEPHONE WIRING, by James F. Fairman. Published by the McGraw Publishing Company, 114 Liberty street, New York City. Ninety-one pages, price $1.00 net.

THE author has produced a logically arranged book for wiremen and managers who desire a reference manual to enable them to avoid working out special problems for themselves. A very brief introduction deals with the elementary principles of electric circuits. The various classes of instruments entering into substation wiring are also described, and instructions concerning methods of securing good workmanship given.

The especially valuable feature of the book is a series of a considerable number of well chosen diagrams, which are lettered and explained in the accompanying text. These furnish a useful assortment of suggestions for those who have to do with the various combinations of main line and extension instruments at subscribers' stations which so often arise when it is necessary to meet a demand for service under special conditions. The book is of a convenient pocket size, bound in flexible leather covers.

WIRING HANDBOOK, by Cecil P. Poole. Published by the McGraw Publishing Company, 114 Liberty street, New York City. Eighty-five pages, price $1 net.

THIS is a pocket book for wiremen which gives a good deal of very practical information in a small space. This result the author has obtained by a very careful selection of material, and the statement of information in a way which, while complete, introduces no unnecessary words. The book

Digitized by Google

takes up the laying out of lighting systems in accordance with the various plans which have been devised, giving the necessary instructions for calculation. A series of diagrams for direct current motor wiring and alternating current wiring are given, and numerous practical diagrams showing the circuit connections of various apparatus, such as motors, transformers, meters, etc., are furnished. An appendix gives a digest of underwriters' rules applying to inside wiring which should be useful to all who wish to have this information in a compact form. Numerous standard tables in the back of the book, which are referred to from time to time in the text in such a way as to explain their utility, form an extremely valuable portion of the book. These are designed to be used in connection with the laying out of systems of the ordinary types. The book is pocket size, bound in leather, and the information contained is of such everyday value that this feature is likely to be taken full advantage of by those who purchase it.

DELEGATES TO NATIONAL CONVENTION ELECTED IN SIXTH INDIANA DISTRICT.

THE members in the sixth district of the Indiana Independent Telephone Association met in the office of the manager of the Citizens' Telephone Company at Brazil, May 2, 1906. Earl Talbott was chairman, and Jesse W. Weick secretary.

The regular routine business was followed by many earnest discussions on points of much interest to the telephone companies in this district. It was predicted that by the next regular meeting, every Independent telephone company in the district would be a member of the Association, each member taking it upon himself to call on non-members and acquaint them with the conditions throughout the State, and the absolute necessity of all Independent companies joining hands in protecting all investors in Independent telephone property. Delegates were selected for both State and National meetings to be held at Indianapolis and Chicago. Mr. J. G. H. Klinger, General Manager of the Citizens Telephone Company of Brazil, was elected delegate to the National convention to be held at Chicago, June 26, 27, 28. J. W. Weick, of Greencastle, and J. F. Slinkard, of Bloomfield, are the alternates.

The following delegates, representing all counties in the Sixth District and 7,500 Independent telephones, were elected to the Annual Convention held at Indianapolis on the 17th and 18th. Earl Talbott, of Lincoln, E. G. Bush, of Clay City, Joseph Moss, of Linton, O. V. Gerrard, Spencer, F. M. Boyd, of Rosedale, F. G. Gilmore, of Greencastle, T. W. Atchinson, of Terre Haute, W. W. Harbell, of Sullivan.

The next regular meeting will be held Aug. 8, at Linton.

Visitors were highly pleased with the promising conditions of the telephone situation at Brazil and throughout the territory. At Brazil the Citizens Company has 1,200 subscribers, while the Bell Company less than 400, so that this district is not behind the others in Indiana.

PLAN FOR GOVERNMENT-OWNED TELEPHONES FOR ALBERTA ASSUMING FORM.

IN the estimates for the Province of Alberta the sum of $25,000 has been voted for the purpose of doing preliminary work on the establishment of a government-owned telephone service. At the same time Attorney-General Cross introduced a bill to be known as the Municipal Telephone Act, which will empower municipalities to go into the telephone business. The one is evidently the complement of the other. It is clear the government intends to establish trunk lines throughout the province and give the municipalities powers to equip and operate local systems and provide for the harmonious working together of the two systems.

Up to the present time there has been no announcement made by the Alberta public works department as to just what work will be undertaken before the parliament meets again. The municipal telephone act provides that any city, town or organized improvement district may establish, own and operate a telephone system and carry on the business in the same manner as a private company, under the complete powers for this purpose, which the act will give.

The act provides that franchises already granted shall stand, but otherwise the council is given complete expropriation powers, allowing it to cross any land or to put its poles wherever it deems advisable. The municipalities are required by the act to keep separate telephone acccounts, and only in the case of a surplus shall money be taken from the telephone account and placed to public revenue. All telephone rates are to be treated the same as ordinary taxes and are to be collected in the same way. All officers will be appointed and dismissed at the pleasure of the council. Municipalities are given power to levy a special assessment for the purpose of establishing a telephone system and are empowered to borrow, over and above all other borrowing powers, a sum not to exceed half the total revenue which has been received for the previous year.

Clause 26 is the most important in the bill. It provides that: "Every municipality owning or operating any telephone system shall have power to enter, by law, into any agreement with any person, company or municipality, or with the government of Alberta, providing for the erection, establishment and maintenance of a telephone system and for connection, intercommunication, joint operation, reciprocal use or transmission of business as betwen any telephone systems owned by the respective parties, and for such consequent division of profits, or such payment or compensation, or such other financial adjustment between the respective parties as may be necessary or advisable for the purposes of such agreement."

The act practically brings into effect the machinery for the establishment of municipal and government owned telephone lines throughout Alberta. The whole Dominion of Canada and every State in the American Union will watch with the greatest interest the working out of the system in Alberta.

FIVE YEARS AGO TELEPHONES WERE
FEW.

RURAL DISTRICTS ONLY DREAMED
OF TELEPHONES THEN
COULDN'T GET THEM!
BUT IT'S DIFFERENT NOW.

The above statements cover one-third of the length, on the inside, of a folded advertising leaflet issued by the Inter-Ocean Telephone and Telegraph Company, of Buffalo, N. Y. The remainder of this interesting advertising material, furnished by Mr. Wm. A. Wadsworth, will appear in a later issue.

WINONA COMPANY STRATS ON ITS TWELFTH YEAR.

THE Winona (Minn.) Telephone Company recently completed the eleventh year of its existence. It started service with about 175 subscribers, to the number of which it has steadily added until now it has over 1,550 patrons, not including the farmers' lines which accommodate more than 200 rural subscribers.

When the company started business it had no outside connections, being purely a local concern. To-day it is able to connect with practically every point in Minnesota and a great many towns in adjoining states.

QUERIES

LIGHTNING BURN-OUTS.—(695.)

I have a route in this city which has two separate grounded or ground toll lines on it, also one telegraph circuit, all three single wires. I have noticed that every time we have a lightning storm it gets on this particular route and burns out a few wires in my cable; these grounded lines and telegraph do not go through my cable, but very nearly every time we have these storms it burns out the cable. Would a repeating coil keep down this trouble from the grounded line (which, by the way, comes into this office straight without a repeater)? Will lightning jump from these lines to a metallic line? C. F. L.

There is very little difference between grounded and metallic lines as regards direct effects from lightning stroke for the reason that the carbon plate arrestors necessary to protect instruments cause each wire to act as a grounded line when subjected to lightning stroke. The question of protecting cable from damage by lightning is best taken care of at cable boxes where conductors should be provided with open space arrestors and possibly choke coils to divert the lightning to ground before entering the cable. It is improbable that the use of a repeating coil at the central office would help this trouble, as assuming that the lightning struck one of the grounded lines and then jumped to some of the metallic lines running into the cable, the use of a repeating coil would in no way serve to stop this action.

MARKING MULTIPLE FOR OPERATING PURPOSES.—(696.)

I should be glad to have you tell me some good plan for distinguishing multiple jacks for party lines, etc., on a switchboard by means of paint. What kind of paint is best to use? A. R.

There are several distinguishing marks used in various places, the particular kind depending upon the whim of the person who chooses the mark. It is customary in a large number of companies, however, to distinguish multiples in accordance with the following code: For party lines, a white mark of the form shown above jacks in the upper row in Fig. 696. This indicates the fact that the line is a party line with more than one subscriber connected. The object of this mark is, of course, to enable the operator to ascertain the number of times she shall ring upon a tion. For instance, if the subscriber calls for 409 and this is a party line, the operator will ask him what party he wishes on that line. After receiving the information she is able to ring the correct party in accordance with the code.

There is another mark for consecutive groups, which consists of one stripe of red or light blue paint. Adjacent groups are marked with different colors alternating red and blue. By this

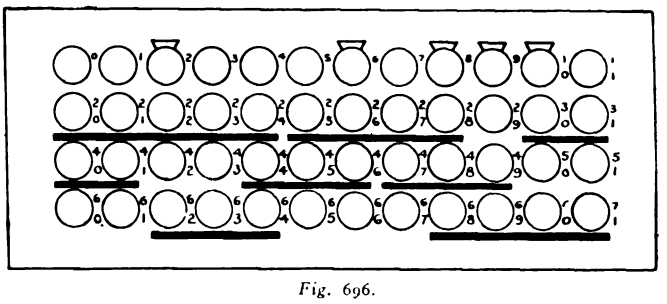

Fig. 696.

scheme when one group of adjacent jacks runs directly into the next group of adjacent jacks a blue mark will be followed by a red stripe, and there is no danger that operators will make an error. If, however, only one color is necessary, it is customary to use red in preference to blue. The object of this scheme is to designate all lines which go to the same subscriber, whether they are lines to individual instruments or P. B. X. trunks. It is considered good practice to group such lines, in order that if one is busy the operator may know, without any tax upon her memory, that the subscriber has a certain number of other lines, and know which these lines are. That is, if an operator receives a call for line 443, and a mark similar to that shown on the third row from the top in Fig. 696, is beneath this jack and several others, she will know that all the lines connected to jacks designated by this mark go to the same person, and she will proceed to test them in succession until she finds the jack which gives no click, indicating that the line is idle. She is thus enabled to complete a call in all cases where all of the trunks are not in use in the minimum time

A green mark is sometimes used to distinguish jacks connected to automatic pay stations.

A very convenient paint for this purpose is the sort that comes in small metallic tubes similar to those used for the familiar photograph mounting or office paste mucilage; Windsor & Newton's paints of this class may be obtained almost anywhere, and are considered standard. One tube each of verdigris (green), flake white and Chinese vermillion should be purchased. The blue shade can be obtained by mixing the verdigris with the flake white. In applying the paints to the jack mounting strips, they should be mixed with liquid dryer, and put on with a fine brush.

SECRET CALLING OF CENTRAL OFFICE.—(697.)

Will you please inform me if there is any standard scheme for calling an exchange without letting the other subscribers on the line know that the central office has been rung? R. L. J.

One standard method of accomplishing the result you mention

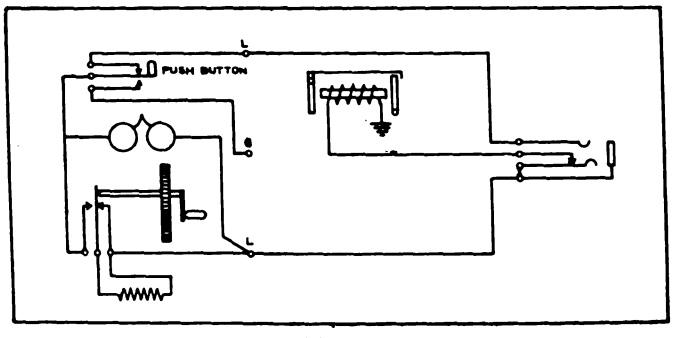

Fig. 697.

is by the use of a push button in the telephone, which is used to bring into operation a grounded signalling scheme. Referring to Fig. 697, the subscribers' station is wired as a regular bridging telephone, except that a push button is inserted in such a way as to connect one side of the instrument normally to the line and to ground when operated. Normally when the subscriber rings, the current from this generator passes out to both sides of the line, and all other bells upon the line are rung, thus enabling him to call other subscribers on a party line by code ringing. On the other hand, if the subscriber wishes to call the central office he presses the button and a current from one side of his generator passes to ground, and from the other side out through binding post L to the sleeve side of the line, from which it passes through the contact of the jack to the drop, one side of which is grounded, thus establishing a complete grounded circuit. It will be observed that when he has finished ringing the push button flies back to its normal position, and a complete metallic circuit is re-established ready for talking; and when the central office operator plugs in, the mechanical contact of the jack is opened, thus freeing the line from the grounded drop, which would tend to unbalance it to an extent which would cause undesirable noise if it were connected up to a toll line. This noise, of course, would not exist on a party line upon which two subscribers are talking to an extent which would cause appreciable annoyance in the average town.

Digitized by Google

(*Continued from page 321.*)

actly, the cable would have to be made up of 5 pairs for talking, 5 single wires for the busy test, and 5 additional single wires for the signals. In actual practice, however, the regulation answering jack cable having but four, this capacity is frequently used, and is split between four strips of jacks. For the toll line multiple, the same cable is used again, and is split between two strips. By this means the actual number of cables used is kept as low as possible. In addition to those already named, there are special cables, which are used under various conditions.

For use in connection with switchboards in which long toll lines are handled, it is customary to use cables in which the conductors are made of No. 19 B. and S. gauge wire, instead of No. 22; the object being to reduce the resistance of the conductor to as low a figure as possible. It is advisable, however, to use this class of cable in offices where the number of lines accommodated is small. Since the increased size of conductors augments the cross-sectional area of the cable, thereby increasing the room occupied, a recent type of cable has for its object the reduction of the conductor resistance with as little increase in the cross-sectional area as possible. To accomplish this end, the talking conductors are made of No. 19 Band S. gauge wire, while the single wires are made of No. 22 gauge.

There is another class of cable which, while it is used almost exclusively for exchange work, still partakes of the nature of cables used for outside construction. This is a cable in which the insulation is of wool. The conductors are of No. 19 B. and S. gauge soft drawn wire, and are twisted together in pairs in the usual way. The insulation consists of one coating of wool braid. The pairs are laid up in reversed layers and are bound together with woolen yarn. Over the whole is placed a lead sheath having a thickness of ⅛ inch. This type of cable is used to terminate lines on the main distributing frame, a short length being spliced to the end of the paper cable, to make runs between the main and intermediate distrbuting boards, where the two are on different floors, and the nature of the building construction is such that the run is to be made in ducts along the walls; where the ordinary type of switchboard cable would be too expensive to use; and where the liability to abrasion in drawing in is such, that the protection of a lead sheath is required. This cable possesses an advantage over the paper insulated cables in that no pot heads need be made. In terminating this cable, the lead sheath is cut away for the required length and the pairs formed up in the usual way. The form is then boiled out in wax, and shellaced, and the conductors are soldered to the lugs. The capacity of this class of cable is high; but since the lengths in which it is used are short, this defect is not of a serious nature.

It is claimed that in warm, damp climates, this cable is not desirable on account of the tendency of the wool to absorb moisture. And on this account its use has been condemned in some quarters, and some companies go so far as to reject it altogether. But if properly terminated, and the forms thoroughly boiled out, this defect is more appearent than real. The author has personal knowledge of an exchange in one of the large Atlantic seaboard cities, where dry air is certainly not prevailing, in which this type of cable has been in use for five years, and the "trouble" on it has been nil.

The Cost of Cables.—The approximate cost of cables can be figured out by means of certain formulas depending upon the nature of the materials of which the cables are made. And also upon the character of the machinery employed in the manufacture. The following rule is useful in figuring the cost of a lead sheath, unarmored cable. It has been found by experiment that the cost of the lead sheaths per foot, is 38 cents; to this add the actual cost of copper,based upon the number of conductors and their diameter. This sum must be multiplied by 1.5 to account for the labor, and the cost of material used in insulating and in serving. The cost of stringing aerial cables, or laying underground cables, can be figured from the following data: In the case of aerial cable, the first work is to string the suspension strand, or messenger strand, as it is sometimes called. In figuring the cost of this piece of work it is safe to assume that a gang of eight men and foreman can string 5,000 feet of guy strand in one day. This figure is sometimes exceeded, and sometimes not reached, but for average work it is a safe assumption. The same gang can also string 5,000 feet of cable in one day. When underground cable is to be laid, the first work is to rod the duct, unless it is already threaded by wire. Assuming the length of sections from manhole to manhole to be 300 feet, one man can rod 10 sections in one day.

In drawing in lengths of underground cable it has been found that a gang of eight men and a foreman can draw in 5,000 feet of cable in one day; so that this figure may be assumed as the one from which the calculations are to be made. In figuring on the cost of splicing, it is well to assume that one splicer and a helper can make one splice per day. Where 50 pair cables are drawn in, sometimes this figure has been exceeded. The length of time taken to make pot heads is the same as that required for splices. As to the amount of material required on the work, the following facts will be useful. As to paraffine used in boiling

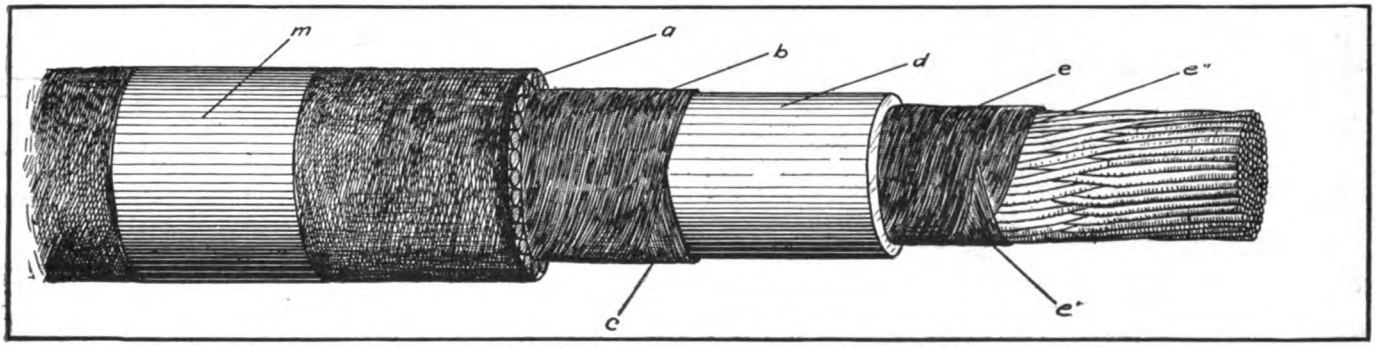

Fig. 14. Type of iron-armored submarine cable with single lead sheath and jute wrappings.

out splices it is usual to allow 2½ pounds per splice. In wiping joints 5 pounds of wiping metal are allowed per splice, and about 2½ pounds per pot head. The amount of sleeving that is required for insulating the spliced joints can be determined in the following manner. Allow 3 inches as the length of each sleeve, then the total number of inches of sleeving needed will be $3 \times N \times n$ where N denotes the number of conductors in the cable, and n denotes the number of splices and potheads. One item which is very important, and which is sometimes overlooked, is that of trucking. The cost of trucking depends upon a great many local conditions, such as the distance of the line from the nearest shipping points, the length of the line, and the character of the roads. As a general thing, it is cheaper to truck in a city than on the suburbs or country, because the distance from the stable to the shipping point, and the average distance from the shipping point to the points of delivery are shorter and the roads are apt to be in better condtion.

It will be found that in the long run one truck can cart 3 reels, 12 miles in one day. To determine, therefore, the number of days required to do the trucking, the total distance to be covered must be computed in miles. By dividing this figure by 3 the number of days required to do the work are obtained.

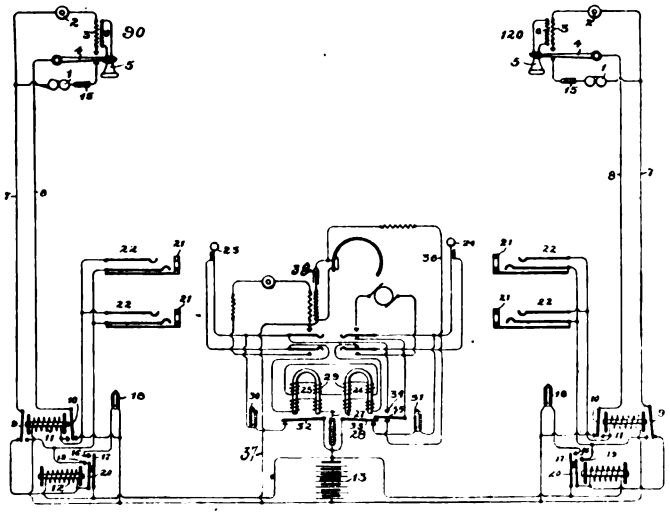
TELEPHONE PATENTS

TELEPHONE SYSTEM.

William M. Davis, Chicago, Ill., patents (No. 816,078; dated March 27, 1906; filed August 5, 1901; serial No. 70,924) and assigns by mesne assignments to the Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y., a telephone exchange system.

The objects of this invention are to provide means for operating the cut-off relay without a third conductor, and also to connect the thimbles of the line jacks with a test circuit which immediately becomes operative upon the removal of a receiver from a hook, thereby preventing the connection of another line to a calling sub-



scriber's circuit in the interim between the display of the line signal and the insertion of the answering plug by the attendant operator. Referring to the illustration, when a receiver is removed from a hook a circuit is formed from the negative side of the battery 13 to the closed contact 10 of cut-off relay 11, wire 8, substation apparatus, wire 7 armature contact 9 of cut-off relay 11, line relay 12, back to battery. The line relay is thereby energized, closing signal contacts 16, 17 and test circuit contacts 19, 20, effecting the display of the signal 18 and connecting the sleeve thimbles of the line jacks with the positive side of the battery. The line under these conditions will show a busy test.

When a subscriber is called, the insertion of the calling plug 24 in the line jack closes a circuit from the negative side of battery, armature 33, supervisory signal 31, tips of plug and jack, winding of cut-off relay 11, back to battery and thereby operating the cut-off relay and opening the line signal circuit. At the same time the supervisory signal 31 is illuminated. When the subscriber answers a circuit is completed from the negative pole of the battery, retardation coil 28, winding of relay 26, sleeves of jack and plug, armature 9, substation apparatus, armature 10, and through winding of cut-off relay to battery. The supervisory relay 26 is then actuated, the supervisory signal circuit is opened, and the sleeve strands of the answering and calling cords are connected together. The sleeve strands are separated to prevent the calling subscriber being annoyed by the test clicks incident to the connection of his line to that of the desired party. The repeating coil windings 29 of the relays 25, 26 serve to connect the two halves of the sleeve circuit.

TELEPHONE SYSTEM.

Daniel Maclauchlin Therrell, Charleston, S. C., patents (No. 815,322; dated March 13, 1906; original application filed July 23, 1904; serial No. 217,846; divided and this application filed August 2, 1905; serial No. 272,375) a telephone system.

The object of this invention is to increase transmission efficiency over long lines. This the inventor accomplishes by designing the substation apparatus to overcome the impedance of the primary coil so as to secure larger primary currents; by maintaining a higher mutual inductance and thus obtaining a higher efficiency of transformation; and by adjusting the secondary system to generate a larger line current at a higher effective line potential.

In the preamble to this patent the inventor states that from researches he has made it is his opinion that little is to be obtained by tuning or readjustment of the line constants in so far as long aerial lines are concerned operating under conditions that might be called existing meteorological conditions.

An elementary understanding of the methods involved can be gained from an examination of Fig. 7. The battery 2 is connected in multiple with the transmitter 1, and the primary 5 of an induction coil in series with a condenser 6. A decrease or increase in the resistance of the transmitter will cause discharge or charge of the condenser, the discharge taking place in the direction of the arrows when the transmitter resistance is lowered. From this operation it will be readily seen that the current passing through the primary winding 5 is alternating in character. This, the inventor claims, results in higher transformer efficiency and better definition of wave form by permitting the use of a greater amount of iron in the core.

In Fig. 9 two primary coil circuits 5, 7, are shown in connnection with condensers 6, 8, and inductances L_1 and L_4. The principles of operation are the same, but a greater efficiency is secured.

In connection with the transmitting circuit the inventor pro-

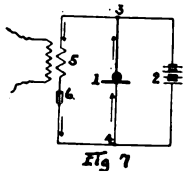


Fig 7

vides besides the requisite secondary coil windings 9, 10, compensating transformers Tr_1 and T_2. These are employed to raise or lower the line voltage, and by proper adjustments of their constants of transformation the original potential of the source can be maintained while reducing the internal impedance to incoming currents as a result of the shunt to them through coils 15, 16.

At B but one transformer is shown, the inventor claiming that equal efficiency is obtained.

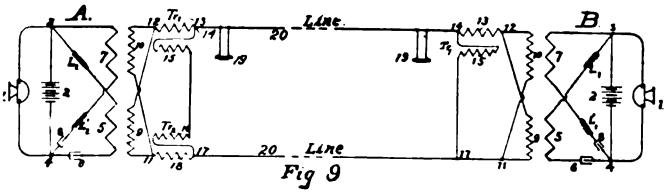

Fig 9

In summing up the results of such circuit construction the inventor claims that a net gain of 100% in the efficiency of the receivers 19 is obtained, and, taking other factors into consideration, a gain of at least 200% is secured above old methods of transmission.

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—Switchboard and apparatus, outgrown and displaced by automatic equipment: Kellogg switchboard, twenty 8-panel, 3-position, mahogany, equipped for 5,200 main lines, ultimate capacity 6,000 lines; Kellogg toll board of 9 positions; Kellogg telephones, 4,064 wall and 2,136 desk; Sterling terminal rack, with protection; power plant, with charging and ringing machines and storage batteries; offered for sale in whole or in part. For particulars address The Columbus Citizens' Telephone Company, Columbus, Ohio. 548

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Capable wire chief, one with experience, for testing cable trouble, etc., in an exchange of about 1,500 subscribers. State age and experience. Address, Box 610, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 610

YOUNG MAN possessing experience and ability desires position as manager with a progressive company. Would be willing to consider a proposal offering part interest in return for services. Address Box 612, AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 612

WANTED—Position in auditing department. Capable of installing system of accounts. Also, position for experienced contract agent and adjuster. Address Box 601, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 601

WANTED—At once, two first-class Independent solicitors for work in Missouri. Salary at beginning depends upon references. Address Box 409, St. Joseph, Mo. 602

WANTED—Position as manager. Can furnish best of references. Am at present manager of an exchange of 1,000 subscribers. Would take some stock. Address, Box 609, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 609

THE FOUNDATION of our business lies in the fact that we are successful in placing men speedily and satisfactorily. Our trained experts know just which men to select for each particular position. Investigate to-day the advantages and facilities we offer. Hapgoods, suite 511, 309 Broadway, New York City. 464

POSITION wanted with a manufacturing company in the advertising or sales departments, by a young man with energy, experience and ability. No reasonable offer refused provided there is opportunity for advancement. Address Box 613, AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 613

WANTED—Position as manager in exchange of 1,000 subscribers or less. Have had five years' experience in telephone business and am graduate of International Correspondence Schools. Best of references. Address Box 597, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 597

TO BE FOREWARNED IS TO BE FOREARMED

If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars? By buying one now you will save its cost many times over before you have had it a year.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

GALVANIZED IRON WIRE.

TESTS of its galvanized wire by several leading technical schools, and the experience of numerous telephone companies are relied upon by the Indiana Steel & Wire Company, of Muncie, Ind., to give force to its statement that it is putting upon the market a wire that will give the highest degree of satisfaction to its users.

The company states that its wire is never rough, and does not crack in splicing. It is tough, strong and pliable, and yet has a very high conductivity. The improved continuous process for annealing galvanized wire which the company employs insures an even temper and a thorough galvanization, without producing burnt or rotten places in the wire, which cause weak spots that will make the wire break very easily in cold weather. As a result of the uniform satisfaction which has been experienced with a wire in which the above claims are justified, the company states that its factory has been running day and night since September 1st. Some of the leading jobbers are handling its wire, and many telephone companies have signified their intention to use its product exclusively in the future.

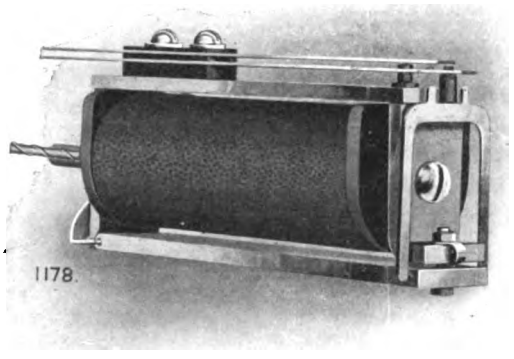
The company has some interesting printed matter which gives standard specifications and the actual results of tests upon its wires, together with recommendations from leading telephone companies, which it will be pleased to send to those who forward a request for this information.

THE CARBOLINEUM WOOD PRESERVING COMPANY, Milwaukee, Wis., is distributing a booklet containing a large number of letters from telephone men who have used its preservative Avenarius Carbolineum and recommend it. During the thirty years this preparation has been on the market ample time has elapsed to prove its wood preserving and strengthening qualities. The company claims it is cheaper than ordinary paint and is therefore of great value in painting cross arms, pole roofs, gains, pins, and pole butts. Further information relative to price and guarantee will be furnished by the company.

THE CONNECTICUT TELEPHONE & ELECTRIC CO., Meriden, Conn., has brought out a new intercommunicating system, using its No. 35 B automatic instrument. The manufacturers claim this system to be non-interfering. It operates with a common return wire and centralized battery for talking and ringing. Diagrams of the circuit and other information will be mailed on request.

THE AMERICAN CONDUIT COMPANY has announced the removal on May 1, 1906, of its Chicago offices to more central and more commodious quarters in the Marquette Building. Mr. A. L. Waterbury, General Manager of the Sales Department, will be glad, as in the past, to receive the friends and patrons of the company at the new office, and all inquiries by mail or otherwise will receive prompt and careful attention.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, Buffalo, N. Y., has recently installed a common battery private branch exchange for the General Railway Signal Company, Buffalo, N. Y., and a number of private branch exchange systems have been furnished and installed for the Frontier Telephone Company, of Buffalo, N. Y., which has also adopted the Century No. 85 Common Battery Desk Set throughout its entire system.



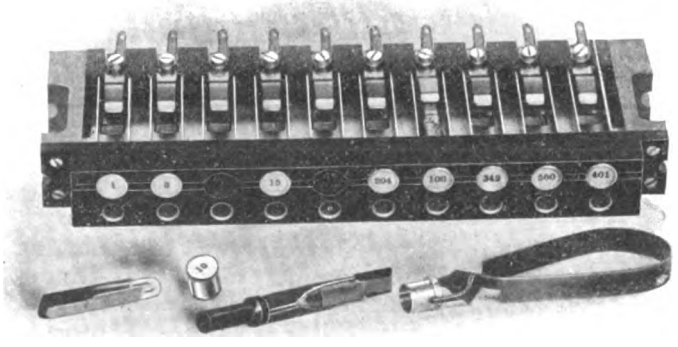
Line Relay Used on the Stromberg-Carlson Lamp P. B. X. Board.

BRANCH EXCHANGE EQUIPMENT.

THAT the proper equipment of the switchboard is most important in securing efficient service is shown very clearly to be the principle which has actuated the design of the apparatus for the Stromberg-Carlson branch exchange.

For line equipment the company recommends its standard arrangement for a lamp switchboard. The jacks and lamps are mounted upon strips, as shown in the illustration upon this page. The lamp signals are one-third candle power, and are lighted when the subscriber removes his receiver from the hook. When the operator plugs into the jack corresponding with the lamp, to answer, the line signal is extinguished.

Lamp jacks are mounted immediately above the corresponding answering jacks. Each lamp is provided with an individual lamp cap, which combines the feature of a designating number with that of covering the lamp. These caps are furnished in various styles to meet the taste of the purchaser.



No. 82 Combined Lamp and Answering Jack Strip Used in Stromberg-Carlson Lamp P. B. X. Board.

The company states that the lamp signal is somewhat more expensive than the visual, which can also be furnished if desired, but that it is well worth the increased cost. Being operated by a relay it is more flexible, and can be adjusted more readily than any other type of signal. Moreover it is less liable to become injured whenever additional equipment is added. It goes without saying that it is more easily distinguished than any other type of signal, and by reason of the close proximity of the lamp and jack greater speed in operation may be attained.

The line jacks are of the double cut-off type. The operator upon plugging in cuts off from the line all auxiliary apparatus. This enables her to obtain for the talking circuit a clear metallic line, unencumbered by apparatus of any sort, which insures the most effective transmission. The design and workmanship of these jacks are of the very highest order.

The line relays, the type of which is shown in the upper illus-

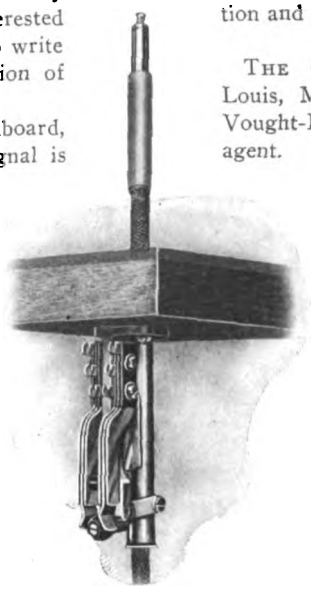
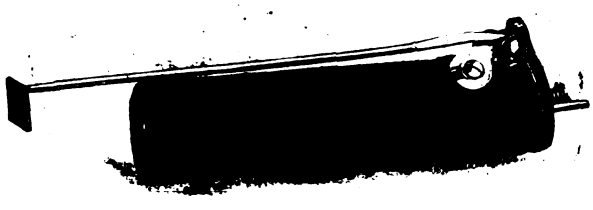
tration, are mounted in strips of ten or twenty on a steel framework in the upper part of the cabinet. The operation of the relay is very positive, and its adjustment to whatever requirements may properly be expected of it is easily accomplished. From the standpoint of design this relay presents a great many extremely attractive features, and those who are interested in it from a technical point of view would do well to write for the bulletin which contains a detailed description of the apparatus.

For those who object to the lamp type of switchboard, for its cost or any other reason, the visual line signal is provided. This is very simple in construction, as is made evident by the accompanying illustration. It consists of a tubular drop with an aluminum vane fastened to the end of the armature rod. The company states that this signal has been thoroughly tried out in practice and operates in a very satisfactory manner. Although very simple, it is not as easy to adjust or remove from the board as the lamp signal. An interesting and attractive arrangement of equipment in the cabinet is made when this type of signal is furnished. A glass plate is mounted in the upper part of the cabinet above the jack space. This plate is provided with alternate spaces of ground and clear glass. The signals are mounted in strips immediately behind the ground glass, and in such a way that the aluminum vane will not be visible in its normal position, but will appear in the clear glass space when lifted by the energization of the magnet at the time subscriber calls. The signals are automatically restored when the operator answers.



Stromberg-Carlson Plug Switch for P. B. X. Switchboards.

In order to secure practical double lamp supervisory signals, the company has introduced a device which does away with the use of a three conductor cord or a ground. This is a plug switch used with the calling cord and constructed as shown in the upper illustration on this page. This piece of apparatus has been used with much success on both large and small switchboards, and is said to be absolutely positive in operation. The great advantage derived from this practice is that the lamp signals are positive in operation; that is to say, the lamp lights when the connected subscriber hangs up his receiver in the same way as on a regular central office switchboard. This method of supervision enables either subscriber to signal the operator for a disconnect signal or a new connection at any time he wishes.



Type of Magnetic Visual Signal Furnished with Stromberg-Carlson P. B. X. when Specified.

Although the line and supervisory apparatus present the most attractive points of individuality, the other material used upon the switchboard is very interesting and well worth the attention of persons who are seeking information on this type of apparatus. The company has issued a very attractive bulletin, to which has been assigned the number 14, describing this apparatus and its standard cabinets. It will be pleased to forward this bulletin to all those who make request for information on branch exchange equipment.

THE TRUMBULL ELECTRIC MANUFACTURING COMPANY, 610 Woodford avenue, Plainville, Conn., is sending out leaflets which show a new type of Ironclad Service Switch. The new switch is of the well known Trumbull type, mounted upon a special porcelain base, which is provided with cutout sockets. The special feature is an iron box, which permits the location of the switch in places where if exposed it would be unsafe on account of dampness, presence of inflammable material, liability of short circuiting and numerous other objections. The use of this special enclosed switch will save the extra expense of running wires from the outlet to a safe position. Further information and prices will be cheerfully furnished by the company.

THE COMMERCIAL ELECTRICAL SUPPLY COMPANY, St. Louis, Mo., is distributing a pamphlet illustrating the Vought-Berger telephone apparatus, for which it is the agent. Half-tone engravings of common battery and magneto instruments are given, besides one of the familiar "President" telephone. The company has a catalogue which lists many articles of use to telephone companies and will send copy free of charge upon application.

THE NORTH ELECTRIC COMPANY, of Cleveland, O., opened on May 15th a branch office and warehouse at Kansas City, Missouri, where it will carry a large stock of telephones of all kinds, switchboards, construction material, and miscellaneous supplies.

This branch is in addition to the Dallas branch office and warehouse at Dallas, Texas, and is made necessary in order to take care of the rapidly increasing business in the States adjacent to Kansas City. The company will be prepared to make prompt shipments from its Kansas City warehouse after May 20th.

The Chicago office of the North Electric Company has been discontinued. Business west of the Mississippi will be handled from the Dallas and Kansas City offices and warehouses, and that east of the Mississippi River will be handled as heretofore from Cleveland.

TELEPHONE BONDS, STOCK CERTIFICATES AND STATIONERY.

AT this season of the year many telephone companies are making their financial arrangements. Funds are being sought to construct new toll lines or exchanges or to retire present liabilities.

It is a well known fact in financial circles that if the stock certificates or bonds which are to be issued are printed on fine, lithographed or engraved stock, they are much more easily sold. This is probably for the same reason that a well dressed salesman will command a better and more respectful and ready hearing.

Quick to grasp the need of something appropriate for the telephone business, the Edwards-Hine Company, of 5 and 7 Pearl street, Grand Rapids, Mich., has designed and placed on the market several attractive forms of stock certificates, and also a very unique bond to which are attached the annual, or semi-annual, interest coupons for whatever period of time the purchaser may desire.

All of this company's special forms show the national shield emblem in two colors in a very attractive manner.

It also carries fine lithographed stock stationery, and voucher checks, embellished with the shield emblem in colors and a telephone instrument making a very attractive presentation for any company. Samples can be procured upon application as well as a full description of telephone accounting and filing systems.

An Analogy in Meat

When a butcher places a piece of meat upon his scales to determine the amount he establishes a balance by means of pound and ounce weights. Suppose he used only the even pound weights and guessed at the odd ounces; he would either cheat himself or his customers.

In selling toll service, a clock takes the place of the scales and weights. But an ordinary clock will not tell exactly how long a line has been in use; hence when an operator computes the time of a conversation, the result is a time period based generally upon a guess.

On the other hand, if a CALCULAGRAPH is employed, a record of the elapsed time in minutes and quarters is mechanically made which is correct and indisputable.

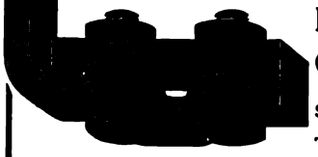
It Makes No Clerical Errors

Write for particulars.

The CALCULAGRAPH CO.
1437 Jewelers Building, NEW YORK CITY

JUST TO REMIND YOU

when buying your cable construction hardware that we make the best that is to be had.



This cut shows our PATENT COMBINATION MESSENGER HANGER for straight lines and corners. There will be no cutting of the strands where the messenger makes a sharp turn if this hanger is used.

Made of forged steel in three sizes, for light, medium, or heavy construction, and furnished with either Japan or galvanized finish.

We make other styles of Messenger Hangers, besides clamps and brackets. Also four different types of cable hangers, pole rings, steps and bolts.

Write for catalogue and prices.

NORTON TOOL CO.
WEST PARK, OHIO. Electrical Department

BATTERY REASONS WHY

Because of absolute, lasting merit, emphasized in the most thorough tests known to the electrical world, the

ROCK ISLAND
NEW PATENT
DRY CELLS

have taken *first* rank among dry batteries. Zinc two grades heavier than that used by others, and carbon vastly superior in quality—are factors in the creation of

THE HIGHEST VOLTAGE.

The *life* of a Rock Island New Patent Battery is 20 to 30 per cent. longer than those imitations offered with the misleading label, "Just As Good." The result of competitive examinations gives us the right to PUT THAT STRONG.

Our Standard No. 8 has received highest endorsement from Telephone Manufacturers and Telephone Companies as the battery for reliably long service. Standard No. 6 is the regular size.

Write Department D for prices.

THE WEEK'S MESSAGES

FINANCIAL.

FT. WAYNE, IND.—The Home Telephone and Telegraph Company, of Ft. Wayne, has increased its capital stock from $250,000 to $600,000.

LEXINGTON, KY.—The Fayette Home Telephone Company has declared its regular quarterly dividend of 1¼ per cent. on its preferred stock.

NEW ULM, MINN.—The New Ulm Rural Telephone Company is to declare a dividend of 6 per cent.

RAVENA, N. Y.—The Ravena and Medway Telephone Company, Ravena, has declared a dividend of 5 per cent.

WATERVILLE, N. Y.—The Waterville Telephone Company has declared a dividend of 9½ per cent. on its capital stock.

NEW PHILADELPHIA, O.—The Tuscarawas County Telephone Company, of New Philadelphia, has increased its capital stock from $200,000 to $350,000.

MARION CENTER, PA.—The Farmers' Telephone Company is to increase its capital stock from $15,000 to $25,000. The company expects to make many improvements in its system.

UNION GROVE, WIS.—The Union Grove Telephone Company has increased its capital stock from $2,000 to $5,000.

FRANCHISES.

MT. CARROLL, ILL.—The Farmers' Mutual Telephone Company has obtained the franchise for which it made application in Mt. Carroll some weeks ago.

JEFFERSONVILLE, IND.—The Home Telephone Company has applied to the Board of Public Works for a franchise to establish an exchange. If the franchise is granted the new plant will connect with the New Albany exchange, and with the lines of the Louisville Home Telephone Company.

FREDONIA, N. Y.—The Home Telephone Company has been granted the right of way for a toll line from Fredonia to Cassadaga. At Cassadaga it will meet the Inter-Ocean line to Jamestown, making a direct line from Fredonia to Jamestown.

GEORGETOWN, O.—The Georgetown Council has granted a franchise to the Independent Telephone Company.

PAWTUCKET, R. I.—The Home Telephone Company, formerly the New England Shaver Telephone Company, has been granted a franchise at Pawtucket.

HILLSBORO, TEXAS.—The City Council has granted the Independent Telephone Company a franchise in Hillsboro, for which it made application some weeks ago.

COMBINATIONS.

DOTHAN, ALA.—The Standard Telephone and Telegraph Company has purchased the Ghent Telephone System.

MATTOON, ILL.—The merging of the telephone systems of Oakland, Kansas, Barton and Redmon into the Embarras Telephone Company, with a capital stock of $45,000, has been completed. The officers are: President, E. N. Blair; vice-president, J. H. Henn; treasurer, George Kirkpatrick; secretary, J. D. Noel.

CEDAR RAPIDS, IA.—The Cedar Rapids Gas and Electric Light Company has purchased the Missouri Electric Light and Telephone Company for $75,000.

GRAND RAPIDS, MICH.—The Citizens' Telephone Company, of Grand Rapids, has acquired the property of the Reed City Telephone Company.

SYRACUSE, N. Y.—A contract has been closed by Daniel G. Gates with the Independent Telephone Company by which the telephone line known as the Madison-Onondaga will hereafter connect with the Independent instead of the Bell system. The Gates line serves Fayetteville, Manlius, Eagle Village and Chittenango.

ELECTIONS.

COLUMBUS, GA.—The Columbus Automatic Telephone Company has elected the following directors: Clarence Brown, Toledo, O.; F. B. Gordon, L. G. Bowers, John T. Norman, Rhode Browne, B. T. Brooks, J. W. Blackmon, Banks Yonge, E. W. Wood, J. B. Huff and T. E. Blanchard, of Columbus.

FREEPORT, ILL.—The Freeport Telephone Exchange Company has elected the following officers: President, Dr. Mease; vice-president, W. A. Hance; secretary and general manager, L. A. Herrick; treasurer, E. T. Morse.

CARROLTON, IND.—The Carrolton Telephone Company has elected the following directors Chas. Dalrymple, C. P. Davis, J. Strahl, Chas. Vetters and Edward Allen.

SLOAN, IA.—The Farmers' Mutual Telephone Company has elected the following officers: Lon Ingham, president; Wm. Worstall, secretary; D. W. Bowers, treasurer.

NEW ULM, MINN.—The New Ulm Rural Telephone Company has elected the following officers: President, Philip Leisch; vice president, Alex Russell; secretary, F. H. Krook; treasurer, Otto Schell.

RAVENA, N. Y.—The Ravena and Medway Telephone Company has elected the following officers: President, W. C. Harden; vice president, Arthur Hartt; secretary, Ernest L. Haight; treasurer, Harrie McK. Curtis.

LOCK HAVEN, PA.—The Sugar Valley Telephone Company has elected the following officers: President, J. I. Shaffer; vice president, H. A. Lamey; secretary, N. D. Tyson; assistant secretary, George Grieb; treasurer, Harry Welshans.

WAYNE, PA.—The Wayne-Monroe Telephone Company has elected the following officers: President, G. F. Waters; vice-president, L. S. Cuyler; secretary and treasurer, J. L. Transue.

FORRESTON, ILL.—The Mutual Telephone Company, of Forreston, has been incorporated with a capital stock of $3,000. Those interested in the new company are Henry and William J. Zumdahl, Ed. and Henry Ratmeyer, Hiram Meiner and Joseph Duitsman.

HERRICK, ILL.—The Herrick Limited Telephone Company, Herrick, has been incorporated with a capital stock of $2,500. The incorporators are A. L. Chamberlain, Harry Hinton and W. Wooters.

NEW ATHENS, ILL.—The Dutch Hill Telephone Company, New Athens, Ill., has been incorporated with a capital stock of $480. The incorporators are John H. Feurer, Peter Knewitz and Henry Wildy.

NEW COMPANIES.

OAKLAND CITY, IND.—The Oakland City Telephone Company, of Oakland City, has been incorporated with a capital stock of $10,000. The directors are C. F. Stevens, Carl Chambers, Alvin Wilson, V. W. S. Trippett, R. F. Mason, J. M. McGowan and John Vandeveer.

DURHAM, IA.—The Plymouth Farmers' Mutual Telephone Company has been incorporated, with its principal place of business at the McMillan School House, Clay Township, Marion County, Ia., with the postoffice address of Durham, Ia. The company will construct and operate telephone lines within the State of Iowa. S. S. Woody is president, and W. U. Harvey, secretary.

RALSTON, IA.—The Ralston Telephone Company has been incorporated with a capital stock of $2,500. Officers are Geo. W. White, president; Geo. W. Wood, Jr., secretary and treasurer; H. S. Olds, manager. The company has bought the plant formerly owned by H. S. Olds, and will enlarge the same and own toll lines to Glidden and Scranton. The company is also putting up an exchange building.

HUNNEWELL, KAS.—The Alpha Mutual Telephone Company, of Rock Falls township, Kay county, with post office address at Hunnewell, Kas., has been incorporated with a capital stock of $100. The incorporators are Ed. Lindsay, D. F. Gilmer, J. Burgett, T. M. Gray and J. O. Lucas, Kay county, Kas. P. O. address Hunnewell, Kas.

ELKTON, KY.—The Independent Telephone Company, of Elkton, Todd County, Ky., has been organized with a capital stock of $50,000. The company will build lines throughout the whole county.

CRIDER, MO.—The Citizens' Telephone Company has been organized at Crider. The company will build a line from Crider to West Plains by the way of Pottersville.

SARCOXIE, MO.—The Sarcoxie Telephone Company, Sarcoxie, has been incorporated with a capital stock of $5,000. The incorporators are H. B. Boyd, B. Pile, B. W. Alley, Harry Bean and H. F. Boyd, all of Sarcoxie.

UNIONVILLE, MO.—The Putnam County Telephone Company has been organized with a capital stock of $24,000. The following officers have been elected: President, E. N. Monroe; vice-president, H. L. Holman; treasurer, L. P. Roberts; secretary, G. E. McCutcheon; business manager, J. H. Holman.

HENDLEY, NEB.—The Spring Green Telephone Company of Furnas county, with its principal place of business at Hendley, has been incorporated with a capital stock of $4,800. The company will build and operate telephone lines in Hendley and surrounding towns. The incorporators are W. T. McKinney, Albert Martin, B. E. Schellenbarger, C. H. Drier and J. H. McKinney.

STEAMBURG, N. Y.—The East Steamburg Telephone Company has been incorporated with a capital stock of $5,000. The incorporators are Frank Anable, Charles L. Bond, Wm. P. Ballard, Trumansburg.

SOUTH BUTLER, N. Y.—The Butler Independent Rural Telephone Company has been incorporated with a capital stock of $1,000. The company is to build a line between Wolcott and South Butler. The directors of the company are Cyrus Aikens, of Savannah; J. B. Aikens, Lucius H. Viele, L. I. Douglass, Delos S. Chapin, J. W. Miller, A. J. Ackerman, all of Butler.

BROWNTOWN, WIS.—The Browntown Telephone Company, Browntown, has been incorporated with a capital stock of $5,000. The incorporators are O. M. Erickson, E. Harse, H. H. Bissell and Iver Ellingson.

LIBERTY, WIS.—The Liberty-Newton Telephone Company has been organized with a capital stock of $1,400. It will establish a telephone system at Liberty, Manitowoc County.

MILWAUKEE, WIS.—The Milwaukee Telephone Company has been incorporated with a capital stock of $10,000. The incorporators are B. C. Roloff, C. L. Gross and S. Stover.

WEBSTER, WIS.—The Webster-Orange Telephone Company is being organized at Webster. The line is to start at Webster and run northeast by way of Orange and Ham Lake.

WEST SALEM, WIS.—The West Salem Telephone Company has been organized, and will build a line to Esdaile.

MEDICINE BOW, WYO.—The Medicine Bow Telephone Company has been incorporated with a capital stock of $10,000. Those interested in the new company are Ed. Walters, R. N. Cronberg, O. P. Reed, John Burnett and Charles Cooper.

LOW BANK, ONT., CAN.—The Low Bank Telephone Company has been incorporated with a capital stock of $40,000. The company will carry on a telephone business in Haldimand County. The directors are A. Barrick, J. E. Furry, A. Mann, all of Haldimand County, Ontario.

TORONTO, ONT., CAN.—The Denorwic and Gold Mines Telephone of the Bourbon Home Telephone Company at Paris, Ky.

CLARENCE L. HUMBERT has been appointed superintendent of the Central Home Telephone Company. He will have headquarters at Paris, Ky.

PERSONAL.

W. F. ACHENBACH has resigned his position with the New York and New Jersey Telephone Company to accept the position of traffic superintendent of the State of Virginia for the Southern Bell Telephone and Telegraph Company, with headquarters at Richmond.

M. G. HOSEA, of Columbus, Ind., has accepted the position of manager of the Bourbon Home Telephone Company at Paris, Ky.

CLARENCE L. HUMBERT has been appointed superintendent of the Central Home Telephone Company. He will have headquarters at Paris, Ky.

MISCELLANEOUS.

BARDSTOWN, KY.—Agitation against the Cumberland Telephone and Telegraph Company is in progress, owing to an arbitrary increase in rates. Much important business is handled here, as the town is the centre of the largest distillery district. Citizens are hoping for the establishment of an Independent company, which in connection with an extension of the lines of the Independent Long Distance Company, would give service to Louisville, 39 miles distant, and other places.

NORTH BRATTLEFORD, SASKATCHEWAN, CANADA.—The citizens of North Brattleford are desirous that some company shall start an independent system in North Brattleford. J. A. Gregory & Company guarantee one hundred telephones.

New Construction in the Field

BLUE MOUND, ILL.—The Blue Mound Telephone Company is rebuilding its entire system.

CHANDLERVILLE, ILL.—The Cass County Telephone Company is to construct a line extending northeast from Chandlerville.

DIXON, ILL.—The Home Telephone Company is to build a line to Palmyra, also a line to Grand Detour.

E. MOLINE, ILL.—The Central Union Telephone Company is to lay a cable from East Moline to Silvis.

ELKHART, IND.—The Elkhart Independent Telephone Company is installing its plant and will also build lines to surrounding towns.

GIBSON CITY, ILL.—The Gibson City Telephone Company, which has just completed a line to Mt. Airy, is to build another line west to the county line.

MOLINE, ILL.—The Union Electric Company, of which H. W. Miller is general auditor, is to build a number of toll lines throughout Iowa and Illinois to compete with the Bell Company.

SPRING GROVE, ILL.—The Spring Grove Telephone Company, which is extending its lines to Ringwood, contemplate building a line to McHenry.

CHURUBUSCO, IND.—The Geiger Telephone Company, of Churubusco, is to install an exchange at Laotto.

LEMARS, IA.—The LeMars Telephone Company is building new lines in the vicinity of O'Leary.

PEWEE VALLEY, KY.—The Louisville Home Telephone Company has completed the construction of a new plant which will enable it to give the highest grade of service.

RUSSELLVILLE, KY.—The new Independent long distance lines south of Bowling Green, Ky., are complete as far as this place. The construction of an up-to-date Independent exchange will be rapidly pushed.

MT. VERNON, ME.—The Mt. Vernon Telephone Company is to construct lines into several neighboring towns.

MANSFIELD, MASS.—The Norfolk and Bristol Street Railway Company is to string 26 miles of telephone wire along its line, and every car is to be supplied with a telephone.

BENZONIA, MICH.—The Benzie County Telephone Company contemplates building a line from Benzonia to Manistee.

STANDISH, MICH.—The North Eastern Telephone Company is improving its system in Standish.

EVELETH, MINN.—The Mesaba Telephone Company is to build a new exchange at Eveleth to meet the demands of increased business. The company contemplates spending $100,000 in the improvement of its system.

PORTALES, NEW MEXICO.—The Roosevelt County Telephone Company is building a line from Portales to Brownhorn.

SOUTHWEST CITY, MO.—The Independent Telephone Line, owned by Messrs. Potter and Bostwick, with exchanges at Southwest City, Sulphur Springs and Beaty, is to build a line on the border of Missouri, extending from near Cayuga, I. T., to either Lanagan or Noel, Mo.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

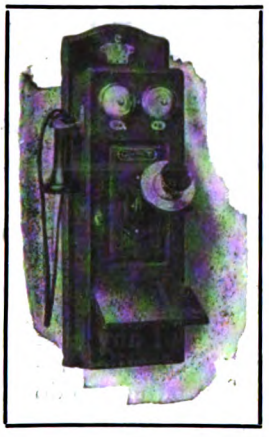
Human Nature is Pretty Peculiar

Everyone of us has a different brand, but on the whole we all agree that the best is none too good. It's the same way with telephones. There are more brands and types than you can shake a stick at, still we are always trying to make a better. We've got one now, our "New Beauty," that will hold us for a while, and we stand pat on the statement that it has no equal. Just send for a sample if you wish to see. Look it over carefully, test it any way you like. Compare it with any others you may have, and then do some hard thinking to find out if there is any point that could be improved. We don't think you can, still we'll be pleased to have your criticism and your order for as many as you may need. We've got them right here in stock, boxed up, all ready to ship so there'll be no delay.



THE EWING-MERKLE ELECTRIC CO., St. Louis, Mo.

CENTURY

100 % GOOD

The reason why you can connect more

Century Telephones

on a line, and still have more than sufficient ringing power, is because the "CENTURY TUNGSTEN" steel generators are equipped with magnets made of tungsten steel. This steel will retain about 30 per cent. more magnetism than any other, and consequently when used in generators increases their power just that much. The generator has other features just as good that we will be pleased to show you. LET US SEND YOU ONE. Our line of Magneto and Common Battery equipment is complete.

MONARCH

THE varying conditions of bridging lines make it necessary to have an adjustment on bridging drops if it is desired that a distinct signal be given the operator. On a short light line a drop receives a large amount of current and without some adjustment feature the armature will pull up and stick without giving a distinct buzz. The operator is then unable to determine whether the call is for central or for another subscriber on the same line unless she plugs in. In all Monarch bridging drops a spring adjustment is provided which makes it possible to bring a slight or great tension to bear against the armature. By referring to the illustration it will be seen that the core of the drop coil is bored out and that a light coil spring is placed within. At the front end this spring presses against the armature, while at the rear end a plunger is engaged. A set screw passing through a split metal bushing in the head of the coil comes into contact with this plunger. On short light lines this screw is tightened so that the spring presses against the armature and causes it to respond quickly to the ringing impulses. On long heavily loaded lines the screw is loosened so that little or no pressure is brought to bear. By this means every drop can be adjusted for its particular line. ¶ Many other valuable features are illustrated and described in the switchboard catalogue. A copy will be sent upon request.

KELLOGG PHILOSOPHY— —THE BEST IS THE CHEAPEST

KELLOGG
FREQUENCY POLE CHANGER

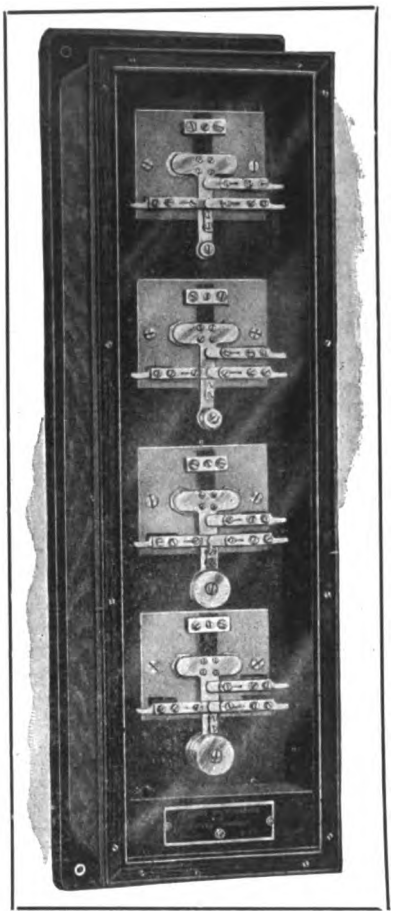
Utmost SIMPLICITY of Operation

THE EFFICIENCY

and beauty of the Selective Harmonic Ringing System of the Kellogg Company has been fully recognized by the entire Independent field, but the difficulty, heretofore, has been that the system required a generating device which involved a rather high first cost, and a relatively large consumption of energy.

The Frequency Pole Changer was designed to meet and overcome all these objections.

It is a very simple device, each unit only involving the use of a magnetic coil and three sets of springs.



"FRONT VIEW"—COVER ON

ADVANTAGES

1. Requires very little attention after once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from Primary or Storage Batteries.
4. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
5. Operates successfully on any standard voltage of a telephone exchange.
6. Practically noiseless in operation.
7. Only THREE contacts on each vibrator.
8. The vibrators have a very long spring, hence they will not break or change the frequency.

This Pole Changer can be used on either Common Battery or Magneto Exchanges

WHAT'S WRONG

with that TELEPHONE INVESTMENT of yours?

Why doesn't it pay you as well as the best of your investments?

Is the reason bad management or bad equipment? More likely the latter.

Probably the company is trying to do a 20th Century business with 19th Century apparatus.

If that's the case, it is spending more and earning less than it might if it had our Automatic Telephone equipment.

This is the only really modern telephone system. It produces the ideal telephone service—quick, sure and secret—at half the operating expense of a manual equipment, and this service commands better rates.

It costs a fixed price per hundred lines to enlarge the automatic exchange, instead of an increased price per each hundred lines, as in the manual equipment.

The automatic exchange is never outgrown; it never has to be "scrapped" and replaced by a complete new one, as with the manual. You just add to it as you do to a sectional book-case.

All these points bear upon the stability and value of your telephone securities. They mean dividends to you.

Over ninety per cent. of all the large orders placed during the past few years, either for new installations or replacements, have been for our automatic system, and all the companies adopting it have, from the increased earnings, been able to pay the interest on their bonds and a good dividend on their stock.

Our Automatic System has been adopted in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Albuquerque, N. M.
Allentown, Pa.
Auburn, Maine.
Auburn, N. Y.
Battle Creek, Mich.
Bellingham, Wash.

Central Energy Telephones

Stromberg-Carlson

TELEPHONE MANUFACTURING CO.
ROCHESTER, NEW YORK

IF you use or contemplate using Central Energy Telephones it will pay you to get a copy of this new bulletin. There is sufficient evidence in it to prove that the telephones illustrated therein are without exception the most modern and nearest to perfection of any ever placed on the market. This statement is not based on the fact that our cabinets are better finished, that we have a better transmitter or a removable hookswitch, but the telephone taken as a whole.

There is not room enough on this whole page to explain all of their good points. By good points we mean the things that make your subscribers satisfied, eliminate troubles caused by accidents or carelessness on the part of users.

It will only cost you a two-cent stamp and a moment's time to get a copy. Just ask for Bulletin No. 15-B.

Shall we send one?

WE MAKE CABLE

To Be Forewarned Is to Be Forearmed

If you read the telephone papers you will frequently see items that read something like this:

> "The X. Y. Z. Telephone Company is spending $..... in the reconstruction of its system. Cable is to be substituted for the open wire lines, * * * * * When the company started in business, it was thought that the capacity of the plant then installed would be ample for all time to come, but it was not long before extensions had to be made. When the improvements are completed the system will be doubled in size."

To those who read between the lines these statements plainly indicate which way the wind blows. "The telephone business is growing fast, very fast." Perhaps this wave of expansion has not reached you, but it will; therefore be prepared. Do only that construction which will enable you to handle an increased volume of business with the least outlay. For the line plant use cable. It is flexible, low in maintenance cost and best for service. Open wire has none of these desirable qualities. You should use the best cable, the cable that you can rely upon, the cable that is the Standard of the World—

The Plant at Decatur

By James G. Bates.

THE Independent telephone system at Decatur, Ill., has made a record for growth in the face of the most formidable opposition which is little short of marvelous. This exchange was one of the forerunners of the great movement of Independent telephony, and started its business nearly two years prior to the expiration of the fundamental patent on the telephone. Early in 1892 there was organized a small co-operative company, under the name of the Citizens' Mutual Telephone Company, for the purpose of installing a telephone system connecting the places of business of its members. The project was not entered into at the time with any thought of permanency, but with the hope of forcing the monopoly to give better service at just rates.

After having secured the pledges of several hundred subscribers, the company began the building of an exchange, putting in the ordinary grounded return circuit line construction, and equipment of the old Harrison - International type. As soon as the Citizens' Company had put its exchange in operation, the Bell Company commenced a rate war, reducing its rates below the charges of the new company. This method of competition, however, did not tend to check the growth of the Citizens' company. Its hold upon the patronage of the people was based on their confidence in the necessity for its existence to keep the rates at a just level and it continued to add new subscribers. As soon as the Bell Company realized that it could not regain its monopoly by competition, even under the reduced rates, it attempted to annihilate its rival by patent litigation. Notices were sent to subscribers as well as the stockholders, threatening to collect heavy damages or royalties from the users who enjoyed the benefits of the Independent service.

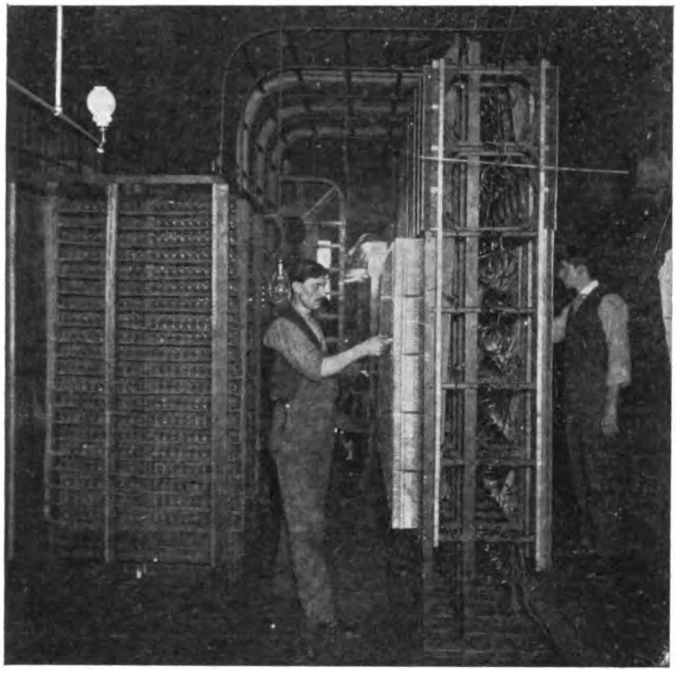
The Manholes at Decatur Are Dry and Comfortable.

The officers of the Citizens' Company, however, were determined to succeed or fight to the bitter end. They assured their subscribers that they would be protected. Inasmuch as the offence, if any, had already been committed and a continuance could do no greater harm or damage, the subscribers agreed to support the local company in every way possible. The patent suits were based on the use of certain switchboard devices which were claimed to be infringements on Bell apparatus. The local company was obliged to defend the case at its own expense and put up the best defense possible, continuing the litigation for over two years before it came up for decision. Before the case was adjudicated, however, the Citizens' company had discontinued the use of the Harrison board and had installed a Utica equipment. The case was finally decided in favor of the Bell Company with reference to the patent infringement, but inasmuch as the Bell Company could not show that the company at Decatur was at that time using the equipment referred to, nor prove how long the equipment had been used by it, nor in fact that the company had ever had this type of board in service, the case against the Mutual Company was dropped. After this defeat, even more determined to stop the operating of the exchange, the Bell company immediately filed another infringement suit on the Utica equipment. This case was also defended by the local company and the litigation continued practically two years before the case was decided. The Mutual Company, profiting to some degree from its first experience had, in the meantime, again displaced its switchboard equipment and adopted another make of apparatus, so that when the second infringement case was decided in favor of the Bell company it did not affect the operating company, inasmuch as there was no satisfactory proof that the patents infringed had been in use in the Decatur exchange.

After this second defeat at the hands of the Citizens' company the Bell people evidently decided that it was impossible to exterminate their rivals by patent litigation, for they resorted to another method for stifling competition, that of buying up the plant of their competitor. About a month prior to the annual stockholders' meeting of the Citizens' company, at the close of 1896, a so-called capitalist giving his residence as Saginaw, Mich., began to invest in the securities of the Decatur company, and through some local attorneys bought up considerable of the stock

Digitized by Google

and secured options on enough to give him control of the stockholders' meeting. At the annual meeting according to the company's by-laws, the stockholders were to elect three directors to a board of five, the two other members having been elected the year previous for a term of two years. It is presumed that the



View of terminal room, showing relays and distributing frame.

capitalist from Saginaw intended to elect the three directors, or a majority on the board, as he had a controlling interest in the company.

Before the stockholders proceeded with the election, however, Mr. C. S. Hankins, now president of the company, then a minority stockholder, requested the chairman to have the secretary read the Illinois State Statutes relating to the right of the minority stockholders to cumulate their vote for the election of directors, saying that he understood that one-fifth of the stockholders could cumulate their vote and elect one director to a board of five. Before the secretary had finished the reading of the section referred to, the new stockholder from Saginaw, with his local attorney, disappeared from the meeting. This left the local stockholders in full command of the meeting, and, in the absence of a quorum, they adjourned until the following evening. It had been learned that the options had been taken to fall due on the date of the annual stockholders' meeting, at the close of which day they had expired.

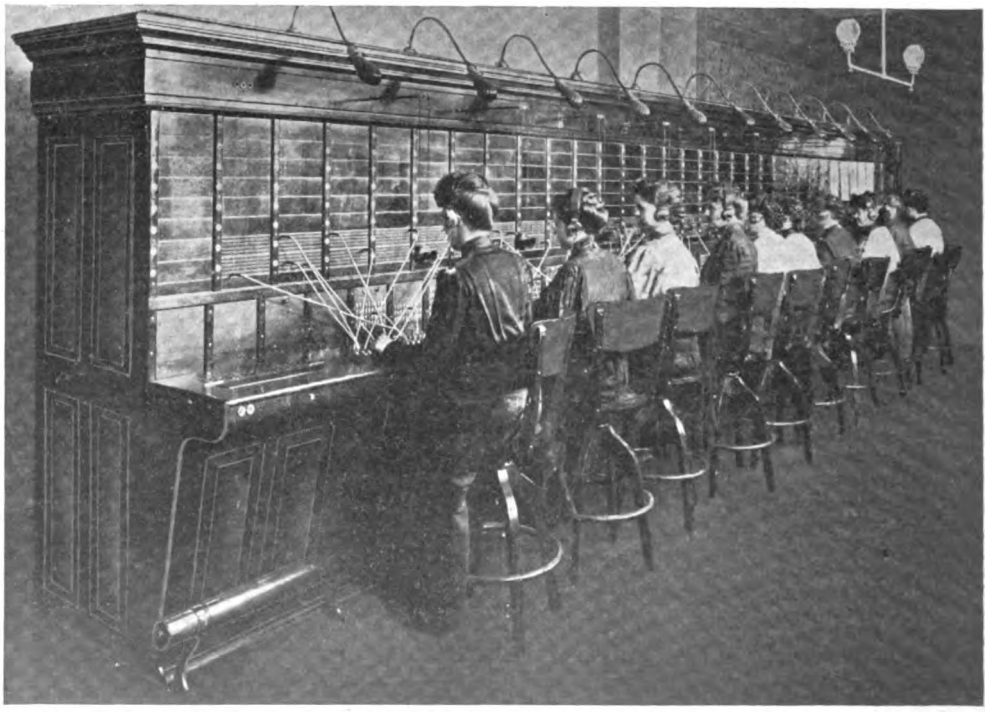
This action on the part of the new stockholder showed the local business men that some definite stand and decisive action must be taken at once, or they must abandon the hope of enjoying the benefits of the Independent telephone service. Before the time of the adjourned meeting there had been transferred to a trustee, to be voted by a committee selected at the meeting, enough stock to give the local people absolute control of the company.

After this the company was a third time made defendant in a patent suit. The manufacturer of the equipment which it was using at this time did not properly defend the case, leaving the burden again upon the local company. This case, like the others, continued in the courts for about two years. In 1898, shortly before the case was adjudicated, the Citizens' Mutual Telephone Company discontinued business, and its property was bought by a local syndicate who organized the Macon County Telephone Company to continue the Independent service. This new company discarded the switchboard apparatus used by the old company, and purchased an equipment of another make.

In face of all these expenses and discouragements the company continued increasing the size of its exchange, and about a year ago had in operation a thousand local lines, which was the ultimate capacity of the switchboard it then had in operation. The demand for service was still constantly increasing, and it became necessary to enlarge the system. It was apparent that it would require a multiple switchboard system to properly take care of the service. At this point a question arose, which is a matter of considerable importance to many of the Independent telephone exchange managers at this time—that is, whether to increase the plant by installing additional trunking sections and equipping the system with additional transfer apparatus, or to install a magneto multiple equipment to operate in connection with the old telephones and grounded construction, or whether to install or provide for a future full central energy system. To install a complete central energy system by changing the central office apparatus, replacing the telephones and rebuilding their outside construction to metallic lines, would have incurred an expense requiring practically a reorganization of the company.

After consideration of the circumstances and probable future requirements by C. S. Hankins, the president of the company, and W. B. Burke, the company's manager for the past seven years, it was decided to adopt a special lamp signal magneto multiple equipment, and at once start rebuilding the plant with a view to ultimately changing to full central energy, but making the changes at intervals out of the profits of the business.

The system selected was designed especially for re-equipping exchanges where companies are required to re-equip their central office to provide for the constantly increasing demands, and where they are not in position to rebuild for complete central energy at one time. The system is so constructed that it may



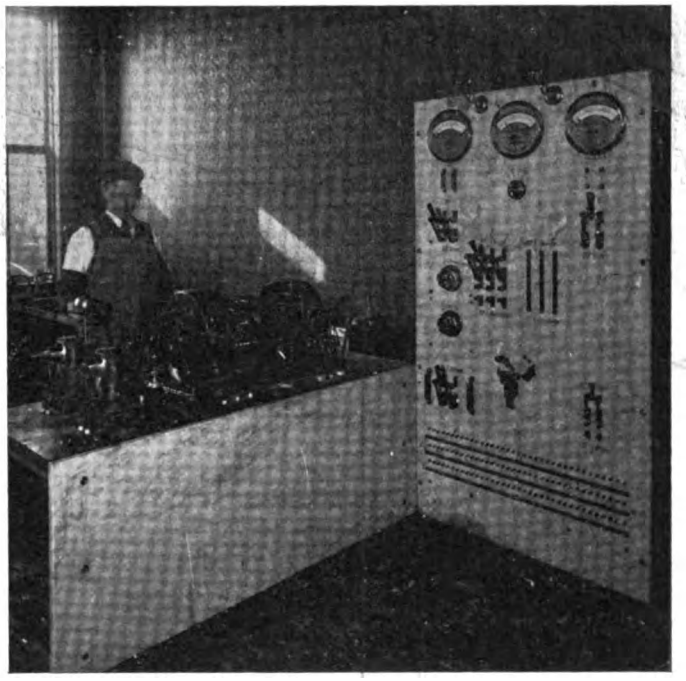
Switchboard of the Macon County Mutual Telephone Company, at Decatur, Ill.

Digitized by Google

be used in connection with common return or grounded line construction, and with the old style individual generator-call local battery instruments, and at any time changed to a full central energy equipment without discarding any of the central office equipment of their make installed. This enables the operating company to change to central energy at any time when the lines are built metallic and when the company is in condition to replace its telephones.

The switchboard which was installed consists of four sections of three operators' positions each. The exchange line equipments are so distributed that there are 120 and 130, respectively, in each alternate position, and there are 50 self-restoring drop signals for farmers' line work in the first annex position.

The board is built with a multiple jack capacity for 4,800 lines. The frame is constructed in sections, arranged for three operators' positions each. Each section is sub-divided with eight panels for the multiple jack space, and with nine panels for the line equipment space, arranged three panels to each position.



Charging and ringing machines and power switchboard in the Decatur exchange.

The framework is self-supporting, and is built of architectural iron, so braced and bolted together as to make it strong and rigid and properly support the necessary equipment, cabling, etc., and withstand the extra strain to which it will be subjected when making future additions or alterations.

The cabinet work is of well-seasoned, quarter-sawed golden oak finished panels. The space in the face of the board unoccupied by the necessary apparatus is filled in with panels to match the cabinet. The plug-board and the panel back of the plugs is covered with heavy sole leather. The key-boards are five-ply with the grain of the two outside and central layers running lengthwise, and the grain of the other two layers running crosswise. The key shelves are in sections of one position each, and are hinged so they may be raised, leaving the keys open for convenient inspection. The shelves are provided with a Yale lock, to prevent operators opening and using the key trough for purposes other than that for which it is intended.

The plug-board is drilled for two supervisory clearing-out signals for each pair of cords. In the present equipment, for magneto-call service, only one clearing-out signal is installed, but all provision is made so that when the system is changed to central energy, the necessary apparatus may be installed for double supervision. On the key shelves are mounted the vertical type combination listening and two-party selective ringing keys.

The first position contains the necessary multiple jacks for serving as an annex to the second position containing the first exchange lines. The annex position is also equipped with 50 high wound, bridging, non-inductive tubular self-restoring drops and corresponding answering jacks for magneto-call rural party lines. The springs in the jacks of the drop line equipments are built of No. 18 B. & S. gauge spring German silver sheet, and have a bending length of two inches. The springs, near the tip end, normally rest with a strong tension against an insulated stop post, to give a positive plug connection at all times. This construction of the jacks enables using a small plug, such as is necessary for large multiple boards, and avoids all liability of poor and loose contacts when the plug is inserted.

The plugs are of such size as to enable inserting two or more in adjoining multiple jacks, which are built on ⅜-inch centers. The plug is provided with a loose sleeve to prevent kinking the connecting cord if the operator turns the plug. The sleeve is held in position to a set ring fastened by a small steel screw.

With this system the regular two-conductor connecting plugs and cords are used. The drop-restoring device is mounted in the path of the plug and supported on a German silver compensating spring, which insures a positive restoring of the drop at all times, even after the parts have become worn from long continued usage. The exchange line equipments consist of the regular two-spring jack with associate lamp jack and lamp, with line and cut-off relays.

The equipment and wiring is so designed and arranged that the line signals respond to a very slight turn of the subscriber's telephone generator in the old instruments now in use, and so that when the instruments are replaced with central energy telephones, the same equipment throughout can be used by simply changing the connection on the relays already provided, and operate as a regular central energy equipment. Although the telephones now in use are varied, there being some of almost every style on the market and many of early make which have weak generators, the relays on the new switchboard equipment are said to respond to every call and make the lamp line signal positive and reliable. The relays are of the tubular type, having the coil mounted in a soft annealed iron tube, so that when the armature is drawn up the coil is completely surrounded by iron. The iron of the armature is all supported on the outside of its pivot, so the energy is all exerted direct with no lost force, making an extremely sensitive and positive relay. The coil being completely enclosed on all sides when the armature is drawn up absolutely prevents all possibility of cross-talk or induction.

The German silver contact springs of the line relays are more than two and one-half inches in length, from the contact to the support, giving ample space for a wide and reliable break in the contacts. The springs rest on an insulated stop at the contact end to enable giving them the proper tension, insuring positive contacts. The springs are firmly clamped between mica insulation by heavy binding screws threaded into metal, not depending on threaded rubber or fibre. The relays are firmly clamped to a heavy iron mounting strip, provided with a substantial brass base, with the outer edge threaded, upon which is screwed a brass tube cap completely enclosing the relays individually, making them dust-proof.

Each position of the board is provided with an operator's set, including a line pilot, clearing-out pilot and the necessary order wire circuit to the toll board. Multiple jacks, wired in parallel with the answering jacks, are mounted in each six panels of the eight panel sections, enabling each operator to make connection with any subscriber's line without reaching beyond the three-quarter section in which the call is received, making the reach only two-thirds of the adjoining positions.

The multiple jacks are built on ⅜-inch centers. The springs are constructed of No. 18 B. & S. gauge German silver sheet, and are two inches in length from their support. At the plug end

The Indianapolis Convention

THE Indiana Independent Telephone Association has just closed one of the most important, enthusiastic and interesting two days' conventions ever held by telephone men in the State. On account of the great progress made in this State and the publicity given the Independent movement during the past few months, the convention was attended by over 300 prominent telephone men—members of one of the strongest State associations in this country. The plan of the association is not only unique, but exceptionally strong in its working and co-operative district branches.

The convention was held in the assembly room of the Claypool Hotel, which was beautifully decorated for the occasion. Conspicuous among the decorations was a large and artistic banner bearing the following inscription:

In Indiana there are:

400 Independent Telephone Companies.
15,000 Stockholders.
200,000 Subscribers.
$20,000,000 Capital invested.

In the absence of George W. Beers, of Ft. Wayne, president of the association, Vice-President Theodore Thorward, of South Bend, presided over the first session. Mr. Thorward said that the meeting was the first annual gathering of the association and was of such importance as to make time precious. For this reason he proceeded at once to the business of the convention. The minutes of the initial Winona meeting held nearly a year ago were read by the secretary Charles S. Norton, of Indianapolis. The minutes contained a brief history of the plan of the organization; the division of the State into eleven districts, each district branch presided over by a vice-president. The secretary's report also gave a synopsis of the meetings held by the district branches and the work accomplished during the first year. The full and gratifying report of the secretary put the convention in an enthusiastic attitude which lasted throughout the succeeding sessions.

The executive committee of which Mr. Jesse W. Weik, of Greencastle, is chairman, made its report, which rivaled that of the secretary for completeness and interest relative to the vast amount of work accomplished during the first year of this excellent association.

In the absence of President Beers, his annual address was read by Mr. A. C. Lindemuth, of Richmond.

Mr. Beers congratulated the association upon the wonderful progress, growth and success during the past year, and said that "Independent companies are growing stronger every day and in direct competition are proving their superiority to the Bell. Rural telephones and small town exchanges were not known until they were established by the Independents and now they serve nearly every hamlet and a majority of the farm houses in this State. Their long-distance requirements are practically satisfied by connection with their country seats, but there is a great lack of information on the part of the local owners, who are unaware that the development of the Independent long-distance service will in the very near future furnish to every Independent exchange connections with whatsoever part of the country its subscribers may require. This condition renders dangerous to your interests the determined efforts the Bell company is now making to connect its toll lines with the smaller Independent exchanges, operating in communities which had been denied all telephone service during the whole life of the patents owned by the monopoly. The people are with the Independent companies, but to retain the support of the people the companies must remain Independent in fact, as well as in name. The best means of holding such companies in line is one of the subjects that should command your attention. Your business requires mutual understandings more than any other that I know of, because the success of each individual exchange depends in large measure upon all the others. The best road to substantial and sustained profit is through organization, such as you have in the National-Interstate Association, of which this body is an important and influential member. You are thus represented by delegates of your choosing, who, with delegates from other State associations, will convene next month for the consideration of business which concerns the telephone companies of the several States, insuring united action upon all matters of general interest."

Mr. Beers urged the necessity of all companies becoming members of the district associations. They thus become workers for the common good, each bearing its fair share of the burden. Territory in which each company operates should be developed to its fullest capacity, and exchanges united into compact system, operating under standard rules to furnish a service of standard excellence. He advised the adoption of a uniform system of accounts, likewise a standard sign in order that the Independent long distance service may be recognized everywhere.

Delegates to the Convention of the Indiana Independent Telephone Association

The district vice-president and the members of the executive committee have contributed largely to the success that has come to the association during the first year. Mr. Beers bestowed much praise upon the secretary for his efforts, which have done much to promote the success of the organization.

There was especial interest manifested in the reports of the vice-presidents from the district associations, as they were cal-

Digitized by Google

culated to show the condition, progress and development of Independent telephony in the eleven districts of the State.

Theodore Thorward, of South Bend, vice-president of the first district, reported the Independent telephone cause in excellent condition in the seven counties of his district. There are seven Bell exchanges and 3,193 telephones in operation in this district, as compared to fifty exchanges and 17,295 telephones in operation by the Independents. Under such conditions it is not remarkable that the Bell company is willing and anxious to connect its toll lines with the prosperous Independent exchanges.

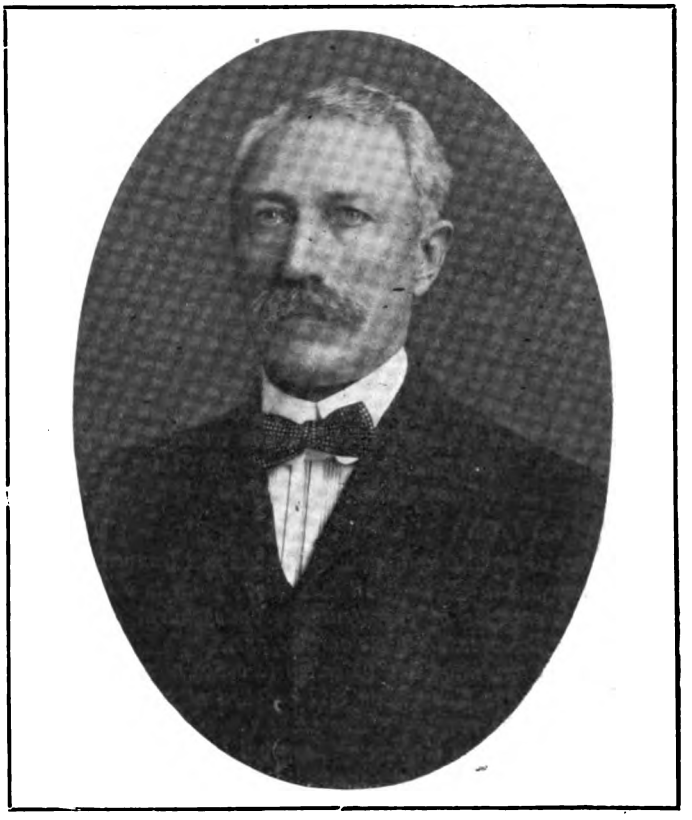
Wm. L. Moellering, of Ft. Wayne, vice-president of the second district, said the progress made by the Independents there is keeping pace with other parts of the State. The number of Independent telephones in use predominates so largely in his district that the Bell competition was scarcely perceptible. In many localities the field has been kept clear of Bell competition—especially is this true in the whole of Whitley county. As in other portions of the State the Bell manœuvers in every manner possible to induce companies to tie up with its toll lines, but the small companies realize the serious consequences of such an act and refrain from entering into any agreements.

Mr. Moellering urged that the memories of the Independents should be kept thoroughly alive to the fact that the Bell does not expect in any move that it makes toward tying up with an Independent company that any real benefit shall accrue to the Independents, but rather will tend to gradually cripple the smaller company. Meetings in his district are largely attended and the interest and harmony among the thirty companies of the association could not be better.

W. S. Uhl, of Logansport, vice-president of the third district, reported that in the eight counties comprising his district there are twelve companies which are members of the association, and that the membership represents 8,615 telephones of the 12,982 telephones in the district and 866 circuit miles of toll line of the 1,595 circuit miles of the toll lines in the district. There are 12,992 Independent telephones in service, as against 4,103 operated by the Bell people. Mr. Uhl said great progress was being made and that 2,000 telephones had been installed during the past seven months. The two district meetings held were well attended and much interest in the proceedings shown by members.

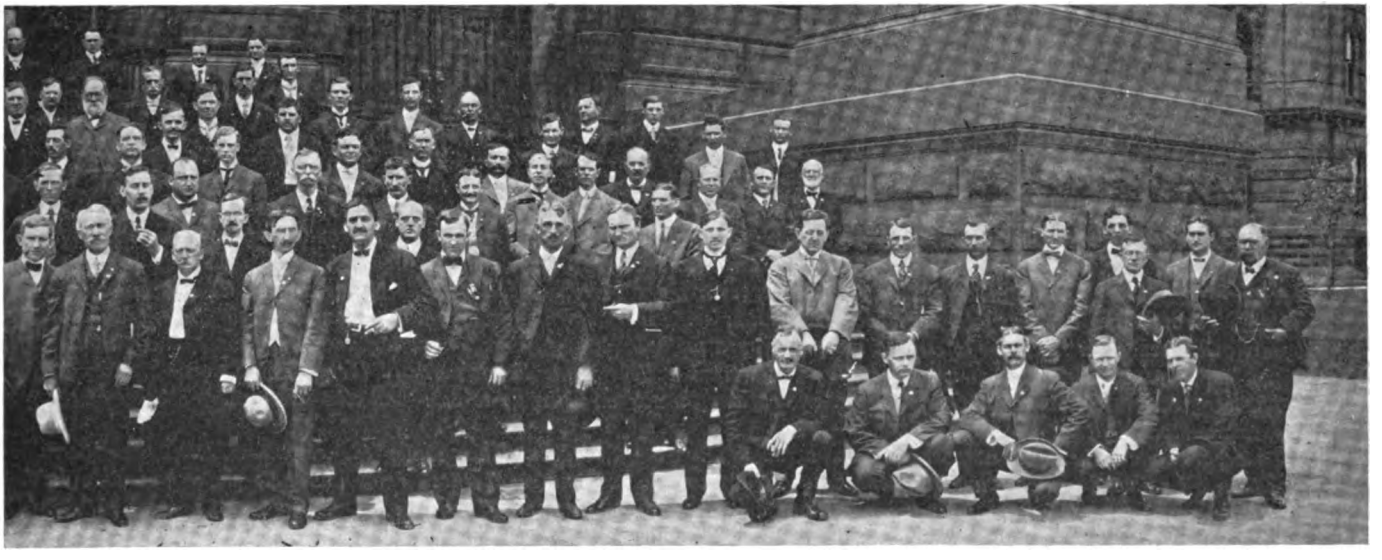
J. A. Browne, of the fourth district, made a brief but satisfactory report. Likewise, O. P. Friberg, of the fifth district, Earl Talbott, of the sixth district, and A. C. Lindemuth, of the eighth district. Mr. Lindemuth said he represented a Quaker community, but he desired to say that when it comes to fighting the Bell monopoly the Quakers forget all about being non-combatants. In all of these districts good meetings were held and considerable growth and development reported.

W. D. Curll, of Petersburg, vice-president of the ninth district, reported a complete organization with seven of the eight com-



A. C. Lindemuth, President of the Indiana Independent Telephone Ass'n.

panies in the territory as members. Mr. Curll said nearly all the companies in his district have increased their capital stock and increased facilities and extensions are constantly being made. A number of the companies have merged with the Central Home Telephone Company, of Louisville, and this will result in a vast amount of improvements and extensions. Mr. Curll described the Evansville situation and said while the Independents had suffered temporary defeat they would soon have a franchise in that city. The Pike County Telephone Company, in his district, some time ago lost its exchange by fire, but the fidelity of its patrons was shown by their disposition to wait until it could be rebuilt rather than accept free service which was offered by the Bell company. Mr. Curll said he was sorry to report that the Wabash Home Telephone Company, of Monroe City, had re-



Representing Telephone Companies Operating in Every County of the State.

Digitized by Google

cently placed the Central Union business on its board and asked the association to take action thereon.

"All the Independent companies report increased business—more than they are able to handle," said Mr. Curll. The companies have adopted the Standard sign, and conditions are good. "We shall soon be shouting 'hello' in Evansville," said he.

Chas. D. Knoefel, of New Albany, vice president of the refreshments, Jesse W. Weik, of Greencastle, acting as toastmaster, started the flow of eloquence by telling a few good stories peculiar to the localities from which each speaker came. Dr. R. F. Blount was introduced as the godfather of Independent telephone associations, and related in an interesting manner his attendance at the birth of the Independent associations.

A. C. Lindemuth, of Richmond, gave an interesting account of the ten months' progress and related some amusing incidents

OFFICIAL BULLETIN NUMBER ELEVEN OF THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.

MAPS:

The Independent toll line map of Ohio has been finished and is being published for distribution by subscription; a descriptive circular will be furnished if desired.

SUPPLY DEPARTMENT:

At the request of a number of Independent companies we have arranged to furnish inexpensive large card board "Shield" signs for use on construction work, bill boards, etc. Write for particulars. The use of the "Shield" is constantly spreading. Independent companies in 38 States are now displaying the emblem. YOURS should be among the number. If not—ask for illustrated catalog—free. Why not get a "Shield" button to wear to the Convention?

CONVENTION:

Let us remind you again of the Annual Convention at the Auditorium Hotel, Chicago, June 26th, 27th and 28th. It will pay you to attend. All indications point to a record breaking meeting. The importance of the gathering insures a large attendance of representative Independent telephone men from all parts of the country and no effort will be spared to make the occasion a memorable one.

The Convention will be called to order at 2 P. M. on June 26th. Mayor Dunne, of Chicago, will deliver the address of welcome. The Convention will adjourn at 5 P. M., June 28th, thus giving all who desire to stay until the last, an opportunity to take evening trains home.

An extremely interesting program has been arranged. There will be no lengthy "dissertations" nor "sermons," but important matters of vital concern to every Independent in the field will be presented in brief, carefully prepared papers, or short practical talks by men who are acknowledged masters of the subjects. All may share in the general discussions which follow. The question box, a feature at each session, will afford an opportunity for anyone to introduce important subjects for consideration. There will not be a dry hour throughout the entire program.

An informal banquet will be held in the Auditorium Hotel on June 27th, at 8:30 P. M. Some of the best after-dinner speakers of the country will be present to respond to toasts when called on by Col. J. D. Powers, of Louisville, Ky., who has agreed to preside as toast master. All who know Col. Powers appreciate the treat in store for those attending the banquet.

With a view of showing the substantial character of the Independent movement and the general prosperity of the companies comprising it, an exhibit of photographs of Independent plants has been arranged. To stimulate interest in this, there will be awarded first, second and third prizes of $15.00, $10.00 and $5.00 respectively, for the best photographs submitted. Every company is invited to participate in this contest. The awards will be made by a committee of Chicago photographers strictly on the merits of the photographs without regard to the size of building, so that all who take part stand an equal show. All photographs will be displayed in the hall during the Convention. Bring a photo of your building whether you care for a prize or not and help the committee make a good display.

The manufacturers and supply dealers are co-operating with the Association in making the Convention a success. They have arranged splendid exhibits of the latest and best in telephone equipment and supplies, besides sundry programs for the diversion of telephone men between sessions. You will not be allowed to get lonely while in Chicago.

Think of the opportunities presented by a gathering like this Convention. Nowhere else could you meet such an up-to-date representative body of Independent telephone men from all sections of the country, with whom you can exchange experiences and ideas, to your mutual advantage, regarding the various aspects of the business in which you are all interested. Through the exhibits you may become familiar with the most modern apparatus manufactured and through the program and discussions learn the latest and most improved methods of profitably conducting your business. In addition to this you get in touch with what is being done by your fellow Independents in all parts of the United States.

The progressive Independent telephone man who prides himself on being up-to-date, and who would keep abreast of the times, will certainly attend the Convention.

To accommodate the large number who are arranging to come, reduced rates, under the certificate plan, have been secured on all railroads. We want everyone who attends to take advantage of these rates and help make our plan to obtain them a success. Read carefully the conditions on page 345 of this issue.

The Association headquarters will be established at the Auditorium Hotel for the purpose of furnishing all necessary information and looking after the wants of visiting telephone men. We will also have a display in another part of the hotel of the various things handled by the supply department, besides the maps which have been prepared to date, by our drafting department. Drop in.

Again we urge, ATTEND THE CONVENTION! You cannot afford to miss it.

tenth district, made a characteristic report from the Knobbs. He said conditions were excellent, Independents were loyal and growing in facilities and popularity with the people. The meetings held were well attended and the interest manifested could scarcely be greater.

The evening session was in the nature of a smoker. After relative to the attempt of the Bell people to persuade the Quakers to forsake the Independents.

Theodore Thorward, of South Bend; L. A. Frazee, of Connersville; A. T. Payton, Huntingburg; A. L. Funkhouser, Evansville, and others gave short talks.

President Beers presided over the morning session of the

Digitized by Google

second day, at which routine business was first dispatched rapidly. The committee on the constitution recommended a change in Article 7, relative to membership fee and annual dues, and also that Article 8 be amended so as to provide for the selection of a larger number of delegates from each company to attend the annual meetings.

The interest manifested in the address of Col. J. D. Powers, of Louisville, on "Independent Telephone Securities" brought out a good attendance. The address was read by Mr. A. L. Têtu, of Indianapolis.

At the conclusion of the reading of the paper a vote of thanks for the excellent paper was ordered sent to Col. Powers, together with the regrets of the association because of his absence.

A. C. Lindemuth, chairman of the executive committee, presented a resolution to the effect that a petition be sent to the Mayor and Board of Public Works of Indianapolis urging them to take favorable action on the application of the new telephone company for a modified franchise.

The committee on uniform methods of accounting made a partial report and asked for additional time to formulate such a system.

The committee on rates made a report to the effect that rates were inadequate and out of proportion to the increasing value of the service now being given. The committee recommended the gradual education of the people up to the fact that the companies must have more money to operate, improve and extend their lines. The committee recommended that all free business be cut out.

The afternoon session of the second day was given up to the election of officers, and resulted as follows: A. C. Lindemuth, Richmond, president; C. S. Norton, Indianapolis, secretary-treasurer; Jesse W. Weik, Greencastle; Theodore Thorward, South Bend; Thomas Davidson, Greensburg; C. D. Knoefel, New Albany; Wm. L. Moellering, Fort Wayne, executive committee.

The following delegates were elected to attend the convention of the National-Interstate Telephone Association at Chicago, June 26 and 28: M. E. Vrow, Elkhart; Geo. W. Beers, Fort Wayne; John L. Osborne, Veedersburg; A. L. Têtu, Indianapolis; C. S. Norton, Indianapolis; A. J. Payton, Rockport; A. A. Ulrey, Decatur; A. C. Lindemuth, Richmond; F. R. Strickler, Franklin; Henry Barnhart, Rochester; L. A. Frazee, Connersville; Jesse W. Weik, Greencastle; E. Hawkins, Noblesville. Alternate delegates selected were George T. Cox, Fort Wayne, and Frank White, Cortland.

The Independent Bulletin was made the official organ of the association, and a vote of thanks tendered president Beers and Secretary Norton for faithful services during the year.

The entire eighth floor of the Claypool Hotel was given up to the electrical manufacturing companies, and a more magnificent and interesting exhibit of the latest devices and telephone apparatus of all kinds was never made outside a national convention.

About thirty of the prominent telephone men enjoyed the hospitality of the representatives of the Stromberg-Carlson Manufacturing Company at luncheon Friday noon, and the representatives of many other companies contributed much to the pleasure and information gained by members of the association through their attendance at this convention.

BELL SUBSCRIBERS FORM PROTECTIVE ORGANIZATION.

STARTING with 150 members, the Telephone Subscribers' Association has been recently organized in Chicago. The object of the association is to protect subscribers to the service of the Chicago Telephone Company, particularly those in the downtown district of the city, from the so-called "petty tyrannies" which that company has inaugurated. A further object of the association is to safeguard the interests of its members who may be drawn into litigation. So much interest is being shown in the organization that it is expected that its membership will be rapidly increased.

PRELIMINARY PROGRAM OF THE ANNUAL CONVENTION OF THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.

Auditorium Hotel, Chicago, June 25-28.

JUNE 25TH.

10 A. M.—Meeting of Permanent Committee.

1:30 P. M.—Meeting of Executive Council and Advisory Board.

JUNE 26TH.

2 P. M.—Convention called to order.

Address of Welcome, Hon. Edward F. Dunne, Mayor of Chicago.

Response, E. H. Moulton, President Twin City Telephone Company, Minneapolis, Minn.

President's Annual Address, Jas. B. Hoge, President National-Interstate Telephone Association.

Officers' Reports.

Appointment of Committee.

Question Box.

Adjourn for the day.

MORNING SESSION, JUNE 27TH.

Meeting called to order at 10 A. M.

Report of Entertainment Committee.

Discussion of and Action by the Convention.

Roll call of States.

Paper, "Official Organs—National and State," Chas. S. Norton, Secretary Indiana Independent Telephone Association, Indianapolis.

Discussion.

Paper, "Look for the Shield," R. A. Walker, General Manager Central Iowa Telephone Company, Iowa Falls, Iowa.

Discussion.

Paper, "Telephone Publicity—Appealing to Public Opinion," Mr. Ivy L. Lee, New York City.

Adjourn for lunch.

AFTERNOON SESSION, JUNE 27TH.

Meeting called to order at 2 P. M.

Report of Committee on Standard Forms of Accounting.

Discussion and action.

Discussion.

Address on the San Francisco Disaster by Mr. John Van Liew, President California Independent Telephone Association, Oakland, Cal.

Report of Committee on Standardization of Equipment.

Discussion and action.

Address, "Southern Toll Lines and Exchange Development," by a representative from the Southern States.

Question Box.

Adjourn for the day.

Informal Banquet, 8:30 P. M. Col. J. D. Powers, Louisville, Ky., Toast Master.

Speakers announced later.

MORNING SESSION, JUNE 28TH.

Meeting called to order at 10 A. M.

Report of Committee on Standard Operating Rules and Regulations.

Discussion and action.

Paper, Suggestions "How to Finance Small Telephone Properties," Theodore Gary, Vice President National-Interstate Telephone Association, Macon, Mo.

Discussion.

Reports of Outstanding Committees.

Discussion and action.

Presentation of New Business.

Question Box.

Adjournment for lunch.

AFTERNOON SESSION, JUNE 28TH.

Meeting called to order at 1:30 P. M.

Transaction of unfinished business.

Report of Nomination Committee.

Election of Officers.

Installation of Officers.

Farewell Address.—Speaker announced later.

Convention adjourns.

REDUCED RATES TO CHICAGO CONVENTION.

DIRECTIONS for securing a return trip ticket at one-third of the regular fare have been issued by the National-Interstate Telephone Association, and are published upon another page of this issue. It is evident that to most of the people who attend the Convention this rate will furnish a means of making quite a substantial saving in the cost of the trip, and care should be taken to secure information which will prevent any failure to obtain the concession through lack of knowledge of the proper routine. The association has taken all the preliminary steps for obtaining this rate, and made the necessary guarantees. These guarantees, however, depend upon a sufficient number of members availing themselves of the privilege; so that it is as much to the advantage of others as for themselves that the first men should obtain the required certificates. It should be borne in mind that this is a place where the man who acts on the motto "Do it now" is likely to reap his reward in the saving of valuable time, as well as money.

PHOTOGRAPHS OF TELEPHONE PLANTS.

ONE of the features of the National-Interstate Convention at Chicago which promises to be very useful and interesting will be the exhibition of photographs of Independent telephone plants. It is an extremely good thing that the officials in charge of the arrangements for the convention have adopted this idea. It will be valuable not only from the amount of general information which will be conveyed in a manner which cannot be attained by any other method, but from the undoubted effect it will have in stimulating the use of the camera by telephone men.

Those who have had experience of this nature are aware of the great advantage which comes from the taking of photographs of points remote from the home office by men from headquarters who have occasion to take trips throughout the company's territory. Upon their return the record contained in a series of well chosen photographs enables the other officials connected with the management of the company to obtain what is the nearest substitute for knowledge acquired by direct personal observation which can be secured. The condition of lines from various points of view, such as the nature of the original construction, freedom from contacts with branches of trees, or proximity to foreign wires, is indicated by a photograph in such a manner as to be readily intelligible, and to convey definite information at a single glance. When special inspections of central office or sub-station apparatus are made another opportunity for the photographer occurs. If an expenditure of money for the correction of undesirable conditions is necessary it is preferable that those who have to make the decision should have all the information obtainable, and few people who have tried the plan will deny that a well illustrated report would in many cases be sufficiently more reliable than one containing only written information to fully justify the expense of taking photographs. It is extremely probably that the sending out of an assistant competent to obtain good photographs would in many cases be a most satisfactory substitute for the employment on special missions of one of the higher salaried officers of the company, who must spend a great deal of time in looking over the ground in order to pass judgment.

In the engineering work of all telephone companies many occasions arise where plans, no matter how carefully made, are found to be incomplete, and this is likewise true of notes. Some point is overlooked, and no definite information concerning it appears when knowledge is desired promptly. Securing it may mean a special trip with an attendant expense altogether out of proportion to the instrinsic value of the information sought. A complete set of photographs of equipment is extremely useful in such cases.

It is true that good telephone men who are accomplished photographers are not frequently met. Nevertheless, skill in photography sufficient to fulfill many of the demands of practical work may be readily developed. All the very large general engineering and manufacturing establishments maintain upon their pay rolls at least one photographer, and the officials of these companies find that his work pays extremely well.

Telephone men who have any inclination to follow this useful line will no doubt find it much to their advantage to develop their skill as far as possible by the choice for practice of subjects connected with their regular work. On the other hand, managers of companies who encourage the use of the camera by their subordinates will on the most unexpected occasions find that their efforts will have worked out to the advantage of the company. Those who visit the convention bearing this point in mind will probably see in the photographic exhibit much to confirm these views.

OPPORTUNITIES IN CANADA.

PROSPEROUS farms are coming into existence all over the Canadian Northwest, and business is increasing at a rate which will soon make this region one of the most important on the continent. The men who are changing this place, which was not so very long ago a wilderness, into one of the most wonderful industrial centers in the world are among other things just waking up to the value of telephone service.

Also, with their increased prosperity, they are able to devote more time to social affairs, and here too the telephone has its advantages, enabling them to adopt a means which will bring most widely separated houses into close connection. Large numbers of rural lines will be built during the next year or two in Manitoba, Alberta and Saskatchewan. A reliable correspondent says that there will be literally hundreds of new companies organized to perform this work. The people at present are almost wholly uninformed as to the sources from which telephone material may be obtained, and it would seem as if there must be an admirable opportunity for the establishment of supply houses in one or more well chosen localities. Such an enterprise should not only be able to build up a large and substantial business, but would be likely to materially assist in the development of this important aid to the industries of the country. There are people in some of the cities who are anxious to see such a business established, and will be glad to give more definite information.

THE INDIANA CONVENTION.

REPORTS of material progress in business affairs and of a whole hearted devotion to Independent telephony as a cause by the district vice-presidents were probably the most striking features of the recent convention at Indianapolis. Most cheering news was furnished, not only of the upbuilding of Independent telephone systems admirably fitted to serve the needs of the public, but of the organization into a compact body, which is calculated to work with a considerable degree of efficiency, of numerous small companies which cover the different sections of the State. The effect of work of this sort, when conducted with the spirit shown at this meeting, cannot be overestimated. The fact that this condition has been brought about in so brief a time since the original plan of organization was proposed gives the Indiana association a most valuable record of accomplishment.

Digitized by Google

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

HIGHWAY RIGHTS IN NEW YORK.

Our company is operating under a State charter (New York). We are continually hampered in the construction of our lines in the country districts and in cities and incorporated villages, where we have local arrangements, by property owners preventing our setting poles.

I would like to have your opinion on the following points:

1. In country districts, where we desire to set a pole or poles in front of a man's property in the highway where no apparent damage will result to trees or property, what right has he to prevent our doing so, providing we are willing to pay a reasonable amount for the privilege?

2. If poles are placed in the highway in opposition to property owner's wishes, can he legally require you to remove them?

3. In case where we have secured permits and had location assigned to us by the duly authorized officials of city or village, can property owners prevent placing of poles?

4. Can our company condemn a right of way either on highway or property? W. J. C.

The above questions will be answered in the order in which they are asked.

1. The answer to this question depends upon the ownership of the highway. If a man who owns the property in front of which the pole is placed, owns to the center of the highway, and the public owns merely the right of way in the highway, but not the fee or title to the highway itself, the landowner may prevent your setting a pole in front of his property, even though no apparent damage will result to trees or property. In the absence of condemnation proceedings he is not bound to accept a reasonable amount for granting you the privilege of setting your poles in the highway, or to give you that privilege at all. See Eels v. Teleg. Co., 143 N. Y. 133, 38 N. E. 202, 25 L. R. A. 640. If the property owner, on the other hand, does not own to the center of the highway, he cannot interfere with you at all, and has no right to surrender to you. This is in the absence of any damage to trees or property. Halleran v. Bell Telep. Co., 71 N. Y. S. 685, 69 N. E. 1124.

2. If poles are placed in the highway in opposition to the wishes of the property owner who owns to the center of the highway, he can legally require you to remove them. A property owner who does not own to the center of the highway cannot require you to remove them at all.

3. This question, like the other two, depends upon the title of the property owner in the highway. Where the public owns the fee in the highway and you have secured permits and had location assigned by the proper officials, property owners cannot prevent your placing poles. If the property owners' rights extend to the center of the highway, the permission from the municipal authorities binds the public, but does not dispose of the rights of the property owner in the highway, and he can prevent you from placing your poles.

4. Your company can condemn a right of way either on a highway or property. Deusenberry v. Mutual Telep. Co., 11 Abb. N. C. 448.

ANNEXED TERRITORY SUBJECT TO FRANCHISE TERMS.

AN ordinance of the city of Chicago granted to the Chicago Telephone Company the right to use the streets and limits of the city for twenty years, and required the company to file with its acceptance of the ordinance a schedule of rates for telephone service "within the limits of the city" and prohibited the company from increasing such rates to its present or future subscribers. The company filed a schedule in compliance with the ordinance. Afterwards there was annexed to the city of Chicago other territory which had previously been within the limits of other minor municipalities, such as towns or villages, which upon the annexation ceased to exist. These towns or villages had previously granted the company the right to use their streets for telephone business upon certain conditions, but without restriction of time or condition as to rates. Upon the annexation the company claimed that it had acquired vested contract rights in the annexed territory under the ordinances of the municipalities that formerly existed there, and that these contract rights were not affected by the ordinances of Chicago and that in the annexed territory the restriction as to rates contained in the Chicago ordinances did not apply. The city of Chicago instituted a suit for the forfeiture of the franchise of the telephone company, and in this case it was held that on the annexation to the city of other towns and villages their local ordinances terminated and the telephone company was bound to furnish telephone service in such localities under its original city ordinance. In the same case it was decided that the telephone company was not entitled, after the annexation, to limit its service at the rates fixed in the ordinances to the same kind of service that had been in existence when the original grant from the city of Chicago was made. These were the holdings of the Supreme Court of Illinois which reversed an order of the Cook County Circuit Court dismissing the suit. People v. Chicago Telephone Co., 77 N. E. 245.

HIGHWAY REGULATIONS IN OHIO.

THE Ohio Postal Telegraph Company brought a suit against the commissioners of Sandusky county, Ohio, for an injunction to restrain the commissioners from enforcing a resolution requiring the company to remove its telegraph line from the center to the north side of the Maumee pike on the ground that the present location of the poles seriously incommoded the public in the use of the highway. In 1893 the county commissioners in consideration of $200 had granted the company permission to construct its lines of poles and wires along the highway, and in pursuance of this authority, the company had built its line along the north edge of the roadway. In 1889 the county commissioners granted to the Toledo, Fremont & Norwalk Railroad Company the right to build and operate an electric railway along the southern portion of the same roadway. The testimony showed that it was impracticable for heavily loaded wagons to pass one another on the roadway between the electric line and the telegraph company's poles. The Circuit Court of the United States for the Northern District of Ohio gave judgment in favor of the telegraph company, but this judgment has been reversed by the Circuit Court of Appeals, which lays down the proposition that the primary purpose of a highway being for travel and transportation, its use by a telegraph company to facilitate communication is subordinate to its use by the public for the primary purpose. It held, under the statutes of Ohio, which provide that the use of a public road by a telegraph company "shall not incommode the public in the use of such road," that a board of county commissioners, which has been given control of a pike by the State, cannot grant to a telegraph company the right to maintain its poles and wires upon it except subject to such statutory limitation. A grant from a board of county commissioners, it was held, cannot preclude it or a succeeding board from ordering a removal of such poles and wires, if at any time through changed conditions their location in the highway shall incommode the public in its use, and the company's action in ordering a removal will not be interfered with by the courts unless an abuse of discretion is shown. The whole matter, the court decided, was within reasonable control of the commissioners. Ganz v. Ohio Postal Teleg. Cable Co., 140 Fed. 692.

IN THE OPERATING FIELD

ENTHUSIASTIC MEETING OF CENTRAL ILLINOIS ASSOCIATION.

ONE hundred thousand telephones and some eleven hundred miles of toll line were represented at the annual convention of the Central Illinois Independent Telephone Association recently held at Peoria. The general tone of the reports given by the officers and members was that the Independents were making great gains against the Bell company, several instances being cited to prove the statements.

In Tazewell county alone the Independents have 13 exchanges and 2,972 telephones, while the Bell has but 2 exchanges and 643 telephones.

It was decided to establish a clearing house through which all toll reports will pass, and Peoria was selected for this purpose.

J. S. Daily, Chillicothe, is secretary of the organization.

The report of the Interstate Company of Peoria, which stated that it had installed nearly 3,000 instruments in eight months, was enthusiastically received.

Amongst the towns and cities represented were Rock Island, Galesburg, Springfield, Bloomington, Petersburg, Pekin, Canton, Monmouth, McComb, Henry, Chillicothe, Tremont, El Paso, Eureka, Bradford, Green Valley, Kewanee, Lacon, Washington, Delavan, Rutland, Lostant and Metamora.

The new officers elected for the ensuing year are: President, Sidney Daily, Chillicothe; vice president, W. G. Olwin, Peoria; secretary and treasurer, H. W. Bullock, Eureka; executive committee: J. W. Barrett, Pekin; M. B. Farwell, Bloomington; W. H. Ames, Tremont.

INDEPENDENT DEVELOPMENT IN NORTHERN MAINE.

ALTHOUGH incorporated less than a year ago, the Independent Telephone Company of Houlton, Me., has secured upwards of 550 subscribers. The company is now considering extensions to the northern part of the county which, when completed, will place a number of small towns and villages in direct connection with Houlton, besides enabling the farmers to secure first class service at a moderate cost. The rates charged are fifteen dollars for business and twelve dollars for residence and farm line service.

HOME COMPANY OF SAN DIEGO, CAL., TO BUILD NEW LINES.

PLANS to extend the system of the Home Telephone Company of San Diego, Cal., are under consideration. It is proposed to build a line through the Imperial valley to connect with Julian and Cuyamaca. The towns of Brawley, Calexico, Holtville, El Centro, and Heber, besides several smaller places, will thus be able to get direct connection with San Diego and Los Angeles. It is expected that construction will start within three months.

APPROVAL OF PUBLIC GREETS OPENING OF INDEPENDENT SERVICE IN COUNCIL BLUFFS.

STARTING with a list of over 2,000 subscribers the Independent Telephone Company of Council Bluffs, Ia., recently commenced business. The inauguration of Independent service in that city places it in direct communication with about 20,000 subscribers in Southwestern Iowa. Over $125,000 has been spent in constructing the system and so great is the demand for telephones that it is expected that a further sum of $50,000 will be expended to take care of its immediate growth. The company has its own exchange building, which cost $12,000, and it spent $20,000 in placing the circuits through the business part of the city underground. The switchboard has an ultimate capacity for 5,400 lines.

The first day the exchange was opened upwards of 3,000 visitors passed through the building and examined the apparatus. Flowers were distributed to all who accepted the invitations to view the building and an orchestra was in attendance. The reception was arranged by C. H. Judson, who had charge of the building of the new system, and manager C. A. Laubach. President F. J. Day of the Independent Telephone Company was assisted on the reception committee by his associates on the board of directors, who are F. R. Davis, E. H. Merriam, F. H. Keys, E. H. Lougee, Dr. H. B. Jennings, C. A. Beno, T. G. Turner and W. H. Kimball.

The people of Council Bluffs are very much alive to the benefits in the way of increased business which will now come to the city and contracts are being closed for service faster than the equipment can be installed, although a corps of instrument men is installing telephones at the rate of sixty a day.

CUYAHOGA TELEPHONE COMPANY ISSUES FINANCIAL REPORT FOR MARCH.

EARNINGS of the Cuyahoga Telephone Company of Cleveland, O., for the month of March in the present year compared with the statement for the corresponding period in 1905, have just been issued. The statement shows a splendid gain in all lines. A surplus for three months of $40,297 is shown. This would indicate a surplus for the year of over $160,000. To pay dividends on the outstanding preferred stock requires $60,000 a year, leaving $100,000, which is over 6 per cent. on the common stock. Here is the statement:

	Mar. 1906.	Mar. 1905.
Gross earnings	$54,224.91	$40,473.42
Expenses	24,780.32	21,354.38
Per cent. expenses of earnings	45.70	52.76
Net earnings	29,444.59	19,119.04
Additional income	1,573.31	1,996.86
Total income	$31,017.90	$21,115.90
Deductions:		
Taxes	$ 2,320.92	$ 1,617.61
Bond interest	11,250.00	9,437.50
Miscellaneous charges	3,796.43	2,848.17
Total	$17,367.35	$13,903.28
Surplus for period	$13,650.55	$ 7,212.62
Surplus for two previous months	26,647.16	13,238.44
Surplus for three months	$40,297.71	$20,451.06

BACK NUMBERS OF THE AMERICAN TELEPHONE JOURNAL WANTED AT $1.00 APIECE.

WITHIN a few days requests have been received for forty back numbers of THE AMERICAN TELEPHONE JOURNAL. The person making the inquiry is very anxious to secure these numbers and has authorized us to make an offer of one dollar for every copy obtained in good condition. Full particulars relative to the issues wanted will be found in the advertising section on page 11. If any of our readers are willing to part with any or all of the numbers mentioned we would consider it a favor if he would notify us at as early a date as possible.

NEW PLANT BEING INSTALLED IN ALLENTOWN, PA.

WORK upon the new plant of the Consolidated Telephone Company at Allentown, Pa., is progressing rapidly. The entire lower floor of the company's building, with the exception of the front office, has been remodelled to accommodate the switchboard. Provision has been made for a future extension of the equipment to a size forty per cent. larger than the present installation, which is for 1000 lines.

Each line is equipped with four-party selective signalling apparatus, so that 4,000 subscribers can be given service. A three-position toll board will be employed for long distance connections. All the apparatus has been received, and it is expected that the new system will be in operation within a very short time.

CUMBERLAND COMPANY LOSES FAVOR IN ELKTON, KENTUCKY.

THE Cumberland Telephone Company a few days ago notified the citizens that it would withdraw all service from Elkton, Ky., and the county. It closed its exchange for about two days, and began moving telephone instruments.

The cause of all this was that the city council passed an ordinance to the effect that all companies not having a franchise for doing business in the city of Elkton should pay a fine of $50 per day for every day they operated from that time forth.

When the citizens observed the Cumberland company taking out its instruments, and making the statement it was going away, they signed an agreement to stand by the city council, and the city council was called to pass a resolution reclaring the occupancy of the streets a public nuisance. At this council meeting the Cumberland Company endeavored to run through a franchise without any restriction. The members of the council, however, held their ground and said the company must buy a franchise with a stipulated rate, the same as all other corporations, or be subject to action as trespassers. The Cumberland company declared it would not purchase a franchise containing a stipulated rate, and before doing so it would remove every instrument and all material from the town of Elkton. The Home Telephone Company immediately made up plans and specifications for giving the town of Elkton telephone connection to various surrounding Independent lines. Upon learning of this action the officials of the company sent to call on the city council a representative who stated that "The proper officers" did not know of this action and that they would certainly purchase a franchise with a stipulated rate which was nothing more than right. He stated that "It was a shame that the citizens of the town of Elkton had been cut off from telephone connection without their knowledge and the company would in fact be very glad to do anything in its power to give the people of Elkton anything they desired." So the Cumberland exchange is again going full blast, while the Home people are rapidly building. The sentiment aroused among the people is so strongly against the Bell company that it is expected that within a short time only a pay station will be left to the Cumberland company in Elkton.

REDUCED RATES TO CHICAGO CONVENTION ON ALL RAILROADS.

ARRANGEMENTS have been made with all railroads for reduced rates returning from the convention to all points from which one-way fare to Chicago is 75 cents or upwards, providing not less than 100 persons are in attendance who have complied with the following conditions:

Full fare, first class, through tickets to Chicago must be purchased not earlier than June 21st nor later than June 27th.

A standard form of certificate properly filled out and signed by the ticket agent must be secured at the station where the ticket is purchased. The agent issuing such certificate will request the purchaser to sign it with ink in his presence.

If through tickets or certificates cannot be obtained at any station the agent will advise the nearest junction point, where they may be secured. Be sure to get a certificate. Agent's or conductor's receipts for fare paid *cannot be accepted* instead.

Upon arriving in Chicago deposit certificates at the convention headquarters in the Auditorium Hotel with Mr. J. A. Harney, assistant secretary, for his endorsement. When 100 or more have been so deposited, they will be visèed by a special agent of the railroad who will be in attendance July 27th and 28th for this purpose, and who will collect a fee of 25 cents from persons presenting them for each certificate visèed. Holders of certificates leaving before his arrival or before 100 certificates have been deposited with the assistant secretary, or who present certificates after the special agent's departure, cannot take advantage of reduced rates under this plan.

Ticket agents at Chicago will sell return trip tickets to starting points at one-third of the regular first class fare to each holder of a properly endorsed and visèed certificate, providing such holder is the person to whom the certificate was originally issued and whose signature appears on it. Neither certificate nor tickets secured under this arrangement are transferable, and for the purpose of identification ticket agents at Chicago will request purchasers of return tickets to sign certificates in their presence. Tickets or certificates presented by unauthorized persons will be confiscated. The association has guaranteed to redeem at regular tariff rates all tickets secured under this plan which are misused or presented for sale.

The railroads request that all desiring to take advantage of the reduced rates advise their respective ticket agents as far ahead as possible, so that through tickets and certificates may be prepared. They further request that these be called for not later than thirty minutes before departure of the train, in order to avoid confusion at stations. If necessary, further particulars can be obtained from local ticket agents.

Please note the foregoing carefully. There will be several hundred people from all parts of the country attending the convention, but unless 100 or more certificates are presented to the special agent no reduction on any of them can be allowed, regardless of the number actually present. Everyone attending the convention is therefore urged to secure certificates and observe all other necessary conditions, so that the association's plan for securing reduced rates may be successful.

THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.
Cleveland, Ohio, May 18, 1906.

A REMINDER FOR BUSINESS MEN.

TELEPHONE

Just delivering 25,000 Directories. Each one used at least ten times a day. Is our special business classification worth anything to you? Exclusive in our Directory.

Are you in the book; have you wires enough?

The Cuyahoga Telephone Company
Electric Building Prospect Street

REPRODUCED herewith is one of the newspaper advertisements of the Cuyahoga Telephone Company. This is an excellent example of the higher class of reading copy issued in the daily papers. It is a direct appeal to men of a special class. To those whom it is especially desired to interest it makes a much stronger appeal than would a much larger amount of space devoted to statements of general application.

ANOTHER OHIO COMPANY MOVES INTO A LARGER OFFICE.

NEW quarters have been secured for the Hamilton, Ohio, Home Telephone Company. The business of the company has ben growing so rapidly under the efficient management of Mr. W. Gilbert Thompson that its present location has proved inadequate. Four floors of a modern building have been leased and the work of transferring the equipment is now going on.

The floors secured include a basement in which the storage battery plant will be located, as well as a storage room for line construction supplies. The general offices will be located on the first floor and the operating room together with operators' quarters on the third floor, while the wire chief's department will be on the fourth floor. When the changes have been completed the company will be in a position to handle the probable increase for some time to come.

QUERIES

PRIVATE LINE ARRANGEMENT.—(698.)

We have a subscriber, A, in a town, X, who wants connection with two concerns, B and C, in a town, Y, twenty miles distant, by means of a private line. He wants to be able to talk to B without C's being able to listen and vice versa. We have tried to arrange switches at stations B and C so that either could cut the other off, but we have not been able to get a satisfactory arrangement. Can you help us? A is not willing to have the line run through our local switchboard at Y, as he wishes his connection to be absolutely private.

It would be extremely difficult to make any arrangement of switches whereby B and C could cut each other off when either wished to talk to A. If the stations are not too far apart, the following simple circuit can, we believe, be worked successfully. Arrange two magneto sets with an extra contact on the switch hook, connect these two contacts by means of a third wire, which includes a buzzer and several cells of battery in series. When both receivers are removed the buzzer will operate, the current returning over the line wire, and will set up a noise in instruments B and C which will prevent either from hearing and will advise A that both parties are on the line. This will also serve for a busy test to B, who might want to use the line while C was using it and vice versa.

CAPACITY OF CONDENSER.—(699.)

Will you please explain the method of finding the capacity of glass condenser constructed as follows: Glass dielectric size 5 inches by 4½ inches and 1-32 inch thick. Two pieces of tin-foil, size 4⅞ by 4¾ inches. I saw an item in a copy of February 17, 1906, in reference to telephone lines being affected by the wireless. Having trouble of this nature to contend with I constructed a number of glass condensers of different sizes and tried them, cutting them in on protectors at substation, getting the best results from the one I mentioned above. It not only stops the arcing, but it stops the noise, giving you a clear line, and does not interfere with the transmission. J. R.

The capacity of a condenser may be computed in microfarads by the formula

$$\frac{K\ S}{4{,}450{,}000\ d}$$

where K = specific inductive capacity of the dielectric,
S = square inches surface of either electrode,
d = inches separation of electrodes.

The specific inductive capacity of glass for telephone frequencies is 6.

The surface mentioned by our correspondent isf 21.3 sq. in.

The separation mentioned is 1-32 inches.

Substituting in the formula we have

$$\frac{6 \times 21.3}{4{,}450{,}000 \times 1\text{-}32} = .00092 \text{ M.F.}$$

This is equivalent to the capacity to ground of about 50 feet of underground cable and we should expect that it would be hardly sufficient to stop sparking across the carbons in cases of violent disturbance from a wireless station.

As a practical form of condenser we would suggest taking three sheets of heavy paraffin paper a foot square and pasting tin-foil 11 inches square on both sides of one sheet. Then placing the remaining sheets above and below, roll the whole into convenient compass.

The condenser should in all cases be tapped across the carbon plates as close as possible so as to have very short lead wires.

NOISE FROM ELECTRIC LIGHT CIRCUITS.—(700.)

A correspondent writes: "Regarding the query of C. F. L. (No. 694), in your issue of May 12, would say that I think the assumption by the writer that the electric light circuits are not grounded does not always apply. If the circuit is constructed on the three-phase plan it can be safely assumed that the neutral wire is not only grounded at the machine, but also grounded at every transformer to comply with the requirements of the Board of Fire Underwriters. In a large number of Western cities, at least, this rule is enforced to the letter, notably so in Chicago.

"If C. F. L.'s cables are well grounded at both ends I am inclined to think that his trouble arises from induction in the open wires leading to his house connections.

"It may also be possible that his cable ground is of a different potential from that of the electric light ground; in which case a ground wire connecting water mains and gas mains, in addition to an earth plate, might remedy his trouble. Some companies prefer to insulate their cables as well as possible by means of marlin hangers at every point except at the office, while others go to the other extreme and ground them thoroughly at both ends in order to equalize potential differences. These, however, must be treated largely as local condition." If there is any further information to be obtained on this point we shall be glad to hear from those who have had useful experience.

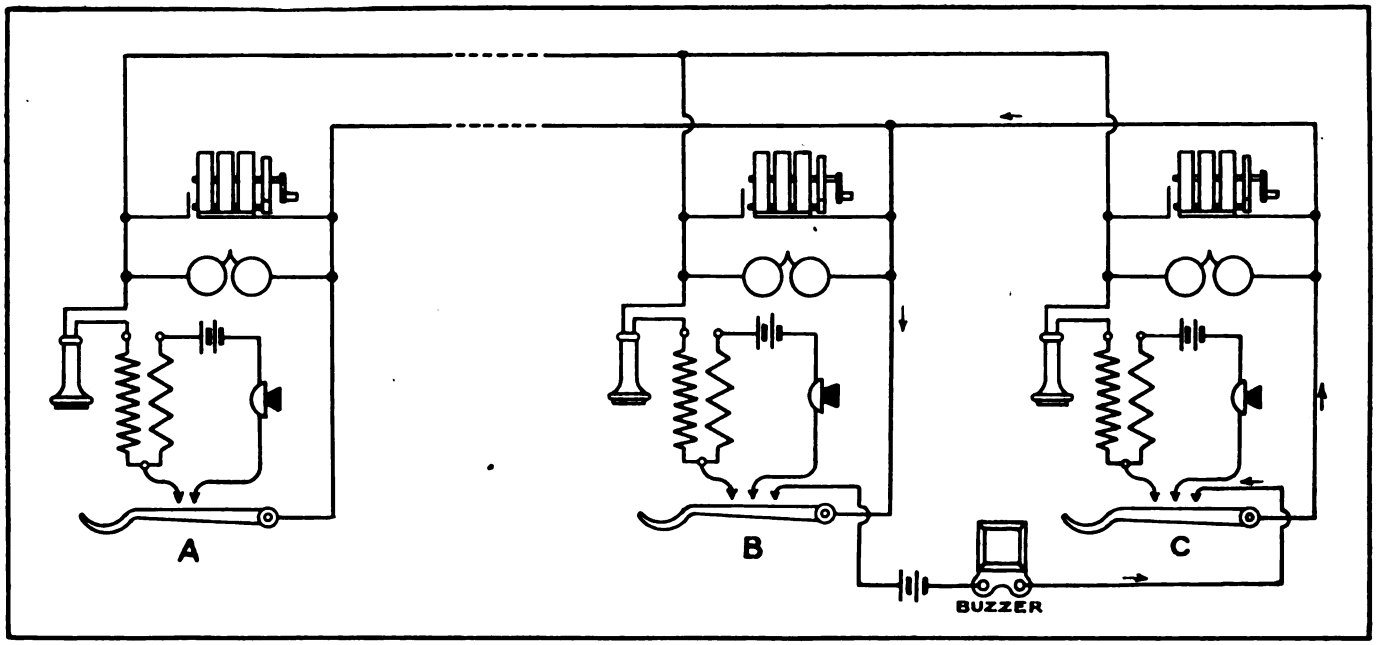

Fig. 698.

THE SYSTEM AT DECATUR.

(*Continued from page 337.*)

they rest against an insulated stop, and are normally under tension, which insures a positive connection when the plug is inserted.

The line lamp jacks are built in conjunction with the associated answering jack and mounted on a strong brass base. The lamps are supported in a spring collet brass socket, provided with an opalescent disc. The socket, with lamp, may be easily removed from the front of the board. The lamp jack springs are so constructed that the lamp can be inserted only so far that the terminals will make proper contact with the jack springs.

The combination lamp and answering jacks are firmly clamped to a strong steel mounting plate by the ferrule of the jack passing through the mounting plate from the front and threading into the base of the jack. The ferrule is insulated from the mounting plate by a hard rubber bushing. The jacks are set into a hard rubber milled face plate, insulating the frame and preventing the jack from turning out of position. The clearing-out lamp and also the pilot lamps are so constructed that they may readily be removed from the front of the board, facilitating the testing or changing of lamps in case of defective signals.

For illuminating the lamp signals and operating the relays, operators' transmitters, etc., the system is provided with a storage battery plant and regular power equipment. The battery plant consists of twelve cells of lead-lined wood tank, Chloride Accumulator storage batteries, of sufficient size to meet the requirements of the present equipment for a period of twenty-four hours without recharging. The capacity of the tanks permits the batteries to be enlarged by adding the necessary elements as the plant is increased until the ultimate capacity of the switchboard is reached with the entire system changed to operate upon a full central energy basis.

The charging machine is of sufficient size to operate the exchange when completed to its ultimate capacity, and is built to operate from a 110-volt direct-current lighting circuit. The motor and dynamo of the charging set are connected by a flexible insulated shaft, giving them the appearance of a tandem machine. The dynamo end is of a necessary capacity to generate sufficient current at a suitable potential to meet the maximum demands of the storage batteries when completed, to supply the ultimate capacity of the switchboard when operated as a central energy system. The charging machine runs very quietly and without undue heating. The power plant is also provided with a Roth dynamotor, built to operate from a 110-volt direct-current lighting circuit, with a secondary output of 100 volts alternating. There was also furnished an auxiliary ringing machine built to operate from a 24-volt storage battery plant, having a secondary output of 100 volts alternating. The ringing machines are mounted on a heavy iron table, provided with a hardwood top, supported on solid soft rubber balls resting on a wooden frame. The table is provided with a marble front, to match the power board.

The power board contains the necessary ammeters, volt meter, volt meter switch and the required switches and other apparatus for properly controlling the power equipment. The power board equipment is mounted on a heavy marble slab, supported on a strongly constructed iron frame.

A view of the relay track and frames is shown. The distributing frame is a combination main and intermediate rack. The line side is provided with 1,300 pair carbon block lightning arresters and Kaisling self-soldering heat coil protectors. The distribution of the lines is done with flame-proof jumper wire. The cable work between the relay rack, distributing boards and the main switchboard, is carried on special overhead iron cable chutes, and is connected in a neat and substantial manner.

The equipment was furnished and installed by the International Telephone Manufacturing Co., of Chicago.

While re-equipping the plant, the location of the exchange was changed to a position nearer the centre of traffic, and in order to provide for the large increase considerable additional cable was put into the conduits and on the heavy aerial leads. On the first page is shown a photograph of the interior of a man-hole with the cables when testing and straightening out the cable and records while cutting over the exchange.

This installation is an interesting example of the type using a lamp signal multiple board for generator-call systems with grounded line construction, as well as of what is known as "growing exchange" system, constructed originally for generator-call telephones and so arranged that it may be changed at any time to full central energy without discarding any of the apparatus installed.

CITIZENS COMPANY OF GRAND RAPIDS HOLDS ANNUAL MANAGERS' MEETING.

ENTHUSIASTIC co-operation formed the keynote of the annual meeting of the managers of the Citizens Telephone Company held at Grand Rapids, Mich., on May 10 and 11.

In addition to about thirty of the Citizens Company's managers, a few representatives of outside systems were present, namely: Clark Smith, of the Grand Ledge Telephone Company; Wm. Robinson, general manager of the Citizens Telephone Company of Muskegon (a separate organization from the Grand Rapids company); H. H. Hutchins, of the Saugatuck & Ganges Telephone Company; F. M. Howard, of Flint, with the Saginaw Valley Telephone Company; H. T. Clough, manager of the Union Telephone Company's Owosso exchange, and W. J. Melchers, general manager of the Union Telephone Company.

During the sessions, which started each morning at nine, several very interesting and instructive papers were read and discussed. The following is a list of these papers:

Address of Welcome, E. B. Fisher, Secretary of Citizens Telephone Company; Monthly Reports and General Office Work, G. C. Britain, Auditor Citizens Telephone Company; Suggestions, C. E. Tarte, General Manager Citizens Telephone Company; Requirements of a Successful Local Manager (by request), H. T. Clough, Manager Union Telephone Company, Owosso; Daily Record of Rental and Toll Revenues, C. E. Smith, Manager Citizens Telephone Company, Cadillac; Keeping in Touch With the Details of the Business, F. V. Newman, Manager Citizens Telephone Company; Rural Collections, D. H. Owen, Manager Citizens Telephone Company, Lowell; Construction Hints, A. Stacey, Superintendent of Construction, Citizens Telephone Company; Some Experiences of a Traffic Manager, G. F. Stratemeyer, Traffic Manager, Citizens Telephone Company; Co-operation of Local Managers. F. C. Hughes, Manager, Citizens Telephone Company, Lansing; Courtesy, J. P. Badour, Manager, Citizens Telephone Company, Allegan; Care of Apparatus, E. Land, Superintendent of Equipment, Citizens Telephone Company; The Value of Discipline in Central Office Management, A. A. Burch, Manager, Citizens Telephone Company, Battle Creek; The Rural Subscriber, F. L. Francis, Manager, Citizens Telephone Company, Portland; Errors, W. S. Vivian, Manager of Clearing House; and The Importance of Knowing Your Subscribers, H. Taylor, Manager, Citizens Telephone Company, Marshall.

On the night of Thursday, May 10th, a banquet and smoker was given to the visiting managers and to all of the male employes in the Citizens Telephone Company's Grand Rapids exchange. The gathering took place in the company's building and was attended by one hundred and sixty. The fun started at 7 P. M., and continued until about 11.30. The entire program was furnished by the Citizens Telephone Company's employes, and included speech making, stories, vocal and instrumental music.

These meetings, which have a permanent place in the company's policy, are very pleasant and helpful to the men who are deputed to handle the company's systems.

RAPID INDEPENDENT DEVELOPMENT TAKING PLACE IN TUSCARAWAS COUNTY, O.

THE Tuscarawas County Telephone Company has exchanges at New Philadelphia, Canal Dover, Uhrichsville, Dennison, Newcomerstown, Mineral City, Tuscarawas and Midvale, with over 3,000 subscribers.

Tuscarawas county is one of the richest in the State for its mineral deposits. It has a population of over 70,000 and is the seventh county in the State in the number of inhabitants.

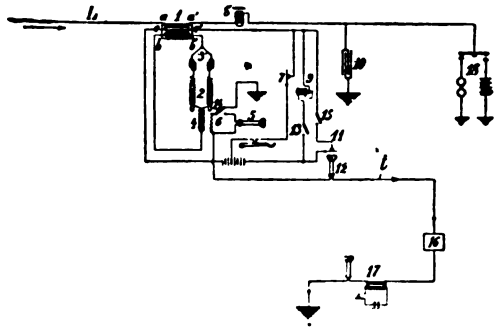
TELEPHONE PATENTS

COMPOSITE SYSTEM.

Carlo Turchi, Ferrara, Italy, patents (No. 809,865; dated Jan. 9, 1906; filed April 15, 1903; serial No. 152,736) a combined telegraph and telephone system.

In this invention means are disclosed for the simultaneous operation of telephone and telegraph instruments over a single



grounded line. To accomplish this result the inventor provides besides a line transformer, or repeating coil, a separator. Referring to the illustration, 1 is the transformer having 3 windings. Coils $a\,a^1$ and $b\,b^1$ belong to the receiving telephone and coil $c\,c^1$ is in circuit with the transmitter and signaling instrument. The separator 2 which is the prime feature of the invention and which is designed to allow only telephone currents to reach the telephone, consists of a closed circuit which receives the telephonic and variable portions of the telegraphic currents through the winding $b\,b^1$ of the repeating coil. This circuit is split into two branches 3 3, which each contain in series self induction and capacity of predetermined quantities. The branch circuits are then differentially wound around soft iron core 4 before they are again united. A winding 6 also surrounds this core and forms the secondary winding, included in circuit with which is a receiver 5. In operation the inventor claims that by adjustment of the capacity and self-induction constants of the separator two separate currents of different frequencies can pass through the differential coil 4, one of which will not be able to set up a magnetic effect sufficient to cause the receiver 5 to respond, while the other will.

The transmitter 7 is included in a local circuit including coil $c\,c^1$. For signaling purposes, owing to the fact that an ordinary generator would operate the telegraph relays, special apparatus is devised. This consists of an interrupter 9 and a sounder 8, in the form of an ordinary receiver. Closing switch 13 sets the vibrator 9 in motion and the interrupted current is transmitted through the repeating coil to operate the sounder 8. Line condenser 10 is provided to close the circuit for telephoning at a time when the act of telegraphing would momentarily open the circuit. If it is desired to connect a subscriber to the circuit, switch 14 would be connected to ground and the circuit completed through receiver 12 and switchboard 16 to ground at the substation. Transmission from the substation direct being impracticable, on account of the weakened condition of the current after passing through the separator, a relay is interposed. This consists of receiver 12 and transmitter 11. Switch 15 is closed, placing transmitter 11 in series with coil $c\,c^1$. The telephone 12 speaks into this transmitter and the words are transmitted in the usual manner; 18 represents the usual telegraph station.

SUPPORT FOR HEAD RECEIVERS.

Kelley M. Turner, New York, N. Y., patents (No. 817,457; dated April 10, 1906; filed January 18, 1906; serial No. 296,653) a support for head receivers.

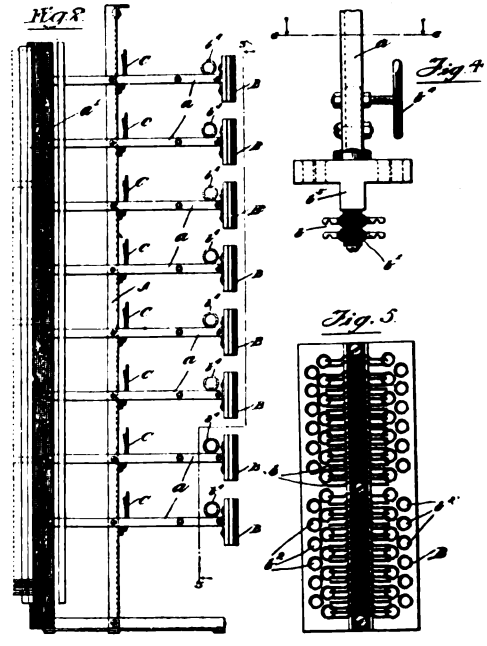
The object of this invention is to provide a means whereby the head band can be folded into a very small space when not in use. This the inventor accomplishes by dividing the supporting band into two parts and joining them together by a pin or rivet, which forms a pivot for folding purposes. The clip or fork to hold the receiver is also pivoted to the band. The ability to rotate the members of the band and its flexibility accomplish the desired end.

DISTRIBUTING BOARD.

Frank B. Cook, Chicago, Ill., patents (No. 816,847; dated April 3, 1906; filed February 2, 1903; serial No. 141,459) an iron frame distributing board.

The principal object of this invention s to provide a board at which the line and swithboard wires may be readily connected and disconnected.

Referring to the accompanying illustrations bars designated by the letter a are horizontally extending arms attached to any



suitable framework. To their forward ends are attached vertical strips a^1 upon which may be mounted any suitable protection devices. Terminal blocks B are removably fastened to the rear portions of the arms a and provided with a shank b^3 for attachment thereto. This shank carries a supporting ring b^4. A vertical strip of insulation b^1 is employed to hold the terminals b in position. The face of the block B is drilled on each side of the insulating strip with a double row of holes to receive the conductors.

The inventor claims that with this construction and arrangement of the blocks B the work of connecting and disconnecting lines is greatly facilitated.

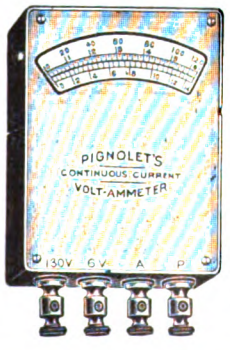
POSITION wanted with a manufacturing company in the advertising or sales departments, by a young man with energy, experience and ability. No reasonable offer refused provided there is opportunity for advancement. Address Box 613, AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 613

WANTED—Several young men to plan telephone toll line and cable construction. Preference will be given to men with good electrical educations. The work is located in the western part of Pennsylvania. Necessary expenses paid when out of town. No applications considered unless age and salary expected are stated. Address Box 618, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 618

WANTED—Position as manager in exchange of 1,000 subscribers or less. Have had five years' experience in telephone business and am graduate of International Correspondence Schools. Best of references. Address Box 597, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 597

THE VALUE OF A MEASURING INSTRUMENT



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

IN THE MANUFACTURING FIELD

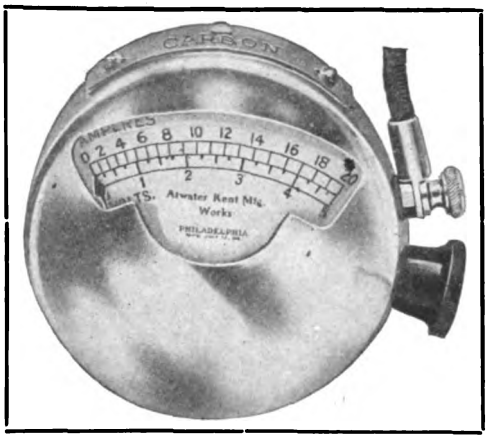
"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

AN INGENIOUS BATTERY TESTING METER.

THE Atwater Kent Manufacturing Works, of Philadelphia, Pa., manufacturers of pocket volt-ammeters, voltmeters and amperemeters, has recently put on the market a new meter called the Atwater Kent "DriSel" Tester, which is having a large sale. This meter is designed as a convenient instrument for making quick and accurate readings on dry cells. As shown in the cut, no leads are necessary, the back of the instrument being placed on the zinc terminal and any part of the side of the instrument on the carbon terminal.

This instrument is made up either as a voltmeter, reading from 0 to 3 volts or as an ampere meter, reading from 0 to 30 amperes. Each one is finished in the finest manner and furnished with a handsome leather case.

The regular meters made by this company, known as the "Kent Pocket Meters," are increasing in demand each year and there are now said to be some twenty thousand in constant use. These instruments are all calibrated by hand to standardized apparatus, made by skilled workmen, have a "Dead-Beat" needle giving a quick and accurate reading, and every instrument is fully guaranteed. As shown in the cut, the Automatic Volt-Ammeter has but one lead and no change is made in the connection to the battery for the two readings, as that in amperes is obtained by simply pressing the button.



Automatic Volt-Ammeter Made by the Atwater Kent Manufacturing Works.

The voltmeters and amperemeters are the same in size and appearance as the automatic volt-ammeter, but without the button attachment. A hand-sewed leather case is furnished with each instrument. The instruments of this company are sold at an extremely low price. Further information may be obtained on application to the company.

THE SWEDISH-AMERICAN TELEPHONE CO., Chicago, Ill., has recently received orders for their complete equipment from the following telephone companies; Farmers' Mutual Telephone Co., White Pigeon, Mich.; Osceola Telephone Co., Osceola, Mich.; Perry Mutual Telephone Co., Perry, Okla.; King City Telephone Co., King City, Mo.; Cuba Mutual Telephone Co., Mayfield, Ky.; Bascom Telephone Co., Bascom, Ohio; Forest Green Telephone Co., Forest Green, Mo.; Moore & Liberty Telephone Co., Enderlin, N. D.; Farmers' Union Telephone Co., Letcher, S. D.

Meter for Testing Dry Batteries Made by the Atwater Kent Mfg. Works.

THE F. BISSELL COMPANY, of Toledo, O., manufacturers of the line of construction specialties which is so well known, recently held its annual meeting, electing the following officers: President Frederick Bissell; vice-president, James Hodge; secretary, C. M. Hamilton; treasurer, L. N. Bardoll. Messrs. Hamilton and Bardoll purchased the interest held by Charles A. Peckham, who was the former secretary and treasurer of the concern.

THE DEAN ELECTRIC COMPANY, of Elyria, Ohio, has recently received orders for a number of common battery switchboards, amongst which may be mentioned the Farmers Mutual Independent Telephone Company, Everett, Washington, one multiple switchboard, 3,000 line multiple, equipped for 960 local and thirty rural lines. This exchange is to be equipped with the Dean harmonic system. The contract also calls for one multiple toll section, and a complete power plant with a harmonic converter. The Niagara County Home Telephone Company has ordered for its exchange at Tonawanda, N. Y., one multiple switchboard of 3,000 line ultimate, with 800 local and thirty rural lines equipped. This switchboard will be equipped for the Dean full selective party line system with duplicate harmonic converters.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, Buffalo, N. Y., reports that recently magneto switchboard shipments have been made to Belmont, N. Y.; Geneseo, N. Y.; Farmersville, N. Y.; Little Valley, N. Y.; Caywood, N. Y.; Lodi, N. Y.; Interlaken, N. Y.; Ithaca, N. Y.; Attica, N. Y.; Russell, Pa.; Freeville, N. Y.; Akron, N. Y.; Springville, N. Y.; Coudersport, Pa.; Charlotte, N. Y.; Williamsville, N. Y.; Stafford, N. Y.; Truxton, N. Y., and Sugar Grove, Pa.

THE FRENCH BATTERY COMPANY, Madison, Wis., reports that its "Fleur de Lis" dry batteries have met with an exceptionally gratifying reception during the short time they have been on the American market. The company has recently moved its factory from Chicago, although it still maintains an office and salesroom at 69 Wells street.

THE LEEDS AND NORTHRUP COMPANY, 4901 Stenton avenue, Philadelphia, Pa., desires to call attention to a new medium price galvanometer which it is manufacturing. This instrument will be found of great value in testing long lines and is so designed as to give very accurate results. It is simple in construction, quick working, has strong suspensions that allow no zero shift, and a sensibility that is adequate for all ordinary measurement purposes and many that require a high degree of precision. With an instrument of this type location of trouble can be quickly determined and thus a great deal of time and money may be saved in the maintenance of a plant. The instrument in question is listed as a D'Arsonval Galvanometer Type P and all inquiries should include mention of this type to secure a full and detailed description.

THE S. H. COUCH CO., INC., Boston, Mass., has issued bulletin number fourteen descriptive of exchange telephone apparatus, construction material and accessories. The first pages are devoted to instrument wiring diagrams and descriptions. Signaling apparatus comes next and this is followed by illustrated descriptions of five distinct types of wall instruments for local and common battery service. On the latter pages will be found illustrated descriptions of the various parts used in the Couch telephones together with a brief description of the Style

39 intercommunicating telephone adapted for trunk line service. Tools, construction material and pay station apparatus complete this very comprehensive booklet which will be mailed to all parties interested upon request.

USES OF WIRE CONNECTORS.

FOR many special purposes in line building the use of a readily removable wire connector affords a means of securing a proper method of construction, both from an economical and practical standpoint. In Fig. 1 is illustrated the H. W. W. wire connector. This is a standard type containing wire grooves which are made with different depths for use with wires of different size. It clamps the wires between opposite grooved plates, which are released for the insertion of the wire, and brought together and clamped by the action of a single bolt and nut. Figs. 2 and 3 illustrate the use of the connector for attaching drop wires, such as the drop wire for a party line subscriber, to a continuous main wire. The connector can be very quickly slipped over the main wire and clamped to it. This particular piece of apparatus by an ingenious arrangement of its parts makes it possible to use smaller wires for the drops than for the main circuit, and to make substantial test joints between line wires and insulated bridle wires connected to cable conductors. Fig. 4 shows two methods of connecting wire ends upon a double grooved insulator.

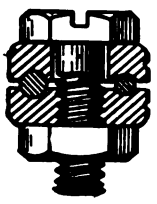

Fig. 1. Construction of H. W. W. wire connector.

This connector has also been extensively used for test joints in toll lines at intervals of five miles or less. In Fig. 6 is shown the method of arranging test connections at a transposition pole. The Chicago Brass Company, 211 and 213 Lake street, Chicago, Ill., is the general sales agent for the H. W. W. wire connector illustrated in connection with this article, and this firm is able to give further information concerning the advantages and economies to be effected by the use of this low priced device.

THE ELECTRIC CABLE COMPANY, of 17 Battery place, New York, has just received large orders for Voltax, the new insulating compound from the American Railways Company, of Philadelphia; S. Pearson & Son, contractors on the Pennsylvania tunnel, and from the United Water Improvement Company of Philadelphia. Reports show that this material has been used successfully both as an insulating compound and as a waterproofing. The company reports the sale of this compound in large quantities to fifty leading railway companies in this country and in England, France, Germany and Italy.

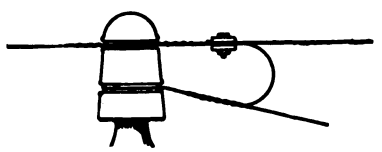

Fig. 2. Method of attaching drop wire to main line.

FRANK B. COOK, Chicago, Ill., has issued a new catalogue which describes his cable terminals. Nine different types are illustrated, each being accompanied with a price list for sizes varying from five to 100 pairs. In connection with these terminals several novel improvements have been made. The fuses are clamped in place by a simple spring device instead of with nuts and screws. The covers are equipped with spring locks which automatically hold them in place when raised for inspection. Terminals which are for use without pot-heads and all junction boxes are equipped with self-soldering nozzles. This catalogue will be found of particular value to parties interested in cable distribution and can be secured free of cost by addressing the company.

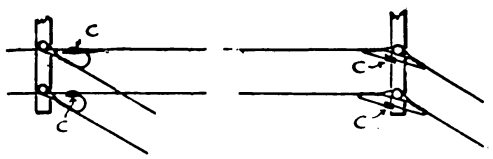

Fig. 3. Test connectors used for taking off loop to subscriber and for carrying line through when wires from both directions are dead ended at corner pole.

THE ELECTRIC GOODS MFG. CO., Boston, Mass., in a mailing card which it is sending to the trade shows the economical value of a private hotel system. This company makes a specialty of telephone equipments for hotels, factories, offices and private houses. Full particulars of instruments and systems to meet any service requirements can be secured by addressing the company.

THE COLUMBIA ELECTRIC COMPANY, McCordsville, Ind., is manufacturing a telephone known as the Columbia Special, to which it wishes to draw attention. This instrument is designed for heavy service conditions where there are a number of parties on one line. The generator is wound for a large output so that it will ring on a line carrying many parties. All the contacts are of pure platinum, and the best silk magnet wire is used for ringers, generators, and induction coils. The talking and listening equipment is said to be excellent, it being possible to transmit the tick of a watch over forty miles of line. The company will be pleased to quote prices and will furnish particulars upon request.

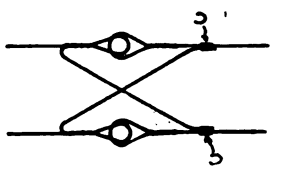

Fig. 5. Test connections at transposition pole.

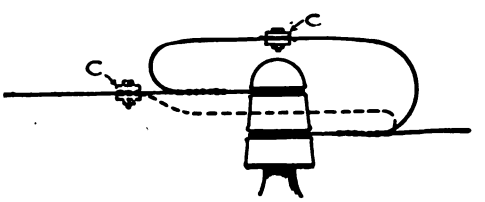

Fig. 4. Method of carrying through line connection on double grooved insulator.

THE FISK-NEWHALL TELEPHONE MANUFACTURING COMPANY, Chicago, Ill., has compiled catalogue No. 4, in which is described a large variety of apparatus. Net prices of each article are given, so that in making up estimates no delay need occur, due to lack of information upon costs. This firm manufactures a steel drop frame which can be built of any size so as to be easily adapted to any make of switchboard in which it is desired to replace old style drops by those of a more efficient type. Amongst other things shown are a new type of distributing frame, a new fuse, enclosed in a glass tube, and the Fi-Ne coil and generator winders. This catalogue can be obtained free of cost by application to the company.

THE TRUMBULL ELECTRIC MANUFACTURING COMPANY, Plainville, Conn., is distributing a folder which sets forth the advantages claimed for its switches. Briefly stated these are perfect contact secured by self-aligning contact clips; superior binding post attachment which insures solid and immovable contacts; and high grade mechanical construction. The switches are made in four styles, single and double contact, and single and double throw. Each type is illustrated and accompanied with list prices and discounts for standard packages or less. The folder contains information concerning the faults frequently present, but not readily detected, in knife switches which should be interesting and useful. These switches have a ready sale amongst telephone companies which use them on various circuits about the exchange, and on small rural line installations. A copy of the folder can be secured by addressing the company.

"GREAT OAKS FROM LITTLE ACORNS GROW AND MINUTES INTO HOURS, YOU KNOW"

Are you getting paid for all the excess minutes your toll lines are in use?

The overtime charges on one call seem to you not worth bothering about. But if you note for one month the number of times your lines are used and the approximate excess minutes and fractions over your time limit, you will be surprised at the loss.

Now multiply this lost amount by twelve months and the result is astonishing.

We want this next statement to sink deeply into your mind. Think over it, sleep over it and remember it every time your toll operator makes a connection:

"A Calculagraph will save every minute of lost time and the saving in three months will more than pay for it!!"

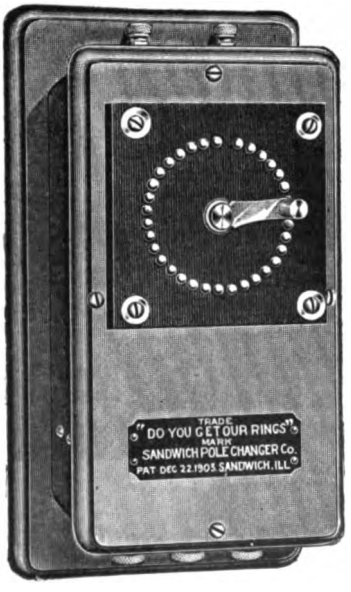
It Makes No Clerical Errors
Write for Booklet

The CALCULAGRAPH CO.

1437 Jewelers Building, NEW YORK CITY

TO GET THREE OUT OF TWO SEEMS IMPOSSIBLE

Yet the Illinois and Sandwich Duplexers easily make two metallic circuits into three



Just stop and think what this means to you in increased facilities without spending a cent for new line construction.

Here are the facts in the case: By connecting our duplexers to the two existing metallic circuits a new one is formed which utilizes each pair of wires as one side of an independent metallic line.

To eliminate all noise due to induction we provide a very simple and efficient balancing device which requires no skill in its manipulation and which will make the new circuit absolutely quiet.

Seems almost too good to be true. Let us prove it by sending a set on 30 days free trial.

We know you are interested; therefore don't delay, but write to-day

NEW COMPANIES.

CYCLONE, IND.—The Cyclone Co-operative Telephone Company, of Cyclone, Clinton Co., Ind., has been incorporated with a capital stock of $500. The stockholders are Albert Strong, W. D. Bolt, W. G. Irons, W. S. Emley, Jas. McIntire, J. B. Derrick, J. W. Bartlett, Edward Spray and others.

EVANSVILLE, IND.—The A. & G. Telephone Company, Evansville, has been incorporated with a capital stock of $5,000. The incorporators are Cornelius Roeder, Christ. L. Goeble and Louis A. Haas. The company will operate telephone systems in Vanderburgh, Posey and Gibson counties.

NEW PARIS, IND.—The New Paris Independent Telephone Company, New Paris, Ind., has been organized with a capital stock of $20,000. The officers are: President, S. C. Richie; secretary, W. D. Rush; treasurer, A. C. Lindemuth. The company will have connections as far south as Eaton and as far east as Eldorado.

PRESTON, IA.—The Preston Telephone Company has been organized, and has completed arrangements whereby it will acquire the Jackson Telephone Company, of Preston.

SIDNEY, IA.—A municipal telephone system is to be installed in Sidney. G. Munsell will be in charge.

LOVELL, ME.—The West Lovell Telephone Company, of Lovell, has been incorporated with a capital stock of $1,000. President, W. S. Fox; treasurer, G. W. Andrews, both of Lovell.

ALANSON, MICH.—The Buckeye Telephone Company has been incorporated with the following incorporators: Calvin S. Dice, J. C. Bowman and Gilbert L. Hicks. The company will build lines east and west of Alanson.

GARY, MINN.—The Gary Telephone Company has been incorporated with a capital stock of $5,000. The incorporators are Halvor Lee, D. C. Jones, Gregor Moe, N. J. Nereson, Anton Lanon, Trom Rishof and Andrew Engeset. The following officers have been elected: Ole H. Sersland, president; Andrew K. Rude, vice-president; Halvor Lee, secretary, and N. J. Nereson, treasurer.

HALLOCK, MINN.—The Kittson Telephone Company, formerly the Hallock Telephone Company, has been incorporated with the following officers: John Birkholtz, president; R. A. Demars, vice-president; T. M. George, secretary and treasurer. The company will build lines to Mattson, Lancaster and Bronson.

NEW RICHLAND, MINN.—The New Richland Telephone Company has been incorporated with a capital stock of $10,000. The incorporators are Milo A. Hodgkins, H. E. Johnson, F. J. Wagner, C. W. Brown and C. B. Johnson.

ST. CLAIR, MINN.—The Independent Telephone Company, of St. Clair, has been organized with the following officers: President, Henry Theilman; secretary, Chas. O'Connor; treasurer, J. W. Chase; directors, P. H. Bowe and William Boswell.

SUMRALL, MISS.—The Sumrall Telephone & Telegraph Company, of Sumrall, Miss., has been incorporated with a capital stock of $5,000. The incorporators are J. R. Anderson, John Nutt, B. R. Campbell.

OSMOND, NEB.—The Southwestern Telephone Company, Osmond, Pierce County, Neb., has been incorporated with a capital stock of $320.

CLAYTON, N. M.—The Kenton Telephone Company, with headquarters at Clayton, Union County, N. M., has been incorporated with a capital stock of $2,500. The company will build telephone lines in Union County, N. M.; Baca County, Colo., and Beaver County, Okla. The incorporators and directors are: Henry Bearly, J. J. Ballard, John W. Turner, A. W. Hanner, R. F. Drew and D. K. Lord, all of Kenton, Okla.

BOUGHTONVILLE, O.—The Boughtonville Telephone Company, Boughtonville, O., has been incorporated with a capital stock of $10,000. The incorporators are: W. G. Blackmore, J. O. Palm, F. E. Hale, Willard Howard, S. E. Gleason, E. A. Van Buskirk.

MINERVA, O.—The Minerva Telephone Company, Minerva, Stark County, O., has been incorporated with a capital stock of $4,000. Incorporators are E. D. Shaw, R. T. Davis, A. A. Bates, C. G. Hursh, B. C. McCauley and W. E. Russell.

TORONTO, O.—The Republic Telephone Company has been incorporated with a capital stock of $25,000 to operate lines in Toronto, Empire and New Cumberland. The incorporators are J. G. Gilchrist, R. Gilson, W. C. Jones, Lee O. Smith and J. T. Campbell.

CLINTON, OKLA.—The Clinton Mutual Telephone Company, with principal offices at Clinton, Okla., has been incorporated with a capital stock of $1,000. The directors are: F. G. Cope, J. D. Kiletrell and F. A. Wadleigh, all of Clinton.

HENNESSEY, OKLA.—The College Corner Rural Telephone Company, Hennessey, Okla., has been incorporated with the following incorporators: Robert L. Sutton, George Gray and others.

HENNESSEY, OKLA.—The Myrtle Rural Telephone Company has been incorporated. J. R. Fowler, W. D. Frakes and others are incorporators.

SAYRE, OKLA.—The Modern Telephone Company, with headquarters at Sayre, Okla., has been incorporated with a capital stock of $10,000. Directors are: D. E. Grubs, O. J. Ivester, L. P. Jones and Robert Rice, of Sayre, and T. S. Wilson, of Prentiss, Okla.

FREEWATER, OREGON.—The Tumalum Mutual Telephone Company has been organized at Freewater, Oregon, with F. J. Bodefelt as president. The company will build a line between Freewater and Walla Walla.

ENTERLINE, PA.—The Enterline-Halifax Telephone Company has been organized at Enterline. The company will commence the construction of its lines at once.

MT. PLEASANT, PA.—The Farmers' Telephone Company, of Mt. Pleasant, has been organized with a capital stock of $3,000. The company is to build a line to Donegal.

VETERA, PA.—The Nicktown & Ebensburg Telephone Company, of Vetera, Cambria Co., Pa., has been incorporated with a capital stock of $5,000. Nathaniel Good, of Nicktown, is among the incorporators.

BRITTON, S. D.—The Marshall County Telephone Company, Britton, S. D., is to be incorporated with a capital stock of $100,000.

HITCHCOCK, S. D.—The Westside Telephone Company, of Hitchcock, has been incorporated with a capital stock of $5,000. The incorporators are: B. W. Lamphier, W. P. Price and Frank Gilley, of Hitchcock.

GORDON, TEXAS.—The Mt. Zion & Lost Creek Telephone Company, of Gordon, Palo Pinto County, Texas, has been incorporated with a capital stock of $1,000. The incorporators are W. H. Rix, R. M. Vaughn and W. J. Pierce.

DALLAS, WIS.—An Independent Telephone Company has been formed at Dallas. The company will operate lines in East and West Dallas and Maple Grove. The officers of the company are: Ben Massie, president; Frank Garner, secretary; John Hanson, treasurer; J. S. Hegtwet, director.

DARLINGTON, WIS.—The Lovett's Branch Telephone Company has been organzed with E. G. Nall as president. The company will build a line from Darlington to Wiota.

STRATFORD, WIS.—The Stratford Telephone Company, Stratford, Wis., has been incorporated with a capital stock of $1,500. Incorporators, R. Connor and others.

UNION GROVE, WIS.—The Union Grove Telephone Company, Union Grove, has been incorporated with a capital stock of $5,000. John S. Blakey, president, and William Callander, secretary.

OTTAWA, CAN.—The Telegraph Company, which is to operate the telegraph and telephone lines of the Grand Trunk Pacific, has been incorporated with a capital stock of $10,000,000. The incorporators are President Hays, Frank W. Morse, Wm. Wainwright, W. H. Biggar and D'Arcy Wainwright of the Grand Trunk Pacific directorate.

SNOWFLAKE, MAN., CAN.—An Independent Telephone Company has been organized at Snowflake with the following officers: Wallace Brown, president; R. T. Robertson, secretary and treasurer; construction committee, Adam Maxwell, John Fallis, R. T. Robertson and James Drew.

ST. CATHARINES, ONT., CAN.—A new Independent telephone company, to be known as the Niagara District Independent Telephone Company, has been organized at St. Catharines to compete with the Bell Company. Alfred Hoover, of Markham, is interested in the organization.

WELLAND COUNTY, ONT., CAN.—The Welland County Telephone Company has been incorporated with a capital stock of $40,000, to construct and operate a telephone system in Welland County. The directors are C. Glenny, S. H. Tripp, W. Robinson, all of Welland County, Ont.

FRANCHISES.

FOUNTAIN, MINN.—John S. Solis has been granted a twenty year franchise for a telephone system in Fountain, and will establish an exchange there.

GLENVILLE, MINN.—The Tri-State Telephone Company has been granted a franchise at Glenville.

NORTHFIELD, MINN.—C. E. Church has applied for a telephone franchise in Northfield.

WEST LEIPSIC, O.—The Farmers Mutual Telephone Company has been granted a telephone franchise at West Leipsic.

FORT SILL, OKLA.—The Wichita Mountain and Orient Railway Company has been granted permission to construct and maintain a telephone and telegraph system through the Fort Sill military reservation.

FINANCIAL.

PRINCETON, ILL.—The Bureau County Independent Telephone Company has declared a semi-annual dividend of 4 per cent.

SLEEPY EYE, MINN.—The Sleepy Eye Rural Telephone Company has declared a dividend of 6 per cent.

Bridging Telephone.—Type M.
This style of cabinet also made into:
3-Bar, Series, Type "K"
4-Bar, Bridging, Type "L"
with any ringer resistance desired.

Western Pioneer Telephone

Five-Bar Bridging

Our **New Western Pioneer** telephone can be furnished for all classes of special service such as **ring through, non-interfering, divided circuit, central checking party line** and in fact can be used where any generator call telephone is now being used. The apparatus used in this instrument is of **New Western design.**

The **common battery type** of **magneto telephone** is becoming popular. The cabinet is compact and neat in appearance, all parts are **conveniently mounted,** the wiring is simple and the cabinet will accommodate a **three, four or five-bar generator.** We manufacture all of the parts used in this instrument. When the upper compartment is open the generator, ringer, hook switch, induction coil and receiver binding posts are exposed. When the battery box is removed by sliding downward, the batteries and battery connections are exposed.

TWICE AS GOOD, COST NO MORE

than the ordinary kind--only one of the many protective devices we make for the critical trade.

These blocks are smaller, neater and better constructed in every way than blocks of other manufacturers for the same purpose. The springs are made of German silver, instead of brass or copper. They cost us more and are better as they do not lose their elasticity. The fuse is of our own special design and patent, giving many times the length over other styles. By wrapping this fuse around the mica we not only secure a "choke coil" effect, acting as an impedence to the passage of the lightning, but heat the wire more rapidly at the angles. By this method we bring the fuse wire within 1-32 of an inch from the ground plate, and give at least eight discharge points to ground. We do not use ordinary soft, easily broken composition fuse wire, but a special hard wire which will stand considerable rough handling, and is of the proper size and conductivity. By the use of this type of fuse and the ground plate there is no necessity for the purchase of blocks with carbons, although, we make and can furnish them if so desired.

A customer wrote us, Jan. 9th, 1906: "Please express at once 500 of your No. 1 patent wrapped fuses. We have purchased about 2,500 of your fuse blocks and will want 500 more. They have met every requirement intended for their use." (Letter on file.)

Free sample on request of an operating company. Write to-day.

THE WEEK'S MESSAGES

CLINTON, MO.—The Mutual Telephone Company, of Clinton, contemplates increasing its capital stock from $15,000 to $100,000. The money will be used to extend the company's system.

ULYSSES, NEB.—The Ulysses Independent Telephone Company has declared a dividend of 12 per cent. for the year.

BELOIT, WIS.—The Beloit Telephone Company has declared a 5 per cent. dividend on its capital stock.

KILBOURN, WIS.—The Farmers' Inter-County Mutual Telephone Company has increased its capital stock from $5,000 to $10,000.

COMBINATIONS.

WINCHESTER, IND.—The Winchester Telephone Company, Winchester, Ind., has been acquired by the Eastern Indiana Telephone Company.

READFIELD, MAINE.—The Crosby Telephone Company, Readfield, has been acquired by the Maine Telephone Company.

CHATHAM, N. Y.—It is quite probable that the Home Telephone Company of Albany will soon acquire possession of the property of the Chatham Co-operative Telephone Company.

ELYRIA, O.—The Rawson Company, of Elyria, has purchased the controlling interest in the Oberlin Telephone Company. The Rawson Company is to entirely reconstruct the system.

ELECTIONS.

MACOMB, ILL.—The Macomb & Western Illinois Telephone Company, Macomb, has elected the following officers: President, C. M. Erwin; vice-president, George Kerman; secretary, E. Y. McLean; treasurer, C. V. Chandler.

OAKLAND, ILL.—The Embarrass Tel. & Tel. Company has elected the following officers: E. N. Blair, president; John H. Henn, vice-president; J. D. Noel, secretary; George Kirkpatrick, treasurer.

PRINCETON, ILL.—The Bureau County Independent Telephone Company has elected the following officers: Dr. E. A. Owen, president; C. O. White, general manager and secretary; S. S. Harris, assistant secretary.

ULYSSES, NEB.—The Ulysses Independent Telephone Company has elected the following officers: President, W. H. H. Starbuck; vice-president, D. A. Wynegar; secretary, G. E. Crosby; treasurer, George Dobson.

LEBANON, N. J.—The Lebanon Telephone Company has elected the following officers: President, S. J. Shurts; vice-president, George Clark; secretary, A. O. Farley; treasurer, E. W. Sutton; directors, J. C. Farley, H. H. Miller, J. E. Ramsey.

AMSTERDAM, N. Y.—The Automatic Telephone Company has elected the following directors: W. Wendell, J. K. Stewart, A. W. Breedon, D. Ostrom, W. B. Charles, J. T. Sudgen, A. R. Conover, L. E. Harrower, B. Fisher, S. Wallin and Geo. McClumpha.

COHOES, N. Y.—The Cohoes & Waterford Home Telephone Company has elected the following directors: Jas. H. Shine, John Clute, Fred. W. Kavanaugh, Thos. Breslin, George H. Fitts, P. H. Andrae, I. M. Brush, Howard Hendrickson.

PERSONAL.

HORTON S. ALLEN has been appointed superintendent of the district of the New England Telephone and Telegraph Company, covering the exchanges of Brighton, Newton, Waltham, Needham, Wellesley and Concord, with headquarters at West Newton, Mass.

D. G. RALEY has been appointed superintendent of the northern division of the Columbiana County Telephone Company, of Salem, O.

CHARLES E. TEUSH, formerly in charge of construction in the Evansville district of the Cumberland Telephone and Telegraph Company, has been appointed general superintendent of construction with headquarters at Nashville.

FRANK TRUHLER has been appointed manager at Hudson, Wis., by the Northwestern Telephone Exchange Company.

A. WALKER, of Iowa Falls, has accepted the position of manager of the Mutual Telephone Company of Des Moines.

KENDALL WEISIGER, who has for the past four and a half years held a responsible position in the engineering department of the Southern Bell Telephone and Telegraph Company, has recently been promoted to a position in the general manager's office. He will have charge of the company's traffic in the seven States in which it operates.

MISCELLANEOUS.

INDIANAPOLIS, IND.—Arrangements have been made by H. S. New, president of the Indianapolis Telephone Company, and Theodore Thorward, president of the South Bend Home Telephone Company to construct a through metallic copper toll line between this city and South Bend. Heretofore the toll business has been transacted through Logansport, but the number of calls has so increased that connections are not established as rapidly as patrons desire. Messages from this city are transferred to the northern part of Indiana and through Michigan by the South Bend exchange.

EDMONTON, ALBERTA, CANADA.—$25,000 has been provided for the preliminary work on the establishment of a government owned telephone service in the province. The government intends establishing long distance lines through the province of Alberta.

New Construction in the Field

GLOBE, ARIZ.—The exchange of the Globe Telephone Company is to be entirely reconstructed, and many improvements made to the system.

MURILLO, ARK.—The Cotton & Reves Telephone Company, of Murillo, Ark., is to build a number of rural lines.

BELVIDERE, ILL.—The Belvidere Telephone Company, Belvidere, Ill., is to rebuild its lines, and put in an entirely new and modern system. The company expects to expend about $25,000 in making these improvements

MACOMB, ILL.—The Macomb & Western Illinois Telephone Company is to build a long distance line from Macomb to Quincy, also one to Keokuk, Ia., by way of Bowen, and one to Peoria.

ODELL, ILL.—The Odell Telephone Company is constructing a new country line.

COLUMBUS JUNCTION, IA.—The Columbus Junction Telephone Company is making many improvements and extensions to its system.

INWOOD, IA.—The Hawarden Telephone Company, of Hawarden, will build a line through Inwood.

SCHLESWIG, IA.—The Schleswig Telephone Company is making many improvements in its system.

TRAER, IA.—The Mutual Telephone Company is building a line to Buckingham.

GAINESBORO, KY.—The Gainesboro Telephone Company is to double the capacity of its switchboard, and will also put up 4,000 feet of cable in Glasgow.

GRAND BLANC, MICH.—The Grand Blanc & Mundy Telephone Company is building a number of new lines.

GRANITE FALLS, MINN.—The Granite Falls Telephone Company is to build several rural lines.

NORWOOD, MINN.—The Norwood Young America Telephone Company is to install a line through Camden.

OKOLONA, MISS.—The Givhan Telephone Company is constructing a line from Okolona to Amory and Aberdeen.

MACON, MO.—The Macon Telephone Company has commenced the reconstruction of its plant. The company contemplates many improvements in its system, including the installation of a new switchboard.

ESKALAKA, MONT.—The Eskalaka Telephone Company is to expend a considerable sum in completing its system.

THOMPSON, MONT.—The Independent System, owned by E. D. Peck, of Thompson, is being extended to Plains. A new exchange is also to be established at Thompson.

LEBANON, N. J.—The Lebanon Telephone Company is to extend its lines in many directions.

BATH, N. Y.—The Wayne circuit of the Bath, Hammondsport and Savona Telephone line is being extended to Weston.

CENTERVILLE, N. Y.—The Neversink River Telephone Company is preparing to install an exchange at Centerville and one at Hurleyville. The company will also build lines to Sheldrake and Woodburn.

COHOCTON, N. Y.—The Cohocton Valley Telephone Company is extending its lines.

HANNAH, N. D.—Messrs. Adams and McGrath, of Hannah, are building lines from Hannah to Sarles, thence from Daniels to Calvin.

LANSFORD, N. D.—H. Willis is installing a telephone system in Lansford.

BURTON, O.—The Burton Telephone Company, of Burton, is making improvements in its system.

CRESTLINE, O.—The Crestline Telephone Company is building a number of rural lines.

MARTINSBURG, O.—The Knox-Licking Telephone Company, with an exchange at Martinsburg, has commenced work on its Purity-Wilkins branch.

NEY, O.—The Ney Telephone Company is preparing to make extensions to its system.

OXFORD, O.—The Oxford Telephone Company is extending its lines along the Eastern Township line.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

MUST BE RUBBED IN

Advertising, like liniment, doesn't do much good when applied with a feather. It needs to be rubbed in for results. Apply it through the right mediums to the right people at the right time, and keep on rubbing it in until returns begin to come. Then still keep on rubbing.—*Jed Scarboro, in Profitable Advertising.*

THE GOULD PLATE

The large contact surface for the active material of the Gould plate is *developed out of the lead of the blank itself*—not by the removal of any metal but by our special process of "spinning" the surface of the lead blank into the numerous ribs.

We employ only chemically-pure lead, dense and uniform throughout.

The Gould plate retains its initial capacity longer than any other type. For telephone work it is unequalled. Complete estimates upon request.

Lower Prices on Condensers

Here's a chance to save money on condensers and improve your service.

Iron Box Condenser
No. 300

Save in 2 ways.
Lower price on the condensers.
Less time used in installing them.

All the tools needed are:
1 screwdriver,
2 screws, and
3 minutes time.

That's how these condensers shown in the cuts are put in, also our No. 186.

On party lines they are as essential to perfect service as the current itself.
No trouble from other receivers being off the hooks if you use a condenser.
You can talk just the same.
No one but the party you are speaking with can hear you.

Just to show you how they improve the service, we'll equip your line with our condensers *Free of Charge*. Use them 30 days. If they are all we claim send us the price, or, if you don't like them send them back—we'll pay the freight.

Better send for our new circular.
The prices in it are lower than in the old ones.

YOU LOSE SUBSCRIBERS

because of the little things in the business. There is little difference between one man and another, but that little counts for a great deal. It is the little things that count.

We have been making dry batteries for eighteen years and every year we have tried to make them a little bit better than the year before. In doing so we think we have helped to lessen telephone troubles, and helped the telephone business.

The "1900" dry battery is one of the little things that make for perfection. Try it.

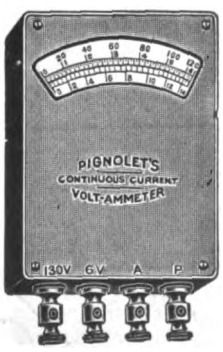
CHEAP VS. EFFICIENT SERVICE



The cheapest telephone service in the world is dear at any price if it is not efficient.

When a man installs a telephone he wants to be able to use it and not to abuse it.

A grounded line nine times out of ten is noisy, and foreign noise on a telephone line will arouse a feeling of anger in the heart of the user that isn't good for the company. You can keep your lines free from grounds and other troubles by periodic tests with a Pignolet voltmeter, and when they do occur, you can locate them with this instrument, and get them cleared often before the subscriber knew his line was in trouble.

If you need your subscribers' good will, you need my voltmeter to get it.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

Please mention THE AMERICAN TELEPHONE JOURNAL when writing to ADVERTISERS.

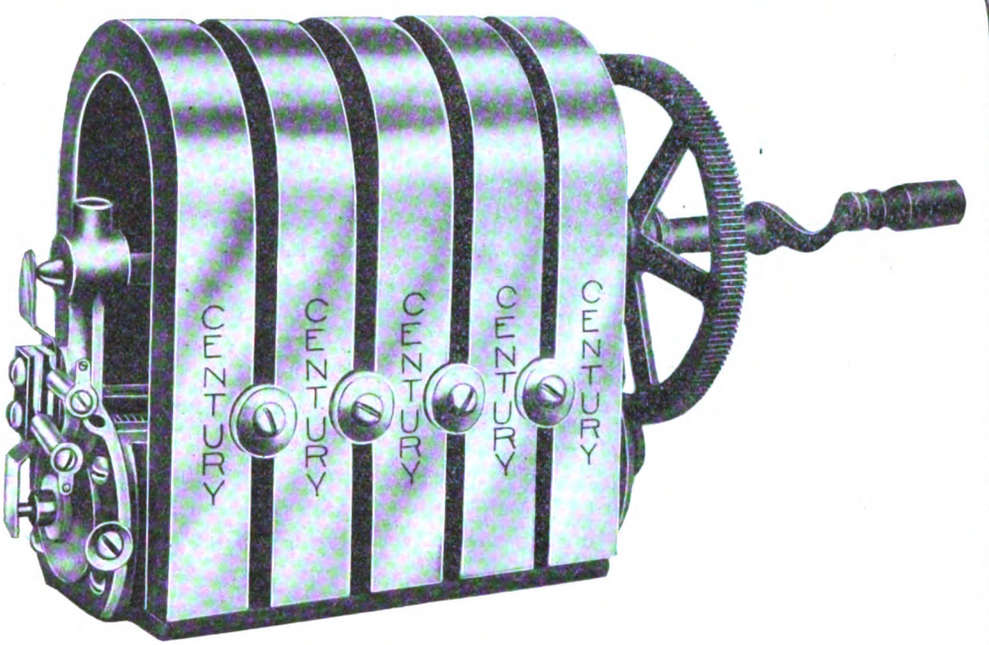
CENTURY

100 % GOOD

The reason why you can connect more

Century Telephones



on a line, and still have more than sufficient ringing power, is because the "CENTURY TUNGSTEN" steel generators are equipped with magnets made of tungsten steel. This steel will retain about 30 per cent. more magnetism than any other, and consequently when used in generators increases their power just that much. The generator has other features just as good that we will be pleased to show you. LET US SEND YOU ONE. Our line of Magneto and Common Battery equipment is complete.

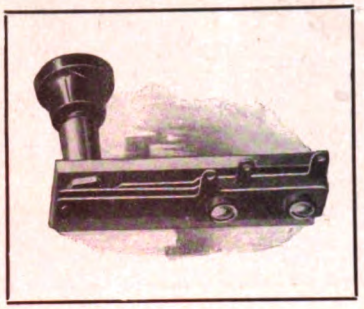
Little Things That Count



Simplicity is a noticeable feature of all MONARCH apparatus. The push button used in bridging telephones for code signalling, to ground the generator, to change the ringing current from alternating to pulsating, etc., is no exception. A mounting to go inside the cabinet, a bushing to pass through to the outside, a plunger with a hard rubber button and any arrangement of contact springs. That is all.

MONARCH TELEPHONE MFG. CO., - - CHICAGO, U. S. A.

Type SW Terminal. No pothead necessary. Equipped with carbons and tubular fuses.

DEAN TELEPHONE APPARATUS

WE wish to call your attention to a few practical points which may seem obvious, yet they are without question the most vital ones in the construction of a telephone. In fact reliability and facility of repair should be the very first in the list of imperative considerations.

A hook-switch with a removable lever which is normally securely locked in place by a spring catch. When it is removed it prevents breakage in handling and shipping.

A transmitter arm which can be removed without disturbing the transmitter wiring.

A very sensitive ringer made by the new Dean construction which absolutely prevents sticking.

A powerful generator which has stood the test of time.

A self-contained arrester with lock-nut line binding posts.

A tapper guard for protecting the ringer from injury.

Four (4) hinges with soldered connection spiral springs to carry wiring to the cabinet lid does away with loose cords.

Two (2) locks which will not fall out when the cabinet lid is open.

Mounting holes in corners of backboards are metal bushed so as to prevent splitting or marring of woodwork.

Circuit wiring run in grooves in the woodwork which is afterwards filled with hot beeswax to prevent entrance of moisture, gives permanent and lasting results.

All exposed metal parts are entirely insulated from circuit, preventing disagreeable or dangerous shocks.

Last but not least, a talking circuit consisting of the new Dean transmitter, receiver and induction coil which will talk perfectly through the longest lines.

The above are some of the reasons why Dean telephones are enthusiastically adopted.

Let us send you one of our thirty-two page Bulletins No. 101 A, which give complete description and circuits.

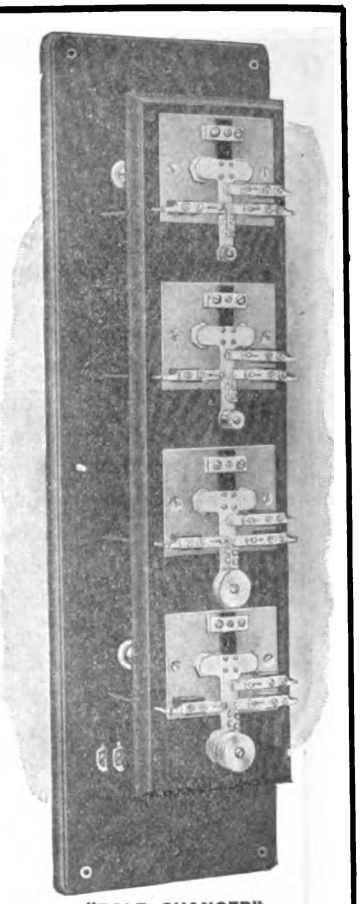
KELLOGG

FREQUENCY POLE CHANGER

Utmost SIMPLICITY of operation

THIS POLE CHANGER can be used on common battery or magneto exchanges.



"POLE CHANGER" COVER REMOVED

Advantages:

1. Requires very little attention after once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from Primary or Storage Batteries.
4. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
5. Operates successfully on any standard voltage of a telephone exchange.
6. Practically noiseless in operation.
7. Only THREE contacts on each Vibrator.
8. The vibrators have a very long spring, hence they will not break or change the frequency.

THE TRANSFORMER CABINET contains all necessary Switches, Fuses, etc.

Pole changer cabinet and transformer cabinet separate.

Can be put in different rooms if desired.

Sold separately or complete.

No additional apparatus needed on power board already installed.

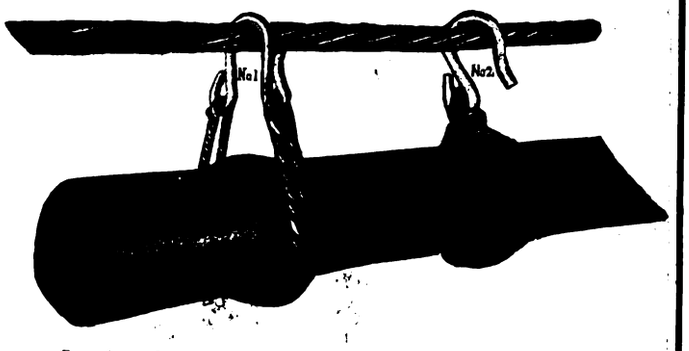
Swisher Marline Cable Hanger

PATENT APPLIED FOR



In the above illustration we show in figure No. 1 the Swisher Marline Hanger, in figure No. 2 the old style now in common use. The advantages we claim for the Swisher Hanger are: First, easy to install. Second, greater strength. Third, hook cannot become detached from strand. Fourth, hook cannot straighten under strain and let cable down. Fifth, in stringing of wires over cable, wires sagging will not catch under hook as in old style. Sixth, after cable has been installed, same can be pulled without opening the hooks.

We use only the best grades of marline and No. 9 hooks galvanized after forming. Our No. 9 hook on account of its construction will stand a greater strain than a No. 6 hook of old style.

WHAT'S WRONG

with that TELEPHONE INVESTMENT of yours?

Why doesn't it pay you as well as the best of your investments?

Is the reason bad management or bad equipment? More likely the latter.

Probably the company is trying to do a 20th Century business with 19th Century apparatus.

If that's the case, it is spending more and earning less than it might if it had our Automatic Telephone equipment.

This is the only really modern telephone system. It produces the ideal telephone service—quick, sure and secret—at half the operating expense of a manual equipment, and this service commands better rates.

It costs a fixed price per hundred lines to enlarge the automatic exchange, instead of an increased price per each hundred lines, as in the manual equipment.

The automatic exchange is never outgrown; it never has to be "scrapped" and replaced by a complete new one, as with the manual. You just add to it as you do to a sectional book-case.

All these points bear upon the stability and value of your telephone securities. They mean dividends to you.

Over ninety per cent. of all the large orders placed during the past few years, either for new installations or replacements, have been for our automatic system, and all the companies adopting it have, from the increased earnings, been able to pay the interest on their bonds and a good dividend on their stock.

Our Automatic System has been adopted in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Albuquerque, N. M.
Allentown, Pa.
Auburn, Maine.

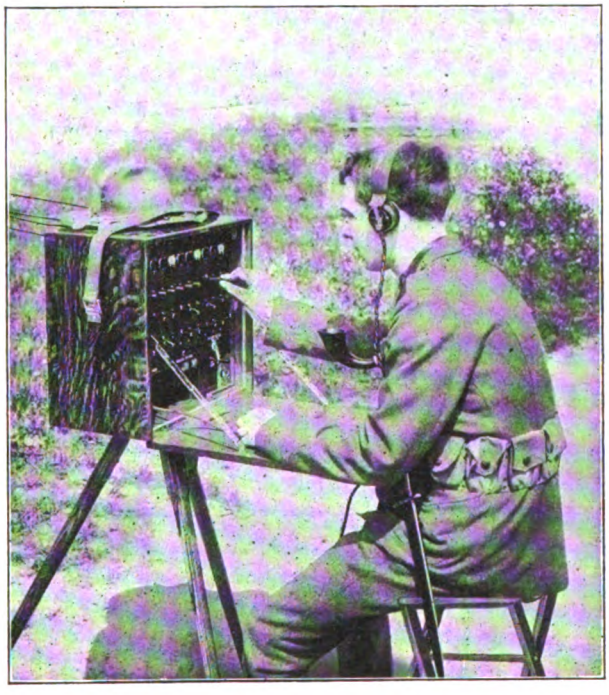
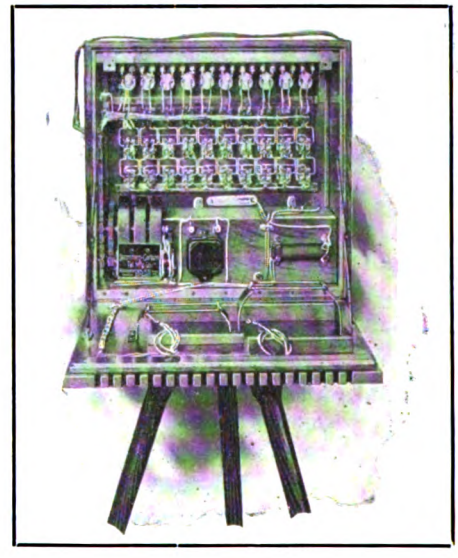
STROMBERG-CARLSON GOVERNMENT SWITCHBOARDS

A NEW TYPE OF SWITCHBOARD FOR ARMY USE

THEIR extreme simplicity and ease of operation together with the well known reputation of the Stromberg-Carlson apparatus appealed to the Signal Officers of the U. S. Army. We are just completing an order for twenty of these switchboards built and designed from exacting specifications prepared by the Engineers of the Signal Corps, which call for apparatus that will be most serviceable in the field and withstand the various conditions and changing climate.





The switchboards here illustrated are of the cordless type, equipped with ten line drops, ten ringing and listening keys for connecting the different lines together. In the manufacture of these instruments it has been interesting to serve the Government officials and the ingenuity and excellent results obtained are apparent.

This work may be considered a new branch of the telephone business, demanding the best efforts of its Engineers and the very highest standards of the manufacturer's art which are essential to receive the final approval of the Chief Signal Officer of the United States Army.

WE MAKE CABLE

If all Telephone Men

throughout the country could get together and hold an experience meeting, positive proof would be forthcoming that the straight and narrow way is the cable way, and that all those who are struggling along on the byways of open line construction will be down and out unless they make haste in changing their ways.

It stands to reason that a system of distribution which reduces line troubles to an almost negative point is far superior to the old scheme of open lines. The right kind of cable will do this, and that kind is Stromberg-Carlson.

However, lest there should be any doubt in your minds as to the veracity of our statements, we have secured the testimony of several men who have travelled both roads.

P. Kerr Higgins, whose reply to our inquiry is given herewith, has had 23 years' experience in maintenance, construction and engineering.

Ten years were spent with the National Telephone Company of Great Britain; three years with the Chile, S. A., Company; six years with the Central Union, and four years on the Pacific coast with the Home Tel. Co., the United States Long Distance Co., and as a consulting engineer.

Mr. Higgins gives his views concerning the relative merits of cable construction and open wire lines in the following letter:

Oklahoma City, O. T., March 28, 1906.

Gentlemen: I am decidedly in favor of using all the cable possible. The modern telephone system must have a large percent (if not all) of its lines in cable for the following reasons: (1) It means superior service to the subscriber. (2) The minimum amount of trouble. (3) Minimum maintenance help and consequently minimum expense. (4) Minimum construction force, both in erection and additions to plant. (5) The foregoing being true, its use simplifies records, reduces the work of the manager and the office force and in this way effects a saving throughout the entire system.

The best way to prove the above is either to try it or segregate the trouble, where both aerial wire and cable are in service. It is now possible to prove the foregoing statements by writing those who have had experience with cable plants for detailed data, which cannot now be disputed as it is no longer an experiment, but a demonstrated fact.

A close examination of trouble in cable and open wire plants shows that the comparison between the two is as 1 is to 58; one being the cable plant and 58 the aerial.

Yours very truly,

P. Kerr Higgins.

Of course, you are convinced that cable is the construction to adopt. If you will write for our booklet 79B you will find abundant reasons for placing your order with us.

Organization in Telephone Work

By P. Kerr Higgins.

No surgeon would attempt to perform any operation until he knew the functions and position of each and every organ of the body with which his instruments would come in contact. In no greater degree is a general manager qualified to organize or systematize any company unless he is thoroughly familiar with the details or units of its organism. The load of carrying on the company's affairs must be as evenly distributed as possible and while he does not allow himself to be taxed with the burden of numerous persons reporting on unnecessary details, yet his lines of communication are so laid that he can at will probe into any point or part he may suspect of weakness. It is found good practice in a large company with, say, over 15,000 subscribers to have a general manager, whose immediate assistants are a business manager and a general superintendent, as shown in the chart of organization.

In the first place the general manager should be accessible to all the executive officers, as he is the head of all departments; the ideas of several men are difficult to transmit to departments, and it is therefore his office to gather information from all available sources and then issue the required instructions to subordinates.

The authority of the general manager has usually a fixed limit as to expense. Up to this point his word and judgment are law, while beyond this he must consult the advisory board or executive committee, and beyond them it is referred to the board of directors who have "carte blanche" from the stockholders. All reports pass in through the channels indicated in the chart, are condensed by the heads of departments, in accordance with a pre-determined plan and chart, and pass on to the general manager for approval and to complete his report. His duties then may be summed up as follows:

Meeting the public on all vital questions; appointing chiefs and organizing departments; approval and authorization of all expenses; receiving and tabulating of all reports; approval of all purchases; fixing of the salary schedule for all employees; general supervision of the plant; making of stated reports to the directors; making of banking arrangements, rebates, notes, special contracts, etc.

As was shown in the organization chart presented in the first article of this series he divides up his work into two distinct sections, the business section and the operating section, and appoints a head for each. As indicated, the business section is divided into three groups: Buying, selling, and accounting.

The business manager is the representative of the general manager and reports to him for the departments under his charge. His special duties are: Buying at lowest price of the best material; the collecting of all accounts; obtaining the best prices for contracts; accounting; passing on all material requisitions; making all reports called for by the auditor if there is such an officer, and if not making such reports for the general manager. In any case a copy is sent to the general manager. He has no authority to change records or methods without the approval of the general manager, and makes it a practice to keep in touch with him at all times so as to carry out his wishes.

O. F. French, General Manager of the Cuyahoga Telephone Company, is the Active Head of an Organization Which Has Achieved Conspicuous Success in Telephone Operation.

At the head of the purchasing department is an official who is commonly called the purchasing agent. He does all the buying for the company under the direction and guidance of the business manager. Any contracts or purchases out of the regular requirements of the plant are submitted by the business manager to the general manager for approval. There is in every plant a certain amount of material or parts of apparatus which must be kept on hand. All this comes under the head of regular requirements. The purchasing agent is held strictly responsible for: The obtaining of the best material at the lowest possible prices; the condition of the stock on hand; the quantity of the stock on hand. He is usually required to have compiled or tabulated, for easy reference for any one in authority over him, a complete list, alpha-

Digitized by Google

betically arranged, of all material necessary in the business, showing the prices obtained and the parties from whom bought. He is also supposed to route the purchases to the best advantage and such routing should be shown on the record together with the reason for so doing. He is required to have on file at all times a monthly inventory (for each month) showing the material on hand, en route or ordered and probable date of arrival. It will be his duty to keep the business manager posted regarding necessary supplies and keep in touch with him, so that officer may know just what is being done in the department.

ARTICLE								
SIZE			LOTS OF			REQUIRED		
DATE QUOTED		BY WHOM	TERMS				DELIVERY DAYS	REMARKS
			PRICE	DIS.	DAYS	F.R		

Fig. 1. Form used by purchasing agent for quotation or market record.

With this end in view it is customary to make the business manager a detailed weekly report. The storekeeper's assistants (if any) and clerks are directly under his charge and he is responsible to the business manager for the discipline and operation of his department. Buying and selling are the most important elements in any successful business, and success usually depends on the method of handling these departments. In order to buy to advantage, the purchasing agent must be familiar with the market and of necessity must have an intimate knowledge of the goods he is interested in purchasing at the best market prices. To this end he must know every manufacturer in the special line of goods he requires. These goods should be plainly classified. This record is frequently kept in the loose leaf form, but the card system can also be used to advantage. A card being made out for each article and the cards arranged alphabetically. This serves at once as a price list, cost list, store record and market list. If kept up-to-date it should serve as a check on the inventory return of the storekeeper, which check is frequently found very convenient and even necessary. When quotations are received they are immediately entered up on the card of the article on which they have been received, with the name of the firm quoting, price quoted, discounts, terms, etc. Where a large number of catalogues is carried it is found very convenient to number them and to refer to them by number. Having made the purchase this is also noted in the same manner. The storeroom record and the purchasing items can be kept on two separate cards, if found advisable. All orders for material should be made on a special blank for that purpose, and carefully numbered and entered on order card. In small exchanges this may be simply copied on carbon paper and filed, but in large exchanges, where much purchasing is done, the record-

Fig. 2. Method of keeping inventory check which enables purchasing agent to know the amount of stock on hand at any time.

card is necessary, filed in same manner as the market or purchasing card. When the material ordered has been received it should be carefully checked up and marked short or O K on the order card together with date of receipt, condition of material and initials of checking clerk. The market prices should be checked up to date on all regular material at least twice a year, whether any of that material has been bought or not. The stock received is as important as the market record, hence should be carefully kept up to date. From this the purchasing agent is able to know when is the best time to buy, what he needs, and also gives a comparative statement of amount of material used over a given period and from this he can tell whether or not it would be economy to purchase in large or small quantities. Having checked the goods and found them as per order, invoice is filed to be again taken up at the end of the month. All orders on being given must be filed in the follow-up file, so that should any delay take place it will at once be detected. This file is usually filed according to months and days, and the order copy filed on the day near which the goods should arrive. This record tells at once if an order has been placed and when; it also tells about how long it takes to fill such an order, thus enabling the purchasing agent to know how far in advance he must order so as not to be delayed. In this stock record a note of all tools, furniture, stationery, etc., should also be kept, so that everything may be known, even how long tools or furniture have been in use. This data may be called for at any time by the board of directors and should be forthcoming.

The head of this department is usually known as the contract

SIGNED

Fig. 3. Form used for notifying purchasing agent that additional material is needed.

agent, because all telephone work is done on a contract basis, and while the price of a single telephone for residence or business is a fixed quantity, the special equipment, which is very extensive, varies much in price according to the needs of the case. The contract agent has full jurisdiction over his department under the direction of the business manager. The importance of this department, like that of the purchasing, is not fully appreciated by a large majority of companies. It should be in the hands of an expert salesman, because this is, after all, what he is or ought to be; a man capable of not only doing the work himself, but of educating and directing others how to do it. The work must be systematized and records carefully kept of all inquiries, visits of solicitors, "follow ups," etc. There is a vast difference between planning to sell goods and selling them, and it is rare that a man is found in whom these two characteristics exist. Telephone business is probably easier than the average work of a salesman, but nevertheless calls for rare judgment and tact. There was a time when any one could have been a telephone solicitor, but this was before competition. Now things are changed; we have two companies and every patron lost is two gained for your opponent. Few people realize this, but it is true. Having found out that some one is in the field who wants a telephone or special equipment, a card showing the name, address, date, requirements, and name of canvasser is made out and filed in the prospective cabinet, and the solicitor goes forth to get the order. Such a solicitor must know and be posted on the work in hand; if a telephone is wanted, he must know how

Digitized by Google

many subscribers his company and also that of his opponent has, quality of service, prices, etc. He must be possessed of the usual characteristics of a good salesman—tact, patience, even temper, perseverance without rudeness, politeness and a careful regard for his personal appearance. If special equipment is desired, in addition to the above qualifications, he must know the combinatons possible for telephone business, or at least the ones most generally called for, such as private, private-branch exchanges, intercommunicating systems, extensions, extra bells, etc. He should first ascertain from the prospective user his requirements, then find the combination that will fill them. If none of the special equipment in use seems to meet his needs, then he will make a memo of them and return at once to his superior for instructions; the matter should not end here, but should be followed up at once, if possible the same day. Purchasers may be divided into three classes, those who really want to buy, those who think they want to buy and those who should buy, having the means and to whom telephone apparatus would be a convenience. Before approaching the purchaser, the solicitor of business will study his man, finding out his name, characteristics, likes and dislikes, so that when he approaches him he will be in some measure ready to handle him in the proper manner. If possible, he should get to see him before his competitor has a chance, and should give him all the points he possibly can at the first interview, avoiding carefully any mention of his opponent. In this way when the opposition salesman arrives on the scene, he is at once put on the defensive by the prospective purchaser and thus handicapped in the sale; in other words, fix in the mind of the prospective purchaser the standard and requirements of your apparatus, for all purchasers desire to seem to possess knowledge of the thing to be purchased, and so it pays to go into detail with him and from the information thus given the apparatus of the second caller will be judged. It is good practice to avoid generalities and hold to facts; tell the truth and avoid anything that would reflect on your company or apparatus. Find out, if possible, how much he knows of the apparatus under consideration and avoid permitting him to make you feel he knows more than you do regarding its workings, as this is liable to embarrass the average solicitor, and can easily be avoided by using a little tact and common sense. If possible he should be shown some parts of the apparatus or a similar apparatus in operation and should also be invited to visit the operating room and see the system in every day use. As the business of the telephone company originates in this department, its affairs must of necessity be in the hands of a competent contract agent, who in addition to his abilities as a salesman and educator of salesmen, has familiarized himself with telephone work. He is and must be held responsible for securing business for the company on the best possible basis, for the character of the contracts, and see that they are taken according to the adopted rates for the various classes of service furnished. The moving of telephones, changes in equipment, keeping the directory department

posted as to all take-outs, changes of address and new contracts, he also furnishes the same data to the cashier's and records departments. He will also issue all intallation, take-outs, removal and change of equipment cards, and these should be done in such a manner as to prevent mistakes or a misunderstanding. All cards will be carefully made out records, using a follow-up case, so that no undue delay may ensue. It will be his duty to follow up through the business manager any apparent delay in filling orders and find out the reason, thus being enabled to post the customer as to the progress of his order—whether it can or cannot be filled, and when. If there is any one thing a patron will appreciate, it is attention to his orders, and this must always be done. Never promise anything unless there is every reason to believe it can and will be accomplished. In view of the fact that trained men are necessary to the success of the contract depart-

ment it is found expedient to have a few "understudies" attached to the regular force, so as to avoid interruption by the resignation or removal of any solicitor. No salesman can make a complete success unles he has made a careful study of the "laws of suggestion." It applies with equal force to the corporation as to the individual, and frequently is the one element that closes a sale, but it must be applied judiciously. The individual needs it to stimulate and build up his own character, especially during the "off days" when everything seems to go dead wrong. The head of the department must be a salesman, for the salesmen or solicitors under him look to him for the solution of their difficult cases and all the "hard nuts" are passed up to him for adjustment or solution; then the solicitors under him are nerved or braced up with the knowledge that the man behind them is their superior in every way. This same rule applies to all departments. The work of each man should be tabulated and posted for reference, as also the data showing the gain and loss during the preceding month.

JOPLIN HOME TELEPHONE COMPANY INCREASES EQUIPMENT OF ITS SWITCHBOARD.

RECENTLY ordered additions to the switchboard of the Home Telephone Company, of Joplin, Mo., will increase its capacity by 600 lines. The company has also placed an order for a new toll board which has become necessary on account of the rapid growth of the company's long distance business. During the coming summer there will be effected a number of general improvements which will enable the company to handle a largely increased volume of business.

THE POPE FINDS THE TELEPHONE A GREAT CONVENIENCE.

SHUT up within the massive walls of the Vatican, Pope Pius X finds the telephone a great blessing. His Holiness recently received the director of the Venetian telephone system and was delighted to hear that with the new connection between Venice and Rome it would be possible for him to speak to his relatives at Riese, his native village. "If I cannot see them it will be a great consolation to at least hear their voices," exclaimed the Pontiff.

The telephone is installed in many parts of the Vatican. Twice a day the Pope rings up his three sisters, who live just outside the Vatican walls; and he keeps in daily communication with his secretary of state, Cardinal Merry del Val, during the latter's absence.

Economical Telephone Accounting and Filing Systems

ARTICLE V.—A DAILY RECORD BOOK FOR A TOLL STATION.

*By Charles C. Wilmot, Telephone Accountant.

This article and all forms reproduced have been protected by individual copyrights.
Copyright, 1906, by The American Telephone Journal Company. All rights reserved.

In a large telephone system having many toll stations in country crossroad stores, postoffices and other places, the amount of commissions paid is small, and it is almost impossible to get accurate reports by the usual bookkeeping methods. The form illustrated in connection with this article was designed to outline a recording system which would be easily made out and verified, and so simple as to be proof against error. As a matter of fact, the company for which this form was originally designed and by whom it was first put in service was accustomed to receive from the traveling auditor after every toll station trip reports that accounts were commonly kept on tops of sugar barrels, loose slips of paper—in fact, anything convenient at the moment the message was recorded. To trace the different messages or ascertain the amount due the company was almost a hopeless task. Since the installation of the new system this company has found that one book of 100 duplicate reports is the only record needed. Best of all, the cash receipts have increased and the number of errors and complaints has been greatly reduced.

Although the forms for in and out messages are shown separately here, in practice they are arranged on one continuous sheet, with the binding attachment in the middle, so that the two forms appear as opposite pages in the book. The original sheets are provided on the back with a monthly report form similar to that shown in Fig. 9, which appeared in the issue of the American Telephone Journal for February 24, 1906. The original sheets are torn out once a month, the summary on the back filled out, and then the sheet is forwarded, accompanied by a remittance, to the general office. The carbon copy is left in the book for a local record.

This form has recently been revised to meet the latest rulings of several traffic associations. Forty in and out messages can be entered on every double page of the record. It has been found desirable to issue for the instruction of station agents full printed instructions for the use of agents at the toll stations. These will explain the purpose of the different columns, and are given in full as follows:

Toll Service: Every message sent or received must be recorded in the daily record book, great care being exercised that the originating and receiving operators check messages accurately and in accordance with the Routing and Tariff books. Spaces are provided in the record book for full information necessary for recording each call, special attention being directed to "overtime" and "messenger service," which must, in all cases, be properly charged and reported. Always have the carbon sheet in proper position so that a duplicate record will be made.

"In" and "Out" Business: *Column No. 1. Item Number*—This column indicates number of messages recorded on each page and will be used mainly as a matter of reference in correspondence by the general office with toll stations, as: "Your item No. — on your report for, etc."

Column No. 2. Rate Column—Enter here the correct day rate.

Column No. 3. Day or Night Message—If "night" rate, insert the letter "N" on line of entry in this column.

Form C-66.

N. B. We Allow no Commissions on Company or "Dead Head" Messages. Note this Class of Messages in "Remarks Column."

Fig 18. Form No. G-66, used for reporting from toll station to general offices. This side for "In" messages.

Column No. 4. —Time—In Section "A" and "B" enter the time of beginning and ending of message. Section "C": This column is to include all "overtime" to be shown in "minutes," for time in excess of three minute service.

"Out Message." Column No. 5. Charges—Section "A." "Tolls sent paid": This column is to show the total cash received for each message, which should include both the three minute rate service fee and the charge made for overtime. The overtime should also show in minutes in "overtime" column. (See column No. 4, Sec. "C.")

Section "B." "Tolls sent collect": This column is to include the amount of all service explained below:

Tolls sent collect are calls originating at station, the charges of which are to be collected by the station receiving them. Great care must be shown in having a thorough understanding with the receiving point that the reversing of such charges is permissible, and that the collection of these tolls will be made.

* Editor's Note.—Mr. Wilmot is manager of the Telephone Systems Department of the Edwards & Hine Company, Grand Rapids, Mich.

Digitized by Google

Section "C." "Messenger fees collected": This column should show the amount of all fees as per explanation given below:

Messenger fees collected are the fees collected by a station and charged on originating calls in addition to the regular tariff. The utmost care must be used that the amount collected corresponds with the fee asked by the terminating station.

Reversed messenger fee charges are absoluely prohibited. All such charges must be collected at the forwarding station.

Column No. 6. Switching Station—Under this heading should be recorded the name of the first switching station. That is to say, where it is impossible to ring directly the station wanted, record the name of the station that does the calling. This information is very important, as it enables the general office to give the proper credit of mileage to the company over whose line the message was forwarded.

"In Messages": Column No. 5. Charges—Section "A." "Tolls received paid": This column is to show the total cash received (at originating office) for each message, which should include the three minute rate service fee and the charge made for any overtime, as per explanation given below:

Tolls received paid are calls terminating at a station the charges of which have been paid and collected at the forwarding point. As much care should be taken in recording these messages properly as of "sent" calls; otherwise false charges or credits will be created for or against a forwarding point.

Section "B." "Tolls received collect": This column is to include the amount of all services explained below.

Reversed Messages—For the convenience of the public, charges on originating tolls are permitted to be reversed to the receiving point, providing instructions are properly given by the sending office to the receiving office before the conversation is held. The office receiving the reversed message should record it under the column "tolls received collect." A notation should be made opposite the record in remark column showing that the message was to be reversed or paid at the receiving end.

Messages on Company Business—It is of the utmost importance that every message of this description is checked the same as a full paid message, and recorded in the daily record book, and notation should be made after the record of such messages, "Co. Bus." The total amount of these messages should be deducted from the total amount of "Tolls sent paid and tolls received collect," as no commission is allowed on "Co." messages. The item of "Co. Business" will be approved if satisfactory.

Monthly Toll Reports—Total each column. On the reverse side of the "Out business" sheet will be found a regular blank form for a report of the total month's business and settlement. divided into debits and credits. These are to be made out in accordance with the following instructions:

Debits: Item A. Any balance due telephone company from last month, with the exception of error sheets, is to be debited after this notation.

Item B. Telephone receipts this line for "tolls sent paid." Messages on company business must not appear here.

Item C. Toll receipts this line, for "tolls received collect."

Form C-68.

OUT BUSINESS } **Report to Citizens Telephone Company, Grand Rapids, Mich.**

N. B. We Allow no Commissions on Company or "Dead Head" Messages. Note this Class of Messages in "Remarks Column."

Form Used for "Out" Messages. This Form and that for "In" Messages Printed on One Continuous Sheet, Which is so Perforated that Either is Separately Detached.

Tolls received collect are calls terminating at a station the charges of which are reversed and are to be collected by the agent at the receiving point. Necessary precaution should be used to avoid the possibility of such calls becoming uncollectable.

Section "C." "Messenger fees earned": This column is to include the amount of all fees as per explanation below:

Messenger fees earned: This fee represents the necessary expense involved in obtaining patrons that are called on received messages. Before paying such fees the terminating station must ascertain to a certainty from the forwarding station that the amount will be paid, otherwise no credit will be allowed. Reversed messenger fee charges are absolutely prohibited; all such charges must be collected at the forwarding station.

Charges for Messenger Service—Special attention should be given to reducing messenger fee charges to a minimum, as in many cases excess charges of this nature have created a prohibitory rate for long distance service.

Messages on company business must not appear here.

Item D. Messenger service receipts.

Item E. Other sources (in detail).

Item F. Check errors—tolls. In debiting check errors give the month in which the errors occurred, together with the name of the station with which such omissions were made.

Item G. Check errors—account of messenger service.

Item H. Balance due manager: This represents any balance due manager on current month's business.

Credits: Item I. Balance due manager: Any balance that is due an agent from a previous month is to be shown after this notation.

Item J-K. Commission: Toll stations are entitled to a commission only on originating business, which consists of "tolls sent paid" and "tolls sent collect." No commission allowed on messages on company's business.

Standardization of Methods and Appliances in Telephony*

By Frank R. McBerty.

IT is the work of the engineer to build a machine accurately fitted for a service. Ordinarily the requirements of cheap construction and proper operation are antitheses; a rough proportion is found to exist between quality of performance and labor of construction and operation. He must determine an adjustment between the quality and the cost of performance. To build a cheap machine that will not work is easy; to build a costly one that will work well is not difficult; to build a cheap one to work well is his sufficient task. The engineer then must provide a standard of performance, or a variety of standards to meet a variety of conditions. In telephony the standards must cover transmission, and promptness and accuracy of switching, since these are the particulars on which the salable quality of the product of the machine depends.

Although a rough standard of telephone transmission was established fairly early in the history of the industry, it is only recently that a rational use of such a standard has been made. With the advent of long distance lines, transmission equal to the conventional standard was found entirely inadequate for an increasing percentage of connections. To meet the new conditions, a new instrument was designed and a new standard was established, namely, the transmission from a solid back transmitter provided with two cells of Fuller battery in an aerial line of No. 8 wire, 200 miles long. In the lack of adequate data the assumption was made that all subscribers' lines would require the maintenance of such a standard transmission, and all equipments were judged in relation to the standard, with no great regard to local conditions. Doubtless in many cases the maintenance of the high standard required for connections of extreme length was not warranted by the occurrence or frequency of such connections in the locality and was needlessly costly. Studies of the percentages of conversations which are held over circuits having different resistances or losses up to the limits, which are now available, together with more accurate knowledge of the costs of maintaining different grades of transmission, now permit the determination of the quality of transmission which is adequate and suitably economical for any locality.

Ordinarily the transmission is affected by the nature of the telephone and transmitter, the resistance and insulation of the conductor, and the nature of bridges and repeating coils necessarily present in the circuit for other purposes. In determining the desirable grade of transmission, the transmitters and receivers, and the appliances in the circuit which may produce losses of energy ordinarily can be left out of account, since good judgment in selecting and arranging appliances is more effective in reducing the cost, without impairing the efficiency of service, than any efforts at cheapening these appliances would be. In general the cross section of the conductor is the controlling consideration in determining the economical grade of transmission. Increased cross section improves transmission in a diminished proportion but it increases cost of conductor, insulation and supporting or containing structures largely. For this reason the engineer should determine for each locality, in view of the electrical losses which will be encountered in varying proportions of the probable connections, the minimum grade of transmission permissible in view of the cost of conductors. The acceptance of a single standard applied uniformly to all cases would not seem to be in the direction of adequate planning.

To take examples; a town exchange remote from a city probably will be the center of a net-work of toll lines extending for some distance into the country. Only a small percentage of the local calls will enter the toll lines, and an extremely small percentage of those will reach such a distance as to tax the transmitting efficiency of the local system. Such a case would seem to call for a sacrifice of quality of transmission, to a considerable extent in favor of economy of construction. In the case of a large city, a considerable percentage of the conversations will be over long and profitable toll connections, while a great proportion will be through long cables. In such a case, manifestly a different standard of transmission must be established, dependent upon totally different relations between necessary grade of service and cost of giving it.

The standard of transmission should, therefore, provide a sliding scale, variable within wide limits and adjustable to actual conditions.

Only recently has a definite effort been made to establish standards of performance in switching connections. There are now available data which show the relations between cost of operating and various degrees of promptness in answering calls, and various degrees of accuracy in establishing connections. Improved service in these particulars involves increased expense in switchboards, central office space, operators' wages and trunk equipment. The cost of the three factors last named should weigh heavily in establishing the grade of service to be maintained in a given locality. Unfortunately, the determination is complicated by the fact that in those places where cost of real estate, trunk equipment and wages are highest, the demands for service of high grade are most imperative, but nevertheless, an adjustment should be reached in each case between the cost and the quality of the switching service. The engineer fails to exercise his function when he accepts unreservedly standards of performance which are established under unknown conditions in other places.

In the title of this paper I have referred to "standard appliances," in deference to current usage. Telephonic appliances are not "standardized" in the sense of being adapted or associated with standards of performance. Proposals to standardize appliances now being generally agitated are rather to reduce telephonic appliances to a few types for uniform application.

The important considerations tending toward so-called standardizing of appliances are, reduced cost of manufacture, reduced quantity of stocks, increased promptness of supply and universal knowledge of uses and maintenances. These considerations are to be weighed against several important disadvantages to which I shall refer later.

The most energetic promoter of standardizing appliances ordinarily is the manufacturer, whose interest it is to reduce costs by increasing the quantity of his uniform product. Frequently, however, the reduction of cost effected by standardizing fails to manifest itself in reduced price to the consumer. In such a case the standardizing of appliances falls short of the possible advantages. It is a matter of common experience that the making of a few special appliances is very costly; the making of a moderate number may approach the minimum possible cost; toward the minimum no great advance will be made with further increase of quantity of uniform product. This consideration indicates that special and unusual appliances in small numbers should be avoided whenever possible, excepting for definite experiments, or important special uses; that a variety of standard appliances used in considerable numbers may be preserved; and that a single type of appliance should be adopted for universal use only when upon careful study it is determined that an adequate grade of service can be attained by its use in nearly all cases.

In these times of extraordinarily rapid development in the telephone business promptness of supply from stock or manufacturer is an important consideration. Such promptness of supply can be attained only if the variety of appliances be strictly limited. The consideration may be a temporary one, however, and its weight often can be reduced by fore-knowledge and planning.

The advantages arising from familiarity with telephonic appliances appear both in relation to the public users and to the operating forces of the company. The public is strikingly incompetent

* Abstract from paper read before the Western Society of Engineers.

Digitized by Google

in the operation of mechanism. Mere unfamiliarity with the telephone greatly retarded the spread of its use; the same cause operates against it with respect to any change, even a trifling one, which affects the mode of using it. The addition of a button to push during ringing, the substitution of an automatic for a magneto call, the requirement that subscriber give his order twice instead of once, or give his order in a particular sequence, involves long and patient education; the education of all users is never accomplished and the system labors under a continual burden of inaccuracy and frequent neglect to employ it when it would be successfully used, if it were familiar. We have no measure of the benefits in increased business and accuracy of service which would arise from uniform apparatus, but no doubt exists that substantial departures from uniformity are seriously harmful. It is to be noted that this consideration affects mainly outward appearances and modes of handling appliances, not their details of structure.

The efficiency of the operating companies' employes is largely dependent upon their familiarity with the structures. I refer not so much to the operators as to the construction, inspection and maintenance forces. The existence in a single exchange of a variety of appliances for the same general purposes very greatly increases the burden of educating these forces for their work; and during the process, which is never completed, faults in the structures are continually produced or permitted because of unfamiliarity with the less common appliances. It is a familiar fact that a lack of uniformity in the sections of the multiple board, by hampering the shifting about of the operators, may seriously impair the efficiency of the force. In constructing or maintaining the plant mere differences in the arrangement of terminals and colors of wire insulations result in defects in performance which are costly to locate and eliminate. So simple a deviation from common practice as requiring that the telephones be poled in the circuit has resulted in serious deficiencies of transmission in a large number of instruments. In ordinary mechanism lack of interchangeability of parts results in the obvious failure of the parts to fit in place. In the telephone industry misfits usually are not apparent; they are left to work their insidious evils unobserved.

The disadvantages of standardizing appliances are somewhat more general in their nature than the advantages. Possibly the most important of these is that standardizing prevents the natural selections which operate where a variety of forms are present to bring the fittest to the fore. Purchasing agents and telephone engineers do not proceed like the forces of nature in their selection of the best types; their knowledge of facts is always inadequate, their compromises are not always wise, and their selections are not adjusted continually to changing conditions. Possibly the most striking example just now of the insufficiency of the engineer's best efforts at foresight, is found in the unexpected and enormous spread of telephones, which compels the early abandonment of exchange equipments planned for long lives. Other examples are the persistent refusals, first on the part of the Bell companies and later on the part of the Independent companies, to adopt party lines. Even the provision of a central battery in the exchange, now accepted as the obvious and only rational construction, was strongly opposed by competent engineers. The distrust of automatic mechanism and the opinion which appears to be current that automatic trunking and automatic distribution of calls are unprofitable may in time prove to be unfounded.

The only substitute for natural selection of the best, from types naturally competing, is an exhaustive study and unprejudiced judgment of all structures which promise improvement or economy in any direction. Such research can be conducted only with great resources, and even then it calls for rare foresight and persistence. From these considerations it might seem that standardizing of appliances was safe and even necessary for an operating company with an established business, but undesirable for a new comer compelled to make his way on a showing of good reason for his existence.

A related disadvantage of standardizing appliances appears in the inertia of ideas and of plant, which result from limiting the types of appliances. The public, familiar with the use of only one form of instrument, may decline to use a different though better one; construction and maintenance forces familiar with one form will oppose, malign or even destroy strange appliances. It is a truism in telephony that the opinion of an operator cannot be accepted as to the deficiencies of familiar apparatus or the advantage of new apparatus.

The conservatisms of the public and of operatives can be overcome by education, however; the most serious inertia is that of the capitalist. Where a variety of appliances are used it is not difficult to show economies of one over the other; the results of their competing performances are manifest; and when the competing appliances are rivals it becomes a matter of life and death on the part of the owner of the less efficient to find a better machine. If only one type of appliance is under observation, the basis for adequate study is lacking; the advantages of improved apparatus are not apparent; decrease of profit is not so directly traceable to the need for an improved mechanism, and the motive for prompt replacement is lacking. Even though it be possible to show a theoretical saving in annual charge in favor of improved appliances, there will be no haste to make the change.

In determining upon standard appliances much, and often undue weight is given to the prevailing usage. Such usage sometimes will be found justified by the fact that the appliance is the survivor of many; but not rarely its wide use rests only upon conservatism or inertia. In examining the reason for existence of such usage, a study of its origin often will be enlightening. The conditions which produced it may be found to have disappeared or diminished in importance; or, as in a number of cases which might be named, mere thoughtlessness may have been responsible for its extensive use. An interesting example is the tubular drop, designed as a bridged clearing-out drop, but used almost universally as a line drop cut off during conversation. The costly construction was necessary for its limited use in the permanent bridge of the circuit; but it was needless in the more common use as a line drop. Similarly the bridging magneto was designed for multi-station lines; but its use became almost universal for lines where its costly winding of fine wire was unnecessary. Even now the sales of bridging bells are mainly of the costly sort adapted for extremely severe conditions of service, which only a small percentage of them are required to meet.

In so far as it is possible the selection of standard appliances should be based upon costs rather than prices. Prices of new and highly efficient or patented appliances are likely to have no fixed relation to costs. Thus, the adjustment of quality to costs of performance, may be entirely vitiated by unexpected and arbitrary changes in price.

While it is desirable that telephone systems in their present condition of partial development should be left reasonably free to improvement, the engineer should be on his guard against waiting for new developments. The structure produced to-day will develop faults to-morrow of a sort peculiar to itself. Existing and tried structures, perhaps with some trifling improvements, the effects of which are certain, should ordinarily be preferred to promising new ones.

One point remains to speak of, which is an important and not always tolerable factor affecting the uniformity of method and appliances in the telephone industry. This is personal interest. On the part of the manufacturer it appears in reluctance to modify his product, or to abandon an obsolete type. On the part of the engineer it often appears in his adherence to appliances of his own design. The inventor is notoriously a poor judge of his inventions. It is nearly always possible to make an appliance different and in the absence of adequate data to advance claims of improvement. The best example of telephone engineering practice in existence, which is also an example of the closest adherence to standard method and appliances, has been achieved almost wholly without invention on the part of the engineers who created the system. Their work has been confined to inspiring others to invent, and selecting the most desirable from the product.

A Lockout Device for Central Energy Lines

By Arthur F. Poole.

ONE of the most marked features of telephone development in recent years is the steadily increasing popularity of the party line. As compared to a subscriber to a private line the party line subscriber is under three disadvantages: He is annoyed by his bells ringing when the call is for another party on his line; his conversation is not private, as any of the other parties on his line may cut in and listen to the conversation; and finally, he may find the line busy when he wishes to use it. The first two objections are the most serious ones. The third is of comparatively little importance, since the subscribers to a party line are as a rule in the residence district and have but few calls per day.

Most of the efforts to improve central energy party line service have been in the direction of giving a selective ring, or of ringing only the bell of the party wanted. This has been developed to such a point that for four party lines the several plans offered by the large Independent manufacturers leave but little to be desired; and if the party line business, present or prospective, warrants the exchange manager in going to the additional expense of the equipment, the disadvantage of a non-selective ring is a thing of the past.

To remedy the second disadvantage—that of the party line subscriber having only the good breeding of the other parties on his line to prevent their listening to his conversation—but few plans have been proposed. On the face of the matter it would seem that the removal of this second disadvantage was fully as important as the first.

The lockout device hereafter described was designed by the writer and has been tested to a limited extent in actual operation. As will be seen from the description, it is simple, has a wide margin for its operation and depends for this operation on conditions which are present in any central energy line, so the device will operate on any of the various circuits now in use. However, its chief merit is that it requires no additional operation by the central office operator, for whatever a central energy lockout will do there is one thing that it must not do, impose additional labor on the already overworked operator at a party line position.

Before describing this device, it will aid in the understanding of its operation to first consider the diagram in Fig. 1, which may be taken as a typical central energy circuit. In this is shown a line and cord circuit. For the sake of simplicity the cord circuit is shown without the listening and ringing keys and

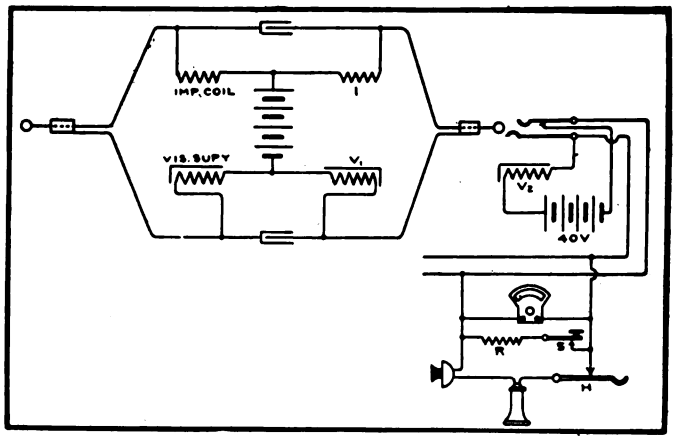

Fig. 1. Typical cord and line circuit, with voltmeter connected to show principle which determines the operation of lockout device.

with visual supervisory signals, while the line circuit is shown with a cut-off jack and a visual line signal. One station is shown with a voltmeter connected across the terminals of the telephone. A resistance "R" is also shown, adapted to be connected across the line by a switch. Suppose that the batteries supply lines and cords at 40 volts, and that the resistance "R" is equal to either the resistance of the line visual "V-2" or the sum of the resistance "V_1" and "I." When the hook switch is open the voltmeter will show 40 volts. Now close the switch "S," throwing the resistance "R" across the line. Since "R" is a resistance approximately equal to that of "V-2," and both of these are large compared to the line resistance, the voltmeter will now read 20 volts, approximately. Now close the hook switch "H," throwing the telephone set in bridge, the resistance of the telephone set being low compared with "V-2," practically all the fall of potential will be in "V-2" and the voltmeter will now read from 3 to 6 volts. Practically the same

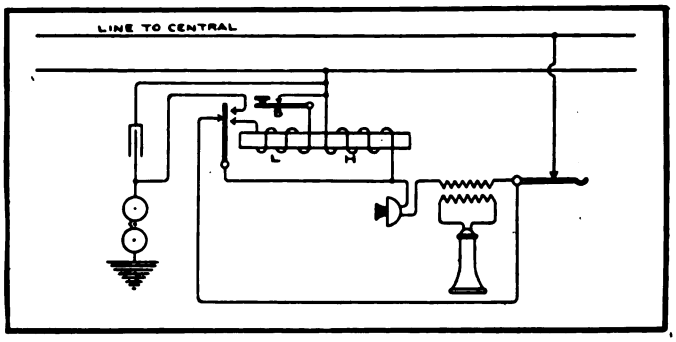

Fig. 2. Method of connecting lockout relay with high and low resistance windings in subscriber's set.

readings will be observed if the cord is in the jack for the resistance of "V-2" is equal to that of "V + I."

The operation of the lockout depends on these different voltage readings across the line, according to whether a high resistance or a low one is bridged across the lines. At each station on the party line a relay is provided having two windings, one of high and the other of low resistance. The object of the latter winding will be explained later. The telephone set at each station is normally inoperative, being shunted by the armature of the relay when it is against its back stop. The relay is so designed that it will take 10 volts across the high winding to pull up its armature and remove the shunt from the telephone set, thus making the transmitter and receiver operative. The operation of the lockout will now be readily seen. All stations on the party line are normally locked out. When one subscriber removes his receiver there is voltage enough across the line to operate the relay at his station and bridge his telephone set across the line. As soon as this is done the voltage between the lines falls to from 3 to 6 volts. A second subscriber removing the receiver at his station would not find voltage enough to operate the relay at his station, since the relay at his station requires 10 volts to operate and the line voltage has been reduced to below 6 volts by reason of the first subscriber being across the line. Consequently the second subscriber is locked out.

In Fig. 2 are shown the circuits of the relay and telephone set at a subscriber's station. A relay is provided having a high winding, "H," and a low winding, "L." The circuit of the high winding is open at the hook switch, and the telephone set is short circuited by the armature being against its back stop. When a subscriber takes his receiver from the hook he bridges the high coil "H" across the line. If no other subscriber is across the line the relay will pull up its armature. Besides removing the short circuit from the transmitter and receiver, thus making them operative, a circuit is completed through the low winding which, as will be seen, is in series with the transmitter. This low resistance coil is for the purpose of holding the relay armature after it has once been pulled up. If it were not used as soon as the transmitter had been thrown across the line, practically all the current would be taken from the high coil and it would require a nice adjustment to hold the armature with such a

Digitized by Google

small current, so the low resistance coil is added and the armature is firmly held to its front stop. It will be observed that a second contact on the armature shunts the low coil with the condenser. This is for the purpose of removing the impedance of the low coil from the talking circuit.

So far it would seem that one party could not talk to another on the same line since when the first party came in he would put the line in condition that the second party would be locked out. The button "B" is provided to furnish means whereby the first calling subscriber can let the second one in. On asking central for the second party he is told to hold the button until he hears the second party answer. An inspection of Fig. 2 will show that the button "B" opens the low resistance path at the first station, this puts the voltage of the line to the value it had when the first party came in, so the second party has voltage enough to operate his relay and consequently gets in on the line. At the first station the condenser is across the break in the low coil so the subscriber there can hear the subscriber at the second station answer. As soon as he hears him answer he lets go the button and both parties are now in on the line.

It will be observed that the installation of the lockouts on a party line entails no additional apparatus whatever at the central station; the operation of the line and clearing out signals being the same as before. And it is only in the rare case of a subscriber wishing to talk to another on the same line that the operator at central has anything additional to do. In this event she has only to instruct the calling subscriber to press the button on his telephone and hold it in the depressed position until he hears the second party answer.

There is no limit to the number of stations which may be put on the same line; the apparatus works just the same on a party line of twenty as on one of two. As will be seen, it will work with any central energy switchboard circuit whatever, and, since its operation is purely electrical, it may be easily installed on telephones now in use. It will work on any selective ringing scheme, since the ringing circuit is not charged. The lockout device comes into circuit only after the hook switch has been raised.

THE TELEGRAPHIST'S AND TELEPHONIST'S NOTE BOOK.

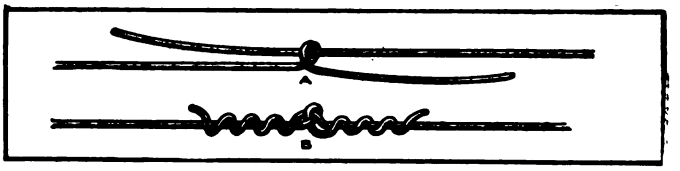
THIS book is reviewed in the London *Electrical Times* as follows: "The name of the author of this funny little book is not given. It contains much information, written for the most part in telegraph office slang, which we are not ashamed of being unable to interpret; we can only guess at its meaning, e. g., 'To prove currents, get R from the distant office, and upset the balance by withdrawing the 4,000 ohms plug from the rheostat (if no switches for the purpose),' etc.; or 'To insert capacity in a condenser, insert a plug,' which is intelligible, but sounds as though capacity were a plug. On more familiar matters there are some startling statements, thus: 'Carbon combined with oxygen gives carbonic acid, the same combined with gas gives carbonic acid gas.' Again: 'The unit of Force is called a dyne, it is that force which acting on unit mass for one second, gives it an acceleration of one second.' The author has a lofty contempt for theory, and labels with that word such things as the absolute zero of temperature. In one place he gives a very loose definition of the strength of field due to a current in a conductor, and concludes with the words, 'This theoretical definition is, of course, of no practical use.' We incline to agree with him. He seems to imagine that secondary cells are completely discharged before recharging, and he puts their efficiency at 90 per cent.; also his views on trigonometry, under the heading of 'Reckoning Angles,' are quaintly expressed. On the other hand there are some useful tables in the book, and a quantity of technical information which looks substantially right, though we would far rather live in ignorance of it than habitually use the language in which it is expressed."

As we are unfamiliar with the book in question this is reprinted without prejudice. The author who has inspired such an ingenious article as this can be content that he has done some good in the world, even if he has shot his technical statements a little beside the mark!

CERTIFICATES FOR REDUCED RATES FROM CHICAGO CONVENTION MUST BE PRESENTED ON JUNE 27 OR 28.

REDUCED rate certificates at the National-Interstate Convention must be presented for endorsement on June 27 or 28. All holders of certificates from ticket agents which will entitle them to obtain the return trip from the Chicago Convention at one-third the regular rates should bear in mind that these certificates must be visèed by the special agent of the railway companies who will be in attendance at the Convention. This agent will be in attendance on June 27 and 28. All holders of certificates should present them as early as possible to Mr. J. A. Harney, assistant secretary of the National-Interstate Telephone Association, at the Convention headquarters in the Auditorium Hotel for his endorsement. After they have been properly endorsed they will be visèed by the railway agent.

Holders of certificates leaving before the arrival of this official, or before one hundred certificates have been deposited with the assistant secretary, or who present certificates after the special agent's departure cannot take advantage of the reduced rates. Attention should therefore be given to these requirements, including the dates, which through an error, were incorrectly stated in the item relating to this matter published in our issue of last week.



Method of Tying Iron Wire Proposed by Charles Claydon. This Method Has Been Found to Give an Especially Good Joint on Rural Lines, Where There is Danger That Insecure Joints Will Be Made By Inexperienced Linemen.

ECONOMICAL TELEPHONE ACCOUNTING AND FILING SYSTEMS.

By Charles C. Wilmot.

(*Continued from Page* 357.)

Item L. Messenger service: After the necessary assurance is obtained that the amount of messenger service is correct, credit may be taken for such messenger service performed by agents.

Item M. Authorized expense: Number the vouchers enclosed, properly signed and approved.

Item N. Authorized rebates; Properly approved and included with the report.

Item O. Checks and cash orders enclosed for balance due the telephone company.

Item P. Amount of coupons enclosed.

Item Q. Cash or stamps enclosed.

Item R. Postage expense and money order or express fees paid.

Item S. Balance due company: This represents any balance due company not remitted with the regular monthly report. The total debit column must agree with the total credit column. This is important.

This Monthly Report must be forwarded to the general office of the telephone company on or before the 5th day of each month, covering the preceding month's toll business. A remittance for the cash balance shown on the monthly toll report must accompany the report in every instance. Remit by postoffice order, express money order, check or draft. Detach the original record of "out" business and "in" business, and forward the same promptly. The carbon copy of the report is to remain in the toll record book for reference in case of dispute. Always have the carbon sheet in the proper position so that a duplicate record will be made.

THE EDITOR'S PAGE

EXTENDING THE CONVENTION'S INFLUENCE.

EVERY Independent manager who is doubtful of the future owes to his stockholders the duty of attending the Chicago convention in order that he may wisely judge how their interests may best be served. The seeking out of such hesitating neighbors and impressing upon them of the advantages to be gained by such a trip is no less a duty falling upon those who are firm in their convictions that the Independent telephone movement is assured of success and that the addition of each individual to the firm union which exists is beneficial alike to the new member and the whole body.

To the man who does not know the true extent of the great work in which the Independent telephone men of this country are engaged nothing can be a more valuable object lesson than a visit to the Convention of the National-Interstate Telephone Association. To-day the telephone manager is confronted by numerous difficulties. To many the very question of competition is at once the initial and most important subject of debate. The manager of a plant which is comparatively isolated from the stronger groups of Independent operators is subjected to a particularly severe pressure. Constant extension of facilities is demanded by the public which he serves, and as a condition of success this must be granted.

The method of securing the widest range of service desired must be determined. Extension of a single system beyond certain territorial limits is hindered by the difficulty of securing capital and the impossibility of deriving a profit from the operation of a plant when the amount and vigor of the efforts necessary to secure and retain business in a field occupied by numerous competitors are so immensely increased as they are by this procedure. Such expansion may only occur within recognizable limits.

Connection with the lines of other companies is therefore the only means for the extension of service and the question to be settled is with what lines such connections shall be made—Bell or Independent. If the manager could only be sure that connection with other Independent lines would make his plant a link in a chain which, while strengthened by his addition, would also contribute to his own power in the local field; one in which each member is increasing in value and influence more rapidly than its competing rival; and be satisfied that each of the powers with which he will be associated would justly observe the conditions which will enable and assist him to develop the territory he has pre-empted in such a way as to secure to him the most complete success and aid him most energetically to develop a profitable long distance business, insuring to him an absolutely just proportion of the profits accruing from such business—if he knew that such results could be obtained now or in the near future by connecting with the lines of other Independent companies, it is with these interests that he would ally himself. To learn whether or not these things are possible he must acquire knowledge from all sources, and at the National Convention he will be in touch with men from all over the country who can give him the information he desires. He will meet representatives from many districts who have confronted the difficulties he is facing, have made their decision, and will tell him the results.

Then there are so many smaller things about which he may be in doubt. How to most economically lay out and build his lines, secure the highest efficiency from labor, keep his accounts, develop rural business, even what constitutes good service—all these things he must know. There is no more economical guide, if judiciously followed, than the experience of others, and this experience will be available to every man who visits the convention.

Perhaps the greatest of all to see and most to his advantage to appreciate is the spirit of the Independent telephone men who will be assembled. This is the sentiment which has been communicated from one man to another, beginning with a few scattered individuals, until we now see a great body of men united in conducting a great industrial struggle. To appreciate that these men, each achieving success in his own community, are all bound together by the firm ties of a common knowledge, a common interest in the battle for Independent success and a common motive which leads all to "LOOK FOR THE SHIELD" as a badge of fellowship—that is the thing!

SHOULD SUBSCRIBERS OWN EXTENSION SETS?

THE question whether or not telephone instruments shall be knowingly sold to subscribers to the service of an operating company for connection to its lines as extension sets presents a rather broad opportunity for consideration by the manufacturers of such instruments. From a legal point of view, the right on the part of subscribers to connect their own instruments to the telephone company's lines and to use them in carrying on conversations with other subscribers has not been definitely overthrown by the courts of one of our largest cities. The matter seems, therefore, to be one strictly concerned with the principles of good business policy.

Some Independent telephone men who are familiar with the conditions in the city where the carrying of this question before the courts has resulted in wide publicity may say that anything which hurts the enemy should be tolerated. Others, on the contrary, who are fully as active in their efforts to promote the success of Independent operation, say that anything which facilitates such a connection injures the telephone business as a whole.

They call attention to the numerous disadvantages, the nature of which can readily be imagined by any practical telephone man, which may arise from the connection of instruments by inexperienced persons. These not only include such as may be due to electrical reasons, but, if the practice were widespread, would involve features capable of producing a considerable effect upon the operating efficiency and profits of a plant. For instance, it is admitted that the connection of extension sets on a line increases the average number of messages per day on that line, because it makes it easier for the subscriber to telephone. Now if all the subscribers to a system giving service on a flat rate basis were to buy and connect telephones the company would not only be subjected to a sensible diminution in future profits through the destruction of an undeveloped source of revenue, but would handle a considerably larger number of connections per day without a corresponding increase in receipts. As this increased load might properly be called abnormal it would not have been considered in any estimates the company might have made, and therefore would be especially inconvenient.

If those among the Independent operating men who have applauded the efforts of subscribers in one case to obtain extension set service in this manner were to consider the subject in the new light we have suggested and then ask themselves, "How far will this spread? Whose turn will come next?" they might be led to think that the subscriber who believes he is charged too much for his extension set service should be educated to correct his grievances in some other way.

The manufacturers, for their ultimate success, must depend upon the prosperity of the operating companies. Many, therefore, think it well worth while for all parties interested to get together and give this question proper consideration in order that if it contains dangerous possibilities it may not develop to a point where it will pass beyond control.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

INTERFERENCE BY STREET RAILWAY COMPANY AS ABUSE OF AUTHORITY.

The street railway system in our village has always been operated by steam, but the company owning it is now about to change the power to electricity. It has a franchise that seems to permit it to do these things. We are already established on the street, but the street railway company is putting up its wires in such a way that they short circuit our wires. Some places they overbuild us and in others underbuild, but in a great many places with both constructions their wires touch and rub up against ours so messages cannot be sent over our wires because the electric current is cut off. What can we do to protect ourselves? A. T. L.

YOUR REMEDY is to apply for an injunction to restrain the street railway company from interfering with your rights. The railway company is bound to so use its own property as not to interfere with the property of another. In so doing the railway company is abusing its authority and is subject to restraint. See Birmingham Traction Co. v. Southern Bell Telep. & Teleg. Co., 24 S. 731.

CONNECTION CONTRACT HELD EXCLUSIVE FOR INDIANA COMPANIES.

THE Home Telephone Company of Wabash, Ind., and the Eel River Valley Telephone Company of North Manchester have been defeated in important litigation in which the plaintiff was the North Manchester Telephone Company, all being Independent companies.

The North Manchester company, years ago, built a toll line from North Manchester to Wabash and entered into an agreement with the Home company of that city, whereby the latter was to grant exclusive right to the North Manchester company for handling toll messages from North Manchester and intermediate points to the Home company in Wabash. The Eel River Valley company demanded the same privilege from the Home company, and threatened to bring suit to enforce its demand. Over the protest of the North Manchester company equal rights were granted by the Home company to the Eel River Valley, which has most of the local telephones at North Manchester, and the North Manchester company brought an injunction suit.

The court decided that the contract of the Home company with the North Manchester was binding and exclusive, and that the Eel River company must be cut off by the Home company from all service over its Wabash lines. The Home company was also assessed $150 damages for giving the Eel River company service in violation of contract.

SETTING OF POLES CANNOT BE RESTRAINED BY ONE NOT PROPERTY OWNER.

AT Omaha, Neb., the Nebraska Telephone Company, after Judge Wheeler of the District Court had sustained the demurrer to the original suit brought in the name of S. B. Wadsworth, filed a new suit against the Independent Telephone Company to enjoin it from placing its poles on South Seventh street outside of what is asserted to be the curb line.

Judge Wheeler on the filing of the petition issued an order restraining the Independent company from proceeding further with the setting of its poles on the thoroughfare in controversy.

When the Independent company commenced placing its poles on Seventh street south of Sixteenth avenue in such a manner as, it was alleged, would interfere with the Nebraska Telephone Company, suit was brought in the name of S. B. Wadsworth, local attorney for the Nebraska company. The Independent company demurred on the grounds that Mr. Wadsworth was not personally interested as a property owner and the Court sustained the demurrer.

According to the petition of the Nebraska company the city engineer fixed the curb line at fourteen feet from the property line. Shortly afterward the Independent company began to set its poles along the street, but instead, it is alleged, of adhering to the curb line fixed by the city engineer, placed its poles exactly opposite those of the Nebraska company and sixteen feet from the curb line, leaving just two feet between the poles of the two companies. As the petition alleges, when the Nebraska company began to place the cross arms on its poles, it found it was unable to do so owing to the fact that the cross arms extend about five feet each side of the pole, while the poles of the Independent company are only two feet distant from those of the plaintiff company.

The Independent company alleges that the action of the Nebraska company is not in good faith, but merely brought to interfere with its business and hamper it as far as possible. The Independent company asserts that while there is no curbing at present on Seventh street south of Sixteenth avenue, the line has been established as sixteen feet from the property line and not at fourteen feet, as contended by the Nebraska company.

TEXAS COURT RULES THAT SUBPOENAS CANNOT BE SERVED BY TELEPHONE.

THE Court of Criminal Appeals at Austin, Tex., has held that a sheriff is not empowered to serve a subpoena on a witness in an arson case by means of a telephone, as it is a method too susceptible to error. The court further held that the serving of subpoenas, as contemplated by the statutes, should be done in person, as the surest means of identification is through personal view.

The case was that of ex-parte Burt Terrell brought up on appeal from McLennan county. Terrell had been fined and lodged in jail for contempt of court, for alleged ignoring of a subpoena to appear as a witness in the case of Ernest Ferguson, charged with arson. Terrell lived at Crawford, about twenty-five miles from Waco, and was summoned by the deputy sheriff by telephone and the subpoena read to him over the wire. When the case was called Terrell failed to appear. The trial was postponed and on its continuing Terrell was brought into court by a deputy who had been sent for him. On his appearance the court fined Terrell and sent him to jail for contempt. Terrell immediately swore out a writ of habeas corpus in the district court, which was carried up on application to the higher court. The Appellate Court in rendering the opinion discharged the applicant.

EJECTMENT AGAINST A TELEPHONE COMPANY.

IT has been held in the State of New York that where the plaintiff owned the fee, or title, in the highway, to the center thereof, and a telephone company had erected its poles in the highway without the permission of the plaintiff who owned adjoining property, the plaintiff might bring a suit to eject the defendant from the highway. The company in this case contended that a suit in ejectment was not the proper method to determine the question, but that the plaintiff should have brought a suit in equity, such as a suit for injunction, but this contention was overruled by the court. Little v. Am. Telep. & Teleg. Co., 8, N. Y., S. 136.

IN THE OPERATING FIELD

INDEPENDENT TELEPHONE MEN OF THE SOUTHWESTERN DISTRICT OF IOWA HOLD A MEETING.

TELEPHONE interests of southwestern Iowa were well represented at a meeting of the southwestern Iowa district of the Iowa Independent Telephone Association recently held at Council Bluffs. No set program had been arranged and the meeting was quite informal.

In addition to a talk on various topics directly connected with the subject of meeting competition those present devoted some time to a discussion of the clearing house question, as applied particularly to a division of terminal charges between the Independent Telephone Company of Council Bluffs and its connections. The adjustment of this matter, however, was left to the clearing house officials at Des Moines.

A short business session was held for the election of officers and for the selection of a delegate and alternate to the National Convention of Independent companies, to be held at Chicago, June 26, 27 and 28. The officers remain as before: President, H. A. Kinney, Woodbine; secretary-treasurer, J. F. Glenn, Denison. Fred C. Musson of Atlantic was named as delegate to the National Convention, with H. A. Kinney of Woodbine as alternate.

Those present from outside of the district included P. C. Holdoegel of Rockwell City, president of the State association, and Charles C. Deering of Boone, the State secretary. The list of those in attendance follows: C. R. Benedict, D. C. Cooper, J. C. Mansfield, Shelby; A. J. Carter, Sioux City; H. A. Kinney, M. A. Reed, Woodbine; J. H. Jenks, M. Fretz, Avoca; E. C. Campbell, Persia; George Battey, Portsmouth; J. K. Alline, Chicago; George T. Hewes, Des Moines; W. H. Bryner, Vail; Phil Zerwas, Manning; P. J. Korth, Earling; C. H. Hallis, Hudson; George W. Sandy, Des Moines; C. H. Smith, Sioux City; J. F. Glen, Denison; P. C. Holdoegel, Rockwell City; Chas. C. Deering, Boone, and J. F. Mouren, Arion.

PROGRESSIVE RURAL COMPANY IN NEW YORK HAS GROWN RAPIDLY.

INAUGURATED in 1899 as a mutual system, the Delaware Valley Telephone Company, which has its headquarters at Deposit, N. Y., has extended its lines into all the neighboring towns and villages. Among other points reached are Stilesville, China, Hambletville, Canonsville, Trout Creek, Loomis, Sidney, Masonville, in Delaware county, and Coventry, Coventry Corners, Bainbridge, Bennettsville, Andrews Hill, in Chenango county, Sanford and North Sanford connections are also made from Deposit in Broome county, with over 2,000 subscribers in other exchanges. The company is owned and controlled exclusively by the farmers and business men in and between the towns mentioned.

TOPEKA COMPANY TO ERECT A NEW BUILDING FOR ITS OFFICES AND MAIN EXCHANGE.

TWENTY-FIVE thousand dollars will be expended by the Topeka, Kan., Independent Telephone Company in the erection of a new exchange building. Suitable property has been purchased and the work of construction will start at once. It is hoped that sufficient progress will have been made to enable the company to give service from its new exchange by November 1. There has been ordered a new central energy switchboard which will have a capacity much greater than that of the board at present in use.

Throughout the business portions of the city all the wires will be placed underground and in the suburban districts aerial cable will be installed. The Topeka company is growing with exceptional rapidity, as is shown by the fact that it was recently found necessary to issue a special directory supplement, containing the names of 800 new subscribers.

NEW ULM RURAL TELEPHONE COMPANY PROSPERS.

GRATIFICATION was expressed by all the stockholders of the New Ulm (Minn.), Rural Telephone Company at the report which was read at the annual meeting. Maintenance charges and costs of new construction necessitated an outlay of approximately $49,000, which left a balance of over $2,000 in the treasury. During the year several new lines were built and a new switchboard was installed. Officers elected for the coming year were Philip Liesch, president; Alex. Russell, vice president; L. G. Vogel, secretary, and Otto Schell, treasurer.

TRUNK LINES TO CONNECT LOS ANGELES WITH SAN FRANCISCO.

PLANS are now being made for the construction of two telephone lines by the Home Telephone Company to connect Los Angeles with San Francisco. One of the new lines will go north almost paralleling the Southern Pacific valley line, and the other line will be by way of the coast and will take in the most important cities en route.

The materials for the new exchange in San Francisco have already been ordered, and it is said that within the next eighteen months the lines will be in working order.

PEOPLE'S COMPANY, OF SWEDESBORO, N. J., SHOWS PROGRESS.

A MARKED increase in the business of the People's Rural Telephone Company, of Swedesboro, N. J., is shown in the May issue of its directory. Communication to new long distance points has been established and the list of subscribers has been increased by a gratifying number of new names. Service is now furnished direct to twenty-eight towns and villages and four exchanges are in operation. These are located at Mullica Hill, Mantua, Swedesboro and Woodstown.

Besides containing the list of subscribers a large amount of general advertising of local firms is included in the directory pages. The top and bottom of every page is set apart for this purpose and three cover pages are also utilized. The business of this company has grown at a remarkable rate from the very beginning, and its progress is such as to indicate that its patrons are very well pleased with the service furnished.

LONG COMMON BATTERY SUBSCRIBER'S LINE REPORTED IN SERVICE IN UTAH.

RECENTLY the Utah Independent Telephone Company cut into service at Eureka, Utah, an ordinary central energy telephone instrument, which is working directly on a line run into the exchange at Provo, which is forty-four miles distant. The instrument is said to be one of the standard telephones made by a leading manufacturer, connected on a No. 10 copper circuit, and supplied with battery at 40 volts. W. N. Winter, of the Provo exchange of the company which operates this long line states that there is nothing of a special nature in the apparatus used at the central office for the connection of this instrument. Included in the forty-four miles of line is one-half mile which passes through cable, and twenty-six miles are supported upon the Western Union Telegraph Company's poles. The balance of the line is of perfectly normal telephone construction. No induc-

Digitized by Google

tion from the Western Union circuits is experienced, and in all respects the transmission and signalling are said to be satisfactory. The people who are using this line would seem to have a good claim for a record for long distance common battery operation.

INDEPENDENT SERVICE FOR MONTANA PROJECTED ON A LARGE SCALE.

TELEPHONE service for the entire state of Montana over Independent lines is the object which is in the minds of those who have organized the Montana Independent Telephone Company. This organization has recently been incorporated with a capital stock of $1,500,000, with headquarters located at Butte. Franchises have been secured in Butte and Anaconda. The company has arranged to take over some properties which are now in operation. In addition to the plants in these cities, the immediate building of exchanges in Helena, Missoula, Great Falls, Dillon and other points is contemplated.

The company will be allied with the Utah Independent Company and toll connections between the two will be made at Pocatello, Idaho. On the west toll lines from the Montana company will connect at Missoula with those of the Home Telephone Company, of Spokane. The long distance lines of the company will, for the present, be run to a considerable extent upon Western Union telegraph poles. This is a development of the contract between the Western Union Telegraph Company and the Utah Independent Telephone Company, which was secured some time ago by Elmer B. Jones, who is Managing Director of the Utah Company, and also of the new Montana company. Mr. Jones was also able to secure for his company privileges on the rights of way of the Rio Grande Western and Western Pacific Ry. Companies, which enable him to build to San Francisco and over all points on the Rio Grande system, so that the facilities for toll lines are in every way satisfactory.

Construction work has been commenced upon several of the plants under the supervision of T. S. Lane. The company has planned to erect substantial plants, and furnish the best service possible, and expects to have at least ten thousand telephones in operation in Montana within a year. The directors of the company are as follows: Andrew J. Davis, President First National Bank, Butte, Montana; S. M. Largey, President State Savings Bank, Butte, Montana; P. B. Moss, President First National Bank, Billings, Montana; Harry A. Gallwey, Manager Parrot Mining Company, Butte, Montana; Charles J. Kelley, Treasurer Hennesy Merc. Co., Butte, Montana; Con. J. Kelley, Attorney Anaconda Copper Company, Butte, Montana; Elmer B. Jones, Salt Lake City, Utah; Geo. T. O'Dell, Salt Lake City, Utah; H. B. Brown, Butte, Montana; Thaddeus S. Lane, Butte, Montana.

LARGE NUMBERS OF RURAL TELEPHONES BEING INSTALLED IN CANADIAN NORTHWEST.

THERE is no agency so powerful in the extension of the Canadian rural west as the telephone. In Manitoba, Alberta and Saskatchewan this fact is testified to daily, and most energetic efforts are being made in all portions of the prairie provinces to organize rural telephone systems. Unquestionably the refusal of the Bell company to co-operate with the promoters of these country districts has retarded the growth of the rural telephone idea, but of late it is making very substantial progress. The country weeklies of the new provinces are conducting very intelligent campaigns toward this end and the Alberta government has recognized this growing sentiment and has indicated a disposition to assist in the development of the rural telephone system on a large scale. This has stimulated the movement very generally in that province.

As an evidence of how the people of southern Alberta are deprived of the benefits of modern intercourse it may be mentioned that from Calgary south, through a thickly populated and wealthy portion of the province, there is no telephone connection. All along the border in British Columbia, Alberta and Saskatchewan the heavy dealers in hay report that they frequently lose large sales because of the superior telephone facilities of their competitors just across the line. There isolated farm houses are provided with telephones, and connections are made through the rural or neighboring lines directly with the big metropolitan exchanges. At all hours of the day produce merchants are in touch with the farmer miles away, and can order or countermand orders at a moment's notice. Thus deals are denied Canadians although their produce may be superior to that of the farmers just across the boundary.

This is merely the crudest form in which the Canadian farmer is at a disadvantage on account of the absence of telephones. Alberta farmers and ranchers are urging the use of rural telephones on the grounds that they minimize the danger from prairie fires which have destroyed so much property in the west during the past few years. In Alberta and Saskatchewan it is said that there are hundreds of opportunities for telephone companies to start business and they will receive every possible assistance from the government and municipalities with which they may do business.

The Blotter of Which This is a Duplicate in Reduced Size Was Designed and Issued by the Stephenson County Telephone Company, L. A. Herrick, Manager, Freeport, Ill.

JOHNSTOWN TELEPHONE COMPANY TO IMPROVE ITS SYSTEM.

IN accordance with plans outlined at its recent annual meeting, the Johnstown (Pa.) Telephone Company has broken ground for a new and modern telephone exchange.

The building will be a handsome one-story brick structure, and will contain besides the new switchboard, which is to have a capacity of 1,000 lines, the offices of the company.

The improvement when completed will have cost approximately $100,000. New underground conduits are to be installed and trunk service to the exchange at Moxham is to be improved by the addition of new circuits. Two new No. 10 copper toll lines are to be built from Seward to Lilly and two others from Johnstown to Hooversville. At present there are only five lines in service between the points named, so that sometimes a great congestion of traffic occurs on account of the heavy business. It is expected that the new circuits will enable the company to meet the demands for its service in a manner which will be very satisfactory to the public.

FIFTH INDIANA DISTRICT ASSOCIATION HOLDS MEETING.

REPRESENTATIVES from the fifth district of the Indiana Independent Telephone Association recently met in Muncie. This district embraces the Independent systems in Delaware, Madison, Tipton, Grant, Jay, Blackford, Randolph and Howard counties.

Among other important matters which came up for discussion was the selection of representatives for the National convention. J. A. Browne and H. G. Miller, of Winchester, were chosen.

Officers who will serve in this district for the ensuing term were elected as follows: President, J. A. Browne, Winchester; secretary-treasurer, S. O. Miller, Fairmount; delegates to State convention, A. L. Johnson, Thomas Bromley, jr., Muncie; O. H. Barnhill, Winchester; H. O. Miller, Fairmount; J. A. Browne, Winchester; F. D. Russling, Daleville; O. L. Barger, Converse; D. Mount, Tipton, and Frank White, Portland.

QUERIES

POTENTIAL DIFFERENCES FOR OPERATING TRANSMITTER.—(701.)

Will you kindly tell me what would be the difference of potential between points A and B in the attached diagram? J. W. N.

The diagram evidently is a portion of the circuit used in a Bell intercommunicating system. As it is impossible to give an answer which would have any practical value from the circuit as furnished, it is shown completed in the diagram at the right of Fig. 701. In the diagram as furnished by you the circuit is open, and the potential at points A and B would be the same as that at the terminals of the battery, namely 20 volts. As soon as the subscriber takes the telephone off the hook, however, the circuit is completed through the retardation coil which is between the instrument and the battery, and a current flows through the coils. The ordinary phenomenon of a drop which is in proporion to the resistance takes place in each division of the circuit.

Assuming, for the sake of obtaining a definite basis for figuring, that the resistance of the receiver is 80 ohms; that of the transmitter 60 ohms; and the line between the retardation coil and the retardation coil to the subscriber's station is 2 ohms, you would have a total resistance in the circuit of 80+60+2+170 ohms, the latter figure representing the resistance of both windings of the retardation coils. The drop throughout the entire circuit is, of course, 20 volts, and neglecting the portion of this drop which is confined to the part of the circuit between the battery and the terminals of the retardation coils, due to the very small resistance in leads from the battery to these coils, it is found that the drop through the coils is $^{170}/_{312}$ of the drop in potential throughout the entire circuit. This gives somewhere in the neighborhood of 10.8 volts, leaving a balance of 9.2 volts, which would be the difference of potential between the points A and B with the circuit closed. This would be the electro motive force available for operating the transmitter, which we presume is the object of your query. There are so many variable quantities, such as the variable resistance of the transmitter, and that introduced by lines of different lengths, that a more practical method to employ than calculation is direct measurement with a voltmeter. If general figures are desired a number of measurements can be taken, under different practical conditions, and the average of these results taken as the desired figure.

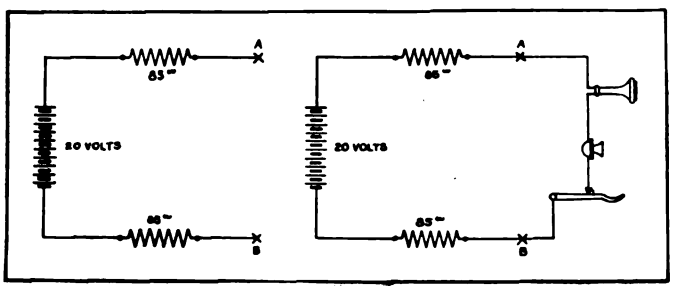

Fig. 701.

FORMULA FOR JOINT RESISTANCE OF TWO CONDUCTORS.—(702.)

Will you kindly explain to me how the formula for joint resistance of two conductors is derived? R. N.

This formula, as usually stated, is that the resistance of a pair of conductors connected in parallel is equal to the reciprocal of the sum of the reciprocals of their separate resistances.

This result is derived from the equation, $\frac{1}{R}=\frac{1}{A}+\frac{1}{B}$ Where R equals the joint resistance of the pair, A equals the resistance of one conductor, and B equals the resistance of the other conductor. The derivation of this expression is very readily understood when it is borne in mind that experiments have shown that the conductivity of a group of conductors joined in multiple is equal to the sum of the conductivities of each of the members of the group. Furthermore, the conductivity may be mathematically expressed as the reciprocal of the resistance; that is to say, if the resistance of a given wire is 10 its conductivity is 1/10; therefore since the sum of the conductivities of the separate wires is equal to the conductivity of the circuit formed by them when united, and the conductivity is the reciprocal of the resistance, the derivation of the above formula is obvious.

Now, to take an example, suppose it is required to find the joint resstance where A equals 2 ohms and B equals 4 ohms.

We have $\frac{1}{R}=\frac{1}{2}+\frac{1}{4}$, or $\frac{1}{R}=\frac{3}{4}$ Then the conductivity is equal to ¾ of an ohm, and therefore R=4/3 ohm. In practice these results are obtained by a modification of formula 1, obtained as follows: $\frac{1}{R}=\frac{1}{A}+\frac{1}{B}=\frac{B+A}{AB}$ Therefore $R=\frac{AB}{B+A}$

Another way of stating this is that the joint resistance is equal to the product of the resistance of the separate conductors divided by their sum.

CONNECTING A 110 VOLT CIRCUIT TO A WARNER POLE CHANGER.—(703.)

Is it practical to connect a 110-volt direct-current to a Warner Pole Changer? I tried it, but there was a spark at the contact springs which melted off the platinum contacts; otherwise, it worked all right. Pease give me instructions as to how I should make proper connections. G. T. M.

A 110 volt direct current may be connected to the terminals of a Warner pole changer, but resistance should be employed. This resistance should, of course, be non-inductive, and the most suitable form is an ordinary electric light lamp. This may be connected between one of the contacts of the pole changer and lighting mains. The spark you mention is due to the fact that the current is too strong, and its heating effect is therefore high. You are very likely in using this excessive current to experience other difficulties, and resistance should be inserted as soon as possible.

RETARDATION COIL IN CORD CIRCUIT.—(704.)

Will you kindly explain why a retardation coil can take the place of a repeating coil in a subscriber's cord circuit? How is it known how much retardation the coil should have? J. F.

A retardation coil is used between battery and cord strands in order that current may be supplied to subscriber's transmitter, while alternating voice currents which pass over the line from his instrument will not be short circuited through the battery, which is of low resistance, but will pass beyond the battery and out over the line of the second subscriber with whom connection has been established. The retardation coil permits the passage of the direct current to the transmitter, but owing to the fact that its effective resistance or impedance to an alternating current is much higher than that which it presents to a direct current, the path across the cord circuits through the two windings of the retardation coil and battery has an extremely high resistance for alternating currents of the frequency set up in conversation. These currents, therefore, pass with the slightest imaginable diminution, due to shunting, from one line to the other.

One of the important factors which determines the dimensions of the retardation coil is that the number of windings and size of the iron core must be such that sufficient impedance to currents of the usual frequency for talking and ringing will be offered to prevent the passage through battery as above stated. As many frequencies are employed a compromise giving the best value for all has to be struck, and the proper development of these coils is the result rather of experiments than of calculations.

TELEPHONE PATENTS

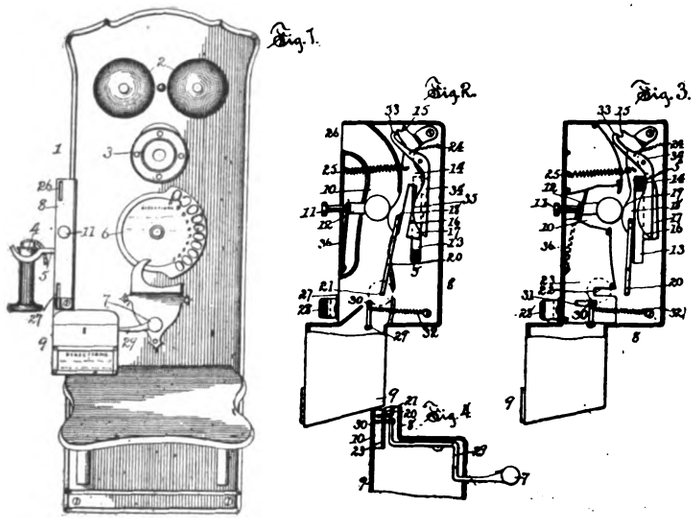
CONDUIT.

Daniel H. Murphy, Milwaukee, Wis., patents (No. 817,086; dated April 3, 1906; filed June 9, 1902; serial No. 110,719) and assigns to the Safety Armorite Conduit Co., Pittsburg, Pa., a conduit for electric wires.

The essential feature of this invention consists in electroplating the exterior surface of a conduit pipe with zinc, and coating its interior with an elastic insulating enamel which, it is claimed, will not crack.

TOLL APPARATUS.

George A. Long, Hartford, Conn., patents (No. 815,107; dated March 13, 1906; filed March 11, 1903; serial No. 147,260) and assigns to the Gray Telephone Pay Station Company, Hartford,



Conn., an automatic coin collector for automatic telephone systems.

The object of this invention is to provide a toll collecting apparatus which may be used in connection with automatic telephone systems.

Referring to the accompanying illustrations 8 is a case mounted on the side of the cabinet and through which the hook switch 5 passes. One leg 17 of a slotted locking lever 14, pivoted within the case, closes the hook opening and prevents the upward movement of that device under normal conditions. A plunger 12, held in position by spring 36, penetrates one wall of the coin chute 26. Attached to the locking lever is a finger 20, having an inturned end 21, working in a slot 22 in the plate 23, which forms a side to the chute channel. Projecting through slot 31 in plate 23 is a detent 30 which is carried by a lever 29 connected to the ringing button 7. Associated with the locking lever is a latch lever 34 having a latch 33, which when in use engages the catch 15 of the locking lever.

The operation of the device is as follows: When a party wishes to use the telephone he deposits in the chute 26 a coin which lodges between the leg 18 of the locking lever and the plunger 12. The plunger 12 is then depressed and the movement communicated through the coin to the locking lever, forcing its leg17 away from the hook switch slot, and causing its catch 15 to engage with the latch 33. When the plunger is allowed to return to its normal position, the coin falls to the bottom of the chute and comes to rest upon the detent 30. The receiver is then removed from the hook which moves to its highest point (see 5 in Fig. 3) and the connection dial is manipulated. If the subscriber discovers, by listening, that the line wanted is not engaged, he depresses the ringing button 7 which causes the withdrawal of the detent 30, and the coin falls into the money box. Should the line be busy, however, the receiver is replaced on the hook, moving it downwards, thereby unlatching the locking lever, which under the action of the spring 25 moves sharply to the left; the end 21 of the finger 20 then throws the coin into the receiving clip 28, from which it may be recovered by the subscriber.

AUTOMATIC TELEPHONE CONNECTOR SWITCH.

A. E. Keith, John Erickson and C. J. Erickson, of Chicago, Ill., patent (No. 815,176; dated March 13, 1906; filed April 21, 1905; serial No. 256,804) and assign to the Automatic Electric Company, Chicago, Ill., an automatic telephone connector switch.

This patent relates to automatic apparatus employed at an exchange to connect one subscriber's line to another.

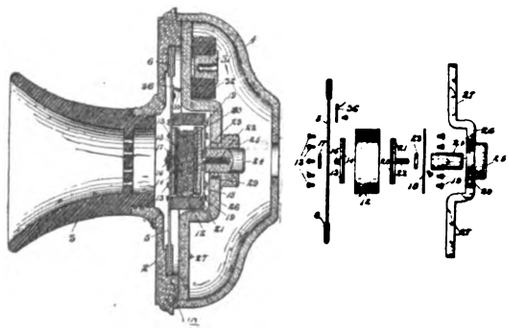
As the specifications require eight sheets of drawings and fifty-one different diagrams, it will be impossible to give a clear analysis of the claims involved. All persons interested should procure a copy for their personal investigations.

TRANSMITTER.

W. W. Dean, Chicago, Ill., patents (No. 817,140; dated April 3, 1906; original application filed January 27, 1902; serial No. 91,456; divided and this application filed April 3, 1902; serial No. 101,149) and assigns to the Kellogg Switchboard and Supply Company, Chicago, Ill., a telephone transmitter.

The essential feature of this invention consists in the mounting of the granular carbon chamber upon the front electrode.

Referring to the illustrations 5 is the diaphragm to which is attached a hard rubber ring 12 by screws 13. The front electrode 14 is fastened to a plate 15 having a threaded extension for its attachment to the diaphragm. The rear opening of the ring 12 is closed by a supplemental diaphragm 18, which is attached thereto by screws 19. The rear electrode is mounted on a plate 24, having a threaded extension 22 which passes through the diaphragm 18 and is attached to the stem 24, which in turn is rigidly fastened to the bridge 27. In operation, vibrations projected



against the main diaphragm 5 cause variations in the resistance of the granular material between the two electrodes in the usual manner; but the containing chamber being attached to and vibrating with the front diaphragm, the carbon particles are continually disturbed and are therefore not so susceptible to packing.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

NEW DEAN BRANCH EXCHANGE.

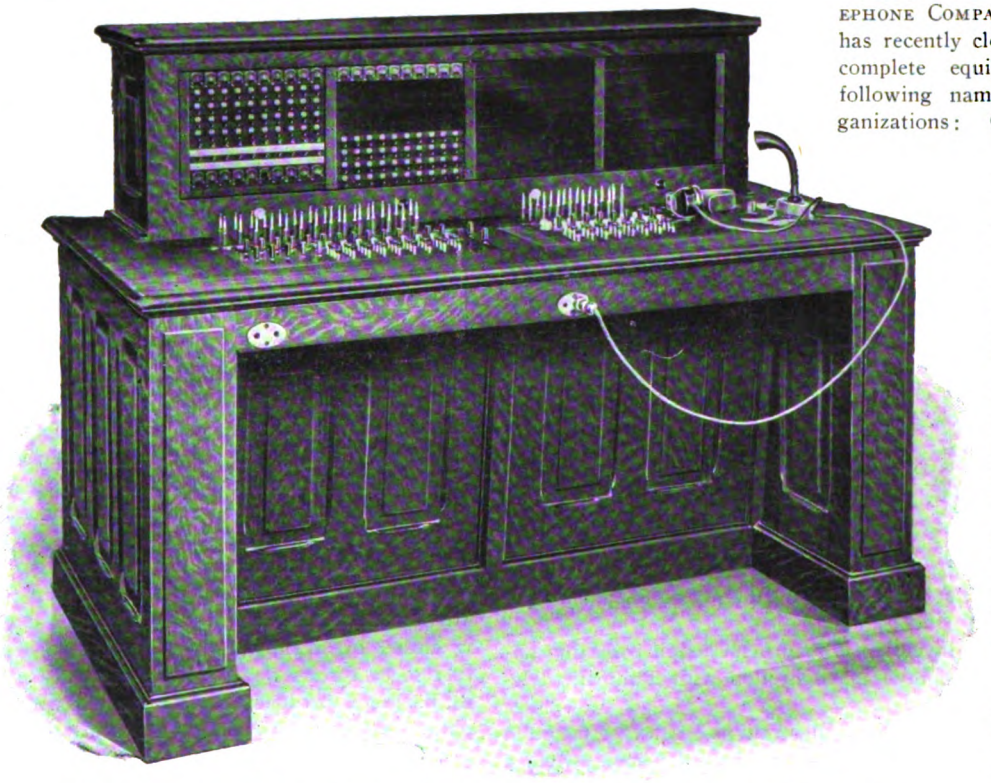
A STYLE of switchboard which is particularly adapted for extremely rapid operation, and so designed and finished as to present a very neat appearance, has recently been brought out by the Dean Electric Company, Elyria, Ohio. It is a two-position common battery board for private branch exchanges or central offices which have less than 300 lines, and is known as the No. 16 type.

The cabinet is furnished in best quarter-sawed oak or solid mahogany as desired. Both front and rear panels are removable by releasing the flush ring catches which hold them in place, this construction making access to all the apparatus a very simple matter. The key shelves are made five ply, with the grain of the wood of alternate layers laid across in different directions so as to prevent warping. They are hinged, and held in place by a very substantial spring lock thus allowing the wiring to be readily inspected, but only by an authorized person.

Space is provided on the key shelf for the installation of a 4-party line combined ringing and listening key which can be cut into each cord circuit if desired.

The plug shelf is covered with one-eighth inch polished leather to prevent noise in operating and wear on the cords and plugs.

The key for switching the hand and power generators is conveniently located on the key shelf, at the right of each operator, and is so arranged that only one generator, either hand or power, can be connected at any one time. The hand generator for each position is mounted in the rear of the cabinet with an extension shaft projecting to the front through an escutcheon to the crank as shown in the view, thereby making it readily accessible as well as convenient for operating.



The New Dean No. 16 Type Switchboard for Private Branch Exchanges or Small Central Offices.

The switch controlling the night alarm bell is wired to ring whenever a line or supervisory relay is operated. Line and supervisory signal pilot lamps are provided at each position.

The operator's breast plate transmitter set shown in this view consists of the well-known Dean long distance type transmitter and receiver, with a hard glazed cotton cord connecting to a plug. This plug when in service is inserted in one side of the operator's twin jack shown in the space below the keyboard. This jack is so constructed that when the plug is withdrawn the operator's circuit is automatically opened. This type of talking circuit has become very popular on account of its great convenience and reliability.

The line relays can be mounted if necessary in the rear of the cabinet, but they are more convenient for inspection and less liable to damage when being shipped, if arranged to be mounted on a separate rack outside of the switchboard.

All wiring on this switchboard is brought down by means of specially formed cables to the connecting racks contained in the rear of the cabinet, and to these connecting racks are led all line wires. The construction is such that the connecting rack is readily accessible at any time without interfering in any way with the mechanism of the switchboard. The equipment in this cabinet is the same as used on the larger Dean multiple switchboard, and which has proven to be so successful. The company states that this switchboard was designed to fulfill the most exacting requirements for switchboards of this size, and it will be pleased to forward detailed information to those sending a request.

THE SWEDISH-AMERICAN TELEPHONE COMPANY, Chicago, Ill., has recently closed contracts for complete equipment with the following named telephone organizations: Ovid Telephone Company, Shepardsville, Mich.; Inter-State Telephone Company, Wilsonville, Nebr.; Tedrow Telephone Company, Tedrow, Ohio; Lago Independent Telephone Company, Lago, Ind.; Farmers' Mutual Telephone Company, Ft. Seneca, Ohio; Farmers' Mutual Telephone Co., White Pigeon, Mich.

THE WESTERN TELEPHONE MANUFACTURING COMPANY, Chicago, Ill., is issuing catalogue E which describes at length the different pieces of apparatus it manufactures. The construction of the Western transmitter, receiver, ringer, generator, induction coil and switch hook is very thoroughly illustrated and each particular is carefully analyzed. Amongst the different types of wall and desk sets, descriptions of which find a place in this catalogue, there are several which embrace new ideas in the design and arrangement of parts. The "Pioneer" instrument conforms in appearance to the common battery wall type, but as this telephone is arranged for magneto service the generator is mounted in the cabinet below the writing shelf. Two distinct types of desk stands are shown. The "Western" Adjustaphone provides a convenient arrangement for desk instruments. In the compilation of this catalogue great care has been exercised to make the text and illustrations clear and distinct. All points of special interest are given greater emphasis by being printed in red. Copies will be furnished all persons who request them.

SUPPLIES WANTED

For use of operating companies wishing to purchase or sell second-hand equipment or supplies. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

WANTED—Prices and description of intercommunicating apparatus to work in connection with common battery exchange service. Must be high grade and work on the button principle. Address Beaumont Telephone Company, Beaumont, Texas. 622

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Competent man (married preferred), who is thoroughly capable of handling both business and practical end of telephone plant operating 500 common battery and 200 rural lines. New plant. Position permanent to right party. Salary $65.00 per month for the first year. Right party can secure stock interest in property and the position of Secretary. Address, with full particulars, to Box 619, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 619

POSITION wanted with a manufacturing company in the advertising or sales departments, by a young man with energy, experience and ability. No reasonable offer refused provided there is opportunity for advancement. Address Box 613, AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 613

WANTED—First-class telephone installers. Also man accustomed to wiring branch exchanges. None but competent men need apply. Good wages and permanent position. Address P. K. Higgins, Gen. Del., Milwaukee, Wis. 621

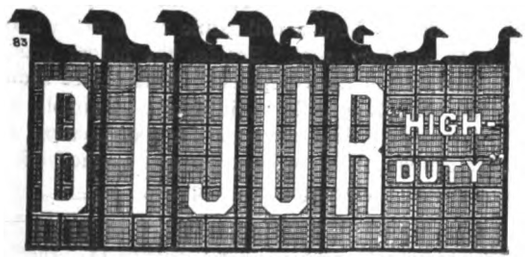
WANTED—A young gentleman of good appearance desires position as traveling salesman with good telephone or supply house. Seven years' experience, last four years as superintendent of switchboards for company operating over sixty exchanges. Can give best of references and reasons for wishing a change. Address Box 620, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 620

WANTED—Experienced purchasing agent desires position with progressive operating or manufacturing company. Good habits, clean record, excellent references. Address Box 623, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 623

MR. MANUFACTURER, our business is to create and delevop A MARKET FOR YOUR PRODUCT. We can sell your entire output at less expense and risk that you can do it. If you have a good thing but don't know how and where to sell it, write us. Hapgoods Sales Company, 305-309 Broadway, New York, U. S. A. Offices in eight American cities and London, England. 464

YOUNG MAN possessing experience and ability desires position as manager with a progressive company. Would be willing to consider a proposal offering part interest in return for services. Address Box 612, AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 612

WANTED—Several young men to plan telephone toll line and cable construction. Preference will be given to men with good electrical educations. The work is located in the western part of Pennsylvania. Necessary expenses paid when out of town. No applications considered unless age and salary expected are stated. Address Box 618, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 618



This battery is distinguished by the fact that the grills are made separately and then welded by a process discovered by Mr. Bijur into a solid framework of either alloy or pure lead; the former being generally employed on account of its greater mechanical stability and oxidizable properties. These grills, while rigidly held in the frame, can expand in all directions, and therefore do not set up strains and so avoid the tendency to grow, burst, or buckle, which has heretofore been a well known disadvantage of many other types.

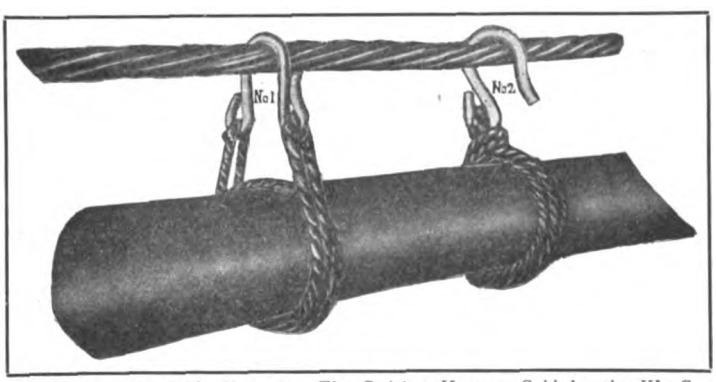
IN THE MANUFACTURING FIELD

PRACTICAL POINTS IN CABLE HANGING.

DESCRIBING the Swisher Marline Cable Hanger in a letter to the W. G. Nagel Electric Company, of Toledo, Ohio, its inventor, who is an experienced construction man, expresses some interesting views.

An illustration of this type of hanger is shown, and reference to it will make clear the point of his arguments. In this figure No. 1 represents the Swisher hanger, and No. 2 the open hook type. The inventor's letter states that with the latter style of hanger, after pulling the messenger wires as taut as they should be, the expansion of the messenger wires and the cables which they support is frequently not in the same proportion. This causes the cable to buckle and become unhooked, and the only way to prevent this is by closing each hook with a pair of connectors. This is an operation which takes time, and causes considerable annoyance to the men who do the work. The misfortune of having several strands of cable lying in the street, as the result of a few hooks becoming detached and the rest of the hooks stripping or straightening out, is alluded to as an experience which can readily be avoided. The operation of moving cable often makes it necessary to send a man out on the messenger and open up the hooks; then after the cable has been moved to the required position a man has to be again sent back to close the hooks. When this has been attended to it is likely to be found that after the cable has been up a few months the wind in blowing in a direction at right angles to that of the line will cause the marline to wear in the eye of the hook instead of allowing the hooks to swing on the messenger wire. Another difficulty mentioned is that caused by the sagging of aerial wires, which when being strung are allowed to drop until they are beneath the cable and on being pulled up become locked between the hooks and the messenger wire. This means either the sending of a man out on the messenger to unfasten them, or else the cutting of the wire at the nearest pole and pulling the span out to be strung over again.



Two Types of Cable Hangers. The Swisher Hanger, Sold by the W. G. Nagel Electric Company, is Shown at the Left.

To overcome these difficulties the type of hanger illustrated at the left of the photograph was devised. The hooks are all made of one size, both as to width and wire. The shape of the hanger is such as to enable it to bear a very great strain in proportion to its size. These hangers are galvanized after leaving the machine which brings them into the required form. In this way the danger of breaking the surface and forming a spot liable to rust when contact is made with a messenger wire is avoided. For supporting twenty-five and fifty pair cables the very best grade of marline is furnished; for the larger sizes the best grade of houseline. This is the same grade of marline and houseline as is used on sailing vessels, and is said to be more durable than even the poles which support the cable. The W. G. Nagel Company will be glad to send out prices, and descriptive matter which gives further information about this interesting type of hanger.

THE EDWARDS-HINE COMPANY, 5 and 7 Pearl street, Grand Rapids, Mich., has issued a folder which describes an extremely useful type of loose leaf binder. It allows the loose sheets to be arranged in substantial covers, which have, to all intents and purposes, the appearance of a regular bound volume. There are no pieces of metal work showing on the outside, to present an unsightly appearance or scratch a well-polished desk. The book is made upon a new plan which secures several important advantages. The binding is flexible, so that the leaves will lie flat no matter where the book is opened, and only a half-inch binding margin is required. The backs are made interchangeable in order that the number of leaves may be increased as desired. The Edwards-Hine Company claims that this book is a money saver and a time saver, and will be glad to furnish illustrations and descriptions to those who forward inquiries.

THE GOULD STORAGE BATTERY COMPANY, which had its San Francisco offices in the Crossley Building, which was destroyed by fire, has established temporary offices at 1701 Geary street, San Francisco. All inquiries relative to its products from Pacific coast patrons should be forwarded to the new address.

THE VOUGHT BERGER COMPANY, La Crosse, Wis., has recently increased its capital stock from $57,000 to $200,000. For some time the company's sales of telephone supplies have been increasing very rapidly, and in order to handle the large business which has been developed the stockholders decided to increase the capital stock.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, BUFFALO, N. Y., is mailing a card which draws attention to a number of very interesting features embodied in its No. 85 local battery desk telephone. This instrument is of the type in which the induction coil is mounted in the base. Amongst the statements upon the card are several drawing attention to various points in the construction of the stand which will appeal to practical telephone men, such as the ease with which the spring contacts and connections may be inspected, the fact that all connections are soldered and terminated in binding posts to which cords connect, and the attractive proportions and design of the stand itself. The company is anxious to have interested people learn more about this set, and wishes to send one of the instruments to any telephone manager who is about to purchase equipment of this sort.

THE FISK-NEWHALL TELEPHONE MANUFACTURING COMPANY, CHICAGO, ILL., has designed the Fi-Ne coil holder which is adapted for use in conjunction with its Fi-Ne coil winders. This piece of apparatus is intended to hold a coil while the wire is being unwound from it to another spool. Besides the holder proper three chucks are included in the equipment. This device should be very useful for rewinding coils as it affords a simple and efficient support for those being unwound for examination and repairs. A leaflet showing the construction and method of attachment will be mailed on receipt of a request.

THE ELECTRIC GOODS MANUFACTURING COMPANY, BOSTON, MASS., is mailing a card which draws attention to two types of flush telephones for interior service. These instruments set flush with the wall, the transmitter, bell, and receiver hook being mounted on the front. They are specially designed for house, apartment, or hotel use and are furnished in brush brass which gives them a very attractive appearance. Wiring diagrams are furnished upon request.

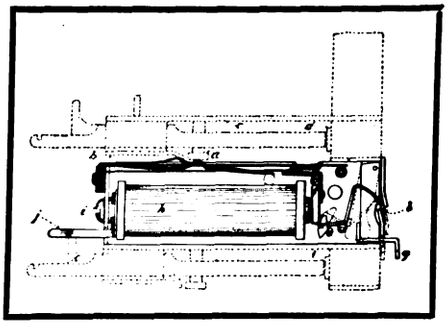
PAT. APRIL 25, 1905

"A Perfect Switchboard Must Have Perfect Drops"

We want YOU to understand this drop



Watch this space It will save you money

A drop with 2 moving parts, the armature and shutter. When armature "F" releases shutter "E" the shutter falls through slot and gives signal to the operator. Compare this arrangement with the usual heavy brass shutter latched up by a brass rod like a farm gate, and you will see WHY the Unitype is more sensitive and positive in action. No pivot screws. Armature and shutter both supported on rods which run entirely across drop case. No adjustment ever necessary. Positive night bell contacts. Shutter always protected and can't be shaken down. Occupies small space and gives no trouble.

Let us tell you more about it.

THE WEEK'S MESSAGES

NEW COMPANIES.

CHICAGO, ILL.—The Manufacturers' Telephone Company has been organized at Chicago, and has applied for a charter. The capitalization is nominally $5,000, but provision has been made for increasing the company's capital at any time it is deemed expedient. The incorporators are Laverne W. Noyes, president Aermotor Company; John E. Wilder, of Wilder & Company; C. H. Smith, president Western Wheeled Scraper Company; Gustav Hessery, Jr., treasurer National Brewing Company, and John M. Glenn, secretary Illinois Manufacturers' Association.

MILLSTADT, ILL.—The West Side Telephone Company, of Millstadt, has been incorporated with a capital stock of $1,140. The incorporators are William Kropp, Jacob Fischer and G. A. Mueller.

GREENFIELD, IND.—The Central Telephone Company, of Greenfield, has been incorporated. Incorporators are L. J. Weber, Andrew Williams and T. H. Scudder.

NOBLESVILLE, IND.—The Hamilton County Telephone Company has been organized with Fletcher Jessup, of Hortonville, as president. The company will have its main headquarters at Noblesville and Sheridan, and will install exchanges at Hortonville, Eagletown and other places.

MASON CITY, IOWA.—The Southwest Mason Farmers' Telephone Company has been organized, with Will Hamlin as president, and W. E. Roberts as secretary.

EDNA, KAN.—The Deer Creek Telephone Company has been organized with the following officers: John Newbury, president; H. W. Burgess, secretary; Wash. Pearson, treasurer. The company's line as soon as completed will connect with the Edna Mutual Exchange.

RAMONA, KAS.—The Ramona Farmers Mutual Telephone Company has been incorporated with a capital stock of $3,000.

VINTON, KAS.—The Vinton & Cameron Mutual Telephone Association has been incorporated with the following officers: G. W. Williams, president; A. Gilstrap, secretary, and E. T. Payne, treasurer. The company will build a line from Vinton to Arkansas City.

BOSTON, MASS.—The Metropolitan Home Telephone Company has been organized with Warren N. Akers as president. The company has applied for a franchise to construct and operate a telephone system in Boston.

CHAPIN, MICH.—The Chapin Mutual Telephone Company, Chapin, Mich., has been incorporated with a capital stock of $1,000.

HARRISVILLE, MICH.—H. F. Barber, manager of the Mutual Telephone Company, of Alpena, is interested in the formation of an Independent telephone company at Harrisville, which will build rural lines to Mikado, Killmaster, Lincoln, Mud Lake and other places.

HOUGHTON LAKE, MICH. — The Loxley Telephone Company, Houghton Lake, Mich., has been incorporated with a capital stock of $1,000.

BIRCH TREE, MO.—The Shannon County Telephone Company, of Birch Tree, Mo., has been incorporated with a capital stock of $10,000. The incorporators are John McClelian, W. I. Marshall, J. W. Chilton and others.

BENNET, NEB.—The Farmers' Mutual Telephone Company, of Bennet, has been incorporated with a capital stock of $10,000. The incorporators are W. F. Torbitt, M. Meyers, John T. Dobbs, Harry Honnor and Everett W. Randall.

LINWOOD, NEB.—The Linwood Telephone Company has been incorporated with a capital stock of $15,000. The incorporators are A. A. Hayek, D. G. Dawson, Frank Faytinger, Thomas Duda, W. F. Dawson, M. J. Rezac, Chas. Homolka, Fred Faytinger and Emil Eolda.

PRATTSVILLE, N. Y.—The Prattsville and Lexington Telephone Company has been incorporated with a capital stock of $600. The incorporators are J. Packham, B. G. Morse, G. D. Roppleyea, Prattsville, N. Y.

TRIANGLE, N. Y.—The Triangle Telephone Company, Triangle, N. Y., has been incorporated with a capital stock of $1,000. The directors are C. B. Self, DeWitt Beardsley, C. E. Adams, Triangle.

BARLOW, N. D.—The Farmers' Mutual Telephone Company, Barlow, N. D., has been incorporated with a capital stock of $10,000. The inporators are J. R. Tingberg, John Indegard, L. Mortenson, E. H. Weigman, G. M. Carlson, G. G. Schmid, Barlow.

CONSIDINE, N. D.—A new Farmers' Telephone Company is being organized at Considine, in which Ben Jones and others are interested.

WAHPETON, N. D.—The Home Telephone Company, of Wahpeton, N. D., has been incorporated with a capital stock of $10,000. The incorporators are Robert H. Divine, Geo. E. Wallace and W. L. Carter, of Wahpeton.

PARKLAND, OKLA.—The Star Rural Telephone Company, of Parkland, has ben incorporated with a capital stock of $10,000. The incorporators are Henry Rowland, J. E. Switzer and D. L. Lamb, of Parkland; G. W. Braden, of Chandler, and Frank George, of Agra.

MONTGOMERY'S FERRY, PA.—J. P. Aiken, of Lewistown, traffic manager of the United Telephone Company, is interested in the formation of a new telephone company, which is to run from Montgomerys Ferry to Newport, connecting with the exchange at that point, and continuing down through New Buffalo, Duncannon and Marysville, connecting at Enola with the Harrisburg exchange.

CENTERVILLE, S. D.—The Citizens Telephone Company, of Centerville, has been incorporated with a capital stock of $50,000. It will construct both local and long distance lines. The incorporators are J. A. Crowe, T. J. Gunderson, C. M. Morgan, Geo. H. Lowrie and E. Mudie.

COLMAN, S. D.—The Farmers' Union Telephone Company, of Colman, has been incorporated with a capital stock of $9,000. The incorporators are A. S. Harvey, Andrew Ulstad and Ole Mickkelson.

LEBANON, S. D.—The Springs Mutual Telephone Company, with headquarters at Lebanon, has been incorporated with a capital stock of $5,000. The incorporators are John Nold, O. W. Beach, Jos. Tilgen and C. L. Keller.

OTTWAY, TENN.—The Ottway Telephone Company has been incorporated with a capital stock of $320. The incorporators are W. H. Smith, J. O. Young, Jacob Wiloughby, R. A. Bromley, W. W. and J. M. Casteel.

CAMERON, W. VA.—The United Farmers Telephone Company, of Cameron, has been incorporated with a capital stock of $10,000. The incorporators are T. R. Chapman, McCracken, Pa.; Gus Leichter, J. C. Lough and A. B. Barnett, Rock Lick, W. Va., and John Hagerman, Cameron.

SOLON SPRINGS, WIS.—An Independent telephone company is being formed at Solon Springs by local business men. The company expects to make connections with the Douglas County long distance line.

LARAMIE, WYO.—The Little Laramie Telephone Company, with general offices at Laramie, has been incorporated with a capital stock of $10,500. The company is to build a line from a point about twenty-five miles west of Laramie, on the Little Laramie River, to Laramie. The incorporators are John W. Ernest, W. C. Vance, Howard R. Ingham, Ollie Wallis and S. F. Phillips.

TORONTO, ONT., CAN.—The Independent Long Distance Telephone Company has been incorporated, and expects to spend $200,000 in construction work during the coming year.

FRANCHISES.

PAPILLION, NEB.—The Home Telephone Company has been granted a franchise at Papillion, Neb.

WEST POINT, NEB.—The Independent Telephone Company, doing business around Beemer and Wisner, is to petition the West Point City Council to be allowed to establish an exchange at West Point.

BATHGATE, N. D.—F. E. Carson has been granted a franchise to construct a telephone system in Bathgate.

BALTIMORE, OHIO.—The Baltimore & Venice Telephone & Telegraph Company has made application for permission to extend its service from Shandon to New Haven, to Harrison, Miami and Cleves.

PORTLAND, ORE.—The Home Telephone & Telegraph Company, of Portland, has applied for a franchise at Astoria.

WARWICK, R. I.—The Home Telephone Company, formerly the New England Shaver Telephone Company, of Providence, has been granted permission to construct a telephone system at Warwick.

ALBEE, S. D.—The Grant County Telephone Company has been granted a franchise for a telephone system in Albee.

FRANKLIN, TENN.—The Home Telephone Company, of Nashville, has been granted a franchise at Franklin.

COLVILLE, WASH.—Geo. K. Armstrong and others of Echo have applied for permission to construct a telephone line from Colville to Echo.

TRIADELPHIA, W. VA.—The National Telephone Company, of Wheeling, W. Va., has applied to the city council of Triadelphia for a franchise to construct and operate a telephone system in that city.

FINANCIAL.

BLAKELY, GA.—The Blakely Telephone Company has recently paid its third annual dividend. This year the dividend on the common stock was at the rate of 6 per cent., and about 4 per cent. was carried to the surplus.

MULBERRY GROVE, ILL.—The Mutual Telephone Company, of Mulberry Grove, Ill., has increased its capital stock from $1,000 to $5,000.

CAPE GIRARDEAU, MO.—The Cape Girardeau Bell Telephone Company has increased its capital stock to $125,000.

MEDINA, OHIO.—The Medina County Farmers Telephone Company, Medina, Ohio, has increased its capital stock from $10,000 to $25,000.

STANTONVILLE, TENN.—The Stantonville Telephone Company has increased its capital stock to $100,000.

COMBINATIONS.

RIPPEY, IOWA.—The Green County Telephone Company has been acquired by Messrs. Amos Burk, Chas. Stotes, John Munson and John Shoemaker.

THE WEEK'S MESSAGES

TECUMSEH, NEB.—The Johnson County Home Telephone Company, the new Independent Company at Tecumseh, has acquired the holdings of the Johnson County Telephone Company, formerly owned by H. F. Canon, of Cook. The Canon lines include the exchanges at Cook and Graf.

LITTLE FALLS, N. Y.—The Interstate Telephone Company is to take over the line formerly known as the County Telephone Company.

BERWICK, PA.—The Berwick Telephone Company has been sold to the Consolidated Telephone Company.

IOLA, WIS.—The Johnson Telephone Exchange has been absorbed by the Scandinavia line.

TWO RIVERS, WIS.—Geo. Martin has bought the interest of J. E. Hamilton in the local telephone exchange, and will make extensions in the system.

ELECTIONS.

ALBUQUERQUE, N. M.—The Mutual Automatic Telephone Company has elected the following officers: D. K. B. Sellers, president; A. E. Walker, vice president; Frank McKee, treasurer; F. A. Storrs, secretary.

ALBANY, N. Y.—The Albany Home Telephone Company has elected the following directors: James Moore, Henry Dumary, W. H. Keeler, Albert Hessberg, E. B. Toedt, Howard Hendrickson, E. M. Woodward, H. H. Bender, Richard Stephens, S. R. Rawson, I. H. Griswold, T. M. Brush, F. H. Sudro, W. E. Brooks and E. E. Williams.

PERSONAL.

F. N. BARHYDT has recently assumed the management of the plant of the Coles County Telephone and Telegraph Company at Charleston, Ill.

J. C. CALHOUN has been appointed manager of the exchange of the Mississippi Valley Telephone Company at Ft. Madison, Ia.

HARRY CRANDALL, of Toledo, has taken a position with the Union Telephone Company at Laingsburg, Mich., as superintendent of construction.

CLARENCE G. KERN, of Owensboro, Ky., has been appointed to the position of superintendent of construction for the Evansville district by the Cumberland Telephone and Telegraph Company.

FRANK LATHROP, who has been general manager of the Ozark Bell Telephone Company at Springfield, has been assigned to Hannibal as manager of District No. 3 of the Missouri and Kansas Telephone Company. His territory embraces the counties of Macon, Shelby, Marion, Randolph, Monroe, Rails, Audrain and Pike.

FRANK B. MOXHAM has been appointed plant supervisor of the Frederick district of the Chesapeake and Potomac Telephone Company, with headquarters at Frederick, Md.

WALTER N. NICHOLSON has been appointed general manager of the Central New York and the Empire State Telephone Companies.

W. V. RAMSEY, who has been manager of the Central Union exchange at Chenoa, has been advanced to the managership of the office at Petersburg, Ill.

JOHN RICHMOND has been appointed general manager of the Farmers' Telephone Company at Scribner, Neb.

F. B. ROGERS, who has for several years been general superintendent of the New York and Pennsylvania Telephone and Telegraph Company, has been promoted to the position of general manager.

H. F. STEVENS has resigned from the office of general manager of the Central New York, the Empire State and the New York and Pennsylvania Bell Telephone companies and has been elected to the vice-presidency of the Hudson River Bell Telephone Company, the duties of which position he will enter upon forthwith. Mr. Stevens will continue to hold the office of vice-president of the other companies mentioned.

WALTER I. SWEET has been appointed manager of the Jersey City district of the New York and New Jersey Telephone Company. This district includes Jersey City, Bayonne, Hoboken, Englewood and all of Bergen County, N. J.

CHARLES G. VICKERY, of Rochester, N. Y., has taken the management of the Salt Lake City plant of the Utah Independent Telephone Company, with the title of General Superintendent.

MISCELLANEOUS.

REGINA, SASK, CANADA.—The provincial government is preparing an act which will enable towns and municipalities to expropriate any Bell company's lines in the province. Address Walter Scott, Minister of Public Works, Regina.

ROSTHERN, SASK., CAN.—The town has sent a committee to visit various municipal telephone systems with a view to having a municipal telephone plant installed at Rosthern. Address John Hamm, Mayor.

New Construction in the Field

FOWLER, CAL.—The Fowler Independent Telephone Company expects to build a line to Oleander.

EMMET, IDAHO.—The Independent Telephone Company is installing an exchange at Emmett, and is also extending its lines.

MACOUPIN, ILL.—The Macoupin Telephone Company, which has lately acquired the Girard Telephone Line, running from Elkville to McVey, is going to greatly improve and extend the system.

COLUMBIA CITY, IND.—The Farmers Mutual Telephone Company is to build a number of rural lines.

COLUMBUS, IND.—The Citizens Telephone Company is considering the installation of a new exchange at East Columbus.

DALEVILLE, IND.—The Daleville Telephone Company contemplates making many extensions to its lines.

ROANOKE, IND.—The Roanoke Telephone Company is building two new rural lines west of Aboite.

SOUTH WHITLEY, IND.—The Whitley County Farmers' Mutual Telephone Company is to extend its lines to Jefferson township and to Roanoke.

CEDAR FALLS, IOWA.—The Corn Belt Telephone Company is to expend $15,000 in improving its system at Cedar Falls.

MAQUOKETA, IOWA.—The Maquoketa Telephone Company is rebuilding some of its lines.

MURPHY, IOWA.—The Murphy Mutual Telephone Company is to build a number of new lines.

SLOAN, IOWA.—The New State Telephone Company is constructing a line from Sloan to Sioux City.

HOWARD, KAS.—The Elk County Telephone Company is to build a number of county lines.

WESTMORELAND, KAS.—The Westmoreland Telephone Company will establish an exchange at Wheaton.

WHITEWATER, KAS.—The Whitewater Telephone Company is constructing telephone lines at Whitewater.

RINGGOLD, LA.—Messrs. Crump and Adkins are to install a telephone exchange at Ringgold, La.

CASCO, ME.—The Casco and Naples Telephone Company is extending its lines in various directions.

ETNA, ME.—The Etna Telephone Company is building a line from South Etna to Plymouth.

MARSHALL, MICH.—The Citizens Telephone Company is rebuilding its lines from Marshall to Eckford.

CROOKSTON, MINN.—The Tri-State Telephone Company is building a line from Crookston to Greenbush.

NELSON, MINN.—The Nelson Telephone Company is about to establish long distance connections.

OSSEO, MINN.—The Rural Telephone Company is to construct lines to St. Michael, Rogers and Hamel, and contemplates establishing an exchange at Buffalo.

ST. JAMES, MINN.—The St. James Telephone Company is building a rural line from St. James to Godahl.

ST. PETER, MINN.—The Nicollet County Telephone Company is building several new lines.

ROSEAU, MINN.—The Roseau Telephone Company is putting up an up-to-date telephone exchange at Roseau with all metallic lines.

DILLON, MONT.—The Southern Montana Telephone Company is to build a line to Poindexter Corner and will make extensions in the Big Hole Basin.

MILFORD, N. J.—The Delaware Valley Telephone Company will build a line from Milford to Frenchtown.

COHOES, N. Y.—The Cohoes & Waterford Home Telephone Company is to build lines from Scanlon's Corners to Dunsbach Ferry.

FREDONIA, N. Y.—The Home Telephone Company is extending its lines to Lily Dale and Cassadaga.

CARDINGTON, OHIO.—The Cardington Telephone Company is preparing to make many improvements in its system, including the installation of a new switchboard.

ALLENTOWN, PA.—The Consolidated Telephone Company is making many improvements in its system.

FACTORYVILLE, PA.—The Merchants' Telephone Company is building a line through Factoryville.

KUTZTOWN, PA.—The Kutztown Rural Telephone Company is to build a line from Kutztown to Kempton.

NEW CASTLE, PA.—The Union Telephone Company, of New Castle, is to build a rural line through to Pulaski.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

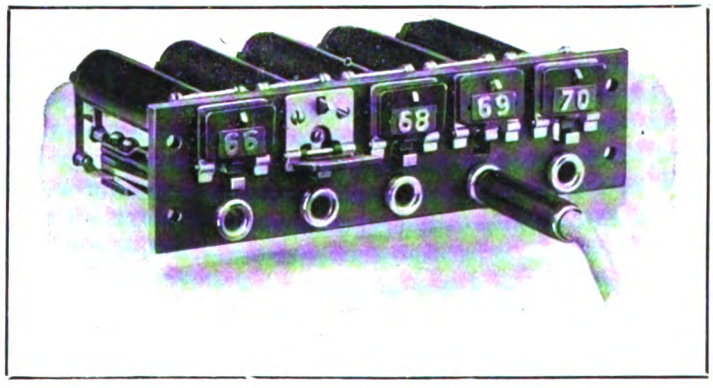
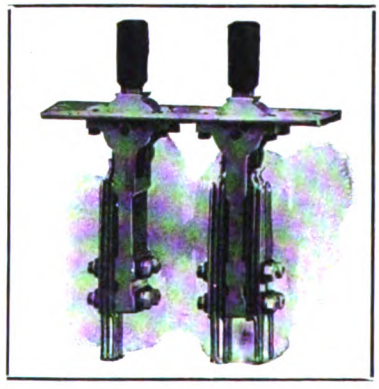
MONARCH

THE two most important parts of the switchboard being the line signal and the ringing and listening key, we illustrate a strip of Monarch drops and jacks and a Monarch ringing and listening key with ring back. These parts have now been on the market for a period of two years, and during that time they have proven themselves to be most efficient and durable. The fact that the armature of the drop is mounted in front of the coil and that the coil can be removed without breaking any soldered connections and without disturbing the armature is a feature that is appreciated by all practical telephone men. The additional advantage secured from this construction is that the adjustment of the armature is positive and permanent.





The ringing and listening key shows the same careful consideration of small details which is so apparent in all Monarch equipment. The mountings for the springs are solid brass so formed as to afford a most substantial support. The springs themselves are made of German silver and the contacts are pure platinum rivets. Little features of this kind will interest anyone in the market for switchboard equipment and an investigation will pay.

A complete exhibit of Monarch Telephones and Switchboards will be found in Room 642 and 644 during the National Interstate Telephone Association Convention, June 25th, 27th and 28th.

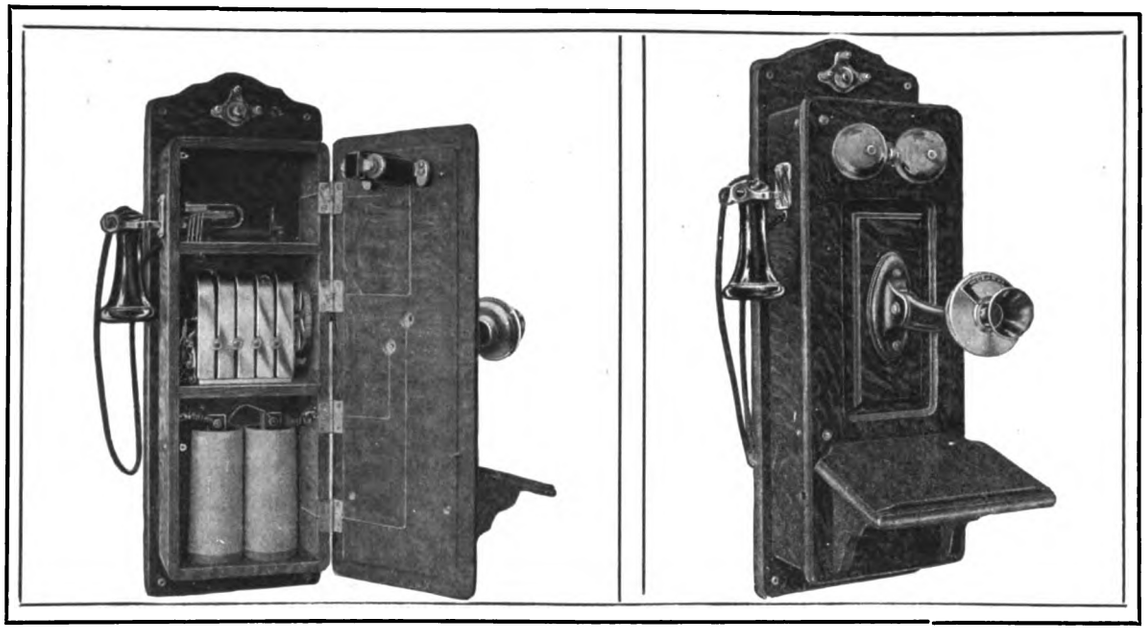
DEAN TELEPHONE APPARATUS

Selecting a Telephone



The selecting of telephones at first may seem to be a difficult problem, on account of the variety of telephones offered for sale and the advantages claimed for each class by the manufacturer, which tend to confuse at first, rather than enlighten the novice who does not consider the real efficiency, reliability and facility of repair, condensation of space in storage, non-breakable part of switch lever hooks, metal bushed mounting holes in corner of back-boards to prevent splitting or marring of woodwork, locks which will not fall out when the cabinet lid is open, and above all transmitters and receivers that have withstood the most severe tests and give the best results for all long distance transmission. When you have considered these points you will do as others have done by placing your contract for Dean telephones.

Our Bulletin No. 101-A gives complete description of our local battery telephones, which is yours by writing.

KELLOGG PHILOSOPHY— —THE BEST IS THE CHEAPEST

KELLOGG

FREQUENCY POLE CHANGER

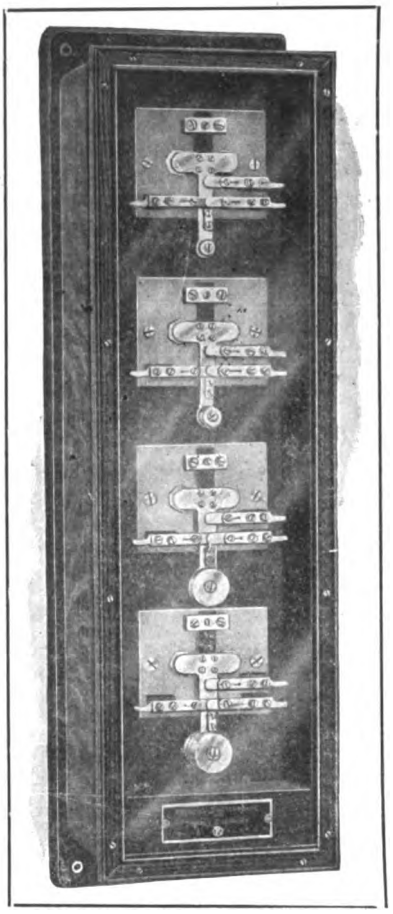
Utmost SIMPLICITY of Operation

THE EFFICIENCY

and beauty of the Selective Harmonic Ringing System of the Kellogg Company has been fully recognized by the entire Independent field, but the difficulty, heretofore, has been that the system required a generating device which involved a rather high first cost, and a relatively large consumption of energy.

The Frequency Pole Changer was designed to meet and overcome all these objections.

It is a very simple device, each unit only involving the use of a magnetic coil and three sets of springs.



"FRONT VIEW"—COVER ON

ADVANTAGES

1. Requires very little attention after once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from Primary or Storage Batteries.
4. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
5. Operates successfully on any standard voltage of a telephone exchange.
6. Practically noiseless in operation.
7. Only THREE contacts on each vibrator.
8. The vibrators have a very long spring, hence they will not break or change the frequency.

This Pole Changer can be used on either Common Battery or Magneto Exchanges

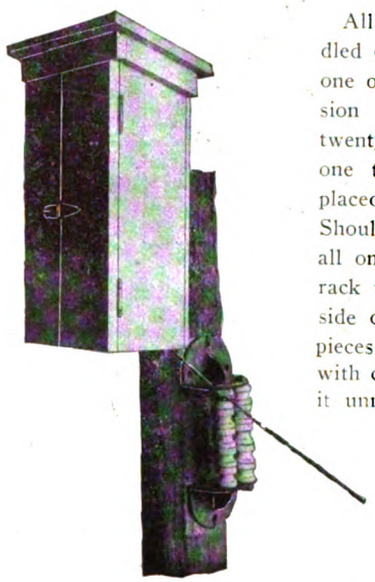
Robinson Pole Distribution Rack

(PATENT PENDING)

SIMPLE INEXPENSIVE PRACTICAL



All drops can be easily handled either by placing rack on one or both sides as the occasion demands. In case of twenty drops equally divided, one ten pair rack would be placed on each side of pole. Should the twenty drops be all on one side, a twenty pair rack would be placed on that side of pole. Top and lower pieces heavy malleable castings with convexed surface, making it unnecessary to gain pole.

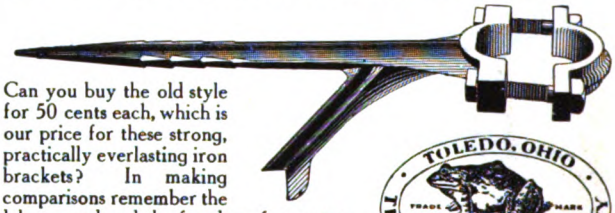
STERLING ELECTRIC CO.
LAFAYETTE, IND.

A REDUCTION THAT MEANS SOMETHING

We have made **NOVELTY POTHEADS** so cheap that it is both wisdom and economy to discard the old style sleeves. Not even expert lead-wipers can compete. Any ordinary man can install our **NOVELTY POTHEADS** with his own tools. We also make sleeves for straight-away and two and three branch sleeves. The prices, not the quality, have been lowered. *Write immediately for Catalog 199*

Our **SECURITY POTHEAD BRACKET** is malleable iron and linemen may stand upon it without danger. Can this be done with the old wooden block bolted or tacked to the poles?



Can you buy the old style for 50 cents each, which is our price for these strong, practically everlasting iron brackets? In making comparisons remember the labor saved and the freedom from vexatious breakdowns.

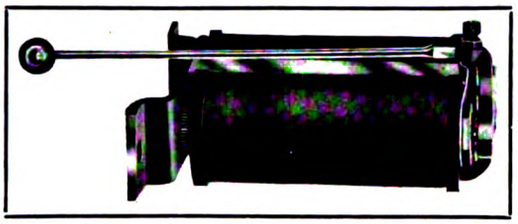
CORRECT RINGER CONSTRUCTION



The above cut represents style of ringer manufactured exclusively by the Swedish-American Telephone Company and clearly demonstrates that all ringer movements heretofore have been manufactured on the wrong principle. This ringer has a perfectly balanced magnetic field. *All* other ringers have the magnet on one side of the coils, thereby dissipating a good percentage of the energy, consequently the bells do not ring as loud and clear as they should nor will as many operate satisfactorily on one line as properly balanced ringers ought to.

The make-up of this ringer not only increases the efficiency but permits of the most durable and compact construction, fewer parts, more positive and accurate adjustment.

This ringer movement is 25 per cent. more sensitive than any other

Sectional drawings and full description of this ringer is one of the features of our No. 27 catalogue. It contains many illustrations of apparatus that will interest you.

ASK FOR IT

SWEDISH-AMERICAN TELEPHONE CO., CHICAGO, ILL.

BRANCHES: 615 Bee Bldg., Omaha, Neb.; 115 West 6th St., Kansas City, Mo.
112 Broadway, Fargo, N. Dak.

WHAT'S WRONG

with that TELEPHONE INVESTMENT of yours?

Why doesn't it pay you as well as the best of your investments?

Is the reason bad management or bad equipment? More likely the latter.

Probably the company is trying to do a 20th Century business with 19th Century apparatus.

If that's the case, it is spending more and earning less than it might if it had our Automatic Telephone equipment.

This is the only really modern telephone system. It produces the ideal telephone service—quick, sure and secret—at half the operating expense of a manual equipment, and this service commands better rates.

It costs a fixed price per hundred lines to enlarge the automatic exchange, instead of an increased price per each hundred lines, as in the manual equipment.

The automatic exchange is never outgrown; it never has to be "scrapped" and replaced by a complete new one, as with the manual. You just add to it as you do to a sectional book-case.

All these points bear upon the stability and value of your telephone securities. They mean dividends to you.

Over ninety per cent. of all the large orders placed during the past few years, either for new installations or replacements, have been for our automatic system, and all the companies adopting it have, from the increased earnings, been able to pay the interest on their bonds and a good dividend on their stock.

Our Automatic System has been adopted in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Albuquerque, N. M.
Allentown, Pa.
Auburn, Maine.
Auburn, N. Y.
Battle Creek, Mich.
Bellingham, Wash.
Berlin, Germany.

LOOK—LISTEN

IS YOUR EXCHANGE CONNECTED WITH THE OUTSIDE WORLD?

This is a very important matter and should receive prompt and careful consideration.

Prompt action is necessary if you are **NOT** connected, because **TOLL** business is very profitable, and toll lines are a great factor in the building up of every local exchange.

Careful consideration is necessary because it is very important to secure the **BEST**, the most **RELIABLE** and **EFFICIENT** equipment.

The name **STROMBERG-CARLSON** on a telephone or switchboard is a guaranty of excellence, thorough reliability and the greatest efficiency. These qualities are due to knowledge, skill and wide experience, together with the fact that only the best material obtainable is embodied in their manufacture.

Look into it **NOW**. Let us know your requirements and write to-day for Bulletin 12-B. It tells all about Toll Boards.

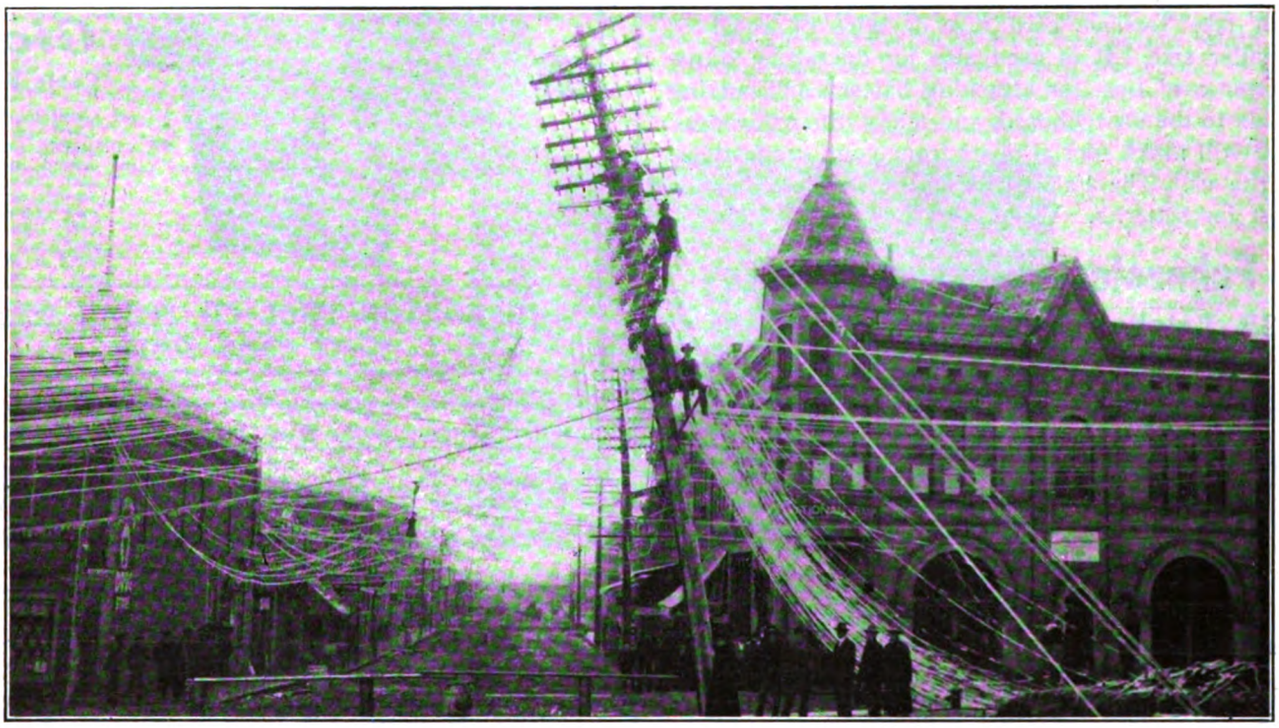
WE MAKE CABLE

DEPRECIATION

In the annual report to the stockholders this item is of particular significance. If you have a well constructed plant upon which the maintenance costs are low, the charges for depreciation or reconstruction will be moderate. But if the line plant is of open wire construction, its maintenance will be costly. Perhaps you may not have suffered much with broken wires or experienced any damage



What a Storm Does to Telephone Lines.--Cable Is Safe

from wind and snow during the past winter, and therefore feel safe.

If you look at the accompanying illustration you will get a good idea of what may happen to your system during the coming winter, and remember it is not a remote possibility either.

If you substitute cable for your open wire leads you are pursuing a conservative course. Aerial cable leads are rarely affected by weather conditions. When corectly installed the maintenance charges are very low under the most exacting conditions, and consequently the net revenue from an all-cable plant will be larger than if open wire lines are employed.

Let us tell you why Stromberg Carlson Cable is the best and consequently the only kind you should consider. Our Booklet 79B tells you how it is made, and we will give you additional proof.

Organization in Telephone Work

By P. Kerr Higgins.

At the head of the Accounting and Auditing Department is naturally the auditor, and his relations with the cashier are very close. While the latter is the subordinate of the business manager his department is open to the auditor, secretary and treasurer. His immediate superior is, however, the business manager and the others simply have the right to inspect the books and obtain reports from this department for the information of the board of directors, and this is only necessary on rare occasions. The cashier is the chief of his department and his assistant and all the clerks of his department are subordinate to him. The business manager looks to him for the collection of earnings from all sources so he is expected to keep careful and accurate records of the accounts of each and every source of revenue and expense. He will also be in charge of the payment of the wages and salaries in each department after proper "O K" by the head of the respective departments and the approval of the general manager or his assistant. The duties of this department are apparently well defined, but on account of the large number of accounts handled and their varied rating the work becomes almost an endless task and the various sub-divisions require careful systematizing. In the handling of the various accounts the card record is found superior to all others and Fig. 1 shows the subscriber's account statement. In addition to this many companies keep a lease record as in Fig. 2, which is usually a long sheet 15 x 20 inches, containing practically a history of each subscriber's account. In this record is kept a complete record of credits and debits for one year, when it is filed for future reference. Some companies keep a cost record for each subscriber. This would show the actual cost of installation and its earnings. This is convenient in cases of adjustment, for example if a subscriber should move it assists in determining whether or not it is well to force payment for the cost of moving. On the Pacific coast, especially in Los Angeles, this is found not only convenient but necessary on account of the transient character of the subscription list and it is customary to force payment for all moves when a subscriber has not had the service one year. The record is also useful in forming approximate cost estimates, the average being made from a large number of these. The voucher system is now almost universally in use for the taking care of the expense account, and the tendency is to employ a combination of voucher and check which very materially simplifies the system and reduces the work. The cashing of such a voucher check is understood to be a receipt for the money and is filed by numbers and entered by the bookkeeper in a similar manner to the old style voucher. This system of voucher-check is convenient for not only large but small exchanges, and ensures the return of the voucher. The distribution of the several accounts is a very important factor and a separate slip should be made for this, unless it is incorporated in the voucher-check (7 x 9) blank, as shown in Fig. 3. The system of accounting is changing very materially from the old method of bulky books to the new and more modern method of the card system, which is much more flexible. The only possible objection to this system is the possibility of losing a card, but this admits of carelessness, for proper locking devices are provided with all modern card systems so that in practice no card is ever lost. This locking device is simple and at the same time effective, and is operated by merely turning a thumb screw in front of the box or if desired a key may be used and kept by the chief. These cards are all numbered from one up, and these numbers may be either an account number or the telephone number, and should contain the name, address, rate, special equipment and space for 12 months, each month being divided for paid and balance due, space being left at the

bottom for remarks. The date of opening the account is also given (see Fig. 1). When rebate is allowed the rebate may be marked in red ink so that one may be able at a glance to distinguish between cash and allowance. In connection with this department the question has frequently been asked whether the position of cashier should be held by a man or a woman. It has been the experience of the writer that in the smaller exchanges, say less than 1,500, a woman is preferable, but over that amount a man is to be preferred. The cashier of the larger exchanges must not only be a first class bookkeeper and possess executive ability but be able to talk telephone, and, when necessary, take the place of the manager. He is therefore to all intents and purposes the assistant manager, except in exchanges of say over 10,000 subscribers, when the position of business manager becomes necessary.

R. F. Bonsall, Treasurer, Maryland Telephone and Telegraph Co.

The cashier must be possessed of a fine knowledge and understanding of human nature, as usually he is called upon to make adjustments and settlements of all kinds. The books usually required in this department over and above the voucher-check system, already explained, are a double entry ledger, a daily blotter and the voucher-check record. The daily blotter is a combination of day book and journal with ruling for the latter. In view of the fact that no two companies use the same style of voucher or voucher-check the ruling of the voucher-check record will be made to suit the requirements of each individual case. It is customary to pay all bills by voucher-check only, hence, where small payments of say less than one dollar are made, the manager or cashier takes care of them in his petty cash account, which is usually fixed at ten dollars, which when used is turned in on a voucher in the usual manner. In this way the petty cash is taken care of without the necessity for a petty cash book, and the dispensing with the cash book does away with the need of a cash account in the ledger, as the bank account will give the required information. When the voucher-check is entered in the proper record, as shown in Fig. 4, the distribution account is copied from the side or back of this, as the case may be, and transferred to the columns in the ledger for that purpose, the total being carried to its proper column. The details having been carefully entered and the amounts checked, an account is then opened in the ledger for each separate classification, the total of its column being posted on the debit side and the total amount being posted to the credit of the accounts payable. It is customary to enter these accounts in groups so as to save time, and all entries, both paid and unpaid, must be made; when paid the date and amount will be entered under the proper column. The grand total must equal the total of all the several columns, except the amount paid. If no mistakes were made the necessity for a separate column for voucher number and check number would be unnecessary, but in practice we find this condition impossible. In entering in the ledger we only enter the total of the corresponding column, for example, operating, maintenance, etc.

struction and general expense. The first, second and fourth are regular, the third is irregular, or does not properly come under the regular work of the exchange, as it should be a separate account taken care of by a fund set apart for that purpose. The author appreciates its importance and knows that it is customary and good economy to have the regular working force take care of this department, but in order to do justice to the running account of the plant, it should be kept in a separate account. In this account would be the original cost of the plant, for example, real estate, wire plant, underground and aerial cable plant, sub-station equipment, central office equipment, fixtures, furniture, the original books and forms to set the plant in operation and any and all improvements, extensions or additions made to the plant with a view to increasing its value, hence, the lines between maintenance and construction must be finely drawn, and having once been made no deviation from them should be permitted. It is therefore imperative that a clear understanding must be had in the beginning so as to start off right. Any changes, additions or improvements which are intended to replace worn out or destroyed apparatus must not come under this head; for example a lead of wires may be completely destroyed by a storm or a fire. While this is extraordinary maintenance it cannot be taken care of by the construction account, but may be allowed for under the depreciation allowance and a sum of money transferred from that account or simply left there, it being understood this account is for such a purpose. It is apparent therefore that the plant having been constructed and charged to that account it is the function of the maintenance account to see that it is kept in first-class repair. In some companies two accounts are kept, the original construction being known and carried as "Plant," the every-day construction as such and transferred to "Plant"

The Location of Cable and Line Faults

By J. Adler.

THE location of trouble in cables or open lines is generally, or at least should be, accomplished by some form of the Wheatstone Bridge. The forms which different makers give to the mechanical details of the bridge are various, but the electrical requirements always necessitate the use of a battery or some other source of current, a galvanometer or telephone receiver to detect differences of potential, and a series of resistances of different values.

These three parts are arranged to give a circuit like that shown in Fig. 1. A and B consist usually of three coils of the value 1, 10, 100 and 10, 100, 1,000 ohms respectively; R is a resistance adjustable from 1 to 1,000 or 10,000 ohms; G is a galvanometer or telephone receiver; B is a battery of four or five cells, E. M. F. about six volts; L, L^1, points where unknown resistance is introduced. Some testing sets have a commutating device to reverse the connections at the points 1 and 3, which permits a greater range of measurement. This commutator is shown to the left in Fig. 1. A bridge that is to be used mostly for location work should have a two point switch in the galvanometer circuit to connect one terminal of the galvanometer either to the junction of the bridge arm and the rheostat (3, Fig. 1), or to the line post L, and also a switch in the battery circuit to throw the battery to the post L^1 or ground; also keys to open the

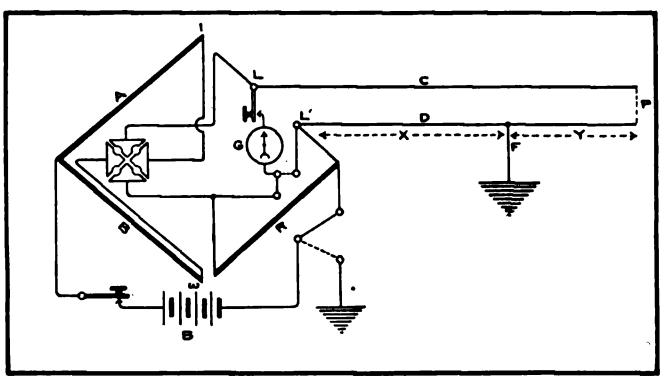

Fig. 1. Arrangement of Wheatstone Bridge. commutating device, etc.

galvanometer and battery circuits. The adjusting of the rheostat is accomplished in one of three ways, as follows: By shunting out portions with plugs; (2) by cutting in different coils in series, also with plugs; (3) by a movable arm travelling over a set of contacts. In case No. 1 the resistance coils are usually sixteen in number and have the value 1, 2, 3, 5, 10, 20, 30, 50, 100, 200, 300, 500, 1,000, 2,000, 3,000, 5,000. In cases Nos. 2 and 3 the coils are forty in number and consist of 10 units, 10 tens, 10 hundreds and 10 thousands.

When the resistances of A and B are equal and R is adjusted so that no current flows through G, then the unknown resistance is equal to the value of R. If the unknown resistance is less than the lowest value of R, make A smaller than B, then balance as before and divide the value of R thus found by the ratio of B to A. That is, if X is .75 ohms and A = 10 ohms and B = 100, a balance will be obtained when R is 75 ohms. For measuring large values A should be greater than B, and multiplication performed instead of division.

The tests usually employed for determining the position of a fault are the Murray and Varley tests. The Varley test is for most purposes the more rapid and more easily made, but the Murray is to be preferred when low resistances will be encountered. A third test, Blavier's, is sometimes used, but not often, for it only fits a few special conditions not usually found outside of a labaratory. Both the Murray and Varley tests require the use of a wire free from trouble, which can be connected to the extreme outer end of the faulty wire under test.

The Varley test is made as follows: Consulting Fig. 1, A B R is the Wheatstone Bridge. P is the end of the cable run or aerial lines, C the good wire and D the bad, connecting to the test set via the line posts L and L^1. X is the resistance of the bad wire from the test point to F, the fault. Have the switches in the position shown by the heavy lines. Connect the wires C and D at P. Have the arms A and B of an equal value, say 100 ohms. Connect D to the post which leads directly to the rheostat, in this case L. Obtain a balance on G and read off R, which equals the resistance of the looped wires. This may be called L. Then ground the battery as shown by dotted line on battery switch, and balance G again. Call the second reading R. From these two readings the following formula is obtained:

$$A : B = (L - X) : (R + X) \quad (1)$$

$$AR + AX = BL - BX \quad (2)$$

$$AX + BX = BL - AR \quad (3)^*$$

$$2AX = A(L - R)$$

$$X = \frac{A(L-R)}{2A} = \frac{L-R}{2}$$

That is, the first loop resistance, minus the second reading with the grounded battery, divided by two, gives the resistance of the bad wire to the fault from the instrument. The number of feet can then be calculated from the gauge of the wire and a table of wire resistances. This method is not entirely satisfactory, because the resistance of the wire varies so much with the temperature, being high in summer and low in winter. The change is especially noticeable in aerial cables or lines, varying as much as 5 to 15 per cent. This undesirable condition can be obviated in this way: An inspection of Fig. 1 will show that L — 2X equals the loop resistance from P to the fault F, and from formula 1, R = L — 2X. Now, if the wire is of uniform resistance throughout and of a known length, divide R by L and multiply the length by the quotient thus obtained. This will give the length from the point P to the fault F. If the length of the line is not known, but the gauge is, multiply R by the number of feet per ohm of the wire from P to F. This gives the length from F around P, to a point opposite F on the good wire. To get the length F P, divide by two.

An example will explain the use of these three mthods.

A No. 19 gauge cable is 7,625 feet long.

19 gauge wire equals 122 feet per ohm at 70° F.

L, the resistance, is 125 ohms.

R, the Varley reading, is 25 ohms.

$$\frac{L - R}{2} = \frac{125 - 25}{2}$$

$$\frac{R}{L} \times \text{length in feet.}$$

$$\frac{25}{125} \times 7{,}625 = 1{,}525 \text{ feet P to F.} \quad (2)$$

$$\frac{R \times (\text{ft. per ohm})}{2} = \frac{25 \times 125}{2} = 1{,}525 \text{ feet, P to F.} \quad (3)$$

The Murray test is made with the galvanometer switch in the dotted position, and the B arm equal to zero. Measure the loop with the battery switch in the heavy line position, and as in the Varley test, call this resistance L. Ground the battery and adjust the rheostat as before, calling this reading R. These two readings enable one to work out Formula 2, which means that X, the distance from the test set to the fault, equals the product of the whole loop resistance as taken first, and the Murray reading taken second, divided by the sum of the resistance of the A arm and the Murray reading.

Note here that the good and bad wires are to be connected to the same posts as in the Varley test. In making the Murray test the same trouble may be experienced from temperature changes as was met with in the Varley test. To avoid annoying corrections, if the cable is of the same gauge throughout take

*Since A = B it can be substituted for B in the equation.

Digitized by Google

half the resistance of the loop and divide it into the resistance to the fault as found by the formula:

FORMULA 2. $A : R = (L - X) : X$

$$A X = R L - R X$$

$$A X + R X = R L$$

$$X (A + R) = R L$$

$$X = \frac{R L}{A + R}$$

This quotient should be multiplied by the length in feet. This will give the distance in feet to the fault from the instrument. Another way of arriving at the same result is to double the Murray reading, divide this by the Murray reading plus A, and multiply by the length. This second one is the easier, but is only a development of the first, as can be seen by the following formula:

FORMULA 3. $$\frac{\frac{R L}{R + A}}{\frac{L}{2}} = \frac{R L}{R + A} \times \frac{2}{L} = \frac{2 R}{R + A}$$

Both these tests have been considered as being made on grounded wires, but a shunted or crossed pair can be located in the same way. In Fig. 2, A is a pair, conductor 2 of which is crossed with conductor 1 of pair B. C is a shunted pair.

If conductor 1, of pair C, is looped to a good wire, and a ground put on conductor 2 at either end, then the Murray or Varley tests may be made as in the case of a grounded wire; for conductor 1 is practically grounded at the point where it touches conductor 2. The crossed pair may be treated in the same way. Pair A is shunted at the far end, or the crossed wire is looped to a good one, and a ground put on either end of conductor 1 of pair B. When a cable has failed, that is when all the wires are bad, or when other conditions prevent the use of a good wire similar in resistance to the bad one, if a clear pair of any kind can be obtained to a point beyond the trouble, a location can be made as follows: First shunt the good pair at the far end and measure its resistance, calling it P. Then connect one side of it to the bad wire and measure again. Call this P_1. Third, make the Varley test and determine X as usual. Subtract one-half the first loop P, from the second loop P_1; divide this result into X as found, and multiply the length of the bad wire in feet by this quotient. This gives the distance to the fault from the instrument. A formula which gives this operation in a condensed form is as follows:

FORMULA 4. $$\frac{\frac{X}{P}}{P_1 - \frac{P}{2}} = \frac{X}{\frac{2 P_1 - P}{2}} = \frac{2 X}{2 P_1 - P}$$

$$\text{Length in feet} = \frac{2 X}{2 P_1 - P}$$

This test is particularly useful where the length of the bad cable only is obtainable. In the above test with the bad wire connected to the usual post it may not be possible to get a balance on G. In such a case, reverse the positions of the good and bad wires and try for a balance. Formula 1 must then be changed to read

$$X = \frac{L + R}{2}$$

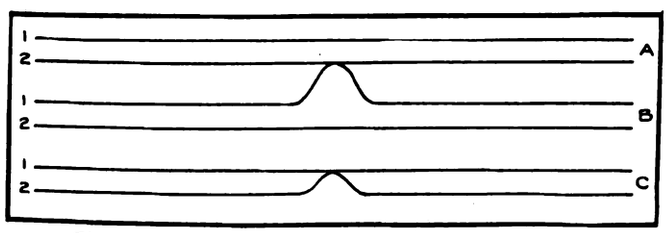

Fig. 2. Conditions existing in crossed or shunted pairs.

Beside its use for the above-mentioned tests, the Wheatstone Bridge can be used to a limited extent to locate open wires. When two condensers are connected, as shown in Fig. 3, if A and R are equal and the capacities of the condensers are equal, no deflection will be noticed at G when the battery circuit is closed. If this is not the case a kick or throw of the galvanometer needle will occur. Assume that D is less than C and unknown; adjust R till there is no throw of the needle in closing Ba. The resistance of A is to the resistance of R_1 as the capacity of C_1 is to the capacity of D. Formula 5 gives the capacity of D in microfarads when C is known.

FORMULA 5. $A : R = C : D$

$$A D = R C$$

$$D = \frac{R C}{A}$$

A cable wire is really a form of condenser, the sheath forming one side, the wire the other, and the covering of the wire the dielectric or insulating medium. Its capacity varies directly with its length, a long wire having high capacity and a short one small capacity. This being so, if the capacity of a wire is known, its length can be easily calculated, all standard cables having a given capacity per mile, which the makers furnish. In Fig. 3 replace D with a clear cable wire. This is done by grounding one side of

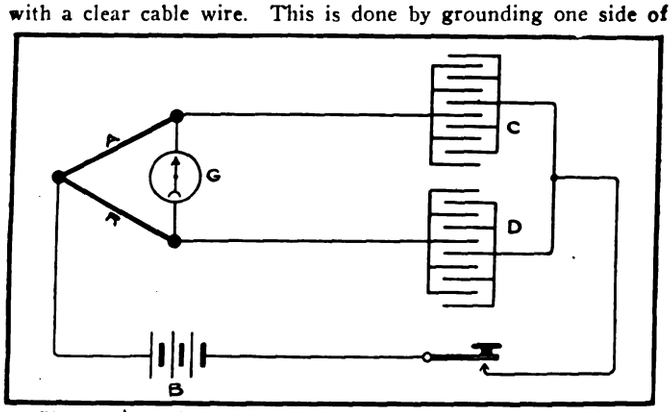

Fig. 3. Corrections of bridge for testing for open wires in cable.

C and grounding the battery. By adjusting R and using Formula 5, the capacity of the cable wire can be found, and from this its length. Now if it is open half way out in the cable its capacity would only be half that of other wires in the cable. If the cable is two miles long, and its capacity is given as 1-10 microfarad per mile, a wire good the full length should be 1-5 microfarad capacity. If the reading taken on the bridge indicates only 1-10, it is safe to say the wire under test is open about half way out. This test can be considerably shortened if the condenser C is replaced by a wire known to be good the full length of the cable. If this is done, simply ground B, and you have the same condition as in Fig. 3. Since capacity varies directly with the length, Formula 5 can be transformed into Formula 6 by replacing C and D in microfarads by C and D in feet.

FORMULA 6. $$D \text{ in feet} = \frac{R C \text{ (in feet)}}{A}$$

The connections of the bridge for this test are nearly identical with those for the Murray. The arm B is zero, thus connecting R directly to A, the galvanometer and battery switches being in the dotted position (Fig. 1). In this test if the balancing is to be done by noting the deflections of a galvanometer, a very sensitive one is needed, and as much a one is not usually furnished with the bridge, it is better to use the following method:

Replace G with a good telephone receiver and use an interrupted current in place of the battery; that from a buzzer, medical coil; or ringing generator will do. When the sound in the receiver ceases or reaches its lowest point, a balance has been obtained. A wire that is grounded and open cannot be located by this method unless the other end beyond the ground happens to be clear, when a location might be tried from the other end. The gauge of the cable makes very little difference in this test, the capacity varying very little with the gauges in ordinary use.

(To be continued.)

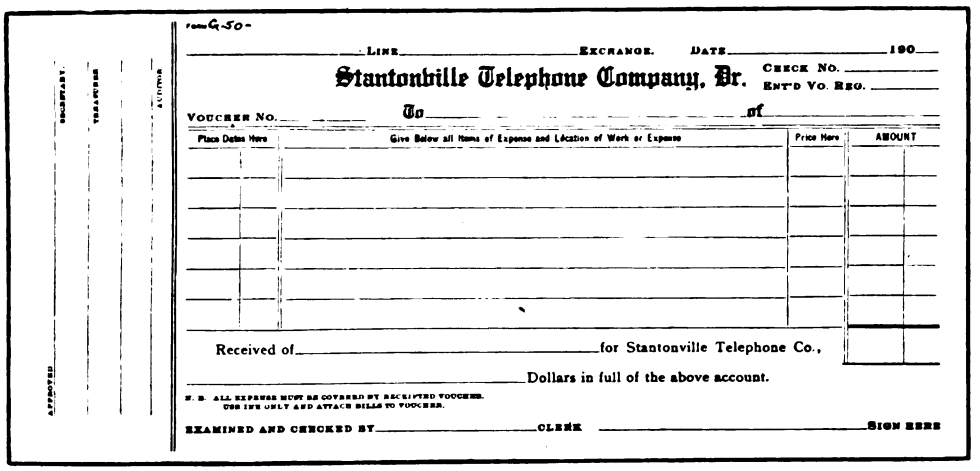
Economical Telephone Accounting and Filing Systems

ARTICLE VI.—VOUCHERS AND FORMS FOR RECORDI NG THEM.

*By Charles C. Wilmot, Telephone Accountant.

This article and all forms reproduced have been protected by individual copyrights. Copyright, 1906, by The American Telephone Journal Company. All rights reserved.

THE method of handling vouchers for expenses incurred by employees of the telephone company should be such as to insure accuracy and proper verification by the men who handle these papers in the office. Form No. G-69 illustrated in connection with this article was designed to meet the needs of every general office auditor for a simple form to be furnished to the local managers of all branch exchanges, construction and maintenance foremen, or any other employees who have the handling and paying out of more or less money for which they are required to produce and list a lot of expense vouchers in order to make a settlement with the office.



Form G-50.

EXAMINED AND CHECKED BY _____ CLERK _____ SIGN HERE

APPROVED SECRETARY TREASURER AUDITOR

Form G-50. Form of voucher used for taking of receipts for petty disbursements.

This form is in duplicate, so that each employee using it has his carbon copy to refer to, and can thus keep his own current account in the top section of form, with ample space for the proper listing of every voucher sent in. Each necessary step for the verifying and authorizing of the settlement is provided for. Several blanks can be used for any especially long settlement containing many items.

When the settlement is made and check issued the form can be folded about the expense voucher (Form G-50) like a band, so as to show the distribution, check number, date of settlement, etc. The package may be fastened with a small rubber band, paper clip or pin, according to the size of the package, and filed in a simple voucher jacket in which the cancelled check, when returned from the bank, is also filed.

When the annual or semi-annual audit is made the authorities for a large share of the disbursements of a telephone company are at the immediate service of the auditor, and at all times can be readily referred to by the office force or management.

In many cases it might be more desirable to file packages in a shallow tray or drawer between guide cards lettered with the name of the exchange foreman or employee. The expense voucher for a year or period of years would thus be filed in monthly consecutive order, under the name of the exchange or employee.

The simple form for an expense voucher, form No. G-50, is self explanatory and is used for the taking of receipts for petty disbursements. The most satisfactory manner of keeping these forms is to have them put up in pads of 50 to 100, with plain manila sheets for carbon copy duplicates. Much waste of stationery and small forms is avoided by having them padded or blocked in specific quantities. This also saves time in filling of orders to be sent out to branch exchanges and taking inventory of stock on hand as quantities may be very easily checked off.

The monthly recapitulation, form No. G-109, is a great time saver to the book-keeper or clerk who has a large amount of freight bills, express bills, shop orders, repair orders, railroad mileage, time and labor charges, etc., to distribute over a large system of exchanges and toll lines. With the exchanges alphabetically arranged, leaving a few blank spaces for additions, it is easy to distribute rapidly a large number of vouchers. When footed this sheet can be rechecked and authorized by auditor and made the basis or authority for a journal entry at the end of each month. The size of the sheet, when properly folded, is 9½ x 11 inches, the same as that of forms Nos. G-75, 76, 77, 78, etc., illustrated in a previous article.

It is most desirable and important for the purposes of a satisfactory

under a loose-leaf system, in one binder. The filing of the original at the general office may also be done in filing jackets or folders of a single size.

RURAL COLLECTIONS.*

By D. H. Owen.

AFTER experimenting with various methods of making rural collections there has been developed a system, now in use at the Lowell exchange of the Citizens' Telephone Company, which has proven itself to be successful and one which involves very little expense to the company.

Bills are made out promptly, and are always ready for collection on the first day of each month. Instead of mailing the bills to the rural subscribers the chief operator calls up each one separately and informs him that it is the first of the month and that his toll bill is, for example, 20 cents, and his rental bill is $4.00, making the total bill $4.20. She asks him to try and remember to call at the office the first time he is in town. They naturally do not all come in and pay, but on an average about 75 per cent. of the rural subscribers pay before the tenth of the month. Those who are a little slow, and are not in the habit of coming to the office, are helped by allowing the troubleman to take their bills along when he has trouble on their line, or in their neighborhood.

If a subscriber fails to call and the manager is unable to collect his bill when in his neighborhood, a bill is sent to him by mail, and attached to the bill, when the occasion warrants, is a slip of paper on which is printed the following:

"Unless the amount of attached bill is paid at our office within.....days of the date hereof, we shall be obliged to discontinue your telephone service until such payments are made. CITIZENS' TELEPHONE COMPANY.
"....., 190.."

Livery hire for the purpose of collecting is very small, the last bill for this purpose being incurred the first quarter of 1905. The operator notifies the subscribers of their bills at times when work is slack, and as there is no expense incurred it makes a saving of several dollars each month over mailing bills to each subscriber, and but little if any more work is involved.

Education is the secret of collecting. A point is made of educating the people in the company's rules, and the golden rule is that rental fees must be paid in advance. When a contract is taken it is impressed on the subscriber's mind that he must pay in advance, and when a rural telephone is installed the first collection is always made at that time, whether it be for a full quarter or a part of a quarter. The subscriber is told that after that time he is to come to the office to pay his bills, and that the collections must be in by the tenth of the month. The people are educated to the fact that the business cannot be run without money. This same rule applies to the local subscribers as well as to those on rural lines.

Most of the trouble experienced is with certain subscribers who made their contracts with a former solicitor, who led them to believe that they could pay their bills any time and it would be all right. It is hard to make these subscribers see that the rules are otherwise than as they were first informed.

From the method of collecting adopted the exchange has been compelled to report only two accounts that could not be collected; one was for 80 cents in 1900, and one for 70 cents in August, 1905, and after the general manager had allowed the rebate for the 70 cents, there was collected 50 cents on the account, which left just $1.00 uncollected for over six years' business.

ATTEMPT OF BELL COMPANY TO KILL COMPETITION IN OSWEGO.

A VERY interesting situation was created when a short time ago the Bell Telephone Company bought out the Ontario Telephone Company, of Oswego, N. Y. The Ontario Company was formed in 1897 by several of the most prominent business men of the city in which it operated; the purpose they stated at that time being to give the public low priced and efficient service, as much dissatisfaction was expressed with that given by the Bell company and the treatment accorded subscribers.

The Ontario Company as originally organized had a capital stock of $20,000. A plant was built which was considered to be good enough for the requirements of the service the company desired to give, and subscribers were obtained to the number of 250. Good service was given by the Independent company, and it is said that in a short time the Bell switchboard became so idle that the operator in order to occupy her time was compelled to bring along her knitting. The business of the Independent company grew to such proportions that in 1902 the capital stock was increased to $100,000, and a new common battery switchboard of modern type, and first class instruments were installed. A few improvements were made on the wire plant, toll lines were built, and various extensions completed From this time the most excellent service was given to the subscribers, the number of which has steadily increased to about 1,600.

In 1903 the Bell Company put up a new building, installed a

THE TELEPHONE AND THE PERSONAL ELEMENT IN BUSINESS.

DIRECT dealings between customers in their homes and sales people at its counters has been introduced by a large department store through the installation of an especially comprehensive telephone system, which provides an instrument for every two or three employees. The company has found that by this means its sales have been increased.

With the present system a customer may talk directly with the person who has the goods under his observation, and if it is required that a substitution should be made, a description of the nature of the material which may be furnished will be given to the customer, and no shipment need be made until the matter is thoroughly agreed upon. The prices may be stated, and it is a simple matter for any difference in quality corresponding to a difference in price to be explained, and many other little details of this sort can be quickly and permanently adjusted. In this way the store which aims to satisfy its customers can proceed to fulfill this object in a much more intelligent way, as it is better advised as to the desires of its patrons in each case.

Such a system, however, can only be successful when other conditions are adjusted to contribute elements just as essential as is the easy and rapid means of communication furnished by a telephone line. It goes without saying that the patience and courtesy in which the sales forces of the larger stores are so well trained are even more desirable qualities when conversation is held over the wire than when the sale is made over the counter. For successful selling by telephone it is found that more than adherence to these ordinary habits of a well bred person is needed. A salesman must use his imagination, have an intelligent curiosity, and ask in the shortest possible time just the right questions, or make just the right statements. In cases where substitution for the order originally called for by a customer is required in order to make the sale these qualities of salesmanship become especially useful. The introduction of the telephone on a large scale in establishments devoted to the selling of goods at retail will serve to emphasize rather than to limit the opportunities for the exercise by the salesman of those personal qualities which so generously contribute to the success of the company for which he works.

STREET RAILWAY TELEPHONES.

PUBLIC sentiment against a street railway company was strongly aroused the other day by an accident which occurred in the suburbs of a large city in the middle west. The cause of the indignation was that after a number of people had been injured there was no way of quickly summoning assistance. It was asserted by those familiar with the situation that if the street railway company had provided a telephone line, and suitable means for connecting instruments carried as a part of the regular car equipment, communication with headquarters might have been held at once, and the delay which was the means of so greatly increasing the suffering of the persons in the car would have been very much diminished.

This calls to mind the peculiar fact that, in general, long cross country lines, which are operated for carrying people between one town and another, are much better equipped for communication between headquarters and the various cars than are the lines of city railway companies. It is rarely indeed nowadays that we find a street railway run along the open highway which does not use a telephone system in connection with an orderly method of dispatching. Such a use of the telephone enables the management to operate its cars with maximum economy, as the despatcher is always aware of the approximate location of every one of the units which he controls. Although very efficient automatic signalling systems are in use, like all other electrical apparatus they sometimes fail to work. In fact they are very much less reliable than the telephone. With them, if the latter instrument is not also provided, the street railway conductor who is in doubt must often remain for a tedious length of time on a turn-out, or proceed on his trip at the greatest risk of collision.

In times of heavy traffic over a portion of the line there is nothing which can be satisfactorily substituted for this means of direct communication between the despatcher at division headquarters and each conductor. It is absolutely necessary that, by means of conversation with persons on the line, the despatcher should be immediately informed of any change of conditions introduced by accidents or any unexpected event, and he should be able to vary his orders in accordance with instructions received from points on the line. The use of the telephone for these purposes secures the fullest flexibility, and enables the operating officials to place each car where it is needed, and handle the reliefs and extra men effectively, and in fact to give a service which secures to the public the greatest possible satisfaction, and the largest profits to the company.

In view of the ample demonstration of its value which has been made by the telephone in the branch of railway service in which it has been given a thorough trial, it appears that the time for its development in connection with suburban street railway lines must be close at hand. It should be urged upon the operators of such lines that no reliance ought to be placed upon the chance that if a break-down occurs the location will be near a residence supplied with telephone connections. The very frequency with which cars are run on suburban lines is another circumstance which instead of being regarded as providing a means of offering assistance to a crippled car should be looked upon as an opportunity to effect economy and retain the good will of the public by maintaining without interruption the transportation of all passengers. It is undoubtedly true that those familiar with the use of the telephone should be able to advance many strong arguments which will hasten its more complete adoption by street railways.

KEEPING A SUBSCRIBER UP TO TIME.

D. H. OWEN, at the Managers' Meeting of the Citizens Telephone Company recently held at Grand Rapids, Mich., emphasized a point which deserves general attention. He brought out most clearly that many of his people were very willing to make their payments promptly and assist the company in every way possible, when they were told that it was necessary.

He found, however, that a solicitor who had been in the exchange before he took charge had given many of the people to understand that the company was a rich corporation, and could afford to wait for its money. Of course when this impression was spread the people who received it clung to it tenaciously, as it afforded them an excuse for following their natural inclination to hold their money as long as possible. The result was that from these subscribers, who were thoroughly honest, it was extremely difficult to get money on time. The point made by Mr. Owen in his paper is that from the very moment a subscriber is connected he must be given to understand that the company is doing business in a manner which requires prompt settlement of accounts, and he has found that the meeting of all dates by the company will cause the subscriber to take a corresponding action with regard to the settlement of bills.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

WHEN VERBAL LICENSE BECOMES IRREVOCABLE.

Can a person who has given verbal consent to the building of a telephone line across his property make the company remove the poles and wire after they have been in use nearly a year? Can he restrain said company from putting more wires on said poles? P. M.

THE verbal consent which the property owner gave to the building of a telephone line across his property amounts to a license. The license is revocable except where the licensee has expended a considerable sum of money in reliance upon it and in such case it becomes irrevocable. In accordance with these principles the property owner cannot make the company remove the poles and wires.

If the company has the right to place its poles on the land and use them for telephone purposes, it can string as many wires on the poles as it finds necessary or convenient for its business. The property owner cannot restrain the company from putting more wires on its poles.

OPERATING WITHOUT PERMIT IN NORTH CAROLINA.

We have an exclusive franchise in a town in this State. A rural company after making formal application for a permit, and being refused, ran a line into the town, placing its poles on private property and spanning the streets with its wires, and put in two or three stations by crossing the street in two places. It now wants to cross the same way and place other stations at the principal stores and thereby reach such points as its patrons most desire without having to connect with our exchange. The town aldermen have notified the concern not to cross the streets again. Please advise me as to the proper steps to take in the matter. Can the town officers have these people remove the wires they already have up? If they should put up others could the town have their wires cut down after having notified the company not to put them across any other streets, without involving litigation and trouble, or what would be the best course to take in the matter? J. D. M.

THE exclusive feature of your contract is of no value in itself, as towns have not the power to grant exclusive franchises. This does not change the fact that a telephone company cannot enter a town without a permit, and its entry as you describe it is illegal. The town officers can therefore cause it to remove the wires it has already put up, and prevent it from putting up any more wires. The best course to take is to have the town make a determined effort to exclude the intruding company from its limits. Whatever course is taken will undoubtedly provoke litigation on the part of the company opposed.

CITY OF CHICAGO CAN REFUSE PERMIT TO INTERSTATE COMPANIES.

THE two great telegraph companies doing business in Chicago and connecting the city with the rest of the world are, according to an opinion rendered by Assistant Corporation Counsel Maclay Hoyne, occupying the streets of the municipality without the vestige of a right and are liable for compensation not only for future privileges but for those past and unpaid for.

The assistant corporation counsel held that:

The city has the power to refuse a permit to companies for the use of the streets, despite the fact that interstate business is done.

The telephone and telegraph companies must have the city's consent to use the streets and must pay compensation for the privilege.

The city can exact license fees for the use of telephone and telegraph poles, wires and conduits—both for the past and future.

The telephone and telegraph companies can be compelled to place wires underground.

EFFICIENCY OF CIRCUIT BREAKERS AGAINST LIGHTNING.

AT Bangor, Me., Justice Whitehouse has handed down a Law Court rescript in the case of Wells vs. New England Telephone & Telegraph Company.

The plaintiff recovered a verdict of $804 for the destruction of her barn and its contents by fire alleged to have been caused by the negligence of the defendant company in the construction and maintenance of its telephone line past the plaintiff's premises on the west side of the highway in the town of Avon. There was a curve in the road, and to counteract the tendency of the line wire to draw a pole from its vertical position a guy wire consisting of a piece of ordinary telephone wire, was stretched from the pole to the corner of the barn.

Immediately before the fire, a thunder shower came up in the vicinity of the plaintiff's buildings. The rain fall was light, but it was followed by a discharge of lightning of extraordinary violence, though but a single flash of light was observed.

Justice Whitehouse stated that in view of the admitted limitations of human knowledge respecting the laws of electricity and the immeasurable potential of a lightning discharge, the opinion of electricians in regard to its possibilities in a given case cannot be adopted with the same confidence as expert opinions based upon knowledge of the more exact sciences; and in view of the manifest effects of the lightning upon the telephone poles and the corner board of the barn in this case, it is the opinion of the court that the evidence warranted the jury in following the conclusions of those experts who believed that the destructive spark was conveyed to the corner of the barn by the telephone wires, in preference to those who testify that the barn was struck by a branch of a lightning bolt discharged directly from the clouds.

If the defendant's theory is correct that it is utterly impracticable to divert lightning currents from such a wire to the earth by means of any insulators or circuit-breakers hitherto devised it cannot be said to be manifest error on the part of the jury to find that such a wire should not have been attached to the barn at all, and that in making such a connection, the defendant, if possessed of scientific knowledge to sustain its theory, did not act with proper regard for the rights of the plaintiff and the safety of her property.

COMPANIES MAY USE SAME NUMBERS.

THE suit brought by the Rocky Mountain Bell Telephone Company against the Utah Independent Telephone Company, and Elmer B. Jones its managing director, for an injunction restraining the defendant from using the same numbers in its directory that the complainant uses, and to prevent the managing director from using the same number for his residence telephone that was used by the manager of complainant for his residence, has been decided in favor of the Independent company. On the hearing the court refused to allow the complainant to introduce testimony because no cause of action was stated in the complaint, and the matters therein complained of were not actionable, and could not be recognized by the court in an injunction proceeding.

IN THE OPERATING FIELD

MINNESOTA COMPANY PREPARING FOR INCREASED BUSINESS.

SEVERAL new lines are being constructed by the Granite Falls, Minn., Telephone Company, which will greatly extend the service in the rural districts. Amongst the circuits now under way is a line along the Yellow Medicine River which will connect with Echo and eventually give a direct route to Redwood Falls. Other lines are to be built to Palmer Creek and into the country northeast of Granite Falls.

The new directory issued by the company shows that it now has more subscribers in the city than the Bell ever had and in addition it has an extensive rural line service which is constantly expanding.

INDEPENDENT SYSTEM CONSIDERED FOR CANADIAN PROVINCES.

TELEPHONE conditions in the minds of Canadian legislators seem to be extremely uncertain, and there is far from a perfect uniformity of opinion. A bill providing for the incorporation of an Independent long-distance company is up for consideration before the Private Bills committee of the legislature sitting at Toronto. The company is to be known as the Provincial Long Distance Telephone Company. The Canadian Bell Company is making every effort to block competition, claiming that it would take away annually $200,000 of business which it now holds by virtue of exclusive contracts with the municipalities. Several matters to be embodied in a final measure were put to vote and unanimously carried in favor of the company's establishment, but many details of importance are yet to be considered.

PLANT OF THE CITIZENS' TELEPHONE COMPANY AT KOKOMO, IND., BEING ENLARGED.

IMPROVEMENTS which when completed will cost $20,000 are now being made to the plant of the Citizens Telephone Company, Kokomo, Ind. All the aerial cables in the business part of the city are to be placed underground and an additional 33,000 feet will be installed. The main switchboard is to be enlarged to take care of 500 additional lines and a separate board is to be installed for the farmers' lines. This will have a capacity for 200 additional subscribers. The contracts call for the completion of the work within two months, as the company is already hard pushed for facilities to handle its rapidly increasing business.

The capital stock of the company has recently been increased from $200,000 to $350,000 and the entire plant throughout the county is being re-constructed. As a single feature of this work the management has put up over 60,000 feet of cable. The exchanges at New Philadelphia, Canal Dover, Uhrichsville and Dennison are installing new central energy switchboards equipped for party line signalling. The outside cable has been re-constructed to form a complete multiple cable system. When all work at present under way is completed the plant will be one of the best in the State.

The company has been unable to take care of its increase of business and expects to install 1,000 telephones within the next year. A good system of toll lines connects with other Independent exchanges, as New Philadelphia is a center of the United States lines giving satisfactory service throughout Ohio, Indiana, Michigan, Pennsylvania, West Virginia and Kentucky.

J. K. Johnston has been general manager of the company since Nov. 1st, 1905. Under his direction the business has already grown rapidly, and the prospects for the future are extremely bright.

CUMBERLAND FAILS TO EXCLUDE INDEPENDENTS.

FRANKLIN, TENN., has recently granted a franchise to an Independent company after it had carefully considered the objections raised by the Cumberland (Bell) Company. J. H. Henderson, attorney for the Cumberland, was instructed to offer 3 per cent. of its annual gross earnings for an exclusive franchise. Notwithstanding this offer the aldermen decided that a competing company would benefit the people of the town, and an exchange will accordingly be established.

INDIANA ASSOCIATION URGES EVANSVILLE TO GRANT FRANCHISES FOR INDEPENDENT SYSTEM.

DURING the convention of the Independent telephone men at Indianapolis a telegram of cordial greeting was ordered sent to the Mayor and Board of Public Works of Evansville for the encouragement given toward the establishment of an Independent system in Evansville, and the secretary was also instructed to send to the Common Council of Evansville the following petition of this association:

To the Common Council, City of Evansville.

The Independent Telephone Association, in convention assembled, representing 150,000 of the 200,000 Independent telephones in the State of Indiana, operated by 400 different companies with an estimated capital of $20,000,000, respectfully petitions you to grant the Citizens' Telephone Company of your city a franchise which, while it safeguards the rights of the city, will permit the Independents to have connection with and entrance into Evansville.

Every county of the State is included in this convention, composed of 175 representatives. We deem it almost beyond explanation that Evansville, the second city of the State, should be one of the three county seats of Indiana having no Independent exchange. The more surprising does it become when we consider that the Independent subscribers in this State outnumber the Bell five to one and that there are 40 county seats with not even a Bell exchange franchise, and several where Bell franchises exist have exchanges numbering less than 75 telephones, in all of which the Independents have larger systems.

We desire to call your attention to the report of the Commercial Club of Indianapolis under date of May 5, which reads as follows:

"WE THOROUGHLY BELIEVE IN THE DESIRABILITY OF COMPETITION WITH THE BELL TELEPHONE COMPANY IN THE TELEPHONE BUSINESS IN INDIANAPOLIS, AND WE FULLY REALIZE THE BENEFITS WHICH HAVE BEEN DERIVED FROM COMPETITION THROUGH THIS INDEPENDENT COMPANY IN THE PAST."

This association, knowing that it is to the interest of Evansville, as it has been to the interest of Indianapolis, to have competition in the telephone business, requests that an Independent exchange system be admitted, which will insure the gates being opened to Independent toll lines, thereby giving your city telephonic connection with the great body of Independent telephones throughout Indiana, Kentucky, Illinois and the entire Mississippi Valley.

BELL COMPANY BUYS PLANT AND RAISES RATES AT STATESVILLE, N. C.

CONSIDERABLE dissatisfaction is being expressed by the people of Statesville, N. C., at the action of the Bell company. It recently bought out the old system of the local owner, and immediately afterwards stated that, on account of the considerable amount of necessary reconstruction which must be undertaken, the rates must be raised. The company has submitted to the Mayor of the city a schedule, and agreed to adhere to it for a period of four years, or until the number of telephones connected with the Statesville exchange shall be in excess of 650. On account of the large number of rural lines which are to be brought in the people seem inclined to believe that upon the expiration of four years the company will be perfectly able to find grounds for raising rates, and expect that such a raise

Digitized by Google

will be forthcoming. Many of the citizens are anxious to see a new Independent exchange built.

VERSE FOR BLOTTER ADVERTISING.

THE Stephenson County Telephone Company, Freeport, Ill., is giving especially good service, and is naturally anxious to confer the benefit of this service upon as many subscribers as possible. The manager of the company, Mr. L. A. Herrick, believes in advertising, and devotes his energies sometimes to the production of matter which shows the effect of his convictions. One of his blotter suggestions is as follows:

The new telephone is like a door that swings each way.
You can misuse it and drive people off or
Keep orders coming day after day.
Let it swing nicely and have it well known
You delight to take orders over the New Telephone.

BELL SERVICE NOT WANTED AT CURRAN.

TO determine whether the Bell or the Union Telephone Company should receive the exclusive patronage of the residents of Curran, Ill., a meeting was recently held and largely attended. After thoroughly discussing the merits of both systems a unanimous decision was arrived at in favor of the Independent company. The Union company will immediately take steps to increase its facilities at this point in order to give its patrons the highest grade of service.

INDEPENDENT PLANT AT QUINCY, ILL., NEARING COMPLETION.

CONSTRUCTION work upon the plant of the Quincy, Ill., Home Telephone Company was started on October 18, 1905. Up to date about 90 per cent. has been completed and it is expected that the system will be in operation by the fifteenth of June. At that time 3,000 lines will be placed in service and it is expected that by the end of the year 5,000 subscribers will have been secured. The total cost of the plant will be in the neighborhood of half a million dollars, upwards of $360,000 having been expended already.

The officers of the company are Jackson R. Pearce, president; Frank J. Perrick, vice-president and attorney; J. H. Murphy, secretary and treasurer, and Frank A. Parker, manager.

FIRST CLASS INDEPENDENT PLANT BEING BUILT AT WEATHERFORD, TEXAS.

CONSTRUCTION work on a new plant at Weatherford, Texas, has just been started by the Home Telephone Company. At present the Independent property consists of a 400 drop magneto board. All lines are either grounded or copper return. About 500 subscribers are connected.

Weatherford is the county seat of Parker county, and has a population of 7,500 people. Demands for a high grade Independent service are urgent, and the building of an up-to-date system by the Home Telephone Company will enable the public to receive in a most satisfactory manner the service which it desires. The entire system will be reconstructed; new quarters have been secured, and a complete central energy system will be installed. In the business section of the city wires will be placed underground, and connected with the cables in the conduit system will be aerial cables, making what will be practically an all-cable system, with only enough aerial feeder wires to distribute from terminal to terminal. It is estimated that 40,000 feet of aerial cable, varying in size from 10 pair to 300 pair, will be installed.

The management of the company expects to have the list of subscribers increased to at least 800 by the time the system is ready to be cut over, about September 1. Besides the city service about 50 rural lines will be cut into the switchboard. In Parker county at present nearly 2,000 rural telephones are being operated, and all subscribers wish to be connected with Weatherford, which is the county seat and trading center for these people. Arrangements are now being made not only to care for this large number of people who are at present using the telephone, but also to develop the territory further. It is believed that inside of a year not less than 4,000 country telephones will be in a position to receive connection with one another through the Weatherford exchange. The long distance lines of the Ft. Worth Long Distance Telephone Company will connect the exchange with important cities on all sides.

The company was chartered April 27, 1906, under the name of the Home Telephone Company, with a capital stock of $50,000, divided into shares of ten dollars each. The officers are W. D. Carter, president; E. P. Sawtelle, vice-president; R. Armstrong, secretary, all of Weatherford, Texas; J. C. Casler, treasurer, Fort Worth, Texas. The above, with the following, make up the board of directors: R. S. Lowe, G. A. Holland, C. C. Littleton, J. T. Cotton, all of Weatherford, Texas, and J. A. Murray, of Fort Worth.

TELEPHONE SYSTEM INSTALLED IN CONNECTION WITH CLEVELAND AUTOMOBILE RACES.

THE telephone played an important part in the hill climbing contest that took place under the auspices of the Cleveland Automobile Club on Decoration Day. The course for the aspiring autoists lay over a hilly road in which there are several short turns, and where autoing under any circumstances is accompanied by enough danger to whet the enthusiasm of any driver.

The Gates Mills hill is nearly one mile long and the rise is slightly in excess of 300 feet. The road is not in good shape, as there are gulleys at places and rough surface and rocks at others. The club managers knew there was danger in making any race up the hill against time, and wanted to supply every safeguard that was possible. They accordingly arranged with the telephone company to prepare a system to meet the special service demand of the day.

A line was run up the hill, and a station placed at the foot and at the top of the hill as well as stations at each of the two bad turns where trouble was feared. The upper hill leg of the course could be watched from one of the way stations and the lower leg of the course from the other. There were several roads leading into the one over which the course was run, so these telephone operators were required to be on the lookout, and each driver was informed of what he must expect before he started.

The construction of the telephone system was very simple. There was a station in the paddock. When one driver had finished the course the operator at the uphill station so notified the paddock station and the next man was put in place to start. Then each of the way stations reported if any teams or pedestrians were on the road and when all was made plain the driver was sent away with a flying start to make the hill.

As the driver went over the tape at the start the timer there pushed a button that rang a gong at the top of the hill giving the official timers the exact start. As the driver went past each of the way stations he was reported to the paddock station, and as he crossed the tape at the finish a push button there was touched, causing a gong at the starting line to ring and give a check to the people who were also timing the races at this point. All stations then communicated with the paddock station before another machine was started. As a result of this more than two score machines went over the course during the day at top speed and yet there was not an accident, not a collision, not a thing to mar the pleasure or interfere with the sport. The drivers having accurate information relative to everything on the course felt secure in their efforts to make the best time possible, the result being the establishment of many better records than had ever been made on the hill before.

The members of the club and particularly the drivers were loud in their praise of the fine telephone service furnished and believed that they had discovered the best way of avoiding trouble for their hill climbing and other contests that could be found. They stated that in future meetings they would have special telephone lines established and with them would police the course for the racers.

QUERIES

DOING AWAY WITH SPARKS AT RELAY CONTACTS —(705).

Will you kindly explain to me if there is any way of preventing fusing of relay contacts due to kick caused by sudden break in the circuit? A. R.

Various methods have been devised, and each has depended to a large extent upon local conditions. In Fig. 705 is illustrated a circuit in which the trouble you mention has been experienced. In this case the circuit which the diagram depicts is a trunking circuit, and it was found that in the normal course of operation a heavy spark passed across the contacts a and b of relay 1, and heated them to the point of fusing. This spark was due to the kick of relay 2, which happens to be so designed that a heavy electric motive force was induced when the circuit through it was broken; that is to say, the current flowing through the negative side of battery B, to contacts a and b, relay 2 and 3, to sleeve of jack, 30 ohms resistance to ground sets up a sufficient magnetic flux through the windings of relay 2 to cause a very heavy electric motive force of self induction to be created. This electro motive force at the moment of rupture sets up a strong current which causes a spark across the gap between armature b and contact a, the path of the current being from relay 2 through the lamp and 24 volt battery B' to ground, and back through ground, battery B', and across the contacts to return to the relay.

There have been proposed two ways of remedying this difficulty. One of these is by cutting a resistance X of 500 ohms across the winding of relay 2. In this case the current due to the kick back of the relay is short circuited through the shunting coil, which actually, of course, has less resistance than the air gap between armature b and its contact. The resistance is so high that it does not shunt the relay sufficiently under the normal condition of the circuit to prevent its proper operation. In order to effect proper operation of lamps the resistance in this event is made 43 ohms, so that the combined value of the resistance in multiple of the windings of the relay 2 and resistance X respectively may be very close to 40 ohms.

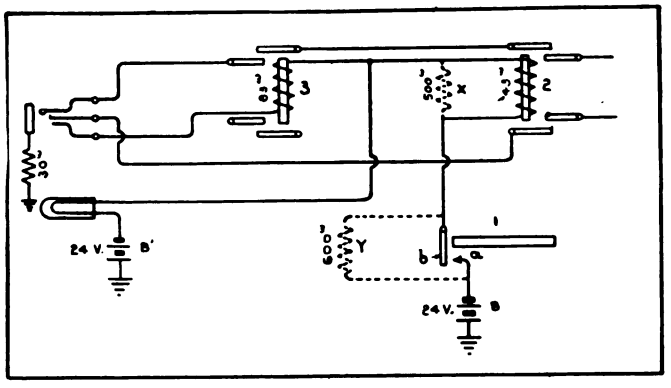

Fig. 705.

Another method which has been devised to do away with the trouble referred to on this same circuit is to connect the resistance as shown at Y directly across the contacts a and b. This short circuits the air gap through resistance, and the current from relay 2 passes through the coil rather than to jump the gap. The resistance of this coil has been established at 600 ohms, as this figure is sufficiently low as to permit current induced by relay 2 to pass through it, while the amount of battery current passing through it to the ground connected to the sleeve of the jack after the opening of contacts a and b is exceedingly small. It has been found that either of these methods gives very fair results, and as the principles are obvious it is possible that they will find a more extended application in other circuits.

TYPE OF RINGING MACHINE FOR FIVE HUNDRED VOLT CIRCUIT—(706).

Will you please explain why it is that, although a dynamotor is very frequently used for supplying a ringing current, you seldom see this type of machine in use upon a 500 volt circuit? J. N. B.

When a machine is to be used upon a 500 volt circuit the problem of insulating its windings properly is a little more difficult than for a machine which receives current from 110 volt mains. This difficulty of insulating against high potential is a little more pronounced when there are two separate sets of windings upon the same armature, such as are found in a dynamotor. The result of a cross between a 500 volt winding and the winding for supplying ringing current to the switchboard is obvious. Not only would the switchboard apparatus be seriously injured in many parts, such as the ringing keys, but the operators would be exposed to great danger. It is therefore considered good practice to take the most thorough measures to provide against such an occurrence, and it is believed by many people that it is inadvisable to wind a 500 volt motor and regular ringing current winding upon the same armature. The usual practice is to use a separate motor and dynamo joined by a shaft having a flexible coupling, making what is known as a motor generator set.

PROTECTION OF STORAGE BATTERIES FROM METALLIC DUST—(707).

I note recent instructions issued for the installation and care of storage batteries state that no metal pipes should be run above the batteries. Will you please explain why this is? N. S.

If a small amount of metal is allowed to fall into the storage battery tank an action is set up which causes the plates to deteriorate very rapidly. When a metal pipe is above the cells the fumes arising from the solution, and an occasional drop of sulphuric acid which may be given off, due to the boiling of the cells at the time they are being charged, come in contact with the metal, causing its speedy corrosion. Draughts of air and jars of the building are very likely to shake loose little scales of metal salts, which drop into the storage cells resulting in the damage referred to above. In many places it is the custom, if the cells are installed in a battery room where pipes have already been run, to box in all metal work in order to avoid any difficulty; but the wiser plan is to do away with the pipes altogether, causing them to take a course which carries them around the room if it is possible. Otherwise, of course, a suitably painted tight wooden box will answer the purpose of keeping all particles of metallic matter out of the cells.

It is well to use black ashpalt paint, as this is not affected by the fumes of the acid.

USE OF CONDENSER ON PARTY LINES—(708).

Why is a condenser sometimes placed in the secondary circuit of a magneto instrument on a heavily loaded party line? J. W.

The condenser is used to enable bells to be rung if one of the receivers is off the hook. On such a line it is a common experience that after one ring has been given several people will listen on the line to hear the conversation. If the desired party does not answer at the first ring subsequent attempts to call him will be useless, owing to the fact that his bell is shunted by one or more receivers which have a comparatively low impedance, thus allowing current from the ringing generator to pass through them instead of the bells.

If a condenser is cut across the line in series with the receivers the impedance to ringing current is raised to a sufficient value to allow the bell to be rung. The added resistance to talking current, owing to the difference in frequency, is not sufficient to be injurious.

ORGANIZATION IN TELEPHONE WORK.

(*Continued from page 374.*)

every quarter or half year as thought best. This has its merits in that the new construction done during the current quarter or half year can be easily obtained. In a few cases this "Plant" account is divided up into parts such as "Wire Plant," "Exchange Plant," "Sub-station," etc., but the writer has found this unnecessary. If the construction is necessary and authorized it ends there and the only thing gained by such detail would be the ability to determine the proportion of new construction necessary for each section.

It is unnecessary to define maintenance, although there seems to be so much misunderstanding regarding it. The idea as already expressed is that anything which is in the nature of repairs or replacements and has not for its primary object the increase in value of said plant comes properly under this head and no other, hence, labor, clearing trouble, new material for old work, and all the expenses in connection therewith, and the moving of subscribers' telephones to new locations, when not paid for, must come under this head.

The charges which would appear under the head of operation would be wages of operators, including traffic manager, supervisors and each person for local or toll work, employed in the operating room directly or indirectly, with the exception of repairmen; salaries and commissions of agents; stationery for operation purposes, including the directory and all help connected therewith, together with material used, etc.; incidental expense in connection with this department; all power charges for illumination, charging of batteries or ringing purposes; all free and franked business; pole contacts, etc.; in fact any expense dependent on the traffic variation. In the case of the directory and similar expense, such as printing when the purchase extends over more than one month, the balance may be divided up between the several months and so carried as an asset from one month to another until disposed of. A general expense account is usually kept in addition to the foregoing and in it are charged the salaries of the manager, general offices, cashier, clerks, collectors, the expense of this and all other accounts which are not easily divided between the others, such as light, heat, taxes, office supplies, insurance, etc. It is customary to collect all telephone rentals in advance, and on the Pacific coast a new practice has been established which reduces labor and expense. To all telephone rentals is added twenty-five cents, which is deducted if the patron pays by check or at the office of the company on or before the tenth day of the current month. This rule is rigidly enforced and works very satisfactorily, the people seeming to rather enjoy the saving of twenty-five cents by sending check or calling personally. By the tenth of the month it is usually found that about 70 to 75 per cent. of the bills have been paid. There are those who advocate the quarterly or semi-annual method, but while a number do this voluntarily, the majority prefer to pay each month, usually for the reason that the rentals do not accumulate to so large amounts.

It is customary to affix to each a contract a number called and known as the "Contract number," which is indicative of the name and telephone number of the patron or subscriber. These are entered in what is known as the "Lease Record," which is a book about 12½ x 15½ inches, each page carrying twenty-five accounts. The book, like all other records, should be large enough to last one year. These accounts are entered consecutively by their numbers, and when a number for any reason has not been used the line is left blank. When changes are made it is customary to close the account and open a new one. This contract number identifies the subscriber throughout the system, except where the telephone number is paramount. It is well to keep separate records of cancelled and active accounts. This record, as shown in Fig. 2, is self explanatory. The totals of the "still due" column are debited to the "rents receivable" and to the credit of the rentals in the ledger. It is common practice to enter all charges at the beginning of the month and the credits at the end of the month. This book ledger has been supplanted by some companies by the card ledger. When changes take place the lease is marked "superseding" stating the number of the new contract; when taken out the word "discontinued" is used. The following abbreviations are frequently noted to distinguish the class of service: B., business; R., residence; Ex., extension; P. B. X., private branch exchange; I. C., intercommunicating; S., special.

ATTEMPT OF BELL COMPANY TO KILL COMPETITION IN OSWEGO.

(*Continued from page 378.*)

modern switchboard, spent a great deal of money on construction, and began to seek the business of the town by extremely vigorous competitive measures. The directors of the Independent company finally received overtures from the Bell company, which offered to buy up the Independent plant with the object of doing away with competition in this manner. It is said that the offer they received was too tempting to resist, and their company was accordingly sold to its competitor.

The Independent company throughout its entire experience was under the control of men closely identified with the business interests of the town, and its service was satisfactory to the people. The sentiment prevailing in the town is very well indicated by the fact that the manager of the Ontario Company has determined to continue to work in the field of Independent telephony, and with this in view addressed to the president of the company the following letter of resignation:

Mr. F. A. Emerick, Pres. Ontario Telephone Company, Oswego, N. Y.

Dear Sir:—Since the announcement of the traffic arrangement between the Ontario Company and the Bell Company, it has been understood that I was to be retained as Manager, in Oswego.

I have given the matter very careful thought and have decided that should I accept any position with the Bell Company I could not carry on the work with the spirit necessary to be successful, as my sympathy and interests are with the Independent telephone cause.

Please accept my resignation to take effect June 1, 1906.

Thanking you for your many kindnesses, I am,

Respectfully yours, W. A. CLEMENTS.

At the time the sale was made the paid in capital stock of the Ontario Company was $100,000. For the property of this company the Bell company paid $130,000, and assumed a bonded indebtedness of $44,000, making the actual cost to them of the Independent plant in Oswego $174,000. In addition to this the Bell company had expended in Oswego a sum which may be roughly figured at $125,000, and it is said that it now contemplates spending between $50,000 and $60,000 for subways and wire plant. This means that the company will within a short time have invested in a comparatively small city about $350,000. Moreover this investment does not represent a plant in which all the parts are capable of contributing to the support of the company. A great amount of it is duplication, and will have to be junked, so that the money spent for it is a sure loss to the company.

In order to make a fair showing on this enormous investment high rates will have to be charged, or poor service given. In Syracuse Independent development is high, and the company there is equipped for giving first class long distance service. The people connected with the Syracuse company are already participating in arrangements for the organization of a new Independent company in Oswego. When this is accomplished they will be able to erect for $125,000 a plant which will give better local service than the Bell, and trunk lines run only a few miles to Syracuse will give service to a town whose business is most closely connected with that of Oswego, and from this point connections may be had with long distance lines giving service all over the State. The very people who have made at a single stroke 30 per cent. profit on their investment by selling out to the Bell company are arranging to put back their money into the new Independent plant. Thus the Bell company has built one plant; bought another; and the money it paid will be used to build a plant for a third company. This new company will be able to base its rates upon the investment of $125,000 required to put up a first class plant; the Bell company will have to base its rates upon the investment of $350,000.

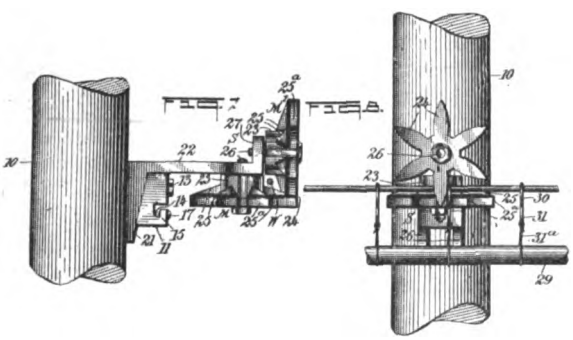
TELEPHONE PATENTS

CABLE SUSPENSION SYSTEM.

Leonard A. McNeil, Maywood, Ill., patents (No. 816,991; dated April 3, 1906; filed September 2, 1904; serial No. 223,083) a cable suspension system.

The object of this invention is to facilitate the erection of aerial cables. For this purpose the inventor employs a special form of hanger, illustrated herewith.

This consists of a block 11, provided with a recess 14, to hold the messenger wire in its final position. Its rear portion J. is reduced to permit the temporary lodgment thereon of a tempo-



rary member 22. This member carries toothed wheels M, M^1, which mesh together at right angles.

In operation the messenger wire W is threaded through the openings between the wheels and fastened at the terminating point in the groove 14. The cable is then attached to the messenger by suitable hangers and pulled into position. As each hanger comes in contact with the teeth of the wheels the latter revolve, maintaining a constant engagement which will not allow the messenger wire to slip out of the desired position.

GROUND ANCHOR.

William E. Cissman, Mount Vernon, Ind., patents (No. 817,044; dated April 3, 1906; filed August 29, 1905; serial No. 276,300) a ground anchor.

In this invention means are disclosed for securing a positive hold upon the earth for the purpose of guying poles or similar uses.

This the inventor accomplishes by a device similar in shape to the letter A. The lower extremities of the legs are bent outwards so as to form holding surfaces to engage the earth. The crosspiece is attached to a rod to which a wire or rod is fastened. In operation a hole is dug and the device lowered into it, with the crosspiece at the base. The hole is then filled with earth. If a strain is now placed upon the rod attached to the crosspiece, it will cause the latter to rise, forcing the arms outwards, and causing the extension surfaces of the legs to engage with the solid earth.

SUPERVISING SYSTEM.

Frank R. McBerty, Evanston, Ill., patents (No. 817,867; dated April 17, 1906; filed January 24, 1902; serial No. 91,031) a supervising system.

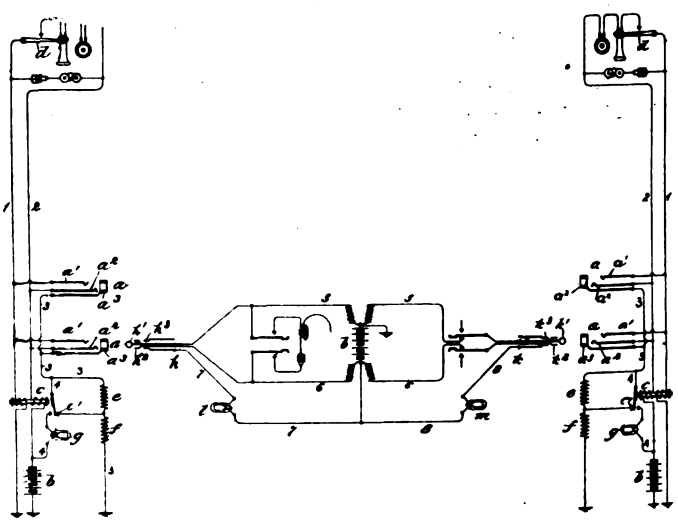
The object of this invention is to provide a means for operating the supervising signals of a cord circuit without the aid of supervisory relays.

Referring to the accompanying illustration the means employed will be made clear.

The line wires 1, 2 include in series windings of the line relay C and battery b. Tip and ring springs a^1 a^2 connect respectively with wires 1, 2. Sleeve or test thimbles a^3 are wired in series to wire 3, and resistances e, f and connect with ground. The armature of relay c is legged to wire 3 by wire 4 and in normal position is in contact with c^1, the circuit thus formed being a shunt around resistance e. The line lamp is shown at g, and the supervisory lamp at b connecting with the sleeve h^3 of the plug and battery b. Tip and ring sides of cord circuit are shown at 5, 6, respectively.

When a receiver is removed from a hook the circuit of the line relay is closed, causing it to attract its armature and thereby lightning line signal g, the circuit being from battery b, over wire 4, lamp g, wire 4, wire 3, resistance e, f, to ground. The line signal 4, is adapted to operate with current flowing through this high resistance circuit. When the operator inserts the answering plug in the jack, the circuit of the supervisory lamp l, which is of low resistance, is placed in shunt with the line signal g, and the latter is extinguished. The supervisory signal does not light because the resistances e, f do not allow sufficient current to pass for its illumination.

When the calling plug is inserted in the jack of a called line the supervisory signal m will be illuminated because the line relay armature is then in contact with c^1 and the resistance e is shunted out. Upon the removal of the receiver from the hook of the called party's telephone the line relay will attract its armature, thereby removing the shunt around resistance e and the



supervisory lamp is extinguished. Upon completion of the conversation the hanging up of a receiver opens the line circuit and the line relay is de-energized. The circuits are then in the same relation as is established after the insertion of a calling plug and before the called party has answered, and the supervisory lamp is lighted, giving a disconnect signal.

The inventor states that the suitable resistance of the various factors which enter into the operation of this circuit may be as follows: Line lamp g 140 ohms, resistance e 75 ohms, resistance f 40 ohms and supervisory signals l, m 37 ohms.

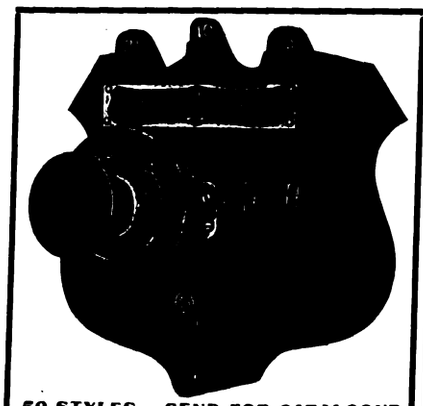
GRAY TEL. PAY STA. CO. HARTFORD, CONN.



50 STYLES SEND FOR CATALOGUE

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—Patent on only simple, positive and practical self-restoring and clear-out drop. Address Box 244, Greencastle, Ind. 627

SUPPLIES WANTED

For use of operating companies wishing to purchase or sell second-hand equipment or supplies. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

WANTED—A second hand fifty or one hundred drop switchboard in good condition made by the Sumter Telephone Manufacturing Company. Address F. P. Linder, Hartwell, Ga. 626

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Competent man (married preferred), who is thoroughly capable of handling both business and practical end of telephone plant operating 500 common battery and 200 rural lines. New plant. Position permanent to right party. Salary $65.00 per month for the first year. Right party can secure stock interest in property and the position of Secretary. Address, with full particulars, to Box 619, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 619

WANTED—A young gentleman of good appearance desires position as traveling salesman with good telephone or supply house. Seven years' experience, last four years as superintendent of switchboards for company operating over sixty exchanges. Can give best of references and reasons for wishing a change. Address Box 620, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 620

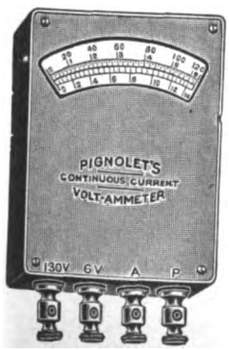
WANTED—Experienced purchasing agent desires position with progressive operating or manufacturing company. Good habits, clean record, excellent references. Address Box 623, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 623

MR. MANUFACTURER, our business is to create and delevop A MARKET FOR YOUR PRODUCT. We can sell your entire output at less expense and risk that you can do it. If you have a good thing but don't know how and where to sell it, write us. Hapgoods Sales Company, 305-309 Broadway, New York, U. S. A. Offices in eight American cities and London, England. 464

WANTED—A young man of experience and ability in telephone salesmanship to represent a large telephone manufacturing company in New York State. Address Box 625, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 625

WANTED—Telephone inspector for telephone manufacturing concern. One familiar with circuits, interior and long distance telephones. Address Inspector, Box 628, care THE AMERICAN TELEPHONE JOURNAL, 100 William St., New York City. 628

TO BE FOREWARNED IS TO BE FOREARMED



If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars By buying one now you will save its cost many times over before you have had it a year.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A NEW MAGNETO SWITCHBOARD.

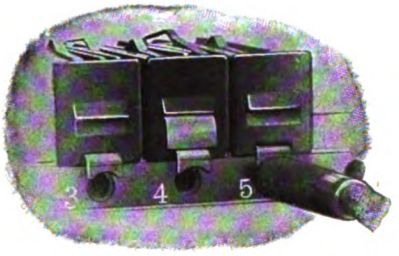

Fig. 1. Front view of three drops for Sumter Unitype Board.

EACH drop in the new Sumter Magneto Switchboard is a separately removable unit, and from this fact the company has decided to call the board the Unitype. It is said to be radically different in design from anything heretofore attempted, and secures the valuable feature of enabling additions to be made exactly as required, doing away with any difficulty of deterioration of apparatus left in idleness in the board. The apparatus may be added when it is ready to go into service, and thus the cost of equipment is not expended until the time when returns for its use begin to come in. Also the difficulty experienced when idle equipment in a board is robbed of some of its parts for repairing apparatus attached to working lines, causing confusion at a later period, is avoided.

Fig. 1 shows the front view of three of the Unitype drops used in this switchboard, while in the opposite column, in Fig. 4, is shown a view of the back of the drops, in which the locking contact springs connecting the drop to the jack are clearly indicated. The drop itself, of which a view is shown in Fig. 2, presents some very interesting features of construction. There are three removable pieces: an armature *f*, shutter *e* and restoring latch *g*. The armature is carefully balanced on a brass rod which runs entirely across the drop frame. This obviates the necessity for pivot screws, which are frequently a serious source of trouble, to say nothing of the annoyance to the repairman who attempts to adjust them. The armature hangs in front of the drop coil *h*. The shutter *e*, which is very light, is held in its normal or unexposed position by the knife edge of the armature, which engages a small projection on the bottom of the shutter. When the armature is attracted the knife edge releases the projection from the lower part of the shutter, and the latter falls back projecting through the slot *l* in front of the drop case, thus attracting the attention of the operator. It is noteworthy that the signal is displayed by the force of gravity alone, thus fulfilling the requirement of a magneto switchboard, that the actuation must take place during the short time that ringing current is passing through the magnet coil. The method of inserting the drops in the board is extremely simple, as no wiring is connected to the drop in any way; it is pushed in by the hand, and proper connections are made through the locking contact springs of the jack. The removal of the drop is, of course, equally easy. The company is making numerous sales of this type of apparatus, and will be glad to give detailed information to any one who will mail a request to the Sumter Telephone Manufacturing Company, Sumter, S. C.

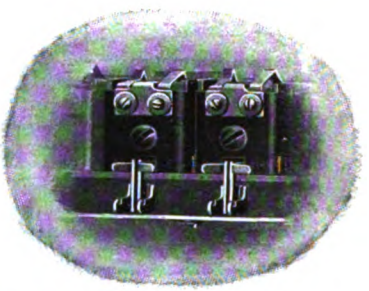

Fig. 4. Rear view of Sumter Unitype Drops.

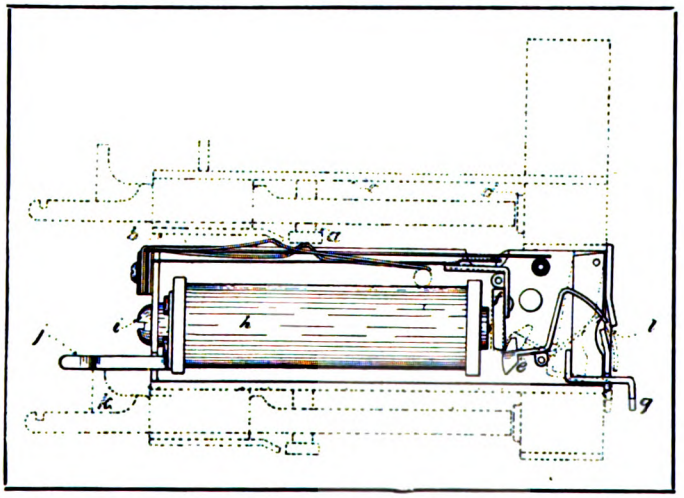

Fig. 2. Sectional view of drop used in Sumter Unitype Switchboard.

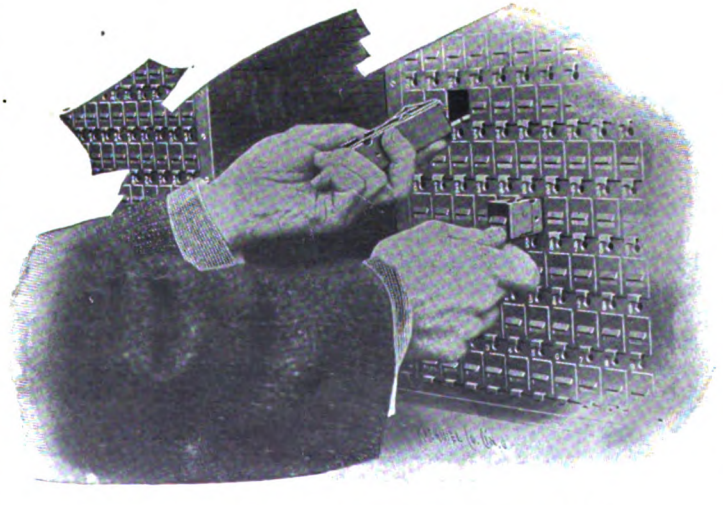

Fig. 3. Method of removing Unitype Drops from Switchboard.

THE SWEDISH-AMERICAN TELEPHONE COMPANY began on May 1st to make shipments of its regular product from the Kansas City branch. Since that date there has been a daily increase in shipments, and at this time the company ships one carload of instruments each week. The Independents in the Southwest were not slow to take advantage of the opportunity offered them, and the Swedish-American Company is to be congratulated on its enterprise and success in this undertaking. It has also recently opened an office at 112 Broadway, Fargo, N. D. This office will be in charge of Mr. C. L. Ward, who will gladly respond to requests for prices and information in the Northwest. Mr. Ward is thoroughly conversant with telephone matters and can therefore appreciate any special requirements which companies may desire to meet.

THE D. & T. ANCHOR COMPANY, La Crosse, Wis., has recently issued a leaflet showing the various types of its well known guy anchor. As this company's business has increased, the demands for anchors for use in special kinds of soil, etc., has grown, and the company has arranged to satisfy them by developing modifications of the standard form to fit each individual requirement. People who are anxious to secure just the right thing should write for this folder, upon which the various types are illustrated and prices given. Any special information desired will also be furnished.

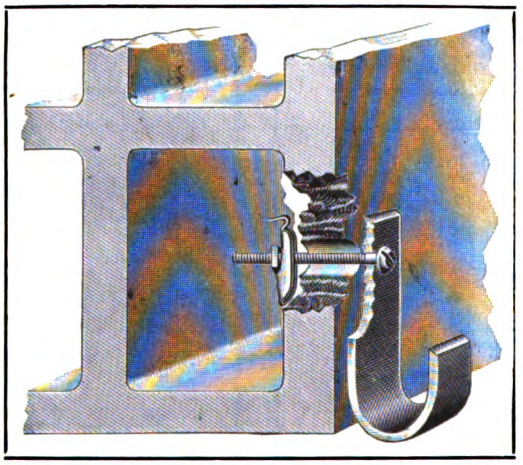
IN THE MANUFACTURING FIELD

A TOGGLE FOR FIREPROOF WALLS.

A NEW device which should be very useful in attaching cleats, telephones or other fixtures to walls has recently been put upon the market by the Electric Appliance Company, 134-140 West Jackson Boulevard, Chicago, Ill. It is especially designed for use in attaching fixtures to walls constructed of fireproof material, such as hollow tile, marble or metal. The accompanying illustrations will show clearly the method of attachment to a bolt, and the way in which, after the insertion of the screw, the tackle flies into a position which enables the fixtures to be firmly held at the turning of the screw. After a small hole has been bored the tackle is inserted as shown in the upper illustration until the loose part drops; all that is necessary then is to pull back the bolt and turn it until the nut holds the apparatus firmly in position. There is no small rivet or other device of limited strength, so that all the parts are properly proportioned. The design is such that pieces of various thickness can be fastened with the same bolts, and the four-inch size will be found to meet the needs of almost any situation. There are, however, ten sizes made, with different finishes, and the company will be glad to send a list showing the dimensions and cost of these different sizes to whoever makes a request for this information.

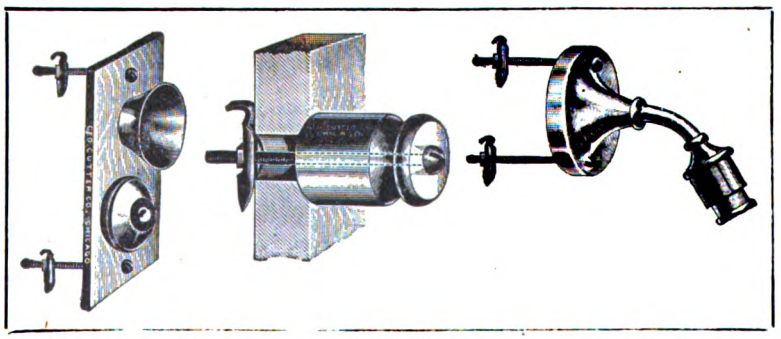


Cutter's Toggle in use on tile wall. Note that thread does not have to be cut off.

THE DEAN ELECTRIC COMPANY, Elyria, Ohio, has received from the Covington Home Telephone Company, Covington, Ohio, an order for a four hundred and fifty line Dean express type switchboard. Besides many larger boards which have recently been sold, contracts are being signed daily for one and two position switchboards of the different Dean types.

GOULD COMPANY ORGANIZES TELEPHONE BATTERY DEPARTMENT.

THE rapid increase in sales of storage batteries for telephone service has made it necessary for the Gould Storage Battery Company, of New York, to organize a special telephone battery department. A corps of experienced engineers has been engaged and these men will devote their entire time to this application of the Gould battery. They will not only give attention to securing a proper battery for each order received, but will be glad to give advice to all telephone managers who use this battery, in order that the high efficiency of which it is capable may be fully secured.



Cutter's Toggle attached to bolts fastening various apparatus.

The Gould Company has already had a great deal of valuable experience in supplying batteries for telephone exchanges. Over three years ago the first order for a Gould battery for this class of work was placed by a large telephone company for a trial installation, and this was subsequently followed by orders for similar equipment in six more exchanges. Other companies have followed the lead of the maker of this original order, with the result that the company, as stated, is making special preparations for handling this class of business.

The Gould plate presents numerous points of special interest. It has a large contact surface for active material, which is developed out of the lead of the blank itself by a patented process of spinning the surface of the blank into numerous thin ribs. Only chemically pure rolled lead is employed, and the great density and uniformity which are so valuable in securing the high economy and long life of the Gould cells is thus secured. Owing to the new addition to its organization the Gould company will be equipped to handle technical inquiries, as well as those to its business department, promptly and accurately.

STERLING FACTORY BUSY.

THE Sterling common battery equipment is winning the approval of many telephone exchange managers in all parts of the United States as well as in some foreign countries. The efficiency of the Sterling circuit has long been recognized by practical telephone engineers, but, owing to the fact that a suit had been brought against the Sterling company by the Western Electric company, many orders had been held in abeyance awaiting the final outcome. Now, however, that the patent situation has been cleared up, orders have been pouring in to such an extent that it has become necessary to put on a night shift in the switchboard room in order to keep up with the company's numerous orders.

In addition to the 5,000 line board at Galesburg and the 1,400 line extension to the Toledo board now nearing completion, there are also installations progressing at Uhrichsville, O.; Marion, O.; Lima, O.; Bloomington, Ind.; Belvidere, Ill.; Cedar Rapids, Iowa; Joplin, Mo.; Wichita, Kan.; Hattiesburg, Miss.; Whittier, Cal., and Callao, Peru.

Magneto call boards for Benton, Ky.; Plymouth, Ind.; Millerton, N. Y., and Germantown, N. Y., have been shipped within the last month, the last two being equipped with the new self-restoring drop recently brought out by the Sterling company. This drop, by the way, has received much favorable comment wherever it has been shown on account of its simplicity and excellent mechanical construction, and the Sterling Electric Company expects to receive many orders for boards equipped with this apparatus from small exchanges in the near future.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING CO., Rochecster, N. Y., reports having closed contracts for switchboards for the following places: Exeter, Neb.; Portsmouth, N. H.; Bedford, Ind.; Hartford, Conn.; Rochester, N. Y. Also a 3,000 line multiple board for the People's Home Telephone Company, Morgantown, W. Va., and one for the Marietta Home Telephone Company, Marietta, Ohio. The company also reports many sales of instruments using its new transmitter.

TO GET THREE OUT OF TWO SEEMS IMPOSSIBLE

Yet the Illinois and Sandwich Duplexers easily make two metallic circuits into three

Just stop and think what this means to you in increased facilities without spending a cent for new line construction.

Here are the facts in the case: By connecting our duplexers to the two existing metallic circuits a new one is formed which utilizes each pair of wires as one side of an independent metallic line.

To eliminate all noise due to induction we provide a very simple and efficient balancing device which requires no skill in its manipulation and which will make the new circuit absolutely quiet.

Seems almost too good to be true. Let us prove it by sending a set on 30 days free trial.

We know you are interested; therefore don't delay, but write to-day

Bridging Telephone.—Type M.
This style of cabinet also made into:
3-Bar, Series, Type "K"
4-Bar, Bridging, Type "L"
with any ringer resistance desired.

Western Pioneer Telephone

Five-Bar Bridging

Our **New Western Pioneer** telephone can be furnished for all classes of **special service** such as **ring through, non-interfering, divided circuit, central checking party line** and in fact can be used where any generator call telephone is now being used. The apparatus used in this instrument is of **New Western design.**

The **common battery type** of **magneto telephone** is becoming popular. The cabinet is compact and neat in appearance, all parts are **conveniently** mounted, the wiring is simple and the cabinet will accommodate a **three, four or five-bar generator.** We manufacture all of the parts used in this instrument. When the upper compartment is open the generator, ringer, hook switch, induction coil and receiver binding posts are exposed. When the battery box is removed by sliding downward, the batteries and battery connections are exposed.

WHAT'S IN A BATTERY?

By any name other than the Rock Island, a battery will not *last* as long or give such *enduring satisfaction.*

The ROCK ISLAND NEW PATENT DRY CELLS

are now being largely used by manufacturers of telephone and telephone companies. They *demand* the best and *know* the best. That's why our Standard No. 8—the largest battery we make—has scored so heavily. It will certainly do *all* the work required and possesses a *source* of

CURRENT THAT CAN BE RELIED ON

Our Standard No. 6 is big enough for general purposes. The Rock Island has stood *every known test*—competitive and exhaustive—and shows 20 to 30 per cent. greater efficiency and longer life than any other dry battery.

Write Department D for prices.

At the National-Interstate Telephone Association at the Auditorium Hotel, Chicago, Ill., June 25-28, the Rock Island Battery exhibit in Room 136, parlor floor, will be worth a visit. COME. This invitation is for YOU.

THE WEEK'S MESSAGES

general manager; Kathleen Odum, secretary and treasurer. John W. Strickland was appointed superintendent.

PERSONAL.

J. H. AINSWORTH, formerly manager of the exchange of the Central Union Telephone Company at Columbus, Ohio, has resigned to become general manager of the Home Telephone Company at Dayton, Ohio.

JAMES W. BOWLING has been appointed manager of the exchange of the Iowa Telephone Company at Fort Madison, Ia.

JAMES R. CARTER has been promoted to the management of its exchange at Kearney by the Nebraska Telephone Company.

HAROLD R. FARNHAM has been promoted from the management of its Hingham exchange to that at East Boston by the New England Telephone and Telegraph Company.

PERCY N. FULLER, formerly in charge of the Charlestown office of the New England Telephone and Telegraph Company, has been promoted to the management of the exchange at Newton, Mass.

A. L. JOYNES, who has been in charge of the Cumberland Telephone Company's exchange at Paducah, Ky., has been promoted to the management of a new district including the exchanges at Princeton, Eddyville, Kutawa, Paducah, Mayfield, Fulton, Bardwell, Wickliffe, Hickman and Clinton, with headquarters at Paducah.

W. H. WALLACE has been appointed manager of the exchange of the Wood County Telephone Company at Bowling Green, O.

B. C. WOLVERTON has recently been appointed chief engineer of the Hudson River Telephone Company. He will also retain the position of chief engineer of the New York & Pennsylvania Telephone and Telegraph Company, the Central New York Telephone & Telegraph Company, and the Empire State Telephone & Telegraph Company. The combined extent of territory covered by these companies includes 55 counties, with numerous important cities.

MISCELLANEOUS.

TOLEDO, O.—The Toledo Home Telephone Company has recently secured a group of large branch exchange contracts. These include one order from the De Vaux Hotel for 100 telephones. Wiring for lines to the 900 shops and offices in the sixteen-story Nicholas building is in progress.

ROCK HILL, S. C.—Paul Workman, owner of the local telphone exchange, is to install a new exchange at this city. The system is to be rebuilt and extended.

MENOMONIE, WIS.—The Menomonie Commercial Club is endeavoring to connect all local Independent companies in Dunn county with the exchange at Menomonie.

New Construction in the Field

BLACK SPRINGS, ARK.—The Black Springs Telephone Company is to build lines from Caddo Cove to Hot Springs, as well as to many other points in Clark and Pike counties.

SAN PEDRO, CAL.—The Home Telephone Company is to make many extensions to its system.

DELTA, COLO.—The Delta Co-Operative Telephone Company is to extend its system.

KEY WEST, FLA.—The Florida East Coast Railway is constructing a telephone line from Miami to Key West.

BROXTON, GA.—The Broxton Telephone Company, which has recently passed into new hands, is to make many improvements in its system.

DAVIS, ILL.—The Davis Mutual Telephone Company is to build a line to Durand.

MULBERRY, ILL.—The Farmers Mutual Telephone Company is building a line from Mulberry Grove to High Bluffs.

COLUMBUS, IND.—The Citizens Telephone Company is to rebuild its system at North Vernon.

DAVIS, INDIAN TERRITORY.—The Davis & Turner Falls Railroad Company is constructing a telephone line to Turner Falls.

STRATFORD, IOWA.—The Independent Telephone Company is to build a new line south of the city, also one east.

PADUCAH, KY.—The Home Telephone Company, of Paducah, is making extensive improvements both in its local and long-distance service.

SHERBORN, MASS.—The Sherborn Telephone Company is building a new line.

SARANAC, MICH.—The Citizens Telephone Company is extending its lines in Saranac and Berlin.

GLENCOE, MINN.—The McLeod County Telephone Company is to rebuild its system at Glencoe and is to make many extensions.

HECTOR, MINN.—The Hector Telephone Company is building a line to Brookfield.

MADELIA, MINN.—The Madelia Telephone Company is about to build a number of rural lines.

PERHAM, MINN.—The Perham Telephone Exchange is to extend its lines.

LAUREL, MONT.—The Mutual Telephone Company is erecting a line from Laurel to Columbus. It will also build a line to Junction.

SPEED, MO.—The Speed Telephone Company is making many improvements in its system.

ASHLAND, NEB.—The Ashland Telephone Company is making many improvements in its system.

PALMER, NEB.—The Independent Telephone Company is putting in a long-distance line from Palmer to Grand Island.

DOLGEVILLE, N. Y.—The Interstate Telephone Company is making many improvements in its local system.

PULASKI, N. Y.—The Black River Independent Telephone Company is to construct a number of rural lines.

RUSH, N. Y.—The Inter-Ocean Telephone Company is building a line in Rush, N. Y.

TRUXTON, N. Y.—The Truxton & Cuyler Telephone Company is constructing its system.

MANDAN, N. D.—C. E. V. Draper is to erect a telephone exchange at Mandan.

CHARDON, O.—The Chardon Telephone Company expects to build a line from Chardon to Cleveland.

LAWRENCE, O.—The Lawrence Telephone Company is to thoroughly overhaul and renew its system.

MEDINA, O.—The Medina County Telephone Company will establish a new exchange at Sharon.

NEW LEXINGTON, O.—The Citizens Independent Telephone Company is constructing its system throughout Perry County. The company expects to cover the entire county, erecting exchanges in all the larger towns.

SIDNEY, O.—The Sidney Telephone Company expects to extend its system.

TOLEDO, OHIO.—The Toledo Home Telephone Company is planning to install exchanges in a couple of towns near Toledo.

ORBISONIA, PA.—The Orbisonia Telephone Company is to extend its lines from Orbisonia to Mt. Union and from East Waterford to Port Royal.

YORK, PA.—The York Telephone Company is to expend about $300,000 in improving its system.

GARY, S. D.—The Gary Telephone Company is building a metallic line to Burr, Minn., and contemplates the construction of several rural lines.

GROTON, S. D.—The Groton Ferney Telephone Company is to extend its lines to Farmington and Bath. It will also build a number of lines in the vicinity of Warner.

VERMILION, S. D.—The Vermilion Telephone Company, Vermilion, S. D., has commenced the construction of its system.

CELINA, TEXAS.—The Celina Telephone Company is installing a new exchange.

CORSICANA, TEX.—Substantial improvements and extensions are being carried on by the Corsicana Telephone Company.

WEATHERFORD, TEXAS.—The Home Telephone Company will install a new, modernly equipped central energy plant and will make many other improvements in its system.

CASTLEDALE, UTAH.—The Eastern Utah Telephone Company is to extend its lines to Emery.

PARK CITY, UTAH.—The Independent Telephone Company expects to extend its lines to Brighton, Wabash and New York.

SALT LAKE CITY, UTAH.—The Utah Independent Telephone Company contemplates building lines to Mammoth and Robinson. The company is also to establish an exchange at Eureka.

KIRKLAND, WASH.—The Kirkland Telephone Company is building a line to connect Houghton, Kirkland, Juanita, Redmond and Bellevue.

WENATCHEE, WASH.—The Farmers' Telephone and Telegraph Company is to build a line to Leavenworth.

MORGANTOWN, W. VA.—The People's Telephone Company is to install a new exchange at Morgantown.

WHEELING, W. VA.—The National Telephone Company, which has acquired the Phoenix lines of Steubenville, is to rebuild that system. The company will also build lines to Toronto, New Cumberland, and will rebuild the line between Mingo and Wintersville.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Date, Etc. "Yours for the asking."

Iron Box Condenser No. 300.

The "Andrae" Condenser

Improves in 2 Ways

Iron Box Condenser No. 301.

There are scores of condensers, good, bad, and indifferent, but few that improve the service as a whole.

The improvement made by most condensers in signalling conditions lessens the efficiency of the talking service.

Here is where the **"Andrae"** condenser shows its superiority.

It allows the high frequency voice current to pass through readily, but acts as an apparent high resistance to the low frequency ringing current.

This not only enables subscribers on party lines to call up other subscribers, whether all receivers on the line are hung up or not, but improves the talking service.

"Andrae" condensers No. 300 and No. 301, shown in the illustrations, are especially adapted for use in connection with telephones already in operation.

A boy with a screwdriver can put up either one of them in three minutes.

We'll give you a thirty days' trial of these condensers free.
If they are not perfectly satisfactory, and entirely as represented, send them back—we'll pay the freight.

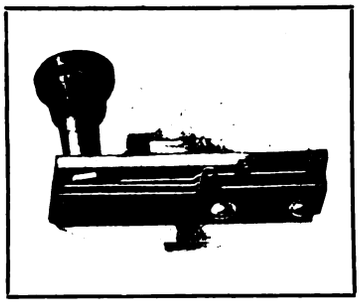
Little Things That Count



Simplicity is a noticeable feature of all MONARCH apparatus. The push button used in bridging telephones for code signalling, to ground the generator, to change the ringing current from alternating to pulsating, etc., is no exception. A mounting to go inside the cabinet, a bushing to pass through to the outside, a plunger with a hard rubber button and any arrangement of contact springs. That is all.

Multiple Tap Cable Distribution

Cook's Terminals furnish the most approved forms of protection, and the best and simplest means of cable distribution.

Cook's Junction boxes are best for cable splicing. They can be used in conjunction with the terminals or alone. At points where you desire to dead-end your cable use Cook's Junction Box. You can add a cable Terminal later if you wish.

SELF SOLDERING NOZZLES
Are Furnished With Both Terminals and Boxes

TYPE A—10-Pair Hall Cable Box.

Horace Greeley said: "Young Man, Go West!"

This short sentence shows Greeley's forethought. He anticipated the future and gave advice accordingly.

The past history of telephone development has been short but the future will be long. Anticipate it and build accordingly. If you build right, you will use cable and you will need cable terminals.

THE HALL CABLE TERMINAL

is the type you should adopt because it was invented by a man who knew what was wanted. In it is incorporated every feature necessary for efficient cable distribution and protection.

Standard sizes are carried in stock and there will be no delays in shipment.

Write for further information relative to this and other specialties.

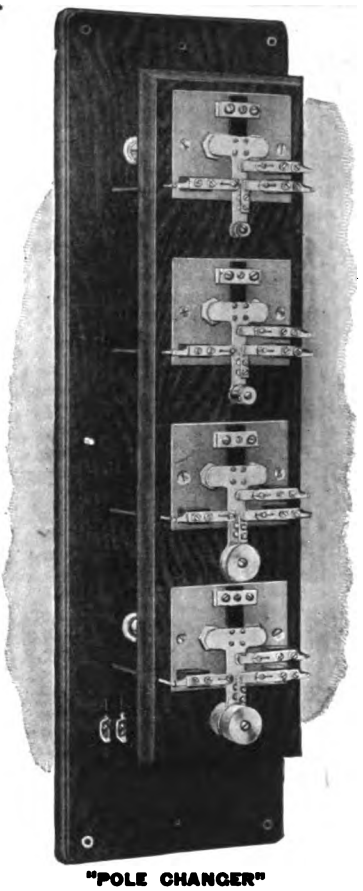
KELLOGG

FREQUENCY POLE CHANGER

Utmost SIMPLICITY of operation

THIS POLE CHANGER can be used on common battery or magneto exchanges.



"POLE CHANGER" COVER REMOVED

Advantages:

1. Requires very little attention after once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from Primary or Storage Batteries.
4. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
5. Operates successfully on any standard voltage of a telephone exchange.
6. Practically noiseless in operation.
7. Only THREE contacts on each Vibrator.
8. The vibrators have a very long spring, hence they will not break or change the frequency.

THE TRANSFORMER CABINET contains all necessary Switches, Fuses, etc.

Pole changer cabinet and transformer cabinet separate.

Can be put in different rooms if desired.

Sold separately or complete.

No additional apparatus needed on power board already installed.

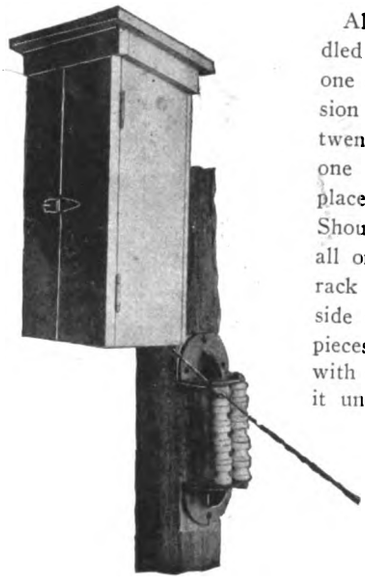
Robinson Pole Distribution Rack

(PATENT PENDING)

SIMPLE INEXPENSIVE PRACTICAL



All drops can be easily handled either by placing rack on one or both sides as the occasion demands. In case of twenty drops equally divided, one ten pair rack would be placed on each side of pole. Should the twenty drops be all on one side, a twenty pair rack would be placed on that side of pole. Top and lower pieces heavy malleable castings with convexed surface, making it unnecessary to gain pole.

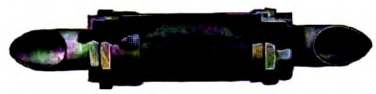
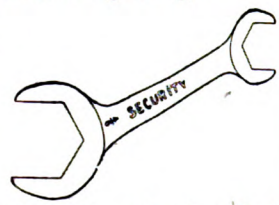
Get our prices and let us send you a trial order. SECURITY COMPOUND used in connection with NOVELTY POT-HEADS makes a fine combination. Any one able to handle a soldering iron can do the work now. No high-priced man necessary to make joints ab-



solutely watertight. It is economy to buy them. OUR NOVELTY SLEEVES are made straightaway, two way and three way. Bulletin No. 125 tells all about their ease and convenience of installing. Alteration quickly and readily made and can



be opened and restored without trouble. SECURITY DOUBLE END WRENCHES cost little, are handy, and are furnished to fit any pothead.

THE F. BISSELL COMPANY.
TOLEDO, O.

John Wanamaker says: "If there is one enterprise on earth that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick to it like a barnacle on a boat's bottom. He should know before he begins it that he must spend money—lots of it. Somebody must tell him, also, that he cannot hope to reap results commensurate with his expenditure early in the game. Advertising doesn't jerk: it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year until it exerts an irresistible power."

DO you realize the importance of the Private Telephone System? There is nothing which makes the operating exchange stronger than by connecting with Private Branch Exchange and Intercommunicating systems.

We are giving this branch of our business special attention and have produced some specially designed cabinets to meet the prevailing conditions and will equip them with any number of lines desired, allowing ample room for growth.

The same ideals of integrity of material and craftsmanship which are responsible for the Popularity and high Standard of Perfection of the STROMBERG-CARLSON APPARATUS are to be found in every detail in the Private Exchange and Intercommunicating equipment.

We invite you to look into and consider this very profitable branch of the business, and solicit your inquiries.

WE MAKE CABLE

DIVIDENDS

on telephone stock are difficult to pay unless the service is reliable and the cost of maintenance low. Open wire construction is exposed to a multitude of dangers; everything from the stone of the small boy to the sleet storm that snaps poles and breaks wires, wrecking the system in a few hours.

Many telephone companies have realized this, and to cut down maintenance expense, thus enabling the payment of dividends, they have substituted cable for their open wire plant.

Isn't it time you thought of doing so too? As an illustration, take the experience of Mr. F. G. Broad, Manager of The Union Telephone Company, of Sidney, N. Y. In a recent letter to us he expresses his satisfaction with the improvement that followed the substitution of cables for open wire construction. Here is what he writes:

SIDNEY, N. Y., March 20, 1906.

STROMBERG-CARLSON TEL. MFG. CO.,
Rochester, N. Y.

Gentlemen:—

With reference to your inquiry regarding our experience with cable as compared with open wires, would say that the cable is much more satisfactory. We had an exchange in Unadilla with about sixty subscribers and all open wires; there was hardly a day passed but what we had a case of trouble.

Last October, we installed cable and to-day we have 117 'phones and have had less than a half dozen cases of trouble since that time. About the same thing may be said about our Sidney plant.

I would strongly advise the use of cable even in very small towns.

I am, yours respectfully, F. G. BROAD,
Mgr. Union Telephone Company.

The Manager looking for results: reliable service, low maintenance, should appreciate the value of cable. Let us send you booklet 79B, telling how our cable is made, and giving other interesting cable information.

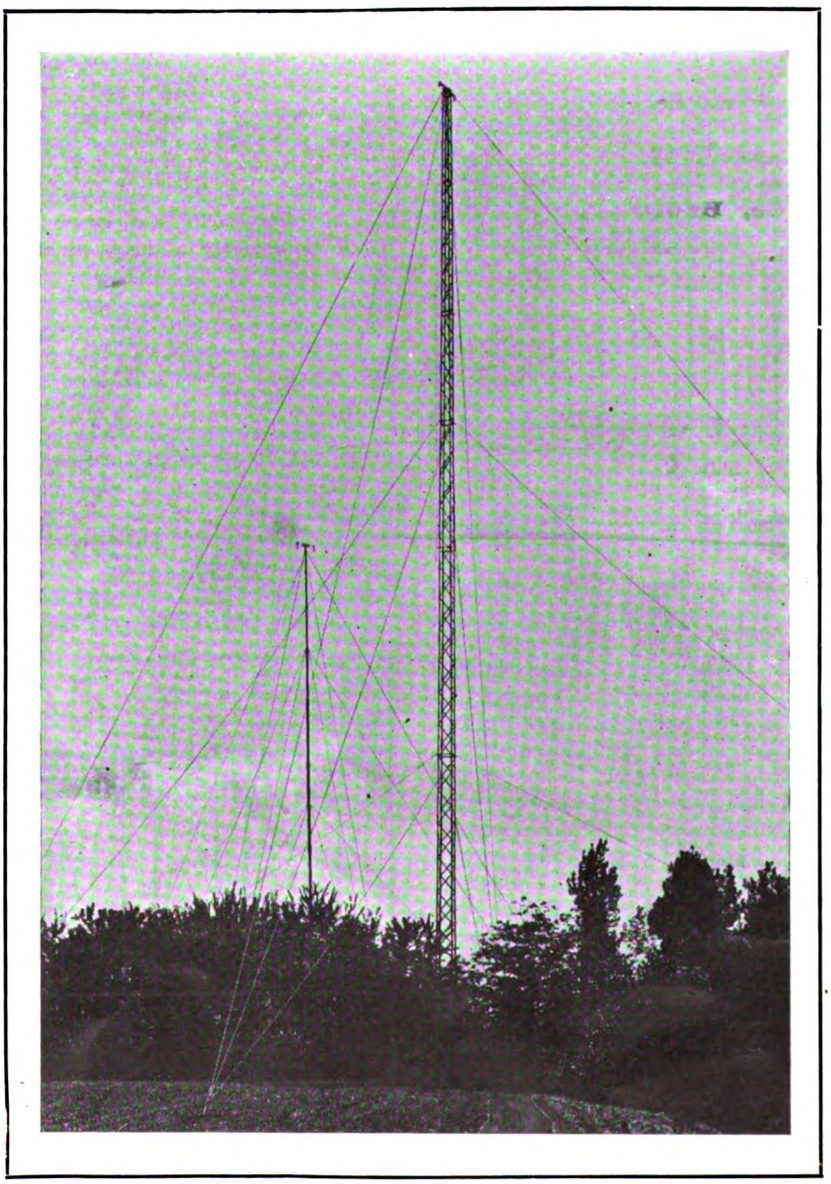
An Ohio River Crossing

By P. S. Pogue.

THE taking of wires across a river is one of the most interesting features of line construction which occupies the attention of a telephone engineer. In many parts of the country different methods have been adopted, and various requirements have been introduced to correspond to local conditions. The accompanying illustration shows a view of two such crossings built by two different companies in taking wires across the Ohio River. The structure which is in the foreground belongs to the Independent Long Distance Telephone and Telegraph Company. It is on a line connecting Owensboro, Ky., with Rockport, Ind., which branches off the main Louisville - Owensboro lead two miles east of Owensboro, and runs by way of Powers, Ky., to the Ohio River, which it crosses to Rockport. The line carries two metallic circuits; one No. 10 B. & S. gauge for long distance service; and one No. 12 B & S. gauge for local service. At the river is located a pole of structural steel 135 ft. high. As on the Rockport side there is a 100 ft. bluff of solid rock it is unnecessary to put up so high a structure, and here a 90 ft. pole has been erected. The length of the span is 3,200 ft., and the Independent Long Distance Company for crossing this broad space has substituted for the regular wires two circuits of No. 10 galvanized plow steel wire. These circuits are working constantly, and are very busy at all times. On account of the length of the span some trouble was experienced in getting the proper amount of slack in the line, but at last, through experimenting, it has been so adjusted that it works very satisfactorily. The thing essential for maintaining a long crossing free from trouble seems to be to have plenty of slack in the line, and that the dead end pole, that is the pole behind the tower, to which the wires are tied, should be securely guyed in every direction, so as to be absolutely rigid. In this way the only motion communicated to the wires is of a rather uniformly varying nature, due to the rise and fall of the strength of the wind, and the movements of one wire corresponds to those of the other. With a pole less securely guyed the occurrence of violent shakes or jars takes place with every sudden gust, and the effect of this is much more to be feared than that of a steady pressure.



View of 135-foot Structural Steel Pole of Independent Long Distance Company, with Pole of Cumberland Telephone Company Showing Beyond.

In the illustration it will be observed that guy wires are run from three separate points along the pole, thus giving sufficient rigidity to the high structure to resist the severe strains which are at times placed upon it. As the surroundings are comparatively open the full benefit of the impression which should be produced by so high a structure for the carrying of telephone wires is gained. The latticed construction which has been used in some European cities especially on account of its pleasing appearance, also provides ample strength with a small proportionate weight. This is necessary, as in the future this pole will have to bear a considerable number of additional circuits.

Digitized by Google

Organization in Telephone Work*

By P. Kerr Higgins.

ALL fixed charges, such as bond interest, depreciation, etc., do not as a rule come under the head of the cashier's department, but are generally taken care of by the general manager or the secretary of the company. The same rule applies to such special expense as right of way franchises, negotiating sale of bonds, discount on bonds, etc. In the payment of employees of departments, excluding the heads, who are usually paid on a separate voucher, it is customary to pay by pay roll. This pay roll is made up by the head of the department, his time-keeper or his clerk, and "O. K.'d" by the head of the department, from whom it is passed to the general manager or his deputy, who approves it for payment. A common practice is to pay bi-monthly, on the third and eighteenth. This gives three days for making up the roll and prevents men from leaving with less than three days' notice.

As previously explained, while depreciation does not come directly under the heading of accounting it will not be out of place at this time to draw attention to its importance. The tendency of companies as a rule is to keep the allowance of depreciation down to the lowest possible amount, which the writer thinks is a grave mistake. It is his opinion that it should be assumed that the plant is practically renewed every ten years, and this being so, one should of necessity allow not less than ten per cent. for depreciation. It is admitted that certain parts and divisions of the plant deteriorate much faster than others, but ten per cent.

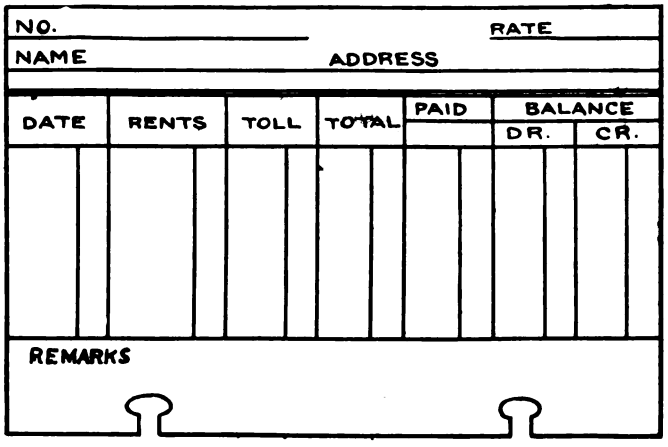


Fig. 9. Form of rental account, loose leaf system.

represents a fair average. This should not be confounded with maintenance. Maintenance is always easily determined, but not so with depreciation; the first is current, the second only determined at the end of the period. It is different from maintenance in that depreciation is always a liability, while maintenance is virtually an asset. The former is the victim of varying conditions, for example, damage due to storms, fires, etc.; deterioration, becoming obsolete on account of progress in the art and other reasons. The one is therefore a direct loss, while the other is only indirectly so. While the allowance of ten per cent. suggested for depreciation will be questioned by many the author's personal experience is that in the past no plant with which he has been connected has remained in service much, if ever, over ten years, and in some of the older plants, where the construction and material were poor, he has known the actual loss to be almost twenty-five per cent. One should be willing to face the facts as they present themselves. The higher the maintenance efficiency is maintained the lower will be the loss on account of depreciation under ordinary conditions.

The recent introduction of the loose-leaf system of bookkeeping makes this article incomplete without a brief review of the same. It is essentially a development of recent date, and as yet has not been introduced to a great extent in the telephone business. The old method of pinning or gumming sheets together for extensions is thus at one stroke dispensed with. By

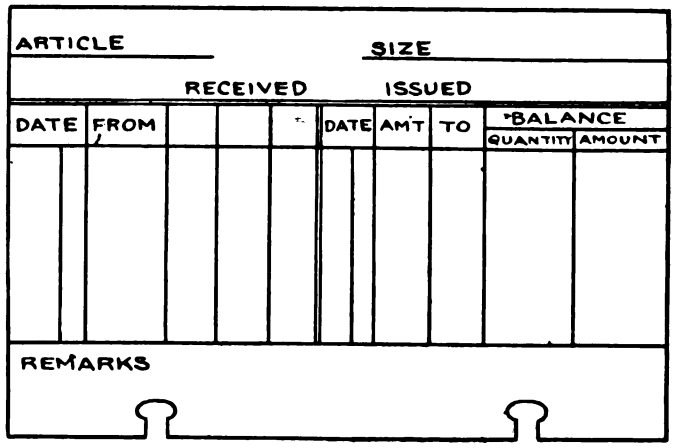

Fig. 10. Supply record for loose leaf system of filing.

this means each leaf is loose and at all times interchangeable and removable instead of being bound in a book. The leading features of this system are: Elasticity, saving in space and material, perpetuity if desired, saving of time and labor, facilitation of changes. In the telephone business this method saves a large amount of labor which is now wasted each year in transferring accounts from one ledger to another. In the larger exchanges this runs into the thousands. Again, when the telephone is for any reason given up or transferred to another party it is only necessary to enter on the register the transfer and change the loose leaf to the new location. It is then possible on this system to take care of almost if not every detail of the telephone business, and the forms shown in Figs. 8, 9, 10, 11 and 12 will give the reader some idea of the manner in which such a system can be arranged. It is true books cannot be very well entirely dispensed with, in fact such a condition is not absolutely necessary, but they can be very materially reduced both in size and number.

By the use of this method the necessity for periodically opening a new set of books is dispensed with. In Fig 8 is shown a form of rental, in Fig. 9 a form of individual rental account, in Fig. 10 a form of supply card, and in Fig 11 a form of toll card. Fig. 12 is the ledger sheet. On the Pacific coast, because of the small number of what are termed "Permanents," that is, those who keep renting from year to year, the loose-leaf system has gained ground very slowly, but is certainly captivating those who have

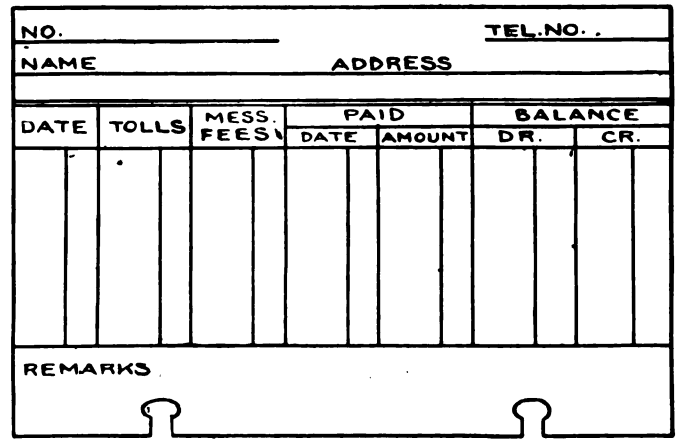

Fig. 11. Loose leaf toll record form.

tried it. It is only a question of a short time before it comes into general use. By this method it is possible to know at a glance the status of any account, and for this reason alone it should recommend itself at once to the officials. It is also possi-

*Continued from the issue of June 9th.

Digitized by Google

ble to keep the pay rolls of the several departments by this method. If books are used and carried from one bookkeeper to another then it is possible for the last one to know all that has transpired during the term of his predecessor. Sometimes this is undesirable and can be easily eliminated by the use of the loose-leaf method without buying a new book. It is possible in the card system to use both sides of the card and it is often good economy to do so, but few seem to avail themselves of this possi-

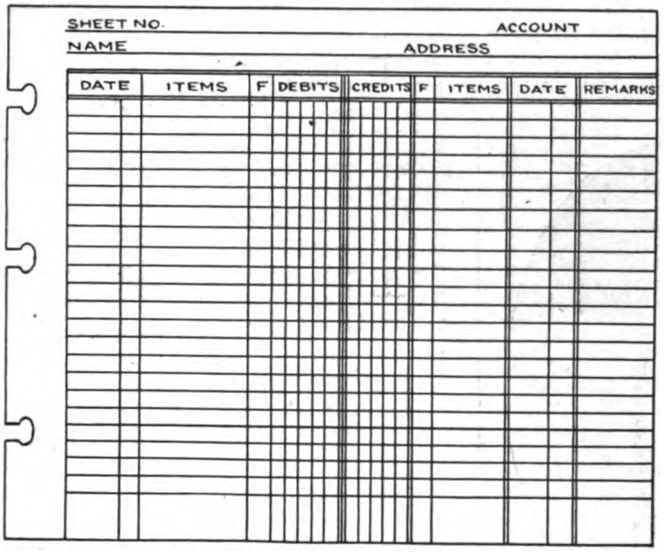

Fig. 12. Form for ledger sheet to be used in loose leaf system.

bility. The forms shown have been simplified as much as possible and can be elaborated upon as to the detail to be obtained by the individual, to an almost unlimited extent.

THE LOCATION OF LINE AND CABLE FAULTS.

By J. Adler.

(Continued from the issue of June 9.)

NOW a few words as to Blavier's test. Sometimes a case may arise where it is impossible to get a good wire. Here is where Blavier's test would prove of value, providing there is no difference of ground potential between the testing point and the fault or the distant end. To make this test connect the bad wire to the post L and ground L_1. With the battery grounded make a measurement. Call this R, which will equal the resistance of X plus the resistance of F, the fault. Ground D, the bad wire, at the far end and measure resistance again. Call this R_1, which equals the resistance of X plus the resistance of F and Y in multiple. From R and R_1 and L (the resistance of D which can be closely approximated if the gauge and length are known), Formula 7 is derived, as follows:

Formula 7.

$$\frac{A}{B} = \frac{X+F}{R}$$

$$A = B$$

$$X + Y = L$$

$$Y = L - X$$

$$\therefore R = X + F \qquad F = R - X \qquad (1)$$

$$R_1 = X + \frac{F\,Y}{F+Y}$$

$$R_1 = X + \frac{(R-X)\,(L-X)}{R-X+L-X}$$

$$\frac{R\,X + L\,X - 2\,X^2 + R\,L - L\,X - R\,X + X^2}{R+L-2\,X} = R_1 \therefore$$

$$R_1 = \frac{R\,L - X^2}{R+L-2\,X} = R_1\,R + R_1\,L - 2\,R_1\,X = R\,L - X^2 =$$

$$X^2 - 2\,R_1\,X = R\,L - R_1\,L - R_1\,R$$

Add R^2_1 to both sides of the equation and extract the square root.

$$X - R_1 = \pm\sqrt{R\,L - R_1\,L - R_1\,R + R_1^2}$$

X must be less than L $\therefore$ Root is negative.

$$X = \sqrt{(R_1 - R)\,(R_1 - L) + R_1}$$

Subtract the first reading from the second, then subtract L from the second reading, multiply these two differences and extract the square root of the product; add this result to the second reading, which will give the resistance of X to fault F.

This test is of value where a pair has a high resistance shunt. If the shunt were solid, of course it would be a simple matter to take a direct resistance measurement, and calculate the length in feet per ohm; but whether the shunt has resistance or not cannot be determined, so when other tests cannot be made this is convenient. The test is made with the battery in normal position, and with the far end of the pair shunted solid for the second reading. In this case Formula 4 gives the loop resistance to the fault, and not the resistance of a single wire. Also Z is the loop resistance from the instrument to the point P. To get the distance to the fault, take one-half X and multiply by feet per ohm. This test is ineffective if the shunt varies considerably, or, in the grounded wire case, if there is a difference of ground potential. With a varying shunt, the resistance might change between the first and second readings, and thus cause serious error in the result; and where difference of ground potential exists a continuous deflection of the galvanometer will occur when the galvanometer circuit is closed. Of course, in the latter case this deflection could be neutralized by inserting an adjustable opposing E. M. F. between Z and the bad wire, but this would make the test too involved for ordinary work.

In the Murray and Varley tests the resistance of the fault or any variation thereof does not affect the result, a high resistance fault requiring only an increase of the E. M. F. of the testing battery. If a galvanometer is not obtainable for these tests, or is not sensitive enough, a telephone receiver can replace it, and either direct or alternating E. M. F. be used.

In working on a short length of cable where the resistance may be only two or three ohms, the Varley test with an even bridge is not satisfactory, close enough readings not being possible. In this case use the Murray, or if the Varley is desired, an uneven bridge can be used and the formula changed to meet the new condition. Supposing the A arm is 10 ohms and the B arm 100 ohms (if the test set has a commutator be sure the high arm is connected directly to the rheostat), then part (3) of Formula 1 is changed to the following:

Formula 8:

$$A\,X + B\,X = B\,L - A\,R$$

$$A\,X + 10\,A\,X = 10\,A\,L - A\,R$$

$$11\,A\,X = A\,(10\,L - R)$$

$$X = \frac{A\,(10\,L - R)}{11\,A} = \frac{10\,L - R}{11}$$

When calculating length for open wire tests, all laterals where the pair under test taps, must be considered as so much additional length. In a test for cable trouble, if the cable is distributed under the multiple tap system, apparent locations must be watched closely to avoid error. In Fig. 4 suppose the wire M is tapped so that it appears at A, B, C, D and E. A location is made from M to

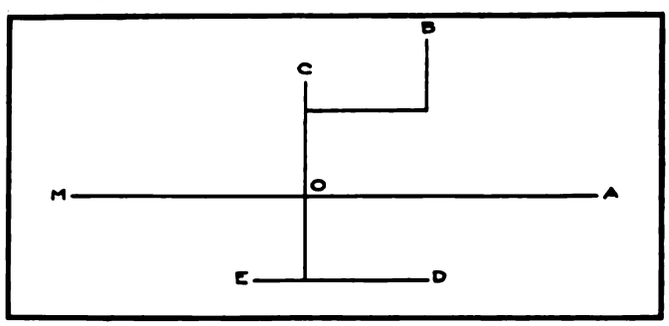

Fig. 4. Condition of lines existing under multiple tap system of distribution.

The Ideal Manager*

By Lon H. Hutchison.

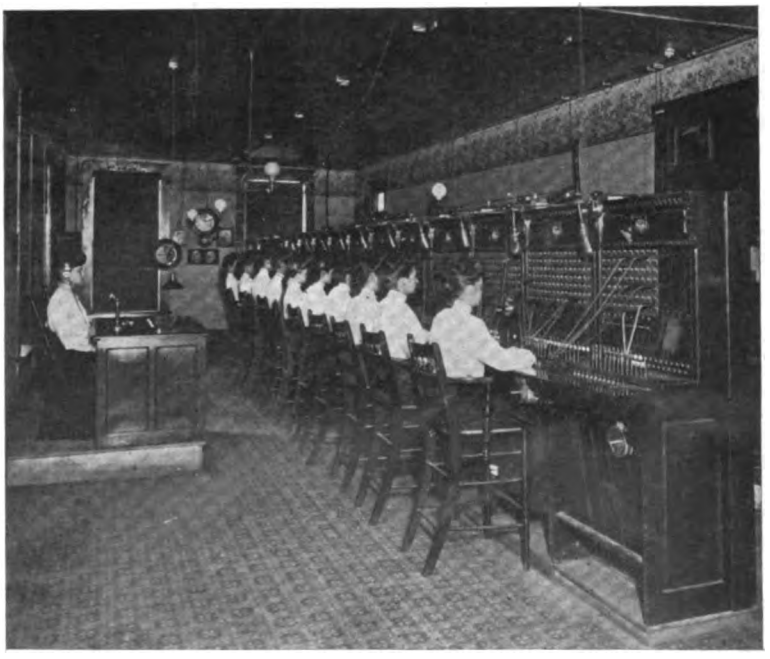
THE manager of a plant of say 1,000 subscribers, who should be a thoroughly practical man, is supposed to know how to install a station, and know when it is done properly, remedy an instrument trouble, locate and repair a trouble in his board, and in an emergency don a pair of climbers, climb a pole and be able to do something when he gets there. The ability to make an accurate measurement with the bridge, know how to open a cable, make a repair and wipe the joints when he has completed the work, are accomplishments, and renders such a man a valuable asset in the stock of a company. The costs of the various items that go to make up a plant, poles, wire, insulators, brackets, braces, arms, batteries, cords, hardware, instruments, etc., change frequently, and constant inspection of discount sheets is necessary if the manager would know where and how to buy. Eternal vigilance is the price of steady, economical growth, as well as of other things we have been advised of.

Lon H. Hutchison, Manager of the Huntington Mutual Telephone Company.

While at all times the head of the exchange, he should have able, willing assistants, and their hearty co-operation is essential to the proper operation and maintenance of the plant. Frequent and regular consultations should be held, and plans and suggestions looking toward the betterment of the service discussed. Friction between the employees should be disapproved, and petty jealousies, which frequently appear, should be promptly smothered. No partiality should be shown, but I have found that a word of commendation to an operator or other employee, who constantly endeavors to make him or herself agreeable to everybody, who considers the company's interests his own, is well expended. The annual vacation of at least a week on full pay brings to the company an increased revenue in good will, appreciation and a desire to please. The finest system in the world, most up-to-date board, amounts to nothing if the operating force is not in keeping. I place the greatest stress for the success of an exchange upon the operating force.

The manager should keep posted in his business through the technical press—and we have some ably conducted periodicals—be able to discriminate between a practical appliance and a catch-penny invention, and be ever ready to give to his company the benefit of any new device for the betterment of the service, or the reduction of expenses. I would not suggest the frequent changing of apparatus or the addition of new makes of instruments, lest he soon find his exchange filled with a heterogeneous collection of instruments which necessitates the expenditure of too great a sum in the way of duplicate parts. One, not more than two kinds of instruments at best, are all that should be used, and in this way a standardization of apparatus is possible—and this is a consummation devoutly to be wished.

Overloading the manager with duties so heavy that he will be kept in the position of a clerk is poor policy. He should have competent help, in a bookkeeper, collector, day and night chiefs, wire chief, inspector, and sufficient linemen to keep the construction work well in hand, as well as to keep the plant free from accumulated troubles. The chief operator who has charge of the operators, the wire chief who handles the board, inspectors and linemen, and the bookkeeper who looks after the collections must work in harmony with the manager, and be held responsible for the work in their several departments. A system carefully worked out and strictly adhered to, which embraces punctuality, civility, decorum and above all discipline, makes the operation of any sized plant what it should be.



The Operating Room of the Huntington (W. Va.) Mutual Telephone Company.

*Abstract from paper read before the convention of the Independent Telephone Association of West Virginia.

CAUSE OF SLOW TELEPHONE DEVELOPMENT IN EUROPE.

HERBERT LAWS WEBB has recently written for the London Times several articles on "Commercial Telephony," in which he gives a number of reasons why Europe has lagged behind America in establishing an adequate service.

The principal cause stated is the difference of the attitude of the public—and of the representatives of the public—of the two continents toward the telephone service. In America the telephone service has been treated as a friend, or as a promising youngster capable of effecting vast improvement in the conduct of affairs. No artificial restrictions have been imposed to hinder its development, and neither the telephone manager nor the public has put the question of cost before the question of efficiency.

In Europe the telephone service has never been treated as a legitimate business enterprise and has never had a fair field. From the very beginning it has been treated as a mere offshoot of the telegraph—which it is not—and it has occupied the position of Cinderella in the family of methods of communication placed under government control. As a result, not only have all sorts of harassing restrictions inseparable from a bureaucratic control been brought to bear, but telephony as a science, telephone engineering as a specialty, and telephone administration as a distinct branch of organized effort have been neglected. Even a consideration from the standpoint of investment should show the error of this attitude.

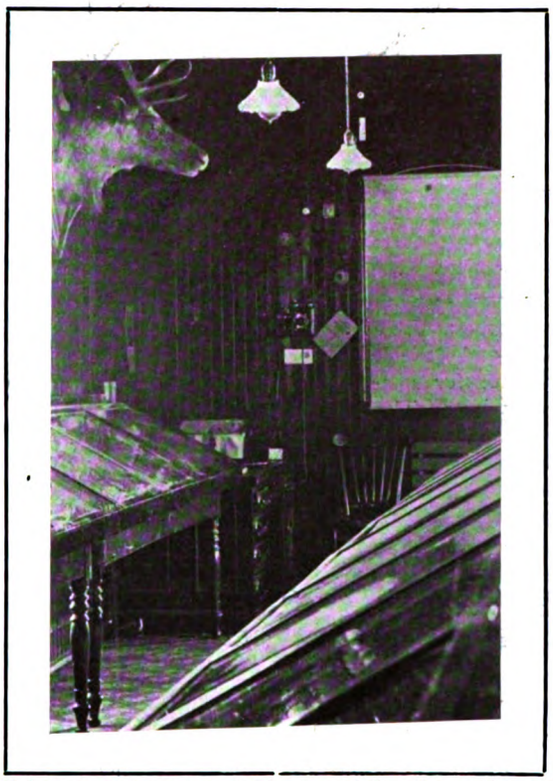
Independent Line Bridging Niagara Gorge

By C. H. Cutler.

AFTER making a fight for business which has brought over nearly every former subscriber for Bell service in Niagara Falls, N. Y., and added many people who have never used the telephone, General Manager R. M. Eaton, of the Niagara County Home Telephone Company, has bridged the Great Gorge with a line and is now giving a demonstration of first-class telephone service to the Canadians.

Niagara Falls is a city where enterprises productive of large results are so common that it takes something unusual to excite attention. Probably there is no place in the country where it is possible to find men who are more accustomed to the daily handling of important business interests. The great number of enterprises undertaken in connection with caring for the enormous numbers of tourists which are daily brought in by the several railroads, and the extraordinary development of electrical and manufacturing industries of various sorts, based upon the almost unlimited water power available, have caused to gather together a group of business men who are particularly alert in seeking all possible advantages.

Especially significant, therefore, is the remarkable success of the Home telephone company, which only a few months ago began to give to the city and surrounding towns first-class Independent telephone service. Starting with old equipment, and a service incapable of competing with even the poorest article which could be offered by an opponent, Mr. Eaton has built up a system which by its merit has won the unqualified approval of those men who must have the best. The most striking of all the extensions which have been begun and so rapidly completed is that which bridges the great gorge of Niagara. Canada is now, for the first time, able to talk with the United States over an Independent line. Provided with wires to the exchanges of both companies from his inclined railway just above the bridge on the American side Mr. Frank E. Lawrence was a frequent user of the telephone. He also operates a similar railway on the Canadian side just below the bridge, and the necessity of being in constant touch with his affairs wherever he might be made telephone connection between the two places very necessary. When it came to a choice the service of the Independent company so far excelled that there could be no question as to the proper instrument to have, and he gave the order that has caused the joining of the two countries. In his building on the Canadian side is now installed a metal case instrument of the most modern type. This is connected with the wires which span the gorge just a few feet below the suspension bridge; so that this telephone line, which is likely to be so significant from a historical point of view, possesses also one of the most remarkable scenic locations of any line in the world.

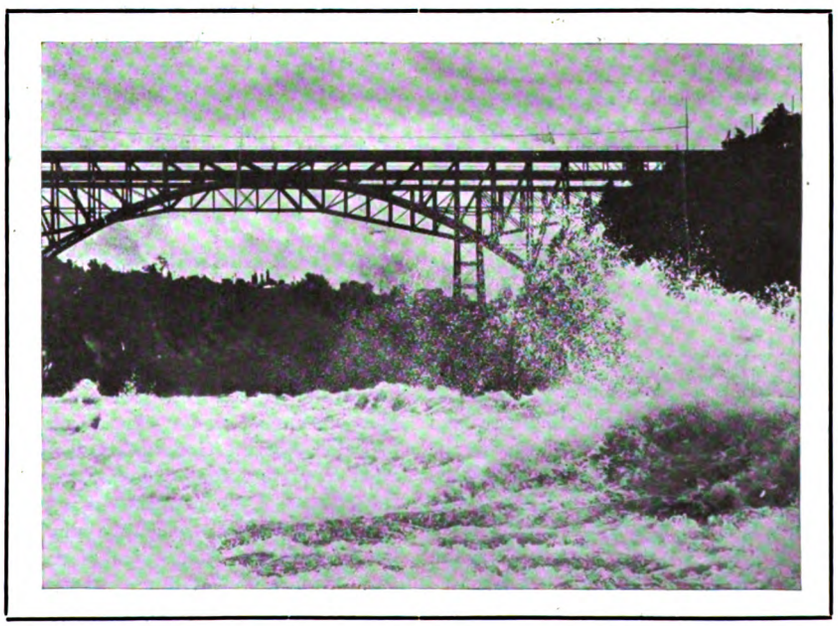


Telephone Instrument and Directory of the Niagara County Home Telephone Co. in the House at the Head of the Inclined Railway, Above the Whirlpool, in Canada.

From the instrument conversation may be held with all of the Independent subscribers in Niagara Falls and many other places connected by the excellent system of toll lines extending in various directions from the exchange. It is remarkable that although such immense quantities of electricity at varying voltages are distributed on the nearby lines of the power companies, conversations heard over this wire are as strong and clear as those in exchanges widely remote from any disturbing influence. The result of this is that to the many people on the Canadian side, accustomed to use the old Blake instruments, the little telephone in the curio store at the head of the railway is an object lesson which cannot fail to reach its mark.

Just at the present time agitation against monopoly in telephone service is proceeding in many portions of Canada. It is likely that in the future the development of the service by interests independent of those at present in control will be widely undertaken. In the light of these facts the single pair of wires takes a place as the forerunner of a most important influence in the progress of Canada, for it is already being realized that the great business interests of the dominion demand the best facilities for communication. The people generally are looking into matters and are eager for information. The opportunity to test the service offered by an Independent company secured through the conspicuous location of this instrument in a place visited by thousands each year is likely to be utilized by many alert Canadians.

The actual start has been made, the excellence of the service is established, and the extension of the Independent telephone movement into Canada seems to be assured.



The Gorge of Niagara, Spanned by the Independent Telephone Lines, which are carried across just below the Suspension Bridge.

IN THE OPERATING FIELD

ILLINOIS COMPANY MAKES WIDE EXTENSIONS DURING PAST YEAR.

RAPID extension of plant during the past year was reported at the annual meeting of the Macomb & Western Illinois Telephone Company recently held at Macomb. The reports of the various officers showed the company to be in a satisfactory condition. No dividend was declared, but the earnings were very satisfactory to the shareholders, five-sixths of whom were present or represented. The opinion was unanimously held that the policies which have prevailed for the past year should be continued under the same management and the following officers and directors, all of Macomb, were elected: president, C. M. Erwin; vice-president, George Kerman; secretary, E. Y. McLean; treasurer, C. V. Chandler; directors, C. M. Erwin, George Kerman, W. I. Savidge, L. E. Guy and Belle Erwin.

As in the past the company will continue for some time to reinvest its profits in extensions and betterments. There is said to be a ready sale of the company's bonds, and the new investments from bond sales and reinvested profits amount to about $2,000 a month.

In the past twelve months the company has constructed 250 miles of pole lines and strung more than 3,000 miles of wire. It has acquired two new exchanges, at Camp Point and Golden, and has extended its long distance service into a considerable territory north and west of Macomb, including many points in Illinois and Iowa.

Within 60 days a metallic long distance line will be built from Macomb to Quincy, where it will connect with the Home Telephone Company. Through that connection the company will be able to reach St. Louis over Independent lines which will give connections all over Missouri and Kansas. It will have connections through the Kinloch Company of St. Louis and reach all of Southern Illinois, including Springfield, as well as Southern Indiana and Northern Kentucky. Another long distance all metallic extension to be made this season is to Keokuk, Ia., by way of Bowen.

The company now owns and operates exchanges at Macomb, Colchester, Rushville, Plymouth, Augusta, Golden, Camp Point, Carthage, Warsaw, Bowen, Loraine, Stillwell, and Quincy.

BELL LOSING MANY FARM CONNECTIONS IN ILLINOIS COUNTY.

EFFORTS on the part of the Central Union Company to regain its lost ground in Illinois seem to be meeting with poor success. Independent development has been so persistent that many of the residents in the country districts have given up the Bell system entirely as the service furnished was inadequate. In Henderson county the local companies have been extraordinarily progressive. Almost every farm house in the county now has Independent service and the residents use the toll lines of this system exclusively.

REPRESENTATIVES OF WISCONSIN INDEPENDENT COMPANIES MEET AT MONROE.

AT the meeting of representative Independent telephone men recently held in Monroe, Wis., representatives of the Brodhead, Jefferson, Browntown, LaFayette County, East Winslow, Juda and Badger State companies were present. They had a long and interesting meeting and formed a county association. The following officers were elected: George Barnum, Juda, president; Leland White, Monroe, secretary. Considerable discussion was held on the condition in Monroe, where there is at present no Independent company. It is believed that many of the people are anxious to see a new company established in order that they may connect with the people in other towns which have connections only with Independent lines.

NORTH DAKOTA INDEPENDENT TELEPHONE MEN UNITE IN FORMAL ORGANIZATION.

REPRESENTATIVES of about twenty Independent telephone companies of North Dakota have organized the North Dakota Telephone Association and adopted a constitution and by-laws. Officers were elected as follows:

President, A. B. Cox, Valley City; secretary and treasurer, John Carmody, Hillsboro.

The object of the association will be to promote co-operation on the part of the various companies.

At the morning session of the meeting the members of the association listened to an address by J. Q. Zietlow, president of the Dakota Central Telephone Company, on "Methods and Right of Way." At the afternoon session there was a general discussion of such subjects as arbitration, right of way, toll line connections, exchange and rural rates, development of the telephone system and cost of construction and material.

Those who attended the meeting were: W. C. McDowell, of the Union County Telephone Company; W. V. Hughes, Hughes Electric Company, Bismarck; Ed. Hughes, Hughes & Dieter Company, Dickinson; T. C. Lane, Kensal Telephone Company, Courtenay; C. H. Tolan, W. F. Hegge and S. H. Hagen, Red River Valley Telephone Company; E. Q. Powilson, Wheatland Telephone Company; A. B. Kerlin, Devils Lake Improvement Company; W. T. Baillie, Hunter Telephone Company; John Carmody and A. T. Krabel, Traill Telephone Company; A. B. Cox, Valley City Telephone Company; C. E. V. Draper, representing the Missouri Valley, Mandan and Southern and Mandan & Northwestern Telephone companies; G. More, Buffalo Telephone Company; E. D. Baker, Forman Rural Telephone Company; M. M. Borman, Abercrombie Telephone Company; E. M. Shannon, Sanborn Telephone Company.

RECONSTRUCTION OF PLANT OF BELVIDERE TELEPHONE COMPANY TO BE COMMENCED.

REQUIREMENTS due to the enlargement of its subscribers' list have caused the directors of the Belvidere Telephone Company, of Belvidere, Ill., to decide upon a complete rebuilding of the company's plant. New lines will be put up, cable installed and a modern multiple switchboard provided in the central office. It is estimated that not less than $25,000 will be expended upon these important improvements.

GREEKS WANT AMERICANS TO BUILD TELEPHONE SYSTEM.

CONSUL GEORGE HORTON, of Athens, advises that there is a growing discontent in Greece over existing telephone conditions. He writes:

"The appliances in use are inadequate and the service unsatisfactory. For this reason the telephones are but poorly patronized, and I am informed on good authority that they are an unprofitable investment to the Government, which controls them. It is probable that the Government would grant a concession to some reliable private company that would install up-to-date, effective telephones. I am confident that this bright, progressive people is ready for such a telephone service, and would support it with their patronage. The value of the present plant is about $125,000. The French Adder system is in use, with German keyboards. There are at present only about 600 telephones in operation at Athens, Piræus, Phaleron, Kephissia, Decelia, and one long-distance wire connecting Athens and Patras.

Digitized by Google

The present charges are 100 drachmas (drachma = 19.3 cents) a year for a local telephone, 250 drachmas where connection is made between cities, and 1 drachma for five minutes' talk between Patras and Athens. Salaries paid to operators range from 120 to 400 drachmas per month. Here possibly may be a profitable opening for American capital, as there seems to be a very general desire on the part of the people, which I have heard frequently expressed, that "the Americans would come and take hold of the telephones." For the granting of this and all similar concessions a vote of parliament is needed, sometimes easily obtained, and in other cases only after many and elusive promises and long and exasperating delays."

BELL IMPROVEMENTS NOT SATISFACTORY TO PEOPLE ON PACIFIC COAST.

TO retain its monopoly the Bell Telephone Company made to the citizens of Eugene, Ore., many promises of improvement in its service. Willing to give the company the chance to redeem its past failures, the business men of the town last December signed a remonstrance against the granting of a franchise to an Independent company. Now they are sorry.

The new plant has been installed, but the service is said to be still far behind that given by the Independents in other parts of the State. Dissatisfaction is being freely expressed and the same business men who generously assisted the Bell company a few months ago have now organized to protest against the inefficiency of the system provided.

In Ashland the company has caused considerable indignation in the minds of many prominent citizens who say that it has asked for exclusive franchise privileges at the same time that it is discriminating against local subscribers in its rates. In Medford the service is frequently condemned by people who, through visits to other places, have become familiar with what can be done with a well equipped telephone system. It is generally understood that the inadequacy of the present system will result in the early introduction of Independent service in all the important towns along the coast.

ANOTHER BLOTTER SUGGESTION FROM ILLINOIS.

DESIGNED for a comparatively new and rapidly growing company, the following verse for a desk blotter offers an interesting suggestion. It was contributed by L. A. Herrick, manager of the Stephenson County Telephone Company, of Freeport, Ill., who has devoted considerable attention to this form of advertising. "Look for the Shield" is the motto which is almost invariably recommended for the left hand side of desk blotters by many designers of this successful form of advertising; Mr. Herrick seems to find it desirable, however, to occasionally make an exception to the rule, and substitute the phrase "Best in the Field," descriptive of his own service. Upon the right hand side appears the following jingle:

Save your dollars and pay us your dimes
for "Hurry up" trips—use the new lines.
Not only in Freeport but in towns all around,
Our "Toll" lines will reach him if your man can be found.

INCREASING RATE OF GROWTH OF INDEPENDENT SYSTEM IN GRAND RAPIDS.

AT the last monthly meeting of the directors of the Citizens Telephone Company, the exceedingly rapid growth of the Grand Rapids (Michigan) exchange was a subject for consideration. The net increase in orders since January 1 has been almost six hundred telephones, the increase for May alone being 122 telephones, and the number in service on the first of June, 7,718, with more than one hundred orders to fill.

Because of this remarkable growth, which has been more especially in the southeastern portion of the city, the board formally authorized an expenditure of $21,000 for increasing the underground system and for cable in that part of the city.

This provision is expected to care for about five hundred more telephones in that district as to cables, and will provide underground ducts for approximately 2,500 more. Throughout the city the growth has been exceptionally rapid, more so, it is said, than at any previous time in the history of the company.

TOPEKA INDEPENDENT COMPANY RUSHING WORK ON IMPROVEMENTS.

IN Kansas they do things rapidly. Only a very short time ago the Independent Telephone Company of Topeka announced its intention of putting in an extensive underground system, and already large quantities of supplies are on hand and more are being shipped. The company intends to take down all poles in the business section of the city and lay conduits for present and future requirements of its rapidly growing system. This information is especially pleasing to the citizens of Topeka at the present time, as work on improvements in the city's appearance is being actively undertaken by some of the leading citizens, and the co-operation of the Independent Telephone Company is much appreciated. Within a few days work will be started on the new office building which is to be erected by the company.

TWO THOUSAND TELEPHONES IN A PHILADELPHIA STORE.

PEOPLE who are watching the introduction of the telephone into department stores are wondering when the limit will be reached. Just now the record is held in Philadelphia, where Wanamaker's big store recently completed the installation of a branch exchange which has connected to it 2,000 instruments. For handling the business a twelve position switchboard is used, and telephones are installed at each counter. They are provided with automatic coin boxes, to insure payment for all outward messages, and may be used by customers if desired. This is a distinct step beyond the use of the instruments only for the business of the store. One hundred and twenty trunk lines are in use to connect the branch exchange with the regular telephone system of the city.

INDEPENDENT COMPANY AT NEWARK, ILL., WIDELY EXTENDING ITS CONNECTIONS.

AT a meeting of the Farmers & Merchants Telephone Company recently held at Newark, Ill., it was voted to increase the capital stock by $15,000 in order to make needed improvements and extensions. The company intends to increase the territory covered by rural lines connected to its exchanges, and also to build into the towns of Marseilles and Seneca. This company at the present time has connections with the Interstate of Aurora, the Northern Illinois of Sandwich, and the Ottawa Home Telephone Company of Ottawa. When all the lines are completed the area over which free service is obtained by Independent subscribers will include the whole eastern and northern end of the county. Extremely good service is being given by these Independent companies, and in consequence their strength is increasing rapidly.

THE LOCATION OF LINE AND CABLE FAULTS.

(*Continued from page 392.*)

either of the laterals or sub-laterals. Send to B and locate from there; if it locates at O again, send to E or D; if it comes again at O it is safe to say it is there, but usually the trouble will be found to be in one of the laterals. Here, it would be well to note that it is of the greatest importance that all connections between the wire under test and the bridge, and also the loop or shunts at the far end, should be of the best. A resistance of two or three ohms introduced through a poor connection, will cause an error, possibly of several hundred feet, in the location. In making any of these tests all unnecessary resistance should be eliminated, such as jumper wires, switchboard cable, etc. If possible tests should be made directly from the cable heads, if underground cable, or from the loop pole, if aerial. Experience and familiarity with the different tests will enable one to judge a condition of trouble, and use the standard test or variation thereof which is most suitable for the particular case.

FEATURES OF THE CONVENTION.

REPORTS from many states indicate that the convention of the National-Interstate Telephone Association, to be held during the coming week, will be attended by a very large number of delegates and visitors. A good program has been arranged, much important work will be undertaken, and the gathering is sure to bring both pleasure and profit to every Independent telephone man who goes to Chicago.

So rapid has been the growth of business that many new men will during the coming week attend their first convention. To these especially will the meeting be useful. It will give an opportunity to learn more of the personality and methods of the men who have done so much for the building up of the larger and more successful systems, and will give an impetus to progress in a great number of new localities.

The manufacturers of apparatus have arranged for most valuable displays, which will be extremely interesting and important features of the meeting. In no branch has the art made such progress as in its manufacturing side, so that the products exhibited here will in general represent the highest grade of material which can be turned out by the engineers and shops of the country. There will be opportunities to inspect new devices, and improvements on the old standards, which will in themselves make the information gained by a visit to the convention furnish a means of effecting economies which will many times over pay the expenses of the trip. Not only will the manufacturers have exhibits of their factory products, but their representatives who will be in attendance include some of the best informed men in the telephone business. Many a puzzling problem has been satisfactorily settled after a brief discussion with one of these engineers, and as their knowledge of practical conditions is wide, their presence will be appreciated by many operating men.

The social features will form a very important part of the meeting, and should not be neglected. Every man, no matter how big or how small a plant he represents, will come prepared to get acquainted with others who are carrying on the work in many states, and help promote the most cordial feeling which is so pleasant a feature of the meetings of Independent telephone men.

Although several good papers will be read the discussion of the subjects of general interest should bring out the ideas based upon the widest possible experience. Not only do methods vary according to locality and service conditions, but in a business which is rapidly increasing there come up many new things which deserve to be told.

The Association has been advancing rapidly as a factor of great and genuine importance as the Independent telephone systems have grown in size and strength. The extension of its influence throughout the entire country is a most valuable aid to the establishment of Independent companies upon a permanent foundation. All questions of policy which arise must be treated in the light of the national responsibility which rests upon the members, in order to secure the highest success for each part of a system which will soon cover the entire country.

TENDENCIES OF EXPANSION.

SOME time ago telephone companies devoted their efforts only to interesting people unfamiliar with the advantages of telephone service. It was a matter of public education. Nowadays, however, the business has got beyond this stage, and the up-to-date manager not only tries to bring new people to the point of connecting their residences or places of business with his exchange, but to extend the system amongst old subscribers.

The essential function of the telephone is to save the time and effort of its user, and its existence depends upon the fact that it enables two people to transact affairs in the same manner as if they were face to face, without spending time traveling over the distance by which they are separated. To carry the matter still further, it is acknowledged that while a person's time may not be equally productive at all hours, it is as valuable at one part of the day as another, and the time lost in going to the telephone is just as much wasted as when it is unprofitably employed in covering the distance to any other point. The telephone, therefore, to be most useful to any person, should be installed wherever he spends a considerable portion of his day, if his time is sufficiently valuable to make the total amount saved in the day equal in value to the average cost of the extension telephone, which is, of course, a very small figure. The extension set, whether attached to a direct line or a branch exchange, offers a means of cutting the lost time to a minimum, and its installation is being widely encouraged and is meeting with the most favorable reception by the public. The thousands of installations which are being made in residences and places of business show clearly the way in which subscribers are coming to realize that the close proximity of a telephone is essential to comfortable and efficient living. People, however, wake up slowly to this knowledge unless assisted. Constant reiterations and illustrations of the fact in ways which will keep the matter continually before the public are necessary in order to develop fully the line of increase which has come to occupy so important a position in the plans for extension.

It is in this way only that the highest development of any territory may be secured, for growth must not be limited by the number of people in the district. This idea is the basis for the introduction of an element which will soon become a very important part of the average telephone plant, judged by its comparative revenue producing powers.

INERTIA IN THE TOLL BUSINESS.

IN his admirable paper on "Standardization of Methods and Appliances," presented before the Western Society of Engineers, and recently printed in this journal, Mr. F. R. McBerty dwelt upon the difficulty of introducing improvements in telephone service, arising from the inability of various persons to appreciate the value of the change. He emphasized the fact that new things are not used on account of any real lack of merit which exists. The failure to take up with the novelty is not for the reason that it is not best to use it, but simply because people are accustomed to something else.

The Independent manager who has built toll lines, and provided an efficient force for maintaining and operating them, and then failed to get sufficient business to make them pay, is aware how strongly this applies to his subscribers. The subscriber looking for toll connections is in the habit of using the instrument which he has always used for business of this class, and it is only by constant efforts that he can be made to break away from this custom. There are, however, ways to convince him that it is to his interest to use the newly established lines. Some managers are much in favor of personal interviews with their subscribers, in which they make practical demonstrations of the efficiency of the service which they can give. Still others believe in steady advertising, and endeavoring to keep the fact they can give toll service to certain definitely mentioned points constantly before the public in this way. The subject is so important, and deserves such general consideration that THE AMERICAN TELEPHONE JOURNAL will be glad to learn more of the methods which have been employed in various places and have resulted in substantial increases in the use of toll lines.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

HOUSE MOVERS CANNOT INTERFERE WITH TELEPHONE WIRES.

Will you kindly answer the following in your next issue: Where our wires and guys on the public highway are suspended sufficiently high to not interfere with the ordinary use of the highway, are we compelled to remove them free of cost when a house is moved along the street? We have been much bothered in this way, our movers claiming that we are required to get our wires out of the way in such cases, and this matter is becoming almost a burden with us. Please tell me if there have been any decisions in Indiana bearing on this matter, also any decisions in other states that would help us to shape our course in the future.

C. R. S.

THE editor knows of no decisions in Indiana bearing on this matter, but the general principles of the subject have been well established by decisions in other States which are quoted below. Under the circumstances you relate, you do not need to remove your wires free of cost when a house is moved along a public highway crossed by your line. If the house mover can use a side street or an alley as well as the highway which is crossed by your wires, he can be compelled to take that course. The party moving the building can be required to pay all the expenses of removing and replacing wires and cables and can be compelled to guarantee payment beforehand. A bond to pay all expenses and hold the company harmless might be required. The basis of this rule of law is that house moving is an unreasonable use of the streets. Northwestern Telephone Exchange Co. v. Anderson, 98 N. W. 706. Nagle v. Hake, 101 N. W. 409.

GOOD PIKE POLES MUST BE FURNISHED.

A CORPORATION maintaining poles to support electric wires must perform its duty by furnishing pike poles for handling such poles, of the ordinary kind and in good condition, and is not liable for an injury to an employee caused by the use of a pole upon which the point has become blunted or dull, so that it can no longer be relied upon as a brace for poles which are being taken down. Town v. Elec. G. & P. Co. (Cal), 70 L. R. A. 214.

COUNCIL CANNOT DECLARE ONE COMPANY'S RATE TOO HIGH.

JUDGE RAMSAY, at Davenport, Ia., has filed his opinion stating in detail his reasons for granting the injunction asked for by the Central Union Telephone Company to restrain the city from destroying its property.

The court says that the first question is as to whether or not the law governing telegraph companies has application in reference to telephone companies. He holds that the telegraph act as construed by the supreme court authorized the city at the time of the passage of the ordinance in 1887 to license the Central Union Company and allow it thereby to erect poles and string wires in the city.

He then dwells on licenses and contracts and holds that by reason of the company's acceptance of the ordinance, its expenditures for erecting poles, stringing wires and making other permanent improvements, the license becomes a contract.

He dwells at some length on special and general privileges and holds that the privileges granted the company are general and not special. He holds specifically that the council should not constitute itself an arbitrary judge in the case. It cannot abrogate a contract by simply stating that it is wrong. It is a matter for judicial consideration.

He decides that the council has no right to declare that the rate of one company is too high and proceed against it personally. Its course should be to establish a rate to apply to all companies doing business in the city and then proceed against any one acting contrary to the ordinance.

DOES INABILITY TO GET FRANCHISE EXCUSE COMPANY FROM INSTALLING TELEPHONES.

Several Jersey City people who signed contracts for the installing of telephone service in their homes, threaten to bring suit against the New York and New Jersey Telephone Company unless the latter at once carries out the agreement made with them. The company, coincident with the formation of the new concern, which has an application for a franchise pending before the Street and Water Board, engaged a force of canvassers to obtain the signatures of new subscribers. When a sufficient number had been secured, the canvassers were dismissed. Since then the company has refused to install the new telephones because of the difficulty of obtaining property owners' consent to the placing of poles on certain streets and the refusal of the Street and Water Board to permit the telephone companies to string wires on the poles of the United Electric Company and vice versa. Can the subscribers compel the company to furnish the telephones under the circumstances? W. L. T.

THE subscribers cannot compel the company to furnish the telephones because the property owners cannot be compelled to give their consent to the erection of poles in front of their property. This does not interfere with the right of the subscribers to sue the telephone company for damages for their failure to furnish the desired instruments. If the company made contracts it cannot perform, that is its own lookout, and it must pay for its failure.

If the company's line extends through the municipality and is not merely a local system of lines within the city, the company is authorized under its charter from the state to conduct a telephone business without regard to permission from local authorities, nor does it need a designation of streets by the common council. This, however, would not relieve it from the necessity of obtaining permision of property owners to construct its line in front of their property. New Home Telephone Co. v. New Brunswick, 40 Atl. 628.

CONSPIRACY CHARGED IN INSOLVENCY PROCEEDINGS.

A RECEIVER has been appointed for the Telephone, Telegraph and Cable Company of America at the suit of George F. Tennant of Jersey City, N. J., acting for the holders of 10,841 shares of stock in the company. A temporary receiver had already been appointed and as a result of Mr. Tennant's action, a co-receiver was also named. The petitioner admitted the insolvency of the company, but alleged that the proceedings were brought in the interest of the Bell telephone combination, and that the temporary receiver was appointed in its interest. It was also alleged that in order to secure the recommendations of the board of directors of the holding company, an offer of C. W. Morse, vice-president of the New Amsterdam Bank, to buy all the stock, was accepted. It was also stated that Morse represented himself to be in sympathy with the Independent telephone interests and that he would not sell out the holding company to the Bell system. This representation is alleged to be false and Morse to be acting solely as agent of the American Telephone and Telegraph Company. It is charged that at annual meetings through alleged dummy directors, he always voted down motions to take legal steps to compel defaulting stockholders to pay the balances due on their respective subscriptions.

QUERIES

THE USE OF A HOLDING COIL.—(709.)

Will you please explain to me the use of a holding coil and give me an example of a circuit in which it is employed? N. L. H.

A holding coil is usually understood to be a coil used in connection with a special line to enable a person to control the supervisory signal at a common battery switchboard in such a way as to prevent a disconnect signal being received by the operator when the person using the line temporarily disconnects his telephone. The method of operating when such a coil is provided may be readily understood by reference to Fig. 709. In this is shown a standard Bell trunk to a chief operator's desk from the switchboard. When calling the desk the operator at the switchboard rings on the line, throwing down the armature of a relay made after approximately the same pattern as the old style self-restoring drop. This puts a ground on the lamp and lights it. By throwing the key which cuts her telephone set across the line, the chief operator pulls up the armature of the relay and extinguishes the light.

Quite frequently the call is of such a nature that she must refer to records, or she may wish temporarily to disconnect and cut in on another line. If such an occasion arises, she simply throws the key which cuts the holding coil across the line, and throws the listening key to the normal position, thus disconnecting her talking set. The retardation coil bridged across the line holds up the supervisory relay at the switchboard and prevents the illumination of the disconnect signal. In this way the operator is prevented from cutting off communication until such action is desired by the chief operator. Although a resistance may be used, it is customary to use a retardation coil, to prevent any shunting effect if the subscriber speaks to the switchboard operator.

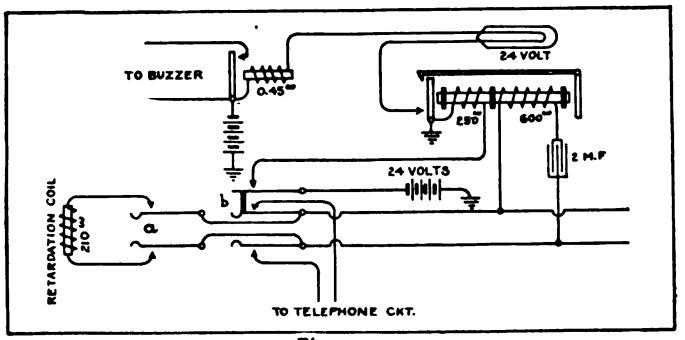

Fig. 709.

LIGHTNING ARRESTERS ON PRIVATE LINES.—(710.)

We have lines which come into our exchange for the purpose of connecting between cables through the main frame. They are private lines between two subscribers and do not connect with switchboard apparatus of any sort whatever. Should we connect these lines together through lightning arresters or simply bridge the gap by a straight jumper wire? R. N.

The proper arrangement depends entirely upon whether the lines outside are exposed to high potential currents or lightning. It is probable that in the average city district, where underground distribution is employed, there may be cases where not only the wires in question, but no other wires in the cable in which they are included, are exposed to high potential currents. In this event it would be sufficient to simply cross-connect them at the frame; otherwise suitable protection should be inserted. If, as in the usual condition in cities, they are exposed to heavy currents, such as electric light wires, the provision of heat coils will be sufficient, and wooden dummy carbons may be used in the arresters. If open wires are connected to any of the lines in the cable through which pass the wires in question they should be protected from the danger of lightning discharge by carbon plate arresters.

The fact that the private lines themselves may not contain any open wire is not in this event a sufficient safeguard to enable the use of carbon arresters to be dispensed with, as a burn-out in the cable may communicate a dangerous current from another pair of wires to those which form the private line circuit.

CROSS RINGING ON PARTY LINES.—(711.)

Our telephone is connected to a party line and our ring number is given in the directory as 11, but our bell is only supposed to ring once to call us. Very often we hear the bell ring and go to the telephone and find that we are not wanted, but the operator says she is calling No. 1; although we are not supposed to hear No. 1's ring, and sometimes do not hear it, whenever this happens No. 1 usually answers, that is, both bells are rung at once. Please explain whether we are getting the kind of service we are paying for, or if there is some trouble on the line which could be corrected? R. C. B.

The trouble you speak of occasionally occurs on party lines of a certain type. This is due to the fact the bell for No. 1 is connected between one side of the line and the ground, and the bell for No. 11 is connected between the other side of the line and the ground. When the operator rings she connects current to the side of the line which carries the bell of the subscriber desired, and as one side of her generator is grounded the desired signal is given; if, however, by any means the two sides of the line become connected together the current will pass across the connecting medium, whatever it may be, to the opposite side of the line from the one to which the desired subscriber is connected and the corresponding bell connected to that side of the line will respond. The difficulty you mention is usually the result of the subscriber having No. 1 being a little slow in answering, so that he happens to take his telephone off the hook at just the time that the operator is giving her second or third ring. The current passes through his transmitter to your side of the line and thence to the ground through your instrument. As the occurrence of such a condition is only occasional, the other advantages of the system over the code ringing party line are considered to be sufficient to offset the slight annoyance caused by the bells ringing unexpectedly.

TEAM WORK IN OPERATING.—(712.)

Is it considered good practice for an operator to answer calls which occur at an adjacent position?

The object in all cases is to avoid delay in the answering of calls, and one of the best methods of doing this is to have operators assist one another. The building up of efficient team work, whereby when one position is extremely busy the prevention of an accumulation of calls may be secured by the assistance of the operators at adjacent positions is one of the most important duties of the supervisor. By a proper study of methods for accomplishing this result the efficiency of the operating force at an exchange in which there is a large number of calls at a position during the rush hours may be very much increased.

CROSS TALK ON GROUNDED LINES.—(713.)

We have two grounded party lines running in entirely different directions. When parties are talking on both lines there is more cross talk than between other lines which run parallel. When an operator plugs in the cross talk disappears. Can you advise us? A. J.

Your difficulty is probably due to a cross between the winding of the drop on each line and the mounting plate. A buzzer or telephone and battery test between the line stud on the drop and its mounting plate would show whether this is correct. If so remove the drop, take out the core, and look carefully for a loose coil of wire, or place where the insulation has been worn off. By making careful repairs of any such trouble, giving a chance for the wire to become crossed with the shell, you will probably remove the cause of the cross talk. The present condition is really a direct metallic connection between the lines.

TELEPHONE PATENTS

TELEPHONE SYSTEM.

Howard M. Post, Chicago, Ill., patents (No. 816,819; dated April 3, 1906; filed Oct. 24, 1902; serial No. 128,528) and assigns to the Kellogg Switchboard and Supply Company, of Chicago, Ill., a two division telephone system.

This patent has for its object the simplification of the exchange apparatus generally employed in the operation of a divided multiple board. A board of this type is divided into sections known as *A, B, C,* etc.; each section containing a separate portion of the multiple. Thus lines from 0 to 4999 will be found in section *A,* lines from 5000 to 9999 in section *B* and so on. The answering jacks of all the lines are multipled to each section. The subscribers' instruments are fitted with as many buttons as there are sections, and in the directory they are listed with the letter of the section at which their multiple appears. The operation of the calling system is a follows: Suppose No. 1562 *A* should wish to talk with 9876 *B;* he would, in signalling the exchange, depress the button marked *B.* This operation causes the illumination of his line lamp in section *B* and the operator completes the call in the usual way. If a number is wanted in the *A* section then the *A* button must be operated.

This invention particularly relates to boards of this type having only two sections and discloses a circuit arrangement that requires but two relays for its operation, one relay being employed to close the lamp circuits at each section.

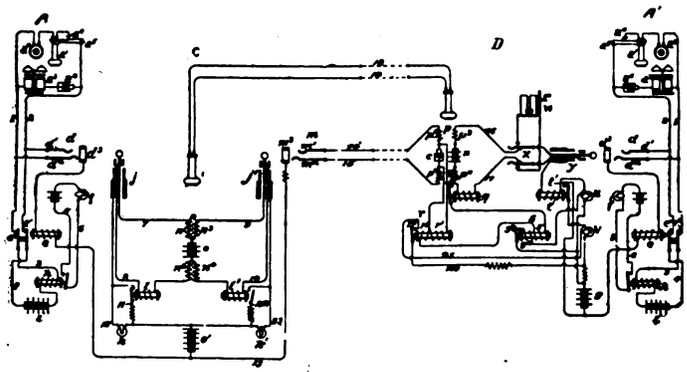
TRUNK SIGNALLING SYSTEM.

Merritt S. Connor, Chicago, Ill., patents and assigns to the Western Electric Company, Chicago, Ill. (No. 820,350; dated May 8th, 1906; filed April 9th, 1900; renewed October 5th, 1905; serial No. 282,063), an improvement in signalling for telephone trunk lines.

This invention consists of arrangements of circuits in connection with specially designed relays for preventing interference with the operation of signals by currents arising from sources foreign to the signalling circuit, such as differences of potential in the earth at different exchanges; and for preventing interference with conversation upon a grounded trunk circuit. The difficulties alluded to are such as have been found by experience to exist upon trunk circuits employing ground returns for signalling. In the invention covered by this patent there is described a circuit containing a source of electrical energy and two signals, with means for controlling their operation which preferably employ no earth returns. The illustration shows a trunk line 14 15, extending from the office C to office D. In this circuit repeating coils, relays, jacks, plugs, lamps, condensers and other features of the circuit are represented by familiar conventions.

The operator at D makes connection with line A^1 on receipt of a notification over the order wire, and the operator at C inserts her plug *J'* in jack *m.* The latter operation causes battery *o* to find a circuit out over the line 14 15 through windings p' and p^2 of the repeating coil *p* and the winding r' of magnet *r,* energizing that magnet and closing the contact r^3. The winding r' of magnet *r,* however, is of so great electrical resistance that it does not allow enough current to flow in the circuit to energize the magnet *l'* sufficiently to close its contact. The signal *k'* therefore remains displayed, its circuit having been completed with the battery *o'* through the plug *j'* and the spring jack *m.* When the plug *y* is inserted into the spring jack *d,* the signal *u* is displayed, its circuit being completed with the battery *g* through the winding of magnet *t,* the plug *y,* the jack *d,* and the winding of cut-off relay *e.* The circuit of the signal *v* is also completed by the closing of the contact *t'*, due to the energization of the magnet *t.* The signal *v,* however, is not displayed, owing to the maintenance of the shunt through the closed contact r^3.

The operator at office D calls the station A', and when he removes the receiver the circuit from the battery *z* through the winding of magnet *q* is completed. The consequent closing of



contact q^2 places a shunt composed of the winding s' of the magnet *s* and of the winding r^2 of the magnet *r* around the winding r' of the magnet *r,* permitting the passage of enough current over the trunk line from the battery *o* to energize the magnet *l'* sufficiently to close its contact, thus shunting out the signal *k'*.

The armature of the magnet *r* is still attracted, partly in virtue of the resistance in the shunt and partly because the winding r^2 energizes *r* by the current which passes through the shunt. At the same time the magnet *s* is energized by the winding s' and closes the contact s^2, which in turn shunts out the signal *u* by the winding s^3, indicating to the trunk operator that the subscriber has answered. The contact s^2 is maintained by the winding s^3 until the withdrawal of the plug *y* from the jack *d* irrespective of the subsequent condition of winding s'.

When the subscriber at A' hangs up his receiver the low-resistance shunt of the winding r' of the magnet *r* is removed, thus sufficiently de-energizing *l'* to permit of the opening of its contacts, which causes signal *k'* to be illuminated. The operator at C then removes her plug causing magnet *r* to be de-energized, allowing contact r^3 to open, removing the shunt from the signal *v* and causing its display as a disconnect signal at the trunk position.

The removal of the plug restores the signal *v* to its normal condition by the opening of contact *t'*, due to the de-energization of the magnet *t.*

TELEPHONE SYSTEM.

Charles B. Smith, New York, N. Y., patents (No. 816,132; dated March 27, 1906; filed November 28, 1898; renewed October 22, 1902; serial No. 128,244).

This patent belongs to that class known as "secret party line systems," and has for its object the design of a system by means of which a subscriber can call the central office or the central office can call a subscriber without disturbing any other station. This the inventor accomplishes by means of three line wires and step by step mechanism at the sub-stations in conjunction with circuit changing switches at the exchange.

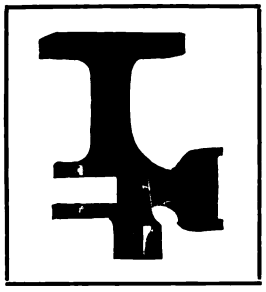
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

FINISHED CASTINGS FOR TELEPHONE PARTS.

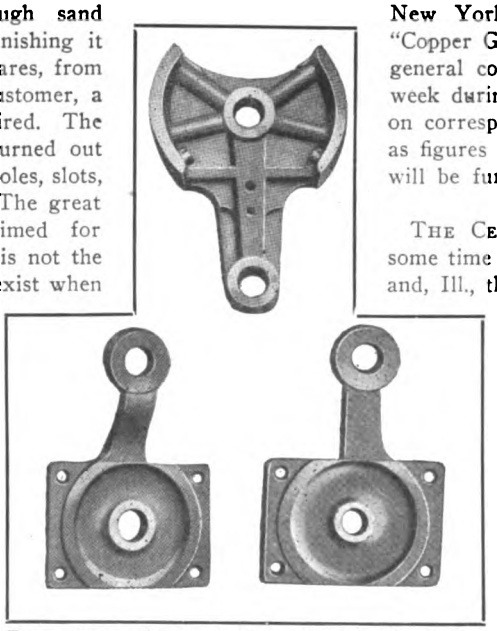
EXTREMELY large sales of its special finished castings are reported by the H. H. Franklin Manufacturing Company, of Syracuse, N. Y. These castings are produced by secret processes, and their favorable reception has contributed in a large degree to the success which has come to this well-known manufacturing company.

The finished castings are made in special dies from an alloy known as "Franklin metal." This material has been pronounced by United States Government experts to be equal in strength to the best quality of cast iron, but is of finer grain, and is suitable for high grade work. It can be japanned or oxidized, and takes a fine nickel plate.



Franklin Metal Casting.

The process by which the castings are made is very interesting. Instead of following the old method of making a rough sand casting, and finishing it by hand or by machine, this company prepares, from blue prints or models furnished by the customer, a steel die, showing the form and finish desired. The castings are made from this die, being turned out in what is practically a perfect state, with holes, slots, lugs and spurs in their proper positions. The great advantage of extreme accuracy is claimed for this method, owing to the fact that there is not the opportunity for variation that is found to exist when the finishing is done by hand or machine under average conditions.



These Parts, Produced by a Special Die Casting Process from Franklin Metal, Have Never Been Subjected to Filing or Other Finishing Process.

One effect of this is to make the parts perfectly interchangeable. The goods can be delivered to a customer true to size as furnished by him upon the drawing, and so finished that not even the stroke of a file is necessary to prepare them for assembling. This should be especially interesting information to manufacturers of telephones and specialties who use small parts in large quantities, and have heretofore been obliged to submit to the delay caused by finishing rough parts as they come from the foundry.

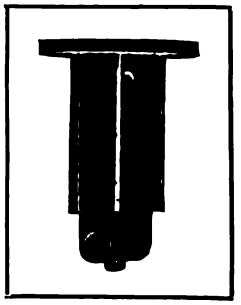
Although various alloys, ranging from fine white metal and aluminum alloys to lower grades where hardness is not required or a lower price is desired, are used by this company, its greatest business is in furnishing castings of the "Franklin Metal." This, on account of its peculiar properties, is said to be especially adapted to the making of many parts used in telephone apparatus. The hardness of the metal makes it very desirable for small gear wheels and other parts exposed to wear which can be accurately cast without any burrs upon their surfaces. An examination of samples shows that the inner surfaces, as well as those outside, are smooth and true. Those who use many small parts in the manufacture of telephone apparatus will do well to write to the company for information and a sample casting.

THE SWEDISH-AMERICAN TELEPHONE COMPANY, Chicago, Ill., has recently closed contracts for complete equipment with the following named telephone organizations: Ovid Telephone Company, Shephardsville, Mich.; Inter-State Telephone Company, Wilsonville, Nebr.; Tedrow Telephone Company, Tedrow, Ohio; Lago Independent Telephone Company, Lago, Ind.; Farmers' Mutual Telephone Company, Ft. Seneca, Ohio; Farmers' Mutual Telephone Company, White Pigeon, Mich.

THE CARBOLINEUM WOOD PRESERVING COMPANY, MILWAUKEE, WIS., has received a very great number of testimonials relative to the superior preserving qualities of its product Avenarius Carbolineum. These letters have been reprinted and arranged in a booklet which can be secured by all parties interested. The company claims that people who have tried this preparation find it cheaper than ordinary paint and much more satisfactory. It is specified by U. S. government engineers for application to all wood work which is to be exposed to the elements, and is recognized as being a sure preventative against the action of the elements and insect life. Prices and full particulars will be mailed on application to the company.

THE NATIONAL CONDUIT & CABLE COMPANY, 41 Park Row, New York, has recently issued a folder entitled "Copper Gossip," which gives figures relative to the general copper market and trade. Prices for each week during April and May of this year, and prices on corresponding dates last year are given, as well as figures on exports and imports. Copies of leaflet will be furnished to those who write the company.

THE CENTRAL ELECTRIC COMPANY has been for some time sending out from its factory at Rock Island, Ill., the Black Hawk dry batteries. These are manufactured especially to provide for the attainment of the longest life and the highest amperage and voltage that are practicable, and are especially designed for telephone work. A corrugated zinc surface is one of the features of this cell, which is said to contribute to the securing of the highest current value. This results in the provision of a very large surface for a given cell diameter, and is said to increase the activity of the cell, and to lengthen its life. The escape of gases which are formed within the cell by the action of the chemicals, and are destructive of the zinc element without contributing to the effective current of the cell, is provided for by a special vent. These features, together with the fact that these batteries are constructed from the highest grade of carbon, manganese and amalgamated zinc, should render them a most reliable product.



Special Form Cast by the H. H. Franklin Mfg. Co.

The Central Electric Company makes some very interesting statements concerning the results of experiments in which its product has been tested in competition with other cells. Details concerning the method of making this cell and its behaviour in service can be secured from the company, which will be pleased to send a full description and prices from its Chicago sales offices, 502 Monadnock Building, upon receipt of a request.

PRICE LIST SENT

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—Cheap, a ten-thousand-dollar telephone system for eight thousand dollars. Best paying system in western Kansas. Address T. F. Poole, Grainfield, Kansas. 630

SUPPLIES WANTED

For use of operating companies wishing to purchase or sell second-hand equipment or supplies. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

WANTED—A second hand fifty or one hundred drop switchboard in good condition made by the Sumter Telephone Manufacturing Company. Address F. P. Linder, Hartwell, Ga. 626

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—The issues of THE AMERICAN TELEPHONE JOURNAL dated January 6th and 13th, 1906. Address, stating price, Box 629, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 629

WANTED—Continued

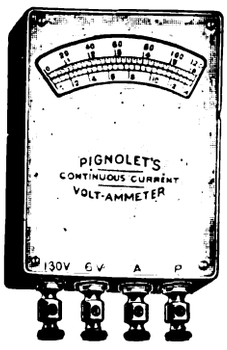
WANTED—Position in purchasing or advertising department of large operating or manufacturing company by energetic young man of experience and ability. Five years in present position. Address, Box 624, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 624

MR. MANUFACTURER, our business is to create and delevop A MARKET FOR YOUR PRODUCT. We can sell your entire output at less expense and risk that you can do it. If you have a good thing but don't know how and where to sell it, write us. Hapgoods Sales Company, 305-309 Broadway, New York, U. S. A. Offices in eight American cities and London, England. 464

POSITION Wanted—Young man, 20 years of age, having two years' electrical experience, desires position with a telephone company where he may have an opportunity to learn switchboard wiring. Address, Box 631, care THE AMERICAN TELEPHONE JOURNAL, 100 William Street, New York City. 631

WANTED—Position as manager of a good exchange. Have had over 5 years' practical experience and am graduate in telephone engineering. Can furnish best of references. Address, Box 632, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York City. 632

THE VALUE OF A MEASURING INSTRUMENT



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

IN THE MANUFACTURING FIELD

A NEW POLE DISTRIBUTION RACK.

THE ability to conveniently distribute wires which all run to stations on the same side of a pole directly from a cable box is secured by the use of the Robinson Pole Distribution Rack illustrated upon this page. This appliance is extremely simple, as it merely consists of two supporting end pieces, which hold in place a rod upon which are mounted a number of porcelain insulators. The racks are made with a capacity for insulators in multiples of five, and therefore any desired number can be readily installed. Moreover, where a 10-pair rack is in place and an increase in the number of subscribers makes it necessary to handle a greater number of pairs of wires a change in the rack can be quickly made without even removing the wires from their fastenings. The upper and lower pieces used for fastening the rack to the pole are heavy, well braced malleable iron castings, with convexed surfaces, and possess sufficient strength to hold any load which is likely to be placed upon them. The use of the convexed surfaces makes it unnecessary to gain the pole, as the casting conforms to the outline of the wood, and in case of the lengthening or shortening of the rack, no blaze is left open to the action of the weather. This appliance is being put upon the market by the W. G. Nagel Electric Company, Toledo, O., which will be pleased to send further information and prices to any one who wishes to obtain them.

The Robinson Distribution Rack, Especially Useful for Taking Off Leads Running from Only One side of the Pole.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Rochester, N. Y., has recently issued Bulletin No. 19 which supersedes Bulletin No. 11 dealing with generator call telephones. The contents include telephones for bridging and selective systems, generators, extension bells, desk instruments, arresters, induction coils, ringers, hooks, transmitters and receivers. In all there are fifty pages, each of which is filled with valuable information relative to generator call apparatus. Accompanying the descriptions of the various parts there are eighty-three illustrations which adequately portray the details of the individual pieces of mechanism. Copies can be procured by addressing the company.

THE ADVANCE LUMBER COMPANY, dealer in poles for telephone lines, has recently moved its offices from 559 Rose Building, Cleveland, O., to 1303 Rockefeller Building, in the same city, in order that it might be better located for the transaction of its increasing business.

W. N. MATTHEWS & BRO., 219 North Second street, St. Louis, Mo., have issued a booklet, which, on account of the subject matter and arrangement as well as the typographical work, takes a leading place amongst manufacturers' publications. It deals with the Stombaugh guy anchors, and Kearney cable clamps manufactured by this company. Descriptions of tests of the anchor and explanations of the principles which give it so great holding power, accompanied by a table showing the strain required to pull out the anchor when set at various depths in the ground, are given. The method of using the cable clamp for carrying a cable around a corner in a way which the manufacturers claim to be extremely economical is explained and illustrated by diagrams and photographs. The book is so attractive and interesting that no telephone manager interested in the subject of which it treats should neglect to secure a copy, which may be readily obtained by writing to the company.

JULIUS ANDRAE SONS & CO., 99 W. Water Sstreet, Milwaukee, Wis., state that the use of condensers upon magneto party lines is steadily increasing in popularity. Until this method of using a condenser was devised there was no way to avoid the annoyance caused on a party line by people listening in, and thereby preventing the ringing of the bell of the desired party, if he did not answer at the first call. By the use of a condenser in series with each receiver on a line this difficulty is avoided, as it is possible to ring the bell of any subscriber, regardless of the positions of the book switches of the other subscribers. The Andrae condenser is made in various styles, some of which are especially designed for installation in connection with instruments already in use, and can be mounted and connected readily by even an inexperienced person. A catalogue and descriptive literature will be cheerfully furnished to whoever wishes it by the company.

THE FAHNESTOCK ELECTRIC COMPANY, 129 Patchen avenue, Brooklyn, N. Y., has recently issued a booklet which contains descriptions of several new styles of the Fahnestock Spring Binding Post. Although one of the best known and most important uses of this binding post is in connection with dry batteries, upon most of the leading types of which it is furnished free of charge when specified, practical men have found that it is adaptable to a great many uses about exchanges. It is reliable, and the speed with which a connection may be made when it is used makes it extremely useful. The company will be pleased to send its booklet, which gives prices and descriptions of the various styles, upon receipt of an inquiry.

THE ELECTRIC CABLE COMPANY is fitting up at Bridgeport, Conn., a factory which will be devoted to the manufacture of Voltax, the new insulating compound, for magnet wire, rail bonds and field and armature coils. These coils are to be insulated with the Voltax compound impregnated under a vacuum to insure thorough absorption and to make the product moisture and water proof. The Electric Cable Company reports an increase of fifty per cent. in the sales of its field and armature coils during February and March over the two preceding months.

THE WESTERN TELEPHONE MANUFACTURING COMPANY, Chicago, Ill., is issuing catalogue E which describes at length the different pieces of apparatus it manufactures. The construction of the Western transmitter, receiver, ringer, generator, induction coil and switch hook is very thoroughly illustrated and each particular part is carefully analyzed. Amongst the different types of wall and desk sets, descriptions of which find a place in this catalogue, there are several which embrace new ideas in the design and arrangement of parts. The "Pioneer" instrument conforms in appearance to the common battery wall type, but as this telephone is arranged for magneto service the generator is mounted in the cabinet below the writing shelf. Two distinct types of desk stands are shown. All parties interested can procure a copy of the book by addressing the company.

THE WEEK'S MESSAGES

NEW COMPANIES.

MECCA, CAL.—The Coachella Valley Home Telephone Company has been organized by Redlands men. The company's lines will extend from Mecca to Indio. The officers are: President, J. D. Turnbell; vice-president, F. E. Dudley; treasurer, C. C. Abbey; secretary, K. C. Wells. Other Redlands men interested in the company are P. M. Gill and H. W. Johnstone.

EFFINGHAM, ILL.—The Kavanagh Telephone Company, of Effingham, Ill., has been incorporated with a capital stock of $30,000. The incorporators are W. M. Kavanagh, H. N. Munson and M. P. Turner.

HEYWORTH, ILL.—The Heyworth Telephone Company has been incorporated with a capital stock of $10,000. The incorporators are Henry E. Fitchhorn, H. Dale Cline, Charles G. Fitchhorn.

WINNEBAGO, ILL.—The Winnebago & Burritt Mutual Telephone Company has recently been organized, and is to build a line to Rockford.

MARION, IND.—The Citizens Automatic Telephone Company has been incorporated with a capital stock of $300,000. The incorporators are O. L. Barger, H. A. Hamil and E. K. Leyman.

EVEREST, KAS.—The Forest Mutual Telephone Company has been incorporated.

CROFTON, KY.—The West Mt. Zoar & Crofton Telephone Company has been incorporated with a capital stock of $286.00. The company is to build a telephone line through Mt. Zoar. The incorporators are John Lanier, J. W. Durham, F. M. Sizemore, J. F. Fuller, Albert Long, Harlan Durham and others.

MAYFIELD, MICH.—The Flint River Telephone Company has been organized.

RIVES JUNCTION, MICH.—The Rives Telephone Company has been incorporated with a capital stock of $1,000. The incorporators are Fred Marquedart, H. K. Wood, J. S. Wood, L. F. Foster, N. F. Wing, J. M. Fuller, J. B. Christie and Elmer Wood. The business of the corporation is to be conducted at Rives.

ANN CAR, NEB.—The Ann Car Telephone Company has been incorporated with a capital stock of $2,000.

CHADRON, NEB.—The Chadron Telephone Company has been incorporated with a capital stock of $25,000. The directors are J. T. May, A. W. Rickman and L. E. May.

CHAMBERS, NEB.—An Independent Telephone Company has been organized at Chambers with a capital stock of $12,000. The officers are J. M. Jackman, president; J. R. Reitz, vice president; W. H. Graver, secretary; Robert McClannahan, treasurer.

MEXICO, N. Y.—Plans are being formulated for the organization of a new Independent telephone company at Mexico, N. Y. C. I. Miller, of Mexico; Manager Bomster, of the Black River Telephone Company, and John Nellis, of Syracuse, are interested.

RICHMONDVILLE, N. Y.—O. R. Mann and I. J. Harrington, of Richmondville; I. D. Winnie, of Seward, and a party of Sharon men have organized an Independent Telephone Company to operate a line from Richmondville to Seward, Sharon and other towns.

WAVERLY, N. Y.—The Elliston Telephone Company has been incorporated with a capital stock of $2,000. The incorporators are A. C. Ellis, W. H. Ellis and H. A. Ellis, Waverly, N. Y.

NEW HILL, N. C.—The Cape Fear Telephone Company, at Bensal, Wake Co., has been incorporated with a capital stock of $575.00. The incorporators are M. J. Baling, L. E. Rollins, T. L. Womble and E. E. Mills, all of New Hill.

CADIZ, O.—The Farmers' Telephone Company, of Cadiz, has been incorporated with a capital stock of $1,000. The incorporators are A. M. McCombs, James Love, J. M. Megaw, S. E. Adams and L. M. Peck.

MALVERN, OHIO.—The Malvern Telephone Company has been incorporated with a capital stock of $4,000. The incorporators are F. E. Hoffee, J. A. Rhiel, J. C. Lewis, Fred Smith and G. B. Richards.

MARIETTA, O.—The Mile Run Mutual Telephone Company, of Marietta, has been incorporated with a capital stock of $2,500. The incorporators are W. F. Watkins, L. F. Winn, Jesse Thomas, Roger Fish and J. S. Wynn.

GUTHRIE, OKLA.—The Northwestern Telephone Company has been incorporated with a capital stock of $520.00. The incorporators are D. M. Sowers and Otto Burst, of Guthrie; Albert Metzger, of Coyle.

ROSSVILLE, OKLA.—The Farmers' Mutual Telephone Company has been incorporated with a capital stock of $2,000.

FREDERICKSBURG, VA.—An Independent Telephone Company has been organized at Fredericksburg, and will run lines from Louisa Courthouse through Spottsylvania, Hanover and Goochland counties.

STEWARTSVILLE, VA.—The Roanoke & Bedford County Telephone & Telegraph Co. has been incorporated with a capital stock of $5,000. The officers are R. L. Dearing, president, Vinton Va.; J. W. Meador, vice president, Stewartsville, Va.; J. A. Jeter, general manager, Stewartsville; A. L. Dickinson, treasurer.

FRANKFORD, W. VA.—The Frankford Telephone Company has been organized with a capital stock of $6,000. The incorporators are S. F. Tyree and others.

SHINNSTON, W. VA.—The Shinnston Union Telephone Company has been incorporated with a capital stock of $4,995. Incorporators are A. M. Hess, C. L. Lyon, L. L. Smith, L. D. Martin, R. W. Shinn and others.

CHILLIWAC, B. C., CAN.—An Independent Telephone Company is being organized at Chilliwac, and will construct 65 miles of lines. Address S. A. Cawley, care Cawley & Paisley, Chilliwac, B. C.

NEEPAWA, MAN., CANADA.—An Independent Telephone Company is being formed at Neepawa for the purpose of building rural lines to be connected with the town system. Address George R. Benton, Neepawa, Man.

MOUNT ALBERT, ONT., CAN.—The Mount Albert Telephone Company has been formed with a capital stock of $10,000. The company will construct lines in Scott and Uxbridge townships. Address T. Graham, township of Uxbridge, or W. D. Stokes, township of Scott, Ont.

FRANCHISES.

MT. UNION, IA.—The Henry County Telephone Company, which recently applied for a charter at Mt. Union, has been granted one for a period of twenty years.

BOSTON, MASS.—The Boston Independent Telephone Company has applied for a franchise at Boston.

BOSTON, MASS.—Application has been made by the Massachusetts Home Telephone Company for permission to operate a telephone system in Boston.

SARANAC LAKE, N. Y.—The Adirondack Home Telephone Company, which has recently established an exchange at Potsdam and obtained a franchise at Malone, has applied for a franchise at Saranac Lake. These are the same people that control the Clinton Telephone Company of Plattsburgh, N. Y.

SCHENEVUS, N. Y.—Orra L. Tipple has been granted a franchise at Schenevus, and is to organize a new Independent Telephone Company to operate in opposition to the Bell sub-licensee company.

HILLSBORO, TEX.—W. T. Smith, of Bynum, has been granted a franchise to construct a telephone system from Bynum to Hillsboro, Massey, Brandon and other points.

SUNNYSIDE, WASH.—The Farmers Independent Telephone Company has applied for a franchise at Sunnyside.

FINANCIAL.

JONESBORO, ARK.—The Automatic Home Telephone Company has increased its capital stock to $100,000.

NEWARK, ILL.—The Farmers' & Merchants' Telephone Company has increased its capital stock $15,000.

MONTEVIDEO, MINN.—The Citizens Telephone Exchange Company has increased its capital stock to $50,000.

HUMBOLDT, NEB.—The City Mutual Telephone Company has increased its capital stock to $25,000.

ALBANY, N. Y.—The United Message Company has increased its capital from $10,000 to $10,000,000. This company is a holding company designed to take over the stock of the Independent companies in the eastern and central part of the State. Among the stockholders are Howard Hendrickson, William A. Hendrickson, H. M. Teator, F. E. Griffin and C. J. Crummey.

COLUMBUS, OHIO.—The Citizens' Telephone Company has declared its usual quarterly dividend of 1 per cent. on its common stock.

COMBINATIONS.

VINSON, OKLA.—W. A. Ambler has sold his telephone business to G. F. McCauley.

ALLENTOWN, PA.—The Consolidated Telephone Company has leased for a term of 999 years the Easton & Bethlehem Telephone Company. It has also purchased the Honesdale Telephone Company and the Berwind Telephone Company, and will at once commence developing and extending these lines.

ELECTIONS.

MEADOWS, IDAHO.—The Meadows-Warren-Roosevelt Telephone Company has elected the following officers: T. B. Snyder, president; T. J. Ford, vice-president; A. B. Lucas, secretary; A. R. Krigbaum, treasurer; F. M. Hubbard, general manager.

ALBION, ILL.—The Edwards County Mutual Telephone Company has

because of the little things in the business. There is little difference between one man and another, but that little counts for a great deal. It is the little things that count.

We have been making dry batteries for eighteen years and every year we have tried to make them a little bit better than the year before. In doing so we think we have helped to lessen telephone troubles, and helped the telephone business.

The "1900" dry battery is one of the little things that make for perfection. Try it.

THE WEEK'S MESSAGES

elected the following directors: O. A. Bunting, Ellery; Edson Gould, Sr., Bone Gap, and Fred Waxler.

DAVIS, ILL.—The Davis Mutual Telephone Company has elected the following officers: President, Jas. Yale; secretary, Daniel Thiel; treasurer, Fred Alberstett.

ELDORADO, IA.—The Iowa River Telephone Company has elected the following officers: President, J. S. Quiggle; vice president, John Windecker; secretary, G. W. Stotser; treasurer, Joe Huse.

BERGEN, N. Y.—The Bergen Telephone Company has elected the following officers: President, George R. Fuller, of Rochester; vice president, A. A. Sands; secretary, C. M. Beattie, of Rochester; treasurer, C. E. Housel.

SCHENECTADY, N. Y.—The Schenectady Home Telephone Company has elected the following directors: C. F. Veeder, E. S. Kellogg, H. C. Hequembourg, H. E. Webster, A. J. Quackenbush, J. M. Andrews, C. E. Palmer, Jas. McNaughton, Howard Hendrickson, S. B. Rawson, T. M. Brush, I. H. Griswold, F. H. Sudro, J. W. Smitley and Homer Strong.

CRESTLINE, O.—The Crestline Local Telephone Company has elected the following directors: Jacob Babst, A. H. Kinsey, J. F. Morkel, C. R. Callagham, F. A. Knapp, Fred Wolfram and G. A. Wright.

PERSONAL.

JAMES T. DANIELS has been appointed manager of the Central Union Telephone Company's exchange at Columbus, O.

W. F. DOUGLASS has been promoted to the management of its exchange at Prospect and Radnor, O., by the Central Union Telephone Company.

C. H. EDWARDS, who has been district manager in charge of the North Dakota division of the Northwestern Telephone Exchange Company, has been promoted to the management of the St. Paul district.

LOUIS S. GREENLEAF, general superintendent of the Hudson River Telephone Company, has been appointed general manager of the company to succeed the late Henry E. Hawley.

DAVID LAIRD, who has for the past four years been manager of the exchange of the Southern Bell Telephone & Telegraph Company at Richmond, Va., has been appointed superintendent of the fifth district, with headquarters at Savannah, Ga.

AUSTIN L. HATCH, formerly in charge of the exchange of the Colorado Telephone Company at Canon City, has been appointed traveling auditor, with headquarters at Denver.

H. HENNES has recently taken the management of the People's Telephone Company at Spring Valley, Minn.

THOMAS F. KEAVENY, who has been manager of the exchange of the Colorado Telephone Company at Las Vegas, N. M., has been transferred to the larger exchange at Canon City, Col.

D. M. THERRELL, formerly superintendent of the seventh district of the Southern Bell Telephone & Telegraph Company, with headquarters at Charleston, S. C., has been promoted to the superintendency of the second district, with headquarters in Atlanta, Ga.

MISCELLANEOUS.

LEAF RIVER, ILL.—Connections are soon to be established between the Leaf River & Egan Mutual Telephone Company and the Illinois Mutual Telephone Company of Seward.

EDMONTON, ALB., CANADA.—The council has ratified an agreement with the Canadian Machine Telephone Company to install a Lorimer Automatic system, which will be operated and controlled by the city. Address Mayor May or City Electrician Ormsby.

New Construction in the Field

PIGGOTT, ARK.—The Home Telephone Company is to build a line from Piggott to St. Francis.

MASCOUTAH, ILL.—The Looking Glass Prairie Telephone Company is about to build a line over the eastern section of St. Clair County, with exchanges at Mascoutah, Summerfield, Trenton and Lebanon.

HUNTSVILLE, ALA.—The Inter County Telephone Co. has spanned the Tennessee River and will have connection with the Huntsville exchange within a short time. This will put the city in telephone communication with a majority of the villages and communities of Morgan and Marshall counties south of the river.

NEWARK, ILL.—The Farmers' & Merchants' Telephone Company is to construct lines to Seneca and Marseilles.

CHARLES CITY, IA.—The Rural Telephone Company is to build seventy miles of additional line.

BARNARD, KAS.—The Farmers' Telephone Company is to build a line to Minneapolis.

HUDSON, KAS.—The German Valley Telephone Company is to build a new line.

REED CITY, MICH.—The Citizens Telephone Company will soon commence construction work on its Davenport line.

BLAKELEY, MINN.—The Farmers & Merchants Mutual Telephone Company is to build a line from Blakeley to Belle Plaine.

WINONA, MINN.—The Winona Telephone Company is to make improvements in its Rushford exchange, and will build a new line from Rushford to Winona.

QUINCY, MO.—The Quincy Home Telephone Company is arranging to build toll lines between Quincy and St. Louis via Hannibal, also between Quincy and Kansas City.

CREIGHTON, NEB.—The Camp Dewey Telephone Company is extending its lines.

GENEVA, NEB.—The Fillmore County Telephone Company is improving its service at Geneva.

HARRISON, NEB.—The Moyer Telephone Line, which has been completed to Crawford, is to be extended to Lusk. This will give Harrison connections west to Cheyenne and Casper and east to Omaha.

WYMORE, NEB.—The Home Telephone Company is constructing its plant at Wymore.

SANTA FE, N. M.—The Santa Fe Telephone Company expects to make many improvements and extensions in its system.

EAST SYRACUSE, N. Y.—The Independent Telephone Company, which has purchased the East Syracuse line, is rebuilding the local system.

ROME, N. Y.—The Rome Home Telephone Company is to greatly improve its system in Rome and the surrounding country.

WATERVLIET, N. Y.—The Home Telephone Company is extending its lines in all directions in the south towns of the county.

FREMONT, OHIO.—The Home Telephone Company is to build a rural line from Fremont to the Maumee Pike.

TOLEDO, O.—The Toledo Home Telephone Company is installing a switchboard extension which will provide for the connection of 1,400 more telephones. The company is also busy putting in four-party lockout telephones on the East Side and the service is thus far working very satisfactorily.

YUKON, OKLA.—The Canadian Farmers' Telephone Company is extending its lines to El Reno, Piedmont and Okarche.

DALLAS, TEXAS.—The Independent Telephone Company is constructing its system at Dallas.

BRIDGEPORT, W. VA.—The Belmont Telephone Company is to extend its lines to Kirkwood Heights.

HUNTINGTON, W. VA.—The Huntington & Teays Valley Telephone Company is to rebuild its lines between Barboursville and Hurricane.

DURAND, WIS.—The Durand Light & Power Company is constructing a telephone line from Durand to Meridean, and expects to construct several other telephone lines.

EAST TROY, WIS.—The Eagle Telephone Company is about to extend its lines to Troy Lakes.

MELROSE, WIS.—The Central Wisconsin Telephone Company is to spend $10,000 in improving its system in Melrose.

NEKOOSA, WIS.—The Nekoosa Telephone Company is to rebuild its system at Nekoosa, and will also install a new switchboard.

PINE GROVE, WIS.—The Brown County Telephone Company is to build a line from Langes to Denmark.

RICE LAKE, WIS.—The Barron County Telephone Company is to construct a new line at Rice Lake.

WELCOME, WIS.—The Metteston Telephone Company will install an exchange at Welcome.

ST. JOHN, N. B., CAN.—The Central Telephone Company, of Sussex, will install an exchange at St. John. The company expects shortly to increase its capital stock to $1,000,000.

DARTMOUTH, N. S.—The Nova Scotia Telephone Company is to install a new exchange at Dartmouth, and is to change its system to a complete metallic circuit.

BRANTFORD, ONT., CAN.—The Canadian Telephone Machine Company has commenced the construction of its system.

CHIHUAHUA, MEXICO.—The Chihuahua Telephone Company is to put in a new line from Chihuahua to the Santa Eulalia mining camp, with a central station at Santa Eulalia.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

THE GOULD PLATE

The large contact surface for the active material of the Gould plate is *developed out of the lead of the blank itself*—not by the removal of any metal but by our special process of "spinning" the surface of the lead blank into the numerous ribs.

We employ only chemically-pure lead, dense and uniform throughout.

The Gould plate retains its initial capacity longer than any other type. For telephone work it is unequalled. Complete estimates upon request.

A PIONEER

North's concealed binding post, self-contained, removable shell receiver, the prototype of his new receiver as above shown, was first offered to the telephone user in 1897.

From the start its novel design, free from all exposed metal parts so dangerous to the user, its permanency of adjustment, substantial construction and ready accessibility were recognized as a great improvement over the old types then in use.

Other manufacturers were quick to see its advantages and imitators were soon in the field. To-day you will find few receivers offered except those modelled after NORTH'S.

The attention of the user is called to the fact that The North Electric Company owns letters patent No. 663,196 and No. 670,564, controlling this type of receiver.

CENTURY
100 % GOOD

DOLLARS FOR YOU!

You operate your telephone system for profit.
You wish the profits were larger.
How to make them so puzzles you.

THERE'S A WAY

Cut down your maintenance cost.

This can be done by using telephone equipment, the development of which is the result of many years' practical exchange operation.

We have constructed and operated a large number of exchanges.

Our profits were increased by putting only the very best of material and workmanship into our apparatus.

Because our trouble bills were smaller.

Yours will be also.

We can prove to you that we can increase the earning capacity of your exchange system.

WRITE US TO-DAY

You will find it to your advantage to know about our complete line of local and common battery telephone equipment.

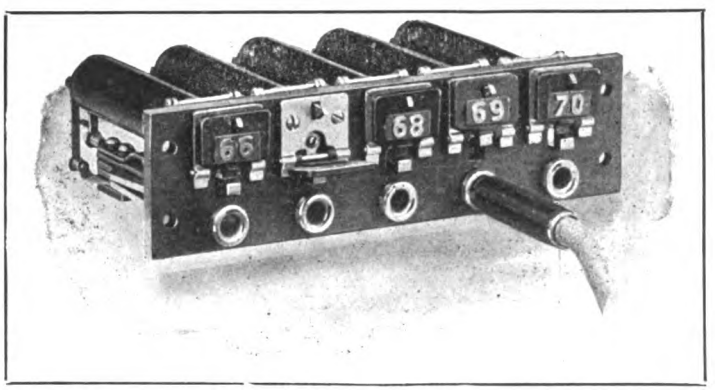
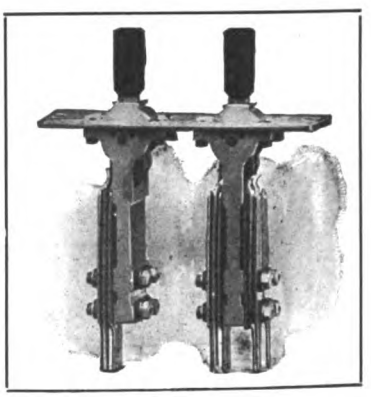
MONARCH

THE two most important parts of the switchboard being the line signal and the ringing and listening key, we illustrate a strip of Monarch drops and jacks and a Monarch ringing and listening key with ring back. These parts have now been on the market for a period of two years, and during that time they have proven themselves to be most efficient and durable. The fact that the armature of the drop is mounted in front of the coil and that the coil can be removed without breaking any soldered connections and without disturbing the armature is a feature that is appreciated by all practical telephone men. The additional advantage secured from this construction is that the adjustment of the armature is positive and permanent.





The ringing and listening key shows the same careful consideration of small details which is so apparent in all Monarch equipment. The mountings for the springs are solid brass so formed as to afford a most substantial support. The springs themselves are made of German silver and the contacts are pure platinum rivets. Little features of this kind will interest anyone in the market for switchboard equipment and an investigation will pay.

A complete exhibit of Monarch Telephones and Switchboards will be found in Room 642 and 644 during the National Interstate Telephone Association Convention, June 26th, 27th and 28th.

To Our Friends and Patrons

THE National-Interstate Telephone Association will hold its Annual Convention at the Auditorium Hotel, June 26th to 28th, and in accordance with the policy pursued by this Company for several years, instead of placing a few switchboards and pieces of apparatus made especially for the occasion on exhibition, we will open the doors of our plant to the Convention and make our entire factory our exhibit. Our plant constitutes an exhibit of which we are justly proud, and it is not possible to give an adequate idea of its size, operation, and product in any other way.

Representatives of the company will be at the Convention, who will take pleasure in showing you through all of our departments and explaining every detail. During the Convention we will have several large and up-to-date automobiles in constant service between our factory and the hotel.

We sincerely trust that you will remember this invitation and that we may have the pleasure of extending to you any courtesies in our power.

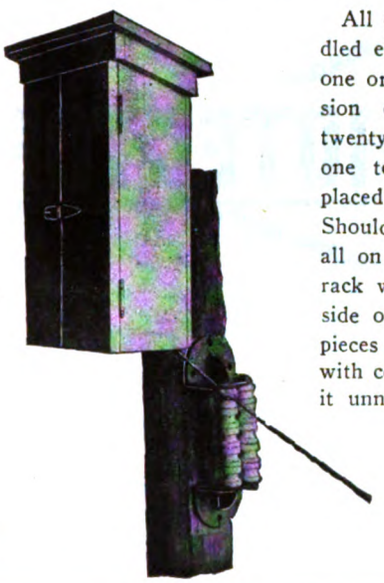
Robinson Pole Distribution Rack

(PATENT PENDING)

SIMPLE INEXPENSIVE PRACTICAL

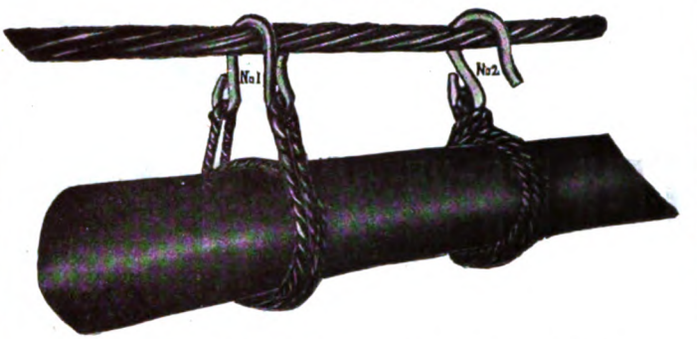


All drops can be easily handled either by placing rack on one or both sides as the occasion demands. In case of twenty drops equally divided, one ten pair rack would be placed on each side of pole. Should the twenty drops be all on one side, a twenty pair rack would be placed on that side of pole. Top and lower pieces heavy malleable castings with convexed surface, making it unnecessary to gain pole.

Send for Catalog No. 8 of Nagel Specialties

Swisher Marline Cable Hanger

(PATENT APPLIED FOR)



In the above illustration we show in figure No. 1 the Swisher Marline Hanger, in figure No. 2 the old style now in common use. The advantages we claim for the Swisher Hanger are: First, easy to install. Second, greater strength. Third, hook cannot become detached from strand. Fourth, hook cannot straighten under strain and let cable down. Fifth, in stringing of wires over cable, wires sagging will not catch under hook as in old style. Sixth, after cable has been installed, same can be pulled without opening the hooks.

We use only the best grades of marline and No. 9 hooks galvanized after forming. Our No. 9 hook on account of its construction will stand a greater strain than a No. 6 hook of old style.

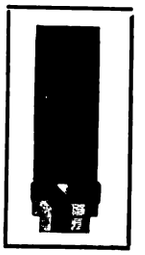
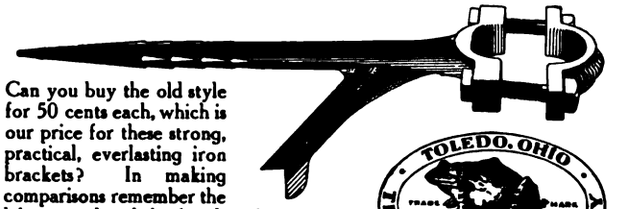
A REDUCTION THAT MEANS SOMETHING



We have made **NOVELTY POTHEADS** so cheap that it is both wisdom and economy to discard the old style sleeves. Not even expert lead wipers can compete. Any ordinary man can install our **Novelty Potheads** with his own tools.

The Prices, Not the Quality, Have Been Lowered. We also make **sleeves** for straightaway, and two and three branch splices. *Write immediately for Catalog 199*

Our **SECURITY POTHEAD BRACKET** is malleable iron and linemen may stand upon it without danger. Can this be done with the old wooden block bolted or tacked to the poles?



Can you buy the old style for 50 cents each, which is our price for these strong, practical, everlasting iron brackets? In making comparisons remember the labor saved and the freedom from vexatious breakdowns.

DO you realize the importance of the Private Telephone System? There is nothing which makes the operating exchange stronger than by connecting with Private Branch Exchange and Intercommunicating systems.

We are giving this branch of our business special attention and have produced some specially designed cabinets to meet the prevailing conditions and will equip them with any number of lines desired, allowing ample room for growth.

The same ideals of integrity of material and craftsmanship which are responsible for the Popularity and high Standard of Perfection of the STROMBERG-CARLSON APPARATUS are to be found in every detail in the Private Exchange and Intercommunicating equipment.

We invite you to look into and consider this very profitable branch of the business, and solicit your inquiries.

Write at once for Bulletin 14-B.

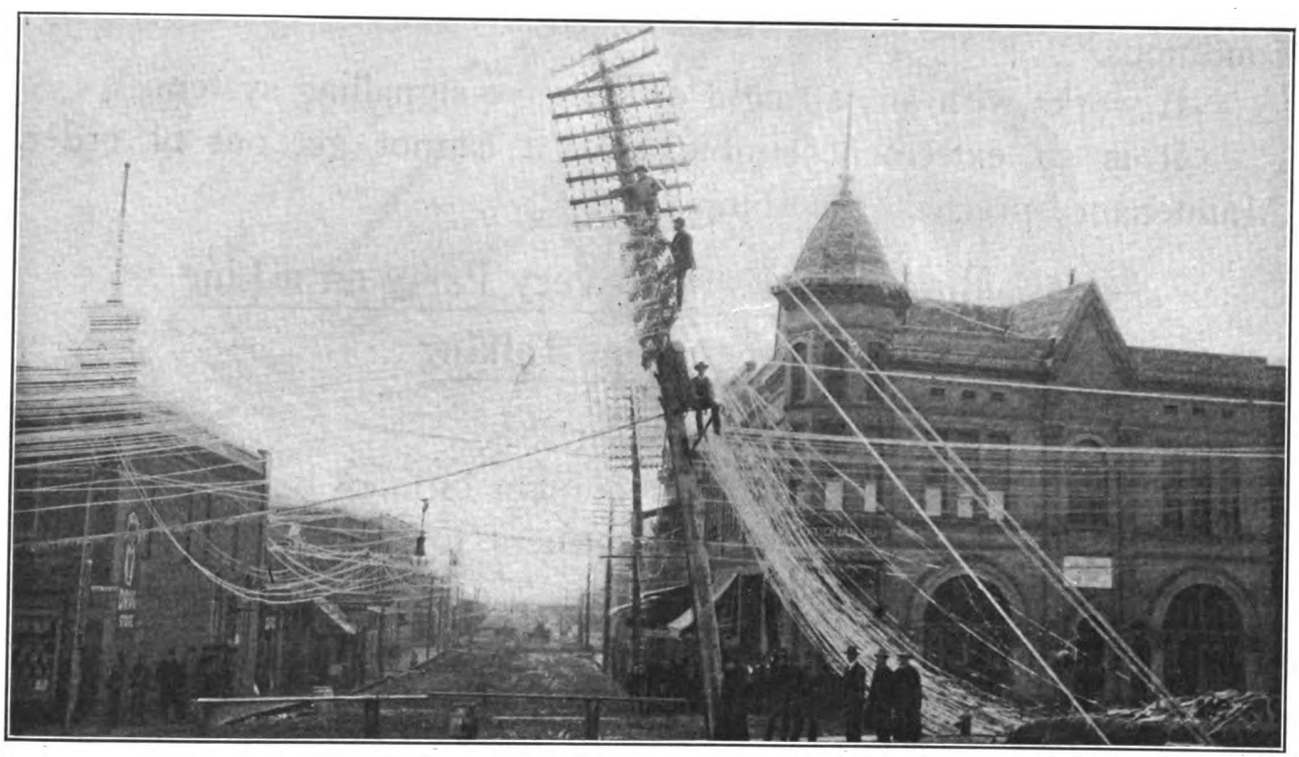
WE MAKE CABLE

DANGER

Danger to people and instruments from contact with light or power wires---danger that interrupted service will cause the company to lose subscribers---danger that the same thing will happen again if the company doesn't replace its open wire leads with cable.



WHAT A STORM DOES TO TELEPHONE LINES---CABLE IS SAFE

Conservative policy requires that you substitute cable for your open wire leads. Once properly installed it will remain in good order with very little attention. Stromberg-Carlson Cable is the best that experience, trained engineers and careful manufacture can make. Booklet 79B will tell you about cable. Write for it.

NOW

If we had started this ad. with LOCK-OUT you would have passed it up, but we didn't. We know that nine out of every ten telephone men grow cynical when party-line lock-outs are mentioned.

THE POOLE LOCK-OUT SYSTEM WORKS

It works on ANY make of central energy telephone under all conditions.

It works with any straight or selective signalling system.

It is so extremely simple that it cannot get out of order. Maintenance practically nothing.

It Absolutely Locks Out Every Party on a Line Except the One Talking

Primarily, then, it is a rate raiser.

Operators can handle greater number of lines, being relieved of the necessity of arguing with subscribers to decide who shall use the line.

No central office equipment required---it is merely an attachment to the subscriber's instrument.

THE IDEAL PARTY LINE

Where's the exchange manager who would not be interested if he were certain it would operate successfully.

Let us tell you more about it, or, better still, see it operate at the Chicago Convention, June 26, 27, 28 and 29.

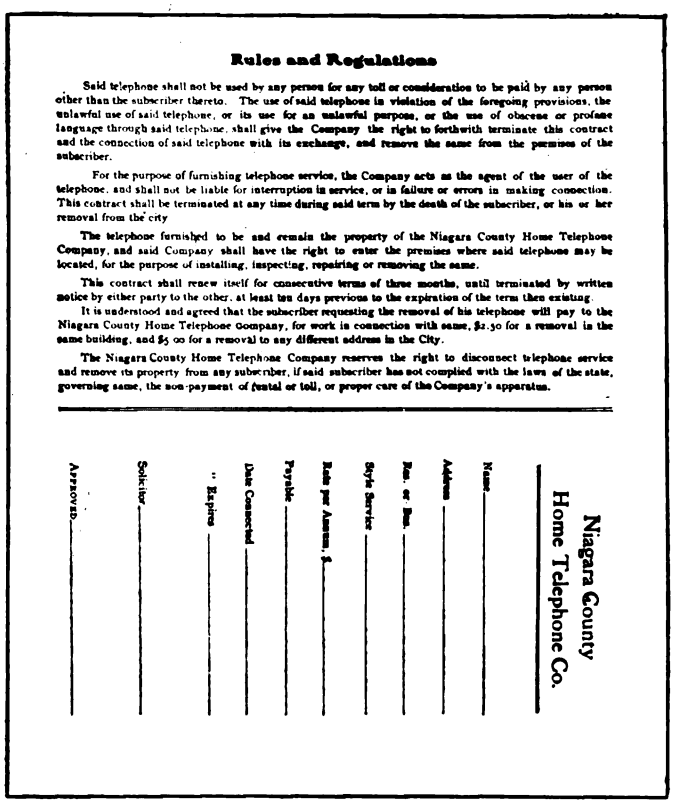
Niagara Falls---the Up-to-Date Telephone Plant

ARTICLE I. SYSTEM IN EXCHANGE MANAGEMENT.

By R. M. Eaton.

OPERATING a system covering the County of Niagara, with three large exchanges in three cities of the county, a great number of rural lines, and toll connections to all important points in Western New York State, the Niagara County Home Telephone Company is increasing the number of its subscribers at a rate which is remarkable even in these days, when the telephone business is proceeding at a pace beyond all predictions..

The problem of meeting the present and constantly increasing demands for its service and promoting extensions of the system in such a way that it shall be normal and healthy and serve the greatest number of subscribers well and profitably is one which in itself is sufficient to fully engage the attention and employ the best efforts and utmost energy of the general manager. To give the time and freedom from minor duties so essential for the successful upbuilding of the plant, it is necessary that all details of operation and extension should be so arranged as to fit one into



Rules and Regulations

Said telephone shall not be used by any person for any toll or consideration to be paid by any person other than the subscriber thereto. The use of said telephone in violation of the foregoing provisions, the unlawful use of said telephone, or its use for an unlawful purpose, or the use of obscene or profane language through said telephone, shall give the Company the right to forthwith terminate this contract and the connection of said telephone with its exchange, and remove the same from the premises of the subscriber.

For the purpose of furnishing telephone service, the Company acts as the agent of the user of the telephone, and shall not be liable for interruption in service, or in failure or errors in making connection. This contract shall be terminated at any time during said term by the death of the subscriber, or his or her removal from the city

The telephone furnished to be and remain the property of the Niagara County Home Telephone Company, and said Company shall have the right to enter the premises where said telephone may be located, for the purpose of installing, inspecting, repairing or removing the same.

This contract shall renew itself for consecutive terms of three months, until terminated by written notice by either party to the other, at least ten days previous to the expiration of the term then existing.

It is understood and agreed that the subscriber requesting the removal of his telephone will pay to the Niagara County Home Telephone Company, for work in connection with same, $2.50 for a removal in the same building, and $5 00 for a removal to any different address in the City.

The Niagara County Home Telephone Company reserves the right to disconnect telephone service and remove its property from any subscriber, if said subscriber has not complied with the laws of the state, governing same, the non-payment of rental or toll, or proper care of the Company's apparatus.

Approved_____ Solicitor_____ ... Expires_____ Date Connected_____ Payable_____ Rate per Annum, $_____ Style Service_____ Bus. or Res._____ Address_____ Name_____

Niagara County Home Telephone Co.

Fig. 1. One side of contract form used by the Niagara County Home Telephone Company.

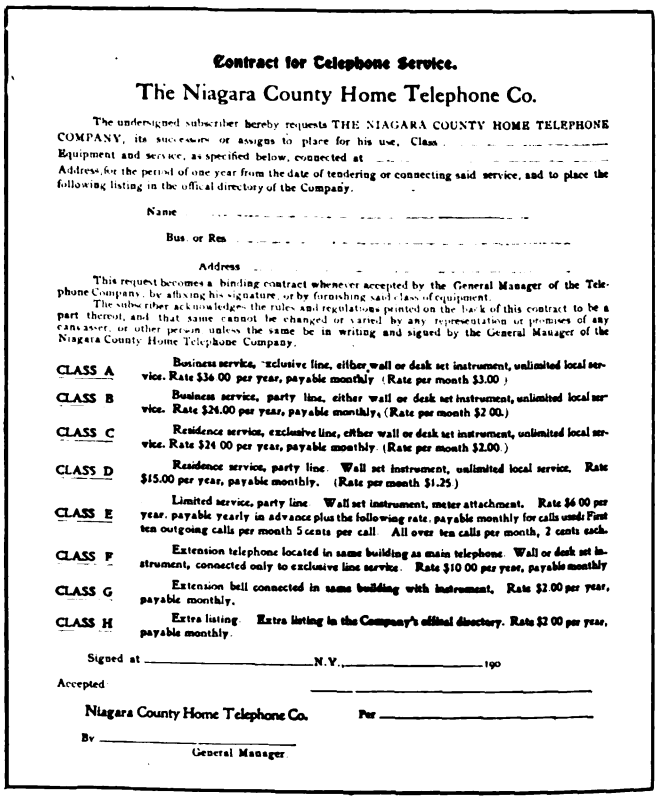
another with the utmost precision, so that in the regular course of a day's work the ordinary business of the company may be conducted properly and efficiently by the employes in the various departments.

A system has been put in operation which enables each one of a well trained group of employes to carry on his or her work along a predetermined line, taking each step with a definite foreknowledge of what shall come afterward, so that the accomplishment of each duty leads definitely toward a known result, and one department checks another in all subordinate proceedings. When the final result is reached it may be relied upon that the processes that have brought it about are almost certain to be without error, entailing the least practical amount of clerical work and recording, and have caused the slightest possible amount of friction.

In planning the system two principles were taken as fundamental. One of these is that all work be done in accordance with definite instructions, issued by the general manager and completely covering all regular cases, unless a valid reason for departure from the rules is shown to a person with authority to permit a variation. The second is that all reports shall be made and tests conducted and recorded in such a manner that checking shall be performed in all cases where essential, that such checking shall be economical and, so to speak, automatic, as conducted between one department and another, and that all written information furnished shall form a part of a useful permanent record.

In the ordinary routine of installing an instrument, for instance, the first step is the securing of the contract. The solicitor who takes the contract is a man who is fully informed as to rates and all other knowledge which has a bearing on his work. No man is allowed to go out until, through careful instructions delivered by the general manager, he is thoroughly acquainted with the propositions which he must handle. Service is furnished either upon a direct or a party line, at a business or a residence rate, and this simplicity of charges affords little basis for confusion. Furthermore, the wording and the arrangement of the contract itself, which was specially arranged with this object in view, is intended to be so simple and so direct that any subscriber by its mere perusal may be sufficiently informed of the exact nature of the agreement into which he is entering.

When the contract has been signed by the subscriber, it is delivered by the solicitor to a clerk who places it upon the desk of the general manager for approval. Assuming that it is acceptable business and a proper contract, it is "O. K.'d" and returned to the clerk. She makes out installation cards in duplicate for each contract, and attaches to them a drop order slip.



Contract for Telephone Service.

The Niagara County Home Telephone Co.

The undersigned subscriber hereby requests THE NIAGARA COUNTY HOME TELEPHONE COMPANY, its successors or assigns to place for his use, Class ... Equipment and service, as specified below, connected at ... Address, for the period of one year from the date of tendering or connecting said service, and to place the following listing in the offical directory of the Company.

Name ...

Bus. or Res ...

Address ...

This request becomes a binding contract whenever accepted by the General Manager of the Telephone Company, by affixing his signature, or by furnishing said class of equipment.

The subscriber acknowledges the rules and regulations printed on the back of this contract to be a part thereof, and that same cannot be changed or varied by any representation or promises of any canvasser, or other person unless the same be in writing and signed by the General Manager of the Niagara County Home Telephone Company.

CLASS A — Business service, exclusive line, either wall or desk set instrument, unlimited local service. Rate $36 00 per year, payable monthly (Rate per month $3.00)

CLASS B — Business service, party line, either wall or desk set instrument, unlimited local service. Rate $24.00 per year, payable monthly, (Rate per month $2 00.)

CLASS C — Residence service, exclusive line, either wall or desk set instrument, unlimited local service. Rate $24 00 per year, payable monthly. (Rate per month $2.00.)

CLASS D — Residence service, party line. Wall set instrument, unlimited local service. Rate $15.00 per year, payable monthly. (Rate per month $1.25)

CLASS E — Limited service, party line. Wall set instrument, meter attachment. Rate $6 00 per year, payable yearly in advance plus the following rate, payable monthly for calls made First ten outgoing calls per month 5 cents per call. All over ten calls per month, 2 cents each.

CLASS F — Extension telephone located in same building as main telephone. Wall or desk set instrument, connected only to exclusive line service. Rate $10 00 per year, payable monthly

CLASS G — Extension bell connected in same building with instrument. Rate $2.00 per year, payable monthly.

CLASS H — Extra listing. Extra listing in the Company's offical directory. Rate $2 00 per year, payable monthly.

Niagara County Home Telephone Co. Per _____

By _____ General Manager

Fig. 2. Contract form. A double sheet with each half printed front and back as shown, is provided. One half is returned to the subscriber when the contract has been accepted.

The contract is dated to show the day installation orders are issued, and held in a basket or drawer assigned to this use to await the return of the installation orders. The duplicate installation cards, with the drop order attached, are forwarded to the

Digitized by Google

wire chief who arranges for the installation of the instrument.

The wire chief detaches the drop order slip temporarily and files the duplicate installation cards to await the running of the line to the premises of the subscriber. The drop order slip which has been detached is read to the foreman of a "drop gang" over the wire. This foreman is required to carry with him a small vest pocket blank book. When he calls up the wire chief for work he is given a number of orders, one of which will be assumed to be the one whose progress we are tracing. He enters in his book the name and address of the subscriber, together with the class of service, and proceeds to lay out the work. If the order calls for party line service he will select the most convenient line to the new subscriber, call central office on this line, ask what the call number is, and if the call number happens to be a party line number he will get a connection with the wire chief, give his name and state: "This is call number —. Can I put another party on it? (Mr. Blank, No. —, —— street.)" If the wire chief has a spare "party" number on this line he will notify the "drop man" whether to go ahead and make his attachment, or select some other line. If the "drop man" is told to select some other line he will take the next most convenient one and go through the same routine, repeating it, if necessary, until he receives an O. K. from the wire chief, when he will be told the letter of the call number which will be assigned to the subscriber. This letter he enters in his book, and proceeds with the work of running the drop.

R. M. Eaton, General Manager of the Niagara County Home Telephone Company.

If the order is for a direct line the "drop man" calls up from the nearest cable box, and is assigned an idle pair of conductors by the wire chief.

The wire chief immediately obtains from the chief operator a verbal assignment of a line and answering jack, and cross connects on the main frame the cable conductors which he has assigned to the switchboard. This is to enable the "drop man" to call central when his work is completed. When the wire chief has given his O. K. for a call number to the "drop gang" he places that number on the duplicate installation cards, and opposite the number of the assigned cable conductors in his cable record book.

After receiving an assignment and recording it the foreman of the "drop gang" proceeds with the running of the wires.

If a "drop man" reports that additional equipment or a line extension is required for running a new order this work is handled by the construction foreman. The wire chief takes a memorandum of what is required and forwards it to the construction foreman. When this memorandum is returned with a memorandum that the work has been completed the drop order is reissued by the wire chief.

If the "drop man" is "held up" for right of way over private property, he reports the fact to the wire chief, drops that job for the time being and proceeds with his next order. The wire chief attaches a written report of the "right of way" required to the drop order and returns both to the clerk. It is then referred to a solicitor or the general manager, depending on the importance of the "right of way" required, and when this has been secured the order is reissued.

Definite rules are issued to the foremen of the "drop gang" upon a typewritten sheet for his permanent instruction and guidance. These rules are worded as follows:

"Lineman running drops will interview the subscriber, find out from him the approximate location of the new instrument, and run the drops to as convenient a point as possible, for the attachment of the inside wiring.

"Drop wires will not be carried into the building, but will be terminated on suitable knobs or brackets, at the most convenient point for entrance.

"When a drop comes in a window, attachment should be below the window rather than above it, except where the drop comes to a cellar window, when the judgment of the lineman may be used.

"Where old drops are in good condition, and go to the proper terminal pole, new drops may not be run, but in his memorandum the lineman will mark "old drops satisfactory."

"Lineman will not install protectors, but these will be installed by the men doing the inside wiring and installing the instrument. For the linemen's information, however, it is well to know that protectors will be installed on all lines over 150 feet in length, from the pole junction box to the subscriber's station, or where the drop wires cross above or below any foreign wires, regardless of their length.

" 'Drop men' must, on commencing a drop, get line and call number from the wire chief, and on completion of the work must call the wire chief from the extreme end of the drop and secure an 'O. K.' test from him, both open and closed.

"The lineman in charge of running the drops will be held responsible for the correctness of the work and all controversy with the subscribers.

"All work will be inspected before being accepted as satisfactory."

When the drop is completed the "drop man," in accordance with his instructions, calls up from the extreme end of the drop and gets an "O. K." from the wire chief before proceeding with the next order. The fact that the drop has been tested, with the date and time, is entered upon the original drop order by the wire chief and it is then placed in the drawer of the "trouble shooter" who is to inspect and accept the work.

Installing the instrument is the next step. One of the in-

stallation cards is given to an installer. The duplicate is held at the wire chief's desk until the installer shall receive his O. K.

Upon receipt of his card the installer obtains from the stock room the instrument and letter called for by each card, together with the wire and other material necessary for his work, and proceeds to the subscriber's station. Like the "drop man" he is supplied with written instructions which convey sufficient information concerning the general method of performing his work, the tools with which he should provide himself, etc. These rules are as follows:

INSTRUMENT INSTALLER'S INSTRUCTIONS.

These Instructions Must Be Conformed With, and Carelessness in Doing So, on the Part of Any Installer, Will Be Sufficient Cause for Dismissal from the Company's Employ.

"Where wires are brought into the building, a piece of twisted pair outside drop wire will be used, brought in through ½-inch circular loom; one hole only being used.

The protector will be placed on the outside wall of the building at the termination of the line wires, or inside, directly where the wires come through the wall or window; in these cases, the installer is to use his own judgment. Protectors will be installed only on such lines as are over 150 feet in length from the cable box, or where they cross above or below any foreign wires.

"Where protectors are installed, a ground wire must be connected, running to the nearest water pipe; if this is not convenient, a piece of galvanized iron rod or gas pipe may be driven into the earth at the side of the building, no less than 3 feet in length, and the wire wrapped around it not less than 6 times. The point of contact between the iron and the wire must be perfectly clean.

"Inside wiring must be done neatly and the instrument placed to conform with the subscriber's wishes. Subscribers may have wall or desk set instruments, as desired, except on residence party lines, when a wall instrument only is allowed.

"Where inside wires are run in damp places, through basements, or in any place where moisture is liable to accumulate, they must be run on split knobs, small size. When the 'run' is absolutely dry, and to all intents and purposes will remain so, the wire may be stapled.

"All joints must be soldered.

"'Rain loops' must be left on all outside wires.

"Installers doing work must properly fill out the card given them and return it to the clerical department upon the completion of the work.

"When an installation is completed the installer must call the wire chief, receive his O. K., and 'time' before the job is left. The wire chief will test for clear line, 'condenser kick,' and the ringing of subscriber's bell.

"All work will be inspected, and no unsatisfactory or unworkmanlike job will be passed.

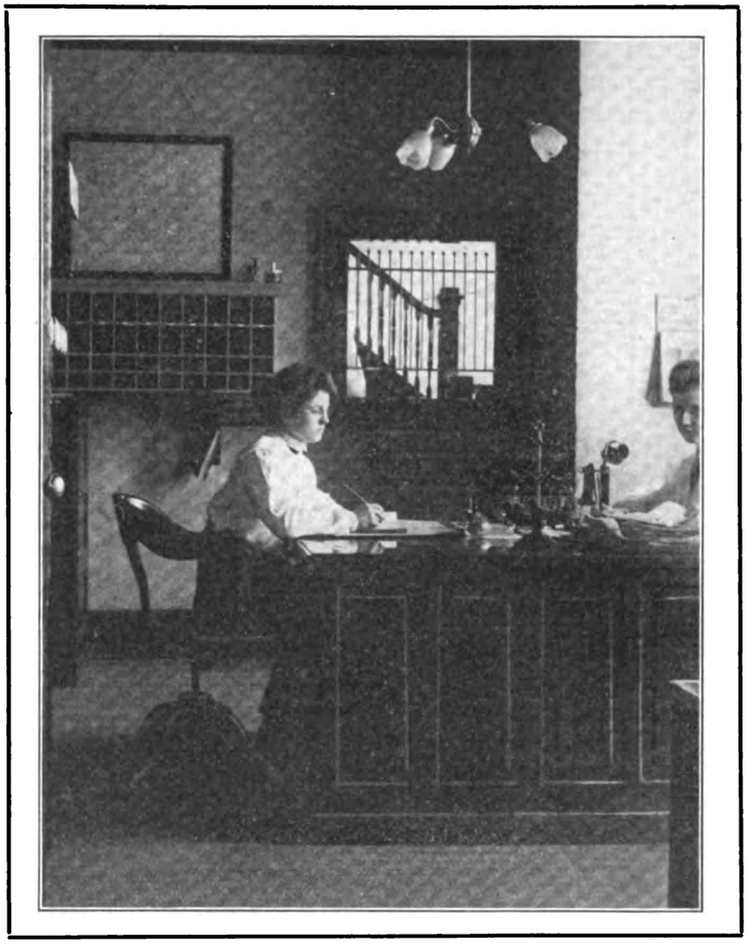
"Installers will equip themselves with the following tools:

"1 brace (angle or ratchet),
"1 long bit, size sufficient to take circular loom.
"1 Syracuse drill.
"1 long gimlet bit.
"1 pair side cutting pliers.
"1 pair long nosed pliers.
"1 hammer.
"1 small key hole saw.
"2 sizes screw drivers, one small and one large.
"1 alcohol flame torch.
"1 small gimlet.
"1 coarse flat file.

"(Special tools, socket wrenches, etc., will be furnished by the company.)

"Installers must report to work in a cleanly condition, and neat in appearance. While on the work they must conduct themselves in a gentlemanly manner, and use all courtesy to the subscribers.

"No voluntary information must be given subscribers as to the company's business, or anything pertaining thereto. For general information the subscriber should be referred to the office of the company."



A Corner of the Clerical Department, Showing Wicket Leading to Stock-room. The Set of Pigeon Holes at the Left is Used for Holding Bills Awaiting Collection.

At the time the instrument is cut into service the installer is required to deliver to the subscriber the regular directory of the company's subscribers and also number cards, as well as a toll directory, if the subscriber wishes to have it.

Upon completion of the work at the subscriber's station the installer immediately calls up the wire chief, giving the call number, name and address of the subscriber, and after the test receives the O. K. of the wire chief. Upon receipt of this O. K. he fills out his installation card. Upon return to the office at night his card is turned in to a clerk at the office. In order to avoid unnecessary communication between employes, with the consequent interruption of the performance of their duties, a basket is left beside the wicket between the stock room and the clerical office. This wicket, which may be seen in the partial view of the general office accompanying this article, was expected at the time the building was planned to provide a means for handling a number of features of the company's business in a very satisfactory way, and has fully justified the hopes which were entertained.

After its receipt from the installer the card is held by the clerk until the arrival of the duplicate which has been held by the wire chief. This duplicate is filled out by the wire chief at the time the O. K. is given to the installer. From it data are transferred to the cable record, and the subscriber's station card record. These two records are the only ones which are kept by the wire chief. After the facts concerning the installation have been noted the wire chief forwards his installation card to the chief operator.

When she receives this card, the chief operator immediately

One of Duplicate Installation Orders, as it Finally Reaches Clerk, Bearing Complete Information.

or suggests additional listings which she believes it would be to his advantage to have. As examples of these may be mentioned the following: Under I, 12—42—Y International Theatre; under T, 12—42—Y Theatre, International; under L, Lumberg, Harris, Manager International Theatre. The chief operator at this time makes a ringing test, which, in connection with the conversation with the subscriber, assures her that no trouble can exist upon the line at the time of the installation. From this time on she is responsible for the service, and if any complaints are made they come to her. She therefore takes the most genuine personal interest in seeing that everything is perfectly satisfactory at the time the installation is made, and if she discovers the slightest defect takes the proper steps to have it promptly rectified. The talk which she has with the subscriber has been found to be very useful indeed in promoting the understanding that everything possible will be done to give him the prompt and efficient service which he needs and assists in building up the cordial interest which is so satisfying a feature of the relations between its subscribers and the telephone company.

It is to be noted that this test by the chief operator is the second check upon the installation, and it is a safe proposition that no trouble which will interfere with the service will be likely to exist after the installation has been passed by both the wire chief and herself. After the test she makes out her card record and fills out the interleaved directory from the installation card, signs it, and sends it downstairs to the clerk.

The two duplicate cards are now for the second time in the hands of the clerk, with all information filled in, showing that the installation has been correctly made, all necessary records made in the two departments through which it has passed, and the subscriber is receiving satisfactory service. They are checked to see that the figures as to time and date, noted by the wire chief and the installer respectively, correspond, and that "O. K.'s" have been properly affixed by both the wire chief and the chief operator. The form on the outside of the contract is then filled out from the information on the cards. From the contract a directory listing card is made, containing all the information concerning the subscriber necessary for a general office card index and which also acts as a catalogue file as it is filed alphabetically. The contract is then given to the secretary, who makes the entry in the regular subscribers' ledger.

Although the subscriber's instrument is in service and all records complete at the time the processes we have traced have been completed there remains one more important step before the installation is asssumed to be satisfactory. This is its acceptance by the "trouble shooter." This employe has assigned to him each morning by the wire chief the troubles which have accumulated during the preceding night. He also takes out the drop order slips for new installations which have been completed and pronounced O. K. When, in the course of his work of clearing trouble, he is near one of the stations covered by a drop order slip in his possession he visits it and inspects it. He goes over the wiring, and inspects it thoroughly from the cable box to and including the instrument. If the work is unsatisfactory to him in the slightest particular he describes the faults on an "employe's report" slip, which he affixes to the "drop order" slip and returns to the wire chief. The man who made the installation is then sent out to remedy the faults, the routine of testing by the wire chief and chief operator is again gone through with, and at his convenience the station is visited for the second time by the "trouble shooter." If he again finds that the work is unsatisfactory he reports the fact, and the installer or drop man who is responsible is sent out to make the work conform to the standard. This time, as a penalty, he is compelled to do the work on his own time. It has seldom been necessary to enforce this penalty.

If, as is usually the case, the installation is satisfactory, it is accepted by the "trouble shooter," and the fact noted on the "drop order" slip. After this the "drop men" and installers are relieved of all responsibility, which thereafter rests upon the "trouble shooter." As this employe is interested in making his work at the same time as light and efficient as possible the effectiveness of this plan may be readily understood. As a matter of fact, the entire work of clearing trouble and inspecting stations in the Niagara Falls district, where there are over 2,000 telephones, is handled by one man. This should indicate that the system described results in a very satisfactory class of work from the installation force. (*To be continued.*)

MINNESOTA COMPANY CONNECTS RURAL SUBSCRIBERS WITH PRACTICALLY THE ENTIRE STATE.

EXTENSIVE toll connections are furnished to its subscribers by the Winona Telephone Company, of Winona, Minn. This company operates exchanges at Rolling Stone, Lewiston, Rushford and Lanesboro, in addition to the main office at Winona. A most rapid growth has been experienced by the company during the past year, the number of subscribers having increased by about 25 per cent. An extensive system of lines into the surrounding country has been built. Connected with the lines leading into the exchanges of the company are 31 toll stations, which furnish a great deal of business from the people in the less thickly settled districts. The rural line development also is extremely high, there being 357 subscribers in this class, of which 85 have been added during the past year. The contrast with the conditions prevailing amongst the Bell subscribers for this class of service is strong, as the latter company has only about 25 people connected to its three rural lines. The Independent company has added new lines more than twice as fast as the Bell. There are now in use 127 miles of toll lines, which enable connections to be established with the most important telephone companies in the vicinity, including the Phoenix Telephone Company, Rushford, Minn.; the Peoples Telephone Company, Chatfield, Minn.; LaCrosse Telephone Company, LaCrosse, Wis.; West Wisconsin Telephone Company, Arcadia, Wis.; Fountain City Telephone Company, Fountain City, Wis.; Plainview Telephone Company, Plainview, Minn., and the Tri-State T. & T. Company, which operates lines reaching all important cities for miles around. The officers of this company are: James A. Tawney, President; John Dietz, Vice President; Otto Troost, Jr., Secretary.

Economical Telephone Accounting and Filing Systems

ARTICLE VII—CASH COLLECTIONS AND RECORDS.

*By Charles C. Wilmot, Telephone Accountant.

This article and all forms reproduced have been protected by individual copyrights. Copyright, 1906, by The American Telephone Journal Company. All rights reserved.

CASH receipts in every telephone exchange should be handled by a thorough system which allows this branch of the work to be taken care of in the same way every day and every month of the year. It must be a uniform labor and time saving method. The plan described in this article has been tried

and tested in different exchanges for a considerable period with most satisfactory results.

The daily collection sheet (Form No. G-14) (copyrighted), which is illustrated in Fig. 1, is 12x9⅜ inches in size, printed on inexpensive stock, and punched for a cheap loose leaf binder. spindle. These coupons are first sorted by telephone numbers or in alaphabetical order, according to the office arrangement used in keeping the subscriber's lease and toll ledgers.

The sheet is totaled and verified and should prove up with the cash. After they have been checked and found to agree both sheet and cash are turned over to the cashier so that the office receipts for the day can be entered in the cash book (See Form G-15 or G-15 c). These items are entered by totals only, the receipts for rentals, tolls, miscellaneous charges and suspense or delinquent accounts being kept in the petty ledger.

Columns are provided for the telephone number, name, period or bill paid for posting check, rentals, tolls, petty ledger and miscellaneous charges. Where rental or toll rebates have been allowed columns are provided for their entry. These rebate items of course must be "O. K'd." by some one in authority. After these totals have been entered by the cashier the sheet or sheets are numbered each day, always beginning with sheet 1, 2, etc. The sheet is then ready to turn over to the bookkeeper who posts directly to her ledger account of the subscriber. On the ledger account is entered a reference to the date and number of the sheet. The bookkeeper can use the column headed "Bookkeeper" for entering the total amount posted to each subscriber's account as a "proof check" of her daily work on each sheet, if desired.

The collectors enter all their daily collections on the same form and turn it in with their cash, rental and toll bill coupons, to the cashier. They make up their account of cash on the back of the sheet, so that the cashier can quickly verify the check turned in from this list. The coupons are checked with the sheet, to see that they agree with the entries made. At first thought this might seem to put considerable detail work on the collec-

Fig. 2. The use of this form (No. G-15) enables cash receipts to be quickly entered each day, and greatly simplifies auditing.

In handling office collections every payment made at the cash desk or received by mail for rental, toll or miscellaneous charges is entered on this form. The sheet is written up, either the last thing before closing or early the following morning, from the rental and toll bill coupons placed during the day on the cashier's

tors, but in most places it is found that very few collections are made after 4.30 P. M., and in actual practice it entails no hardship on the collectors. A decided advantage in this plan is that it inculcates habits of more careful and systematic work on the part of each employee in the collection department. Each sheet turned in is given a consecutive number for the day. If the office sheets number 1, 2, 3, and the first collector making a re-

port hands in three more sheets they are numbered 4, 5, 6, and the totals entered in the cash book (Form No. G-15) with his name, and so on for each collector employed.

These sheets become the original itemized cash book for all

Copyright, 1906, by THE AMERICAN TELEPHONE JOURNAL Company. All rights reserved.

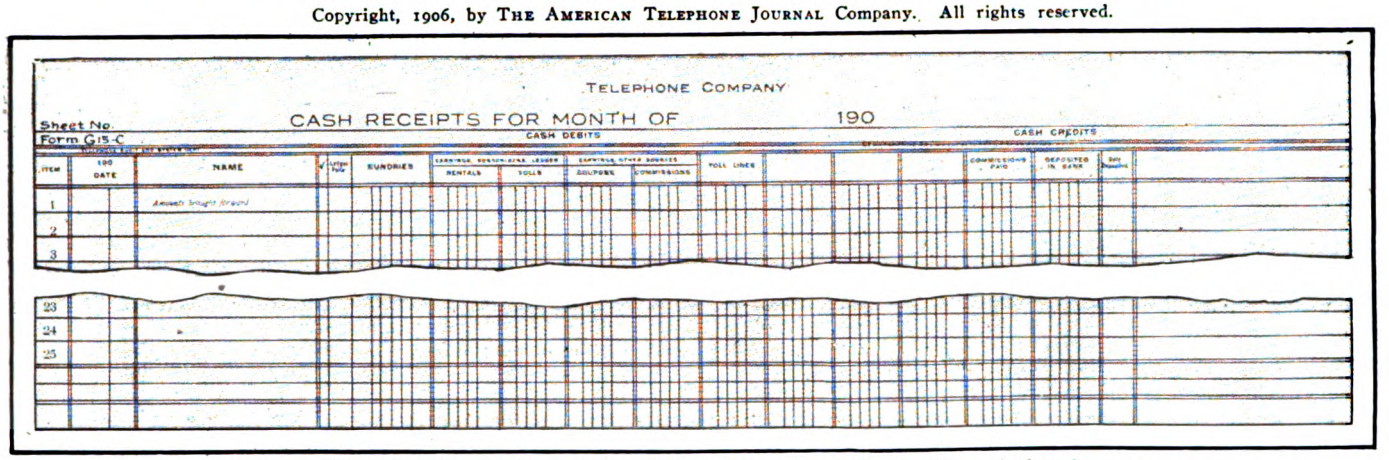

Fig. 3. This form (No. G-15-C) is designed for use in either small or medium sized exchanges.

subscribers' payments and collections. After the totals are entered and the cash book folio noted these sheets are turned over to the bookkeepers, whether there be one or ten employed, to be posted up. Every payment of the previous day can be posted by 11 A. M. the following day and the postings verified. The bookkeepers' initials or name are written in on each sheet handled and all are turned back to the cashier who arranges them in consecutive order, and files them away in a transfer binder with a cheap manila index sheet, cut a little wider than the form, between the group covering each day's work. The date in large figures appears on each index sheet. Immediate reference can be instantly made to any individual collector's sheet for any day's work. One very important feature of this plan is the ease and rapidity with which an audit can be made of the cash receipts of any large company. As each six months' or year's work is audited and verified and but little reference is made to these records, binders can be put away out of the dust in a very small space.

This form, No. G-14, is equally practical and desirable as a

article on "Forcing Collections," by Mr. F. V. Newman, which was published in THE AMERICAN TELEPHONE JOURNAL, issue of April 28, 1906.

The daily cash sheet, Form No. G-15 (copyrighted) has been in use for some time in a large general office having over eighty branch exchanges and many toll stations. It serves as a daily recapitulation sheet of all cash receipts (mainly made up from Form No. G-14) for the entire system. Each day's work is proved and the daily totals entered on a monthly recapitulation kept on the same form with the printing in the centre eliminated. The space headed "Sundry Cash Receipts" is used to enter all sundry cash receipts for capital stock sold, sale of coupon books, material, etc. This system is based upon the plan of depositing all cash receipts in the bank, making all disbursements by a voucher system and petty cash account. By this method the management can produce a voucher and check for every cent paid out. An audit of the cash receipts can be made mainly by the totals, and the disbursements quickly and correctly verified.

The use of Form No. G-15 C (copyrighted) for cash receipts and disbursements is largely self explanatory. It was designed for the use of small and medium size exchanges, either with or without the use of Form No. G-14 previously explained. It may

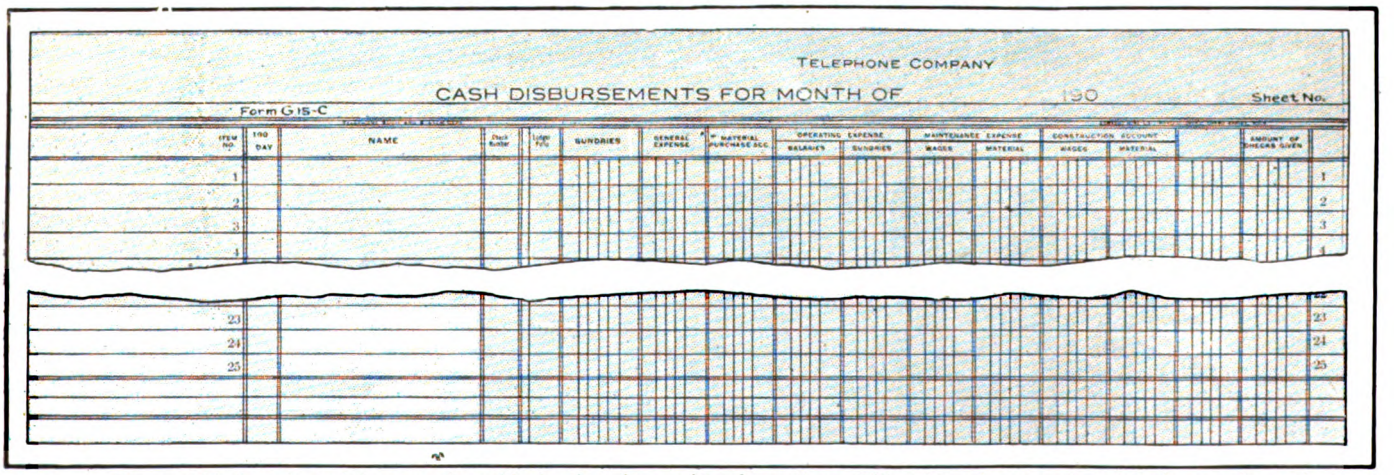

Fig. 4. This form is used in connection with the sheet for receipts shown above. Either loose leaves or bound books may be used.

branch exchange collection report to the general office, and especially so where the general office is keeping a duplicate set of records with each subscriber in its private branch exchanges. When used for this purpose the form is made in duplicate, by inserting a carbon sheet. The original is mailed to the general office, the carbon copy serving the purpose of the branch exchange cash book, from which the people in charge post to their own local records.

In connection with the work of every telephone collection department especial attention should be given to the very able

be arranged either as the debit or credit side of a regular bound cash books and check register or as two separate loose-leaf or bound records.

The form as illustrated is designed to be used where all cash receipts are deposited in the bank, but can be used without changes for disbursing payments by either cash or check if desired.

Blank columns are inserted which can be used either for debits or credits. The printed headings on columns can be changed to suit the varying needs introduced by different local conditions.

Cable Laying on the Thames

By John Putnam.

Illustrations from Photographs by the Author.

If the reader will take a map of Connecticut and look carefully at its southern boundary, which is Long Island Sound, he will notice numerous indentations of the coast formed by inlets, harbors, creeks and rivers. Some of the rivers are very wide and run well up into the state.

Along the shore are cities of considerable importance, which have large populations. Telephonically these cities are well developed, and their business interests intertwine so closely that a vast network of toll lines connects them with each other and with their more northerly neighbors. To get these toll lines from town to town requires the frequent crossing of rivers too wide to span, so recourse is had to some type of submarine cable. This article purposes to describe such a cable and the usual method adopted in putting one down.

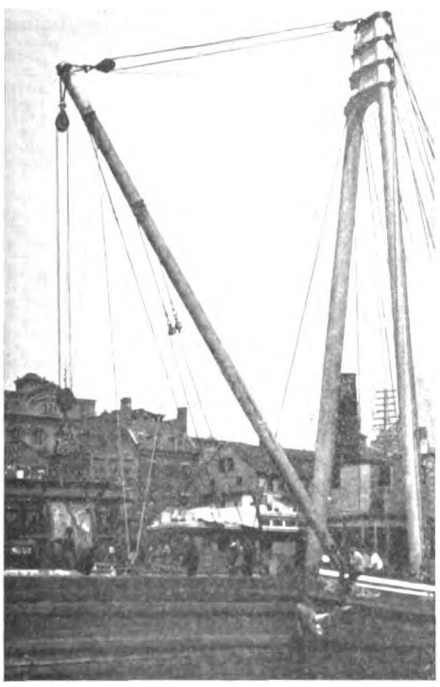

Fig. 1. The transfer from car to lighter.

The cable chosen as an example was recently laid by the Southern New England Telephone Company across the Thames River at New London, Conn. Figure 1 shows the cable being lifted from a flat car, by means of a powerful derrick, to the deck of a lighter, where it is placed on blocking which raises it clear of the deck. Although the company has laid much longer cable, this is one of the heaviest it has ever handled. In this case the derrick had to lift 18,000 pounds, or nine tons. As the week before, however, it had handled a twenty-five ton boiler, and as it has a lifting capacity of thirty tons, the nine ton reel of cable was easily set in place.

Let us take a closer look at the cable, as shown by Figure 2. By comparison with the size of the men, it can be seen that it is of no small proportions. Through the center of the reel is passed a steel shaft, each end of which rests upon blocking built up by timbers.

The cable is 1,450 feet long, weighs 18,000 pounds and is composed of 100 pairs of No. 19 gauge B. & S. conductors. These conductors are coated with an enamel covering to a thickness of three to five ten-thousandths of an inch. This is in order to increase the dielectric strength of the insulation, the idea being that lightning or other high voltage currents will not as readily jump from one conductor to another, as they would if the insulation consisted only of paper. Over the enamel covering there are two wrappings of paper wound in opposite directions. The conductors are of copper of a specified purity, and are twisted in pairs with the lay not exceeding three inches. They are then laid up in a cylindrical coil in reversed layers, and the coil is covered with two wrappings of paper. Outside of the coil of wires is a lead sheath 5-32nds of an inch in thickness, the lead being alloyed with tin to not less than three per cent. Over this lead sheath are three layers of jute, wound in reverse directions. Outside of these is an armor of iron wire, No. 4, B. W. G., diameter .238 inches. The lay of this armor is not less than twenty, nor more than twenty-four inches. Over the armor are two wrappings of hemp, laid on in reverse directions. This hemp is saturated with a preservative compound, consisting of 65 parts of mineral pitch, 20 parts of fine sand and 5 parts of tar. The cable is then covered with whitewash, or similar material, to prevent its separate coils from sticking together and to the reel. The armored wire is galvanized according to standard specifications. The completed cable measured 9½ inches in circumference.

Fig. 2. Mounting the reel on blocks.

As to its electrical properties, the No. 19 gauge conductor has a resistance of not more than 45 ohms per mile at 68 degrees Fahrenheit. Its insulation resistance is not less than 500 megohms per mile, the insulation of each conductor being measured with an electromotive force of 500 to 550 volts against all the rest of the conductors and the sheath.

In Figure 3 all is in readiness to start up the river to the point where the cable is to be laid. At the right of the picture can be seen the motive power of the lighter, a powerful sea-going tug. At first glance this may appear an expensive outfit to hire for this work, but when it is understood that there is $2,000 in-

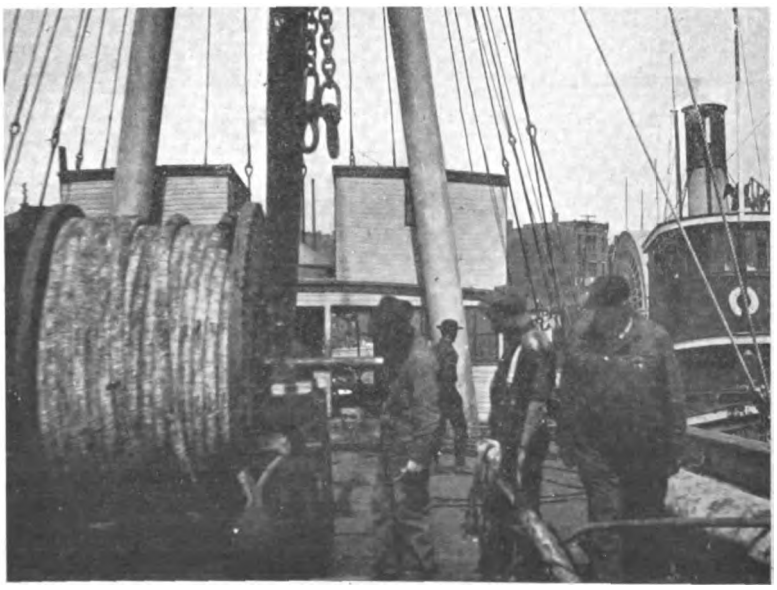

Fig. 3. Ready to take the cable up stream.

Digitized by Google

vested in the reel of cable at the left, and that it is bought to fit the Thames River at a certain point, with only sufficient slack to go into the cable houses, the comparative cost of a wrecking lighter and tug for a few hours does not appear so large.

This cable was laid at a point about a mile up the river, just south of the Railroad Bridge, a locality made famous as being near the finish line of the annual Harvard-Yale boat race. Figure 4 shows the west bank of the river, and is the start of our cable-laying journey. If the reader will look closely at the picture the cable can be seen running from the water's edge up the beach to the cable pole. The landing of the shore end is an interesting operation to watch. The men take the end of a rope ashore, pass it through a snatch block that is fastened to the butt of a telephone pole, and bringing it back on the boat, firmly fasten it to the end of the cable. The other end of the rope is then passed around the drum of one of the steam winches, which, when started, begins to pull the rope aboard and the cable ashore.

Fig. 6. The improvised brake at the stern.

The cable house will be noticed over at the left of the picture, on the pole near the abutment of the bridge. After a sufficient length of cable has been taken ashore all is in readiness for the short journey across the river.

The captain has ordered the tugboat pilot to keep as near to the bridge as possible, and the trip to the opposite bank begins. In Figure 5 the middle of the river has been reached, as can be seen by the position of the draw part of the bridge, the draw tender's house just coming into view at the right of the picture. The men on either side of the reel are bearing against its periphery with levers of plank. This acts as a brake to prevent the cable from unreeling too rapidly. It can readily be seen that it must be under some tension, or the current might wash it down the river, the shortest distance across would not be made, and as the cable is just long enough, it would fall short of reaching its destination. If the reader will look closely at Figure 5, it will be noticed that two courses, or layers, of the cable have been unreeled, as the marks on the inside of the flanges of the reel plainly show.

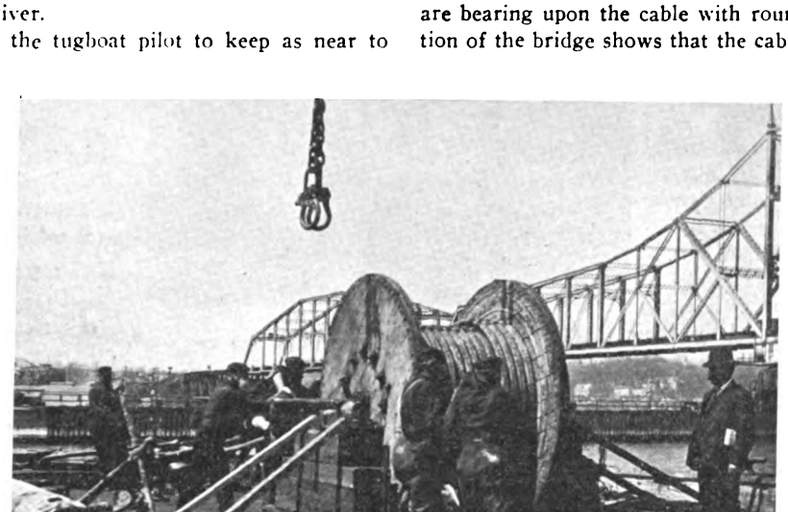

Fig. 5. Cable running off the reel, in midstream.

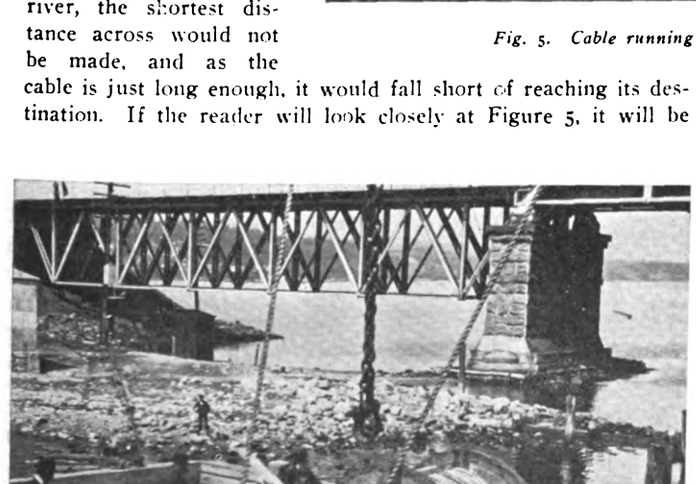

Fig. 4. Starting from the west bank of the Thames.

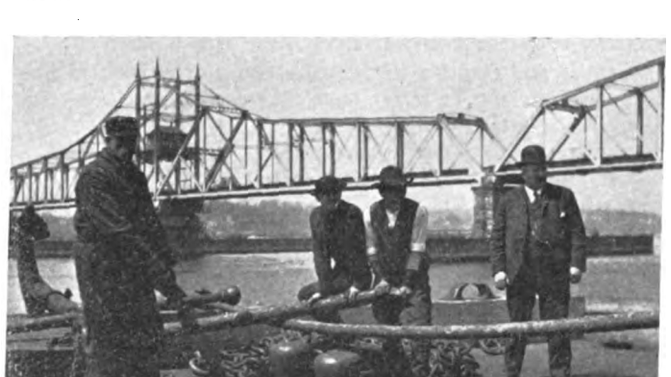

Another style of brake is shown in Figure 6, in which the crew are bearing upon the cable with round wooden levers. The position of the bridge shows that the cable has progressed still farther towards its destination, as the draw tender's house is now at the left of the picture.

Soon the lighter bumps on the east shore of the Thames River, the last forty or fifty feet of cable are uncoiled from the reel and laid upon the deck, the men get into the rowboat with the cable end and go ashore with it. In Figure 7 they can be seen carrying it up the beach. Then the same hitch up with a snatch block, a rope, and the donkey engine on the lighter, as previously described, is made, and the slack is pulled out and farther ashore.

Captain Goodale, of the T. A. Scott Wrecking Company, has handled the laying of many cables for the Telephone Company, so his first question at the end of the journey was, "How long did it take." "Eight and one-half minutes," came the reply. "Huh, we ought to have done it quicker than that." Notwithstanding the Captain's opinion, however, the cable was laid quickly enough, and the whole operation was conducted with a smoothness and foresight that spoke volumes for the ability of the Construction Department of the Southern New England Telephone Company. To sum up the work, it might be said that the expected always happened, the unexpected, never. The telephone lines seen in Figure 7 carry the toll lines to Westerly and Providence, R. I.

The journey back to the dock is without incident, and in Figure 8 the empty reel may be seen being lifted back onto the flat car for shipment to the manufacturers. At the left of the picture, the blocking between which the cable rested shows particularly well as the reel is hoisted out of the way. "Tell them not to make the cables any bigger," were the parting words of the Captain, it being evidently his opinion that this cable had been plenty large enough for convenient handling.

Such is the usual method of laying submarine cables across

Digitized by Google

rivers. About it there has seemed little to tell without being verbose, for the pictures tell the story better than the text, and a careful study of them will be well repaid. The excuse for describing so seemingly simple an operation is that there are probably telephone men who have never seen it done. In Colorado it is said they lay submarine cables on the land, in order that the wires may be secure from the interference of land or snow slides. It may interest readers in that part of the country to read how in the East such cables are laid in the water. Sometimes, however, unusual means of laying these cables are rendered necessary, and in a succeeding number of this journal the laying of a submarine cable with the help of a locomotive will be illustrated and described.

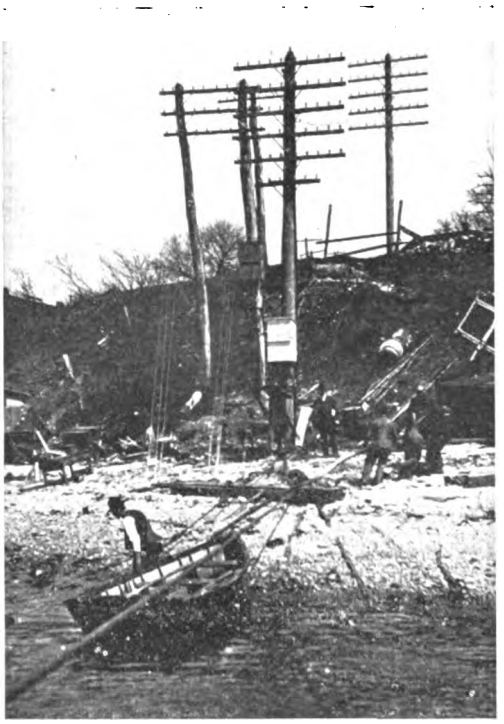

Fig. 7. Taking the cable ashore on the east bank of the Thames River.

TELEPHONE THE GREATEST MEDIUM FOR DISTRIBUTING INFORMATION.

NEWS GIVING over telephone lines is growing in extent and in many parts of the country is superseding all other methods of communication where promptness is required.

An excellent example of the advantages of this plan was recently furnished the people of Massachusetts on the occasion of the promulgation of the appeal of Governor Curtis Guild for contributions to the sufferers by the earthquake in California.

This letter of the governor was read at a meeting of the relief committee and given to the telephone company at five o'clock in the afternoon and by eleven o'clock in the evening it had been dictated over the telephone and copied by the mayor, as the chairman of the board of selectmen, or his representative, in every one of the 356 cities, towns, villages and hamlets in Massachusetts except two, one being a mountain village in the Berkshires and the other a fishing hamlet on the island of Martha's Vineyard.

The letter was also given to the editorial office of every newspaper in Massachusetts during the same time.

This information reached the cities and larger towns in time to provide for calling special meetings of citizens and to be read before audiences already gathered together at theatres, concerts and other entertainments, enabling thousands to give twice by giving quickly.

In ancient times the most rapid method of communication over anything approaching so considerable a territory is said to have been by the kindling of signal fires upon the hilltops. The contrast with this primitive method is hardly greater than that which exists to-day between the use of the telephone, which enables all desired information to be given to millions of people almost on the instant and that of other systems of transmitting intelligence which are being so rapidly superseded.

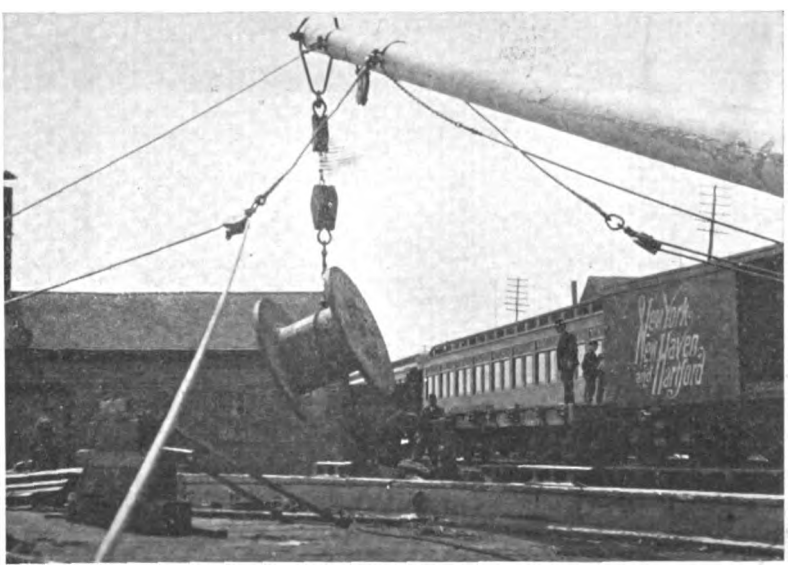

Fig. 8. The last operation; swinging the empty reel aboard the car after the cable has been laid across the river.

CENSUS BULLETIN ON TELEPHONES AND TELEGRAPHS.

THE condition of the telephone industry in 1902, as shown by figures collected by the Census Bureau, is indicated in a special report which the Government has recently issued. The report includes the statistics which were made public in a bulletin issued a considerable time ago, but much additional material has been introduced in the way of general historical and descriptive matter prepared by Mr. Thomas Commerford Martin, who has acted as expert special agent for the department. This matter has been so chosen and arranged as to give a rather comprehensive summary of the progress and present state of the art and should be an important agent in promoting the growth of a knowledge of the importance of the industry.

The report contains statistics concerning the physical equipment, service and financial operation of different classes of telephone systems. So rapid, however, has been the progress of the industry since the collection of these figures that not only on account of the increase, but on account of the change of proportions which has accompanied this increase the figures concerning development possess little more than historical interest.

THE POWER OF SLANG.

THAT a change of telephone numbers is a bad thing is agreed, but a well known official of one of our largest companies recently decided that in his case its inconvenience was well worth enduring. As the story is told in the town where he lives, Gen. ——'s number used to be 23, and the general who disagrees with Brander Matthews that slang is condensed metaphor, felt that as treasurer of the company which owned the wires, he could keep on having 23 for his number if he chose to do so.

Night after night from his friends would come call on the heels of call.

"Is this 23?"

"Yes."

"Not really? Well, skidoo for yours."

Being anti-slang the —— household could not fall back on profanity, which is the ruffianly relation of slang. It could only go back to bed and consider.

The last straw was the following:

"Is this 23?"

"Yes."

"May I speak with Mr. Skidoo?"

"There is no such per son here; this is Gen. ——'s residence. Mrs. —— is speaking."

"Oh! Mrs. Skidoo. Then how are Mr. Skidoo and all the little Skidoos? What, no Skidoos, you say? How curious!"

Then the General rushed out and closed the conversation.

But in the morning he changed his number, and no one else has applied for it to date.

An Automatic Monitor

By John Grant.

INDEPENDENT companies must derive their greatest strength from the furnishing of a service superior to that which is given by their competitors. There are two important elements which contribute to the maintenance of such a service. The first is the requirement of well designed and constructed switchboard and outside plant. With the necessary amount of money at hand there can be obtained a switchboard, lines, and instruments which are capable of being handled in such a way as to give results which conform to or even surpass the highest standards of our competitors. A normal amount of effort and expense serves to keep these appliances in such condition that they will continue for years to give the same results as at the time of installation. These may be considered as established standards, imposing limitations, it is true, but of such a nature that improvement by the removal of these natural or physical causes which determine them are in the province of the inventor.

The manager of a telephone exchange is concerned with efforts to make the handling of calls with the apparatus at his disposal as efficient as possible. It is service that he has to sell and this is the commodity to the improvement of which his work should lead. This means that among other things he must constantly endeavor to have his operators manipulate their switchboard apparatus in such a manner as to complete each call without inaccuracies and with the minimum delay. What is more costly than a poorly manipulated switchboard? This is the cause of the loss of nearly all subscribers who discontinue their contracts, and of the failure to receive toll business with the constant increase at once of earnings and prestige to the Independent company. The friendship and confidence of subscribers, on the other hand, when secured by giving the most valuable service attainable, is an extremely useful aid to the securing of new business. Our operators, therefore, must be taught to educate the public to demand the best service, and to give such attention to their work that this service may be furnished constantly, without a break which may be taken as a cause of complaint.

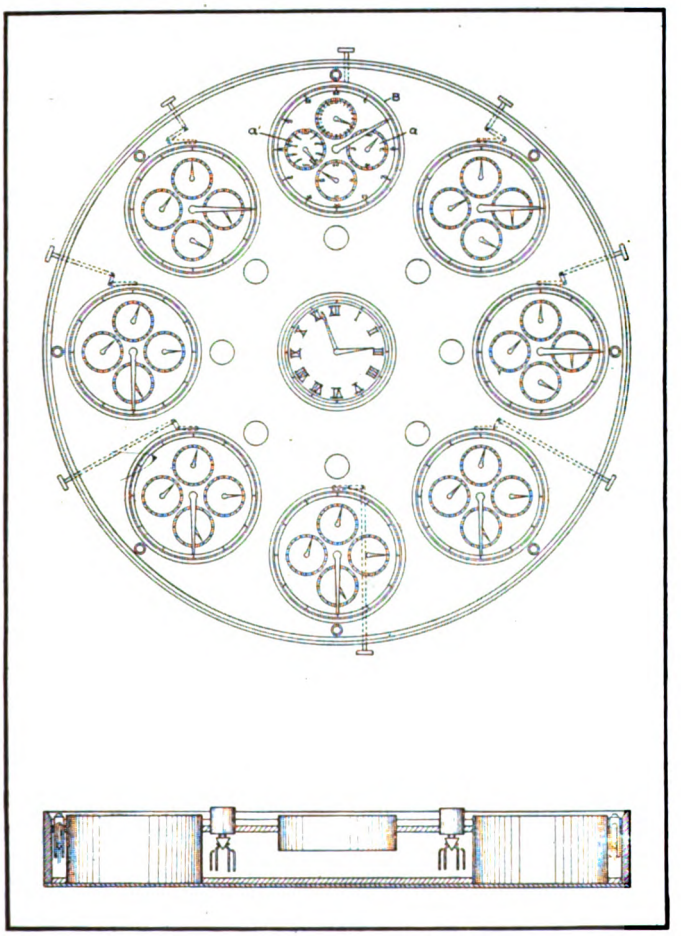

Fig. 1. Front and sectional view of complete "automatic monitor" for eight-position switchboard.

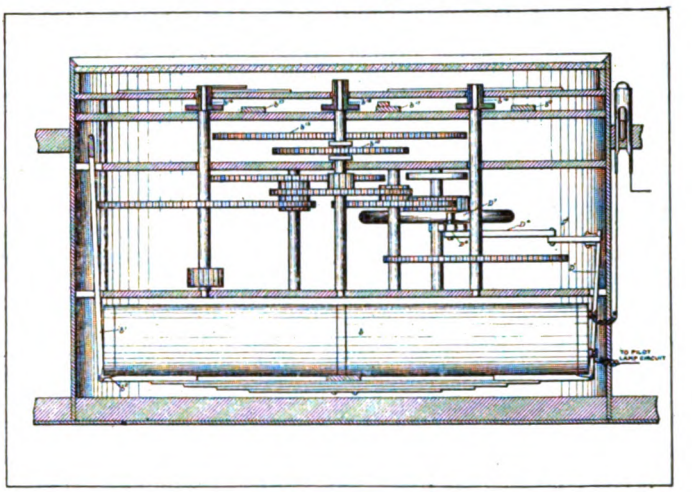

Fig. 2. A sectional view showing apparatus for moving indicators. The remainder of gearing is shown in Fig. 3, page 419.

The local operator should be intelligent, accurate and courteous. One with these qualities can be trained in the requirements of her work until she is capable of securing the best results. Experience has demonstrated the nature of these results, and established standards which are to a large extent agreed upon. In the methods of securing them however, the greatest divergence of practice exists. Various plans for obtaining knowledge of the grade of service which are actually given have been devised. Tests are made, and with the information obtained from them the manager is able to discover the amount of improvement necessary. Stimulation of interest, and where necessary, measures of discipline are resorted to in order to spur the operators to more constant efforts.

It is evident that whatever method of checking the work of the operator is resorted to should, for the attainment of the highest objects, be economical in operation, give a check not merely on a percentage of calls but upon all connections which are made, and be absolutely accurate. It is desirable that any difficulties in the service should be detected at the time they occur. Correction of the operator at fault is thus possible at the time when it will be most useful.

With these scientific requirements admitted it is a logical deduction that proper automatic apparatus, located under the observation of the manager or a competent chief operator affords an ideal check on the work at the switchboard. Such an apparatus should record for each position at the switchboard the number of calls, and enable any irregularity in a single call to be instantly detected by the person in charge of the service.

E. K. Hertford, now manager of the Charleston Home Telephone Company, of Charleston, W. Va., became impressed some time ago with the necessity for such apparatus. Eager to give his own subscribers the best returns for their payments, and aware of the benefit which might be obtained by his associates, he has invented an instrument, in connection with a system of application, which has enabled him to secure a constant and accurate knowledge of the work done by his force of operators. In this apparatus there is provided for each switchboard position a set of dials upon which is registered by means of electromagnetically controlled recording mechanisms, the total number

(Continued on page 418.)

THE EDITOR'S PAGE

PROGRESS BETWEEN CONVENTIONS.

DELEGATES to the Chicago convention next week may congratulate themselves on having completed a year of great achievement since the last annual meeting. Much has been done for the promotion of the success of the Independent companies through the efforts of the National-Interstate Association. Within the year we have seen established a number of new State organizations, and existing branches have extended their influence and systematized their efforts until they have arrived at a point where, almost without exception, each company represented feels and acknowledges the value of their work.

The spirit of the central organization has spread over the entire country, and all Independent men are now working together with a common object. With the slogan, "Look for the Shield," as a rallying phrase all officials and managers are carrying on the great fight with all the confidence which comes from the knowledge that they are receiving the earnest support of their associates. No longer has anyone the feeling that he is carrying on a hard struggle alone against desperate odds; each realizes that he is joined with his friends in making the success of a tremendous enterprise, and that his efforts are known and appreciated.

The gathering of classified information concerning operating companies by the officers of the association has gone far enough to be definitely useful in many ways. For one thing, it has resulted in enabling many operating companies to put their toll line work on a firmer foundation. Only a short time will elapse before the advantages of this will become evident in financial returns.

Then there is the matter of adding new members, which affects the old supporters in a double sense. Every additional town which contains an Independent system adds just so much to the value of plants in those places with which it connects. Many operating companies have been approached with proposals to join the Bell system, but through the untiring watchfulness of the officials of the association and the assistance of men in the localities affected, the convincing knowledge of the advantages they will gain by retaining their independence has been lacking to few indeed of these wavering individuals.

The standing committees of the Association have made a good start on the work in which they are engaged. This is so important that no haphazard statements must be issued before the committees are sure of their ground. There can be no jumping at conclusions on their part; when they make an announcement it must be one which they feel sure is right. So, at best, the most that can be expected now is a statement of the course taken by their investigations, of the rough form of results which may be looked for, and definite plans for the future. Next year, however, the work of these committees should go far enough to permit the issuing of reports which can be used to bring about improvements in the methods of handling work now in use by many companies.

One of the most useful influences exerted by the association has resulted in a widely increased public knowledge of the meaning of Independent service. The space devoted to Independent progress by the daily press is increasing, and, in spite of the contrary reports, all remarkably similar, which are circulated with so much diligence, people throughout the country are coming to realize very thoroughly that most Independent companies are sound business enterprises and give good service.

One thing taken up by the Association has resulted in much general good, but is nevertheless criticized unfavorably by some careful members. This is the conducting of a supply department. Its value in promoting the introduction of emblems which have assisted to a remarkable extent in building up the feeling of enthusiastic co-operation and have had a definite advertising worth, is positive and unquestionable. Many feel, however, that it is unjustifiable to use the efforts of the able men who are charged with the direction of the Association's policy and affairs in conducting a business enterprise for profit. It is pointed out that the competition of the Association with any of the private organizations contributing to the development of any branch of the telephone business is hardly advisable, and may ultimately lead to unpleasant complications. The connection of the Association with the supply business would not be open to these objections if it were confined strictly to an establishment of just and uniform standards. But once the standards are fixed the Association should not attempt to enter the field of the regular manufacturing and supply houses. There is work enough for it in settling on standards and strengthening the organization, and there is danger that more important things may be sidetracked if profit making is attempted.

LOOK FOR THE SHIELD!

The Association can show results, and all the operating companies should be willing to pay toward its support an amount definitely proportioned to the benefit they receive. It is to be hoped that an adequate means by which the distribution and collection of the entire necessary expenses of carrying on the work of the Association may be assured without a waste of the energy of some of the best men in the field will be agreed upon at this convention.

Everyone realizes that this has been a big year. Growth has been tremendous, and managers feel happy and confident. The officers of the Association look for still more rapid progress in the future, and ways in which it may be made still more useful to its members will be made clear. It is for the members at the convention to help complete projects in which the whole body may join, unite in deciding on the best ways to push them, and above all, to get to know one another—to get together—for the pace next year will be fast.

SYSTEM IN TELEPHONE EXCHANGE MANAGEMENT.

LITTLE can be accomplished in an enterprise where the head attempts to do all the work himself. Details of the daily routine must be taken care of as they come up, and a careful supervision of each process will so occupy the time and dissipate the energies of a high managing officer that the duties for the performance of which by his superior ability and experience he is peculiarly fitted must perforce be neglected.

The ideal condition for which most telephone managers are striving will permit them to know when a piece of routine work has been started and completed, and in case of an emergency allow the state of its progress to be determined very quickly by reference to a proper record kept within the office.

Furthermore it is desirable that the method of carrying out each kind of work should be such as to insure uniformity and correctness through proper checking, not merely of records, which is, after all, of secondary importance in spite of its very real necessity, but of the work itself.

The article by R. M. Eaton, begun in this issue, describes the methods which he has built up for handling the work of the Independent company at Niagara Falls. The exceptional success which has been made by his company gives to this article the highest value as an exposition of thoroughly practical methods.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

CHARACTER AND SITUS OF COMPANY FOR TAXATION.

Will you give us the space in your valuable department to answer the following questions:

1. Our company is incorporated (in Pennsylvania) under the act and its amendment providing for the incorporation of telegraph companies, although we do a telephone business. Are we to be taxed under the revenue laws as a telegraph or as a telephone company? We do no telegraph business.

2. The property of the company is owned and its business is carried on partly within and partly without the State. Can our capital stock be taxed in both States? R. C. D.

ANSWERING your questions in order the Editor will say, first, that the act under which you are incorporated determines your character for purposes of taxation. You are therefore liable to be taxed as a telegraph company under Revenue Act June 7, 1879.

As to the place of taxation, a ratable proportion only of your capital stock can be taxed in each State. See Commonwealth v. W. U. Tel. Co., 2 Dauph. Co. Rep. 30.

UNIFORMITY OF TAXATION.

Where the State constitution requires a uniform rule in levying taxes and the statutes provide that the rate for telephone and telegraph companies shall be the average of all taxes raised for all purposes, local as well as State in the commonwealth, is the law enforcible? J. C. W.

SUCH a tax law was held unconstitutional in Michigan where the taxes assessed for the State bore a proportion to the amount to be raised and all property was charged with a common and equal percentage upon its assessed value. Pingree v. Auf. Gen. 78 N. W. 1025. 44 L. R. A. 679.

CITY CANNOT BY CONTRACT DIVEST ITSELF OF POLICE POWER.

The city entered into an agreement when it granted us a license to do business that we should not have to renew our poles or wires except at our discretion. This was made part of the ordinance and in consideration therefor we furnished the city with free telephones in the city hall and each of the fire department stations. Now the common council asks us to replace some of our old poles with new ones on the ground that they are in danger of falling. This is not the case at all, but what we wish to know is whether the city can make us do this in the face of the clause in the ordinance granting us our discretion in keeping our line in repair. A. E. A.

THE city had no authority to enact the clause in question. The State law delegates to the city authority to regulate the use of streets and alleys by telephone and telegraph companies. Of this authority the city cannot divest itself by contract or in any other way. It can therefore compel the replacing of poles or wires when necessary. By showing that the poles are not in danger of falling you might legally resist the enforcement of the new ordinance.

HOUSE MOVER'S LICENSE ENTITLES HIM TO CUT WIRES IN MILWAUKEE.

HOLDING that under the city ordinance of Milwaukee the Wisconsin Telephone Company has no right to maintain its poles and wires in their present condition, but should have them under ground, Judge Tarrant has dissolved the injunction, secured by the company, restraining August Bartz from moving a house across the intersection of Twenty-fifth and Cherry streets. The company obtained the injunction on the ground that the operations of Mr. Bartz would require the cutting of five of its cables and eight wires. It was alleged these wires and cables supplied some 1,100 telephone users in the northwest side of the city.

Judge Tarrant's decision follows in part:

It is the decision of the court that the defendant, being in possession of a valid license from the city of Milwaukee, has a right to move the house along the streets in question—that is, pursuing the conduct which the defendant pursued, notifying the plaintiff of his intention to move, and that the plaintiff is not entitled to the injunction restraining the defendant from so moving upon the showing in this case.

It appears, as I understand it, although the question was not argued except as it appears in affidavits and briefs, that under an ordinance of the city of Milwaukee the plaintiff was required to lay underground wires and conduits and has no authority to maintain its poles in their present condition, and upon that showing it was the right of the defendant under its license to move the house in question without obstruction. This is no permission to the defendant wilfully to destroy the wires, but notice may be served on plaintiff of this decision.

Some point was made that the ordinance in question is unconstitutional, but the court would certainly not feel warranted in so holding under the present showing.

The ordinance referred to was passed October 19, 1891, and requires that on certain specified streets and on "such other streets as the public interest may require," the wires of the telephone company must be placed in underground conduits.

GEORGIA COMPANY PUTS ITSELF UNDER STATE RAILROAD COMMISSION.

THE first application of a telephone company to place itself under the jurisdiction of the Georgia State Railroad Commission established by act of the last session of the legislature was made recently when the Denton Telephone Company of Willacoochee, Goffee county, filed its consent with the board. The application was promptly granted and in future the company will have its rates regulated by the State Commission.

Under the law, companies operating under jurisdiction of the board have the right to condemn rights of way through which they desire to construct their lines; the compensation to be paid to the property owners is to be fixed by a board of arbitration.

MAYOR OF PENNSYLVANIA CITY VETOES FRANCHISES TO PRESERVE POLE TAX.

MAYOR McCALL of York, Pa., has vetoed bills granting to the York Telephone Company and the Pennsylvania Company the right to construct and maintain conduits in the city. The bills had passed both branches of councils.

In returning the bills without his approval Mayor McCall gave various reasons, principal among them being that to grant the privileges would take away the revenue coming from pole tax without substituting any other method of immediate return to the city; also that the ordinance as constructed does not specify streets that may be occupied, thus giving unlimited rights over all streets and alleys. Other parts of the ordinance are found defective.

TEXAS TELEPHONE COMPANIES EXEMPT FROM INTANGIBLE TAX LAW.

OWING to the word "telegraph" being attached to the corporate name of the Southwestern Telegraph and Telephone Company, Tax Commissioner Davies, of Texas, asked the attorney-general if the company came within the provisions of the Williams intangible tax law.

The attorney-general has advised him that it does not, as the company is not engaged in a general telegraph business for profit, merely having private telegraph lines between its offices for personal use. Telephone companies are specifically omitted from the provisions of the law.

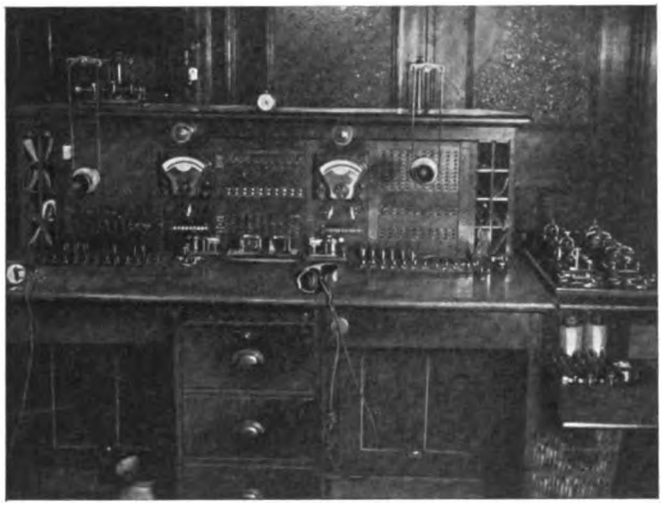
The Importance of Efficient Testing Apparatus

By Louis Mühlheizler.

WE all know that the battery gives the energy of the telephone plant. Whether it is at the instrument or central office, it must be maintained in first-class condition to obtain good transmission, efficiency and also to obtain good working conditions of relays and other signaling apparatus. This is the first important feature of the telephone plant.

The second important feature of the telephone plant is efficient testing apparatus. This is a very vital point and worthy of due consideration in every telephone exchange. No matter what size the exchange may be, it should be equipped with the best testing apparatus obtainable and have men in charge who are capable of so handling it as to obtain results. Efficient testing apparatus is economical for the reason when tests are made it will show



Testing Set Used in the Pittsburg Exchange of the Pittsburg and Allegheny Telephone Company, of which Mr. Mühlheizler is Superintendent of Maintenance.

whether the trouble is in the switchboard, line, telephone or cable head. When the nature of the trouble is ascertained, the troubleman is sent to the place where the trouble really exists and it is cleared in a very short time.

In a large telephone exchange considerable trouble arises daily owing to natural causes. This must be handled with intelligence, or, in other words, "good horse sense." With the right kind of testing apparatus and a competent wire chief to test and handle the trouble there is no reason why there should be any trouble carried over at the close of each day, excepting when storms cause exceptional damages. When the trouble is handled with speed and accuracy it reduces the cost of maintenance for the reason that it does not require so many troublemen to take care of the plant.

An essential feature which must be provided for in the testing apparatus is the location of toll line trouble. When trouble is properly tested and located on toll lines it can be cleared in a very short time, reducing the cost of time, railroad fare and livery hire to a considerable extent.

It will be surprising to note that in some of our modern telephone plants throughout the country trouble is handled without any system whatever. The chief operator reports to the wire chief the telephone of John Smith in trouble. The wire chief notes the ticket, looks wise, does not make any test, but wakes up the troubleman, who is sitting on a chair with his feet on the manager's desk.

"Say, Jim, John Smith's telephone is in trouble again. Suppose you go out and see what the trouble is." Jim, of course, complies, goes to the subscriber's station or place of business, calls up the operator and requests her to ring the bell. This ends the inspection and Jim goes back to the office again without calling the wire chief to test. The wire chief inquires what trouble he found and Jim says: "Oh, nothing; Smith does not know what he is kicking about." The chances are that this exchange has no testing apparatus except something of a very crude form. The consequence is that the subscriber gets tired reporting his telephone and orders the company to take it out. The telephone company probably not only loses a good subscriber but considerable toll business, all on account of inefficient testing apparatus and lack of intelligence.

For the handling of trouble in the larger exchange districts, say plants of five thousand capacity, the troublemen should be divided up into districts and each case of trouble tested out before sending a troubleman. Each troubleman should remain in his particular district, clearing trouble and reporting from each telephone to the wire chief as the line is cleared.

The wire chief will at once ascertain whether the line and telephone are in good working order. The troubleman then proceeds to the next case of trouble and so on until all trouble is cleared. He remains in his district and keeps in touch with the wire chief by telephone. The troubleman is not authorized to return to the exchange unless ordered to do so. There are also cases where one troubleman has more trouble in his district than he can take care of and another troubleman who is not so busy in his district can help out without returning to the office. In this way things are kept running smoothly, since the men are controlled by an employee who has a means of determining the exact conditions existing on his lines.

AN AUTOMATIC MONITOR.

By John Grant.

(*Continued from page* 415.)

of calls answered, timing each from the second or fraction thereof each call is received at the switchboard until the operator has answered the subscriber. In connection with each set of dials a duplicate pilot lamp is mounted and so connected as to be illuminated at the time the call is received at the switchboard, and a switch is so arranged that the chief operator may, at will, listen to the conversation carried on by the operator by the connection of her receiver in multiple with the tertiary winding of the operator's induction coil.

The mechanism by means of which these objects are accomplished is ingenious, and comparatively simple. In Fig. 1 is shown a view of a typical outfit which contains within a single

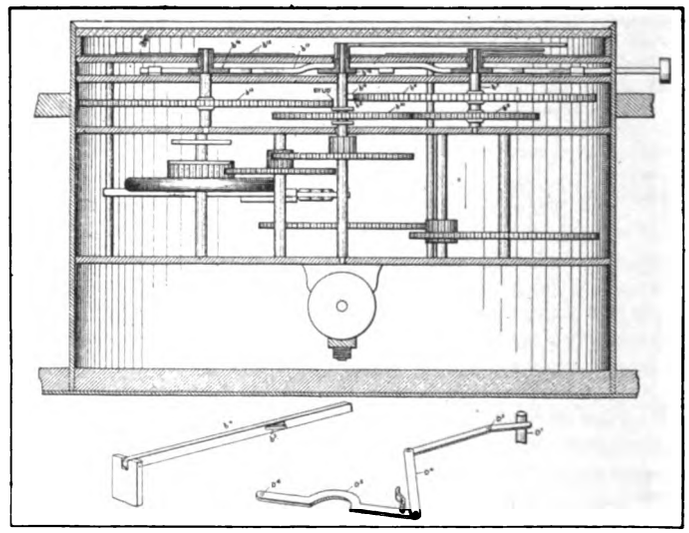


Fig. 3. View of recording apparatus in section approximately at right angle to that of Fig. 2. Details of call actuating device and timing controller.

circular case the apparatus for obtaining simultaneous records on eight separate local operators' positions. In the centre is an ordinary clock which indicates the time of day. This is useful as a means of checking records of individual calls possessing extraordinary features which may be noted at the time such calls are made. Surrounding the dials of this clock are the dials as-

Digitized by Google

sociated with the eight sets of recording mechanism. Referring to the dial B, it is to be noted that the periphery is divided into 60 divisions, each of which represents one second. Of the dials within this the lower is graduated in 60 divisions, each of which represents one minute, and the upper has 24 divisions, each representing one hour. Suitable hands are provided for moving over the faces of these dials to indicate the elapsed time. The function of the other two dials is to register the number of calls received at a position. The right hand dial is graduated to register by the movement of its hands each call up to 100, while the left hand dial registers the number of hundreds.

The indicating hand on this dial rotates through the space of one division for each complete rotation of the hand on the dial to the right. The figures indicate the actual numbers of calls for convenience in reference.

To operate the call register there is provided for each indicator a double pole magnet b, so connected as to be actuated during the time that the pilot lamp at the operator's position to which it corresponds is illuminated. While one end of this magnet is used for actuating the timing mechanism, the other is used solely for controlling the call registering needle. To this end, the armature b^1 is hinged to the ears b^2. The armature has lying beneath the magnet an angular extension which, through its engagement with a spring, holds the armature in a normal position remote from the magnet pole. When the magnet is energized, the attraction of its armature imparts sufficient movement to an operating arm b^4 and an attached pawl b^5 to cause the wheel b^6, with which the movable pawl engages, to advance through the space of one tooth. The number of teeth upon the wheel b^6 is equal to the number of divisions in the unit register, and the rotation of the spindle b^7, which is permanently attached to the toothed wheel, causes the movement of the attached indicator over one division of the dial, registering the call indicated by the pilot lamp on the switchboard. Turning with the spindle b^7 and wheel b^6 is a gear wheel b^9 which meshes with a wheel loosely mounted on a spindle associated with the timing mechanism. A pin attached to the latter gear causes the rotation of the wheel b^{12} through a space occupied by one tooth for each rotation of the wheel b^{10}. As the number of the teeth in the two wheels b^6 and b^{10} is so proportioned as to secure a reduction from 100 to 1, each engagement of the pin with the wheel b^{12} corresponds to one complete rotation of the hand on the unit dial, or 100 calls. As the rotation of the wheel b^{12} through the angle corresponding to one tooth advances the pointer b^{15} one division on the dial of "hundreds" a complete record of calls is obtained.

In practice it is found desirable to obtain a direct record of the number of calls answered by each operator. Rather than to obtain a continuous record for a position and subtract the number of calls answered at the time any operator begins work, it is preferable to start the counter at zero when she takes her seat. For this purpose restoring mechanism, of the sort frequently used in stop watches, consisting of the cam b^{16} and sliding rod b^{17} is used to set the indicators back to the starting point at the will of the chief operator.

For the timing mechanism a suitable simplified clock work arrangement, using a main spring associated with properly proportioned and inter-connected gear wheels, is provided. In order to start the timing mechanism simultaneously with the receipt of a call and to stop it when the call is answered by the operator, thus putting out the light, there is provided at the opposite end of the magnet from that which controls the call register an armature d^1 similar in shape to the one previously described. A lever d^2 is pivoted at d^3 and has one end connected to the armature d^1. This lever has one end pivoted to a link d^4, which in turn is connected to a sweep arm d^5, having one end, d^6, pivoted to the casing.

The sweep arm carries a spring shoe d^7, designed to engage the balance wheel of the timing mechanism. When the armature d^1 is attracted such a motion is imparted to this ingeniously arranged link work that the shoe is thrown lightly into engagement with the balance wheel, and then with a pronounced reverse movement starts the wheel in motion. This arrangement prevents the stopping of the balance wheel on the "dead center."

Tracing the operation of the complete device, it will be evident that when a subscriber calls the pilot lamp at his position is lighted. As the pilot lamp and the controlling magnet mounted in the indicator are wired in series with the switchboard light, the indicator pilot is illuminated, the call registered, and timing commences and continues until the release of the armature of the magnet due to the breaking of the circuit at the switchboard, which occurs when the operator plugs in and answers the call.

When the pilot lamp is illuminated, the chief operator may, if she wishes, depress the corresponding listening key, which is of the non-locking type, to ascertain that the conversation carried on by the operator is regular, and that she answers the call as soon as the answering plug is inserted in the jack. When an operator leaves the switchboard there will have been automatically made a record showing the number of calls, and the sum of the times which have elapsed between the receipt and response to the several calls. From this is computed the average time of the answering of each call received.

As a duplicate apparatus may be installed in connection with a disconnect pilot, a similar record for this feature of operating may also be obtained.

Although the registering feature of the device applies only to the interval elapsing before the operator inserts a plug in the answering jack, and not to the time preceding the operator's answer, this introduces no difficulty nor irregularity in the record. Strict instructions that calls shall not be plugged out before the operator is ready to answer are issued, and the ability to check the observance of these rules is conveyed to the chief operator by the provision of the pilot lamp and listening key, as above described. A fine is imposed for all violations of this rule, but they very seldom occur.

Upon the records furnished by this apparatus is based a system for the supervision of operating, which has enabled Mr. Hertford to build up the efficiency of the service in his exchange to a very satisfactory point, and his methods will be fully described in the future.

NEW YORK CAPITAL RECEIVING SERVICE FROM PROGRESSIVE INDEPENDENT COMPANY.

TWENTY-FIVE per cent. increase in business for the year speaks well for the enterprise of the management of the Albany Home Telephone Company, of Albany, N. Y. Operating in the capital city of the state, which is the headquarters for a particularly active competing company, the Independent organization has succeeded in increasing the number of its subscribers by about 1,000 during the past year, making the total number connected to its plant about 4,000. The only exchanges owned by this company are in Albany County, and are located at Albany, Watervliet and Green Island, the latter two being of comparatively small size. There are, however, connected to the system 375 toll stations, of which 200 have been added within a year; also 100 rural line subscribers, this being an extremely good showing for this district, which is quite thickly populated. About half of this class of business has been added since the last convention. Business is regularly interchanged with other Independent companies operating in Troy, Schenectady, Cohoes, Amsterdam, Ballston, Saratoga, Mechanicsville, Glens Falls, Hudson, Poughkeepsie, Kingston, Catskill, Rome, Utica and Chatham. Toll business is carried on by subscribers for a distance of 200 miles north, 100 miles southerly and 100 miles to the west. Unfortunately, the lack of proper Independent development in the cities of Western Massachusetts prevents the company from furnishing the connections desired by many of its subscribers, but it is hoped that this condition will be remedied before long.

Progress has been substantial, the plant is constructed according to proper methods, and further development of this territory should proceed at an extremely rapid rate. The officers of the company are: Howard Hendrickson, Pres.; Irving H. Griswold, Vice-Pres.; J. H. Prince, Jr., Sec.; H. M. Keys, Mgr.

QUERIES

OPERATION OF AUTO-STARTERS.—(714.)

Will you please inform me how an "auto starter" operates in connection with a Westinghouse induction motor? R. J.

An auto-starter is a device used to start polyphase induction motors having short circuited secondary windings. In its stand-

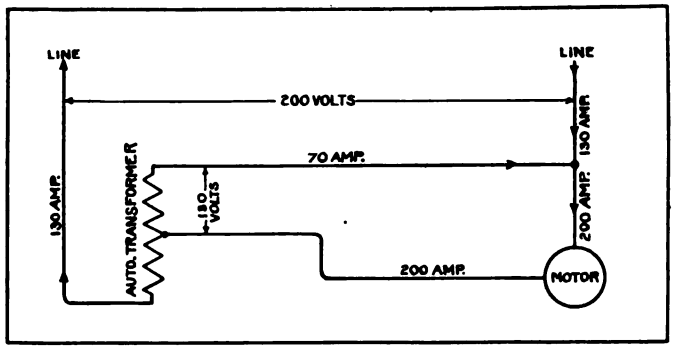

Fig. 714-a. Instantaneous direction and value of current in one phase.

ard form it consists of an oil-immersed switch of the drum type and two auto-transformers, so connected and operated that grad-

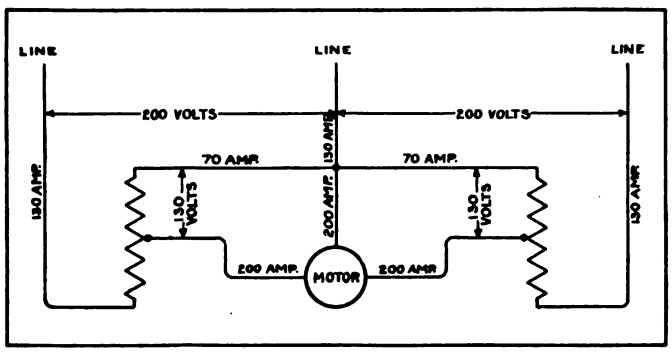

Fig. 714-b. Effective values of amperage at starting.

ually increasing voltages are applied at the terminals of the motor. In this way the starting torque is developed in a series of easy steps and the motor is gradually brought up to its full running speed. The method of starting the motor is illustrated in Figs. 714*b* and 714*c*. Fig. 714*b* shows a 3-phase auto-starter connected across a 200-volt line, the motor being connected to taps from the auto-transformers applying 130 volts to the terminals. Fig. 714*c* shows this combination diagrammatically when the motor is connected directly across the line. It should be noted that the auto-transformers are disconnected so that no current passes through them when the starter is in the running position. Figs. 714*d* and 714*e* are complete wiring diagrams for a 2-phase and a 3-phase circuit showing the connections between the line, the auto-starter and the motor.

The action of the auto-transformer is illustrated in Fig. 714*a*, which shows the instantaneous direction and value of the current in one phase of the motor circuit. It will be noted that the transformer is connectetd across a 200-volt line. The motor is connected from the line to a tap from the transformer giving 130 volts across the motor terminals. If we assume that the instantaneous value of the motor current is 200 amperes, the line current will be 130 amperes approximately, and the circulating current supplied by the transformer will be 70 amperes. This condition can be taken to represent two wires of a 3-phase circuit in which the current was zero in the third phase.

Referring to Fig. 714*b*, the effective values of the amperes at starting are given for all three phases of the motor and line. In this case it is also assumed that the motor current is 200 amperes. In a 2-phase circuit the arrangement of current is similar, as will be seen by the complete diagram, Fig. 714*d*. The action of the auto-transformer is similar to that of a regular transformer, the current being inversely proportional to the voltage, so that the line voltage times the line current is approximately equal to the motor voltage times the motor current, the excess current in the motor circuit being furnished by the transformer action.

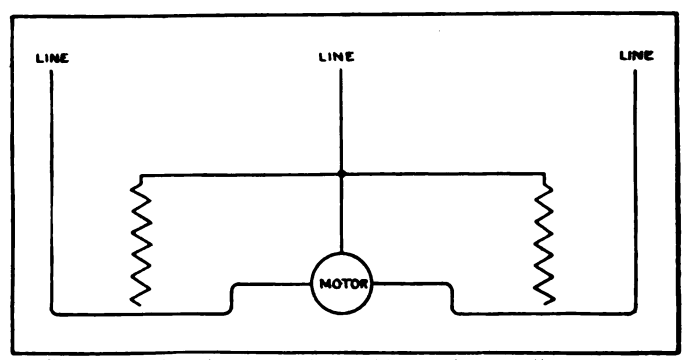

Fig. 714-c. Running connections, with transformers disconnected.

Torque: The torque of an induction motor is proportional to the square of the voltage applied at the motor terminals. By referring to Fig. 714*b*, the torque of the motor will be less than the torque if the motor were connectetd to the line by the ratio of 130 squared, divided by 200 squared. By referring to the curves in Fig. 714*b*, it is seen that when the motor is starting from rest, the torque gradually increases to a maximum and then drops off. Bearing these curves in mind, it may be readily seen that sufficient voltage must be applied to the motor terminals to produce sufficient torque to start the load. This voltage will

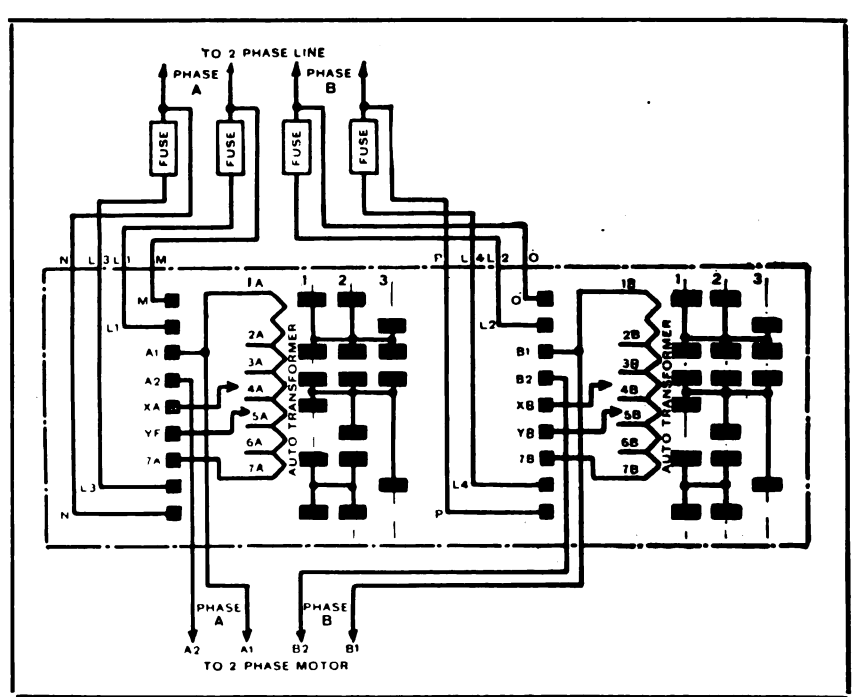

Fig. 714-d. Diagram of connections for auto-starter used in connection with motor running on two phase line.

Digitized by Google

then bring the motor speed up until the torque of the motor reaches the torque of the load. At this point additional voltage must be applied to the motor terminals to increase the speed of the motor. This is similar to starting a direct current motor when the voltage at the motor terminals is changed by altering the resistance in the starting rheostat.

With the usual form of auto-starter, at least two starting notches are provided in addition to the running notch, so that the change from one voltage to another can be more gradual and the line current will be less than if only one starting notch were provided. Because of the self-induction of these motors a smaller number of starting steps are required than for direct current motors.

By referring to Figs. 714*d* and 714*e*, it will be seen that the auto transformers are provided with five intermediate steps. This permits of the auto starter being so connected that the first notch of the starter will impress sufficient voltage on the motor terminals to start the load. The second notch will then be connected to a tap on the auto-starter which will be midway between the first tap and the line. The connection for the starting notches should be made to the same voltage taps on the auto-transformer for each phase.

For instance, if XA is connected to 4A, then XB should be connected to 4B, YA should be connected to 6A, and YB should be connected to 6B. In this way similar currents pass through all windings.

Generally the line current at starting is considerably greater than the line current when the motor is brought up to speed. In the standard motors the line current is generally two and a half times as great as the full load current when the motor develops full load torque at starting. Usually, however, these motors are started up light so that considerably less line current is required at starting. In most cases, however, this line current will exceed the full load running current and any fuse placed in this line would open during starting. To avoid this, extra leads are brought out of the auto starter and connected to the line beyond the fuse. These leads, which are marked M, N, O and P, are used only in the starting positions, the wires leading through the fuses being disconnected at this time. On the third or running notch of the auto starter the leads M, N, O and P are disconnected and the line wires L_1, L_2, L_3 and L_4 are connected to the line through the fuses. This matter is made clear by reference to the two-phase diagram, Fig. 714*d*.

(Continued on page 423.)

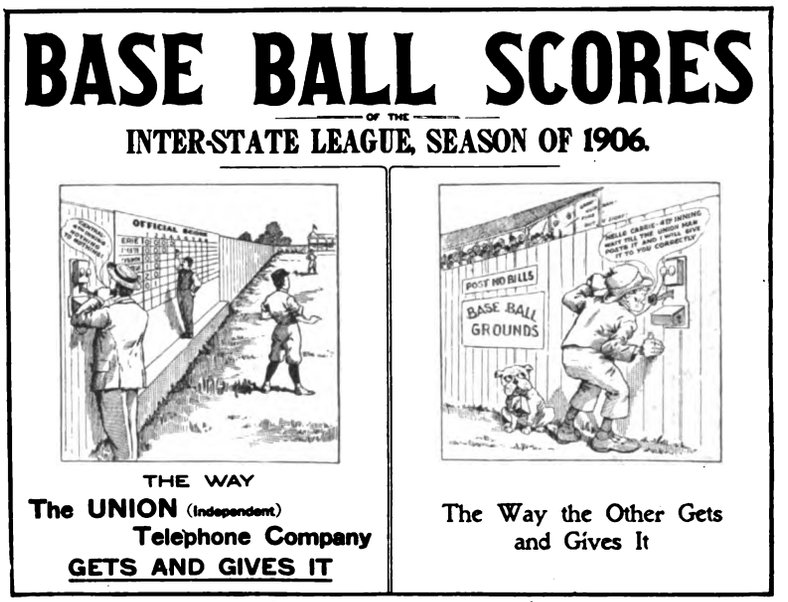
IN THE OPERATING FIELD

REMARKABLE PROGRESS OF INDEPENDENT COMPANY IN ITHACA, NEW YORK.

ENTHUSIASTIC support of the Independent Telephone Company by the people of Ithaca, N. Y., and vicinity has contributed to make its growth extraordinarily rapid. Last September the company had between 1,200 and 1,300 telephones; now about 3,200 are connected to its exchange at Ithaca, and various lines entering this district which are controlled by the company. Operating in a territory which was well developed by the Bell Company the latter's system is being gradually broken up. Not long ago the George Junior Republic, of Freeville, N. Y., signed a contract with the Independent Company, which gives it a switchboard, instruments and Independent service. The Trumbull Corners Company was up to the middle of last January a sub-licensee of the Bell Company. The benefits of Independent service were, however, too obvious, and a contract with the Ithaca company was entered into. Later an attempt to buy stock by the Bell concern was frustrated by the purchase of a controlling interest by friends of the Independent movement.

In Newfield, Enfield, Mecklenburg and Trumbulls Corners there are now approximately 100 subscribers each, and the Ulysses Telephone Company, operating in the towns of Ulysses and Hector, has a long distance contract with the Ithaca Company. Contracts with other small companies in the vicinity furnish connection with all the neighboring towns, so that the Independent development of the county is remarkably strong. New lines are being added constantly, and one toll section, as well as one rural and two local sections have recently been added to the switchboard. The construction is of the highest character, and the nature of the service is such that the Bell Company, which formerly completely controlled the territory, is said to have now telephones only in Ithaca, and a few toll stations in the surrounding country.



The Union Tele. Co., of Erie, has Placarded the Town with the Poster of which this is a Reproduction. Its Competitor Does Not "Stand In" with the Base Ball Men.

HOME TELEPHONE COMPANY RAPIDLY BUILDING UP ITS SYSTEM IN HAMILTON, OHIO.

DURING the past year Hamilton, Ohio, has seen the growth of the Independent Telephone Company proceed constantly until it now furnishes service to 30 per cent. more people than were connected a year ago. This company, which is managed by the following officers, F. M. Hughes, President; J. W. Sloneker, Secretary; W. Gilbert Thompson, General Manager; operates in Butler County, Ohio, and has exchanges at Hamilton, Trenton, Somerville, Reily, Shandon and Bethany, of which Trenton and Shandon have been added within a year. The principal exchange, which is operated on the common battery system, is at Hamilton, and has 2,100 subscribers, representing a very fair development in the town, which, however, is bound to increase still further in the future. Eighteen toll stations have been established in the surrounding country, and furnish service to many people. Exceptionally satisfactory results have been obtained by this company in securing rural line subscribers, the number of which has been doubled during the past year, making a total of 800. This class of business is handled over 90 separate lines, of which 40 have been added to take care of the 400 additional subscribers. One hundred miles of toll line are also operated by the company. These furnish the desired connection to Independent companies in Oxford, O., and Brookville, Ind., and completely cover Butler County, O., connecting with the lines of the United States Long Distance Company for service to the larger and more remote cities of the state. A plant which can be maintained very economically is installed, there being 5 miles of underground cable, and 12 miles of aerial cable of different sizes in service, of which there have been added two miles of each during the past year. Still further increases are expected in the business of this company at a rate proportionate to the extremely good showing which has been made in the past.

DEVELOPMENT OF TOLL STATION BUSINESS OF TRI-STATE COMPANY HAS BEEN NOTABLE.

NEW exchanges for three different towns have been added to the plant of the Tri-State Telephone and Telegraph Company, which has headquarters at Minneapolis. Large exchanges at St. Paul, White Bear, Faribault, Albert Lea, Litchfield and Grand Forks are owned by this company, with 23,700 telephones connected in the seven towns. This, however, does not represent the total size of the system, as in addition the company operates 15 common battery exchanges, and lines in the smaller towns, not enumerated here, bring the total number of subscribers up to 70,000. During the past year 3 new common battery exchanges have been built, and 5,500 new subscribers have been connected. A vast system of toll stations, of which there are at present 1,100, 200 having been added during the past year, furnish service throughout many counties.

The local company was originally conducted separately, under the name of the Twin City Telephone Company, but has recently consolidated with the Tri-State Telegraph and Telephone Company, thus acquiring the large local business which has been described. The original Tri-State was purely a long distance company, and has brought into the new organization, which bears the same name, 2,500 miles of toll line, which has been increased from the 1,900 miles which were in service last year.

Extensive construction work has been carried on during the past year in all cities where exchanges are operated. In Minneapolis alone there have been added 124,535 feet of 100 pr. cable, 174,620 feet of 200 pr. cable, and 66,894 feet of 400 pr. cable, as well as enough cable of other sizes to bring the total amount of underground cable up to 527,837 feet. Of aerial cable there have been added 531,176 feet, including 171,268 feet of 100 pair, 278,109 feet of 50 pair and others of sizes varying between 150 and 25 pair. Proportionate extensions have been made at St. Paul and other cities. These figures give a very inadequate idea of the extent of this extremely important system, but are

sufficient to show that the growth and progress in this locality has been rapid, and that conditions are extremely favorable for further extension of the Independent company. The officers of the company are: President, E. H. Moulton, Vice President, L. L. C. Brooks; General Superintendent, L. D. Richardson.

LARGE SYSTEM IN ONE ILLINOIS TOWN BUILT UP IN LITTLE MORE THAN A YEAR.

IN Freeport, Ill., the Stephenson County Telephone Company is making an extremely good showing, having built up a very large subscription list in a little over a year. The company operates a single common battery exchange in Freeport, which is a city of about 15,000 population. Connected to its exchange there are 1,725 subscribers, of which 1,488 have been added since the last convention. This it will be seen is somewhat higher than one telephone for every ten people, and is far ahead of the Bell Telephone Company in the same town, the latter company having only 550 subscribers.

Service to the surrounding country is given by means of 25 toll stations. Connections are also made for about 150 rural lines, having an aggregate of 1,500 subscribers. Development in this class of business had proceeded to a very considerable point before the extreme activity of the past year caused the city subscribers to be so largely increased, consequently the rural line growth has resulted in the additional connection of only about 200 subscribers. The lines for this class of rural business are not owned by the Stephenson County Company, but receive service through its exchange. Contrasted to this high development, the Bell Company is said to have not over 500 rural line subscribers, and to have added only 40 to 50 during the past year.

The amount of toll line operated by the company conforms to its policy of thoroughly developing the local territory without reaching out extensively to other places. About 60 miles are owned directly, and the company controls the operation of about 50 miles more, owned by companies closely associated. The toll line plant owned by the company is, however, nearly double what it was a year ago. Considerable aerial cable is used in the city, there being about five miles in service, of which two have been added within a year. The company has an extensive system of connections with Independent companies operating in neighboring towns. Service is interchanged with the following: Carroll County Tel. Co., Savanna, Ill.; Daviess County Tel. Co., Galena, Ill.; Ogle County Tel. Co., Rochelle, Ill.; Dixon Home Tel. Co., Dixon, Ill.; Rockford Home Tel. Co., Rockford, Ill.; Interstate Ind. Tel. & Tel. Co., Sterling, Ill The toll business over the above system is growing rapidly, and from Freeport and the connecting rural lines messages are sent over the entire eight counties of Northwestern Illinois and two counties in Southern Wisconsin.

OPERATION OF AUTO STARTERS.

(*Continued from page 421.*)

The standard auto starter is arranged for connecting both two-phase and three-phase. On a three-phase circuit the sides of the line M and O are connected together, also lines L_1 and L_2.

The operation of the auto starter is as follows:

The handle is moved from the off position to the first starting notch. After the motor has come up to its full speed on this notch the handle is moved to the second starting notch and thence to the running notch. In order to stop the motor the handle is moved one notch further. This throws the switch to the off position and the handle is disconnected from the switch so that it may again be returned to the starting position. The advantage of this is apparent, as it gives a quick brake in going to the off position and the switch is not dragged back over the starting notches, causing unnecessary burning on these notches. The handle is arranged with a thumb latch which locks it securely in the off and running positions. A ratchet wheel inside the controller indicates the two starting notches and prevents the handle being returned from the running notch to the off position past the two starting notches.

PROGRAM OF THE ANNUAL CONVENTION OF THE NATIONAL-INTERSTATE TELEPHONE ASSOCIATION.

Auditorium Hotel, Chicago, June 25-28th, 1906.

JUNE 25TH.

10 A. M.—Meeting of Committees:
Standard Forms of Accounting.
Standardization of Equipment.
Standard Operating Rules and Regulations.

A GENTLEMAN prominent in the Independent operating telephone field, and a telephone engineer, recently wrote us, "I wish to again thank you for the pleasant trip, and the privilege of seeing your apparatus, which I consider the most revolutionary of any yet produced in the telephone business." He voices the sentiment of all who have seen it.

Our system is simply perfection in perfect simplicity. We have, as pronounced by prominent telephone engineers, a thoroughly complete, simple and perfect system, by which we do automatically everything necessary in a thoroughly up-to-date telephone system; a number of things never before thought possible in either manual or automatics, and many things which cannot be done manually. We use less switches and parts than any other system.

We can change your present central energy manual system to automatic without the necessity of changing the telephones. This is an enormous saving, and it will pay you to investigate.

We install exchanges of any capacity.

Write us for our pamphlet No. 666, which describes our system.

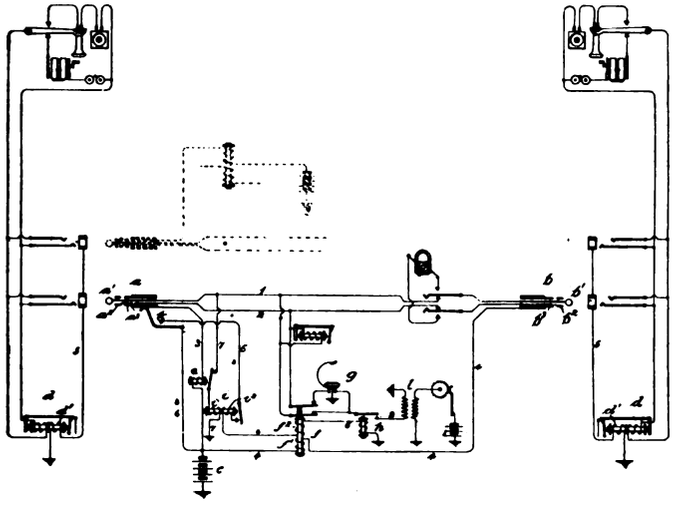
TELEPHONE PATENTS

SECRET SYSTEM.

Henri A. André, Paris, France, patents (No. 816,894; dated April 3, 1906; filed April 27, 1904; serial No. 205,089) and assigns to the Western Electric Co., Chicago, Ill., a secret switchboard system.

The object of this invention is to prevent operators from listening on a busy circuit. This is accomplished by auxiliary apparatus, including a plug seat switch, *k*, which closes its contacts when a plug is removed from its seat, a cut off relay *f* to open the operator's listening circuit from the line and a transformer *l*, one winding of which includes an interrupter and the other terminates at ground and the open contact of relay *h*.

When an answering plug is inserted in a jack it raises the potential of the sleeve circuit, current flowing from battery *c* and wire 3 through the sleeves of plug and jack to ground. If an operator attempts to insert a plug in a busy line the tip comes in contact with the sleeve thimble of the jack, and battery will



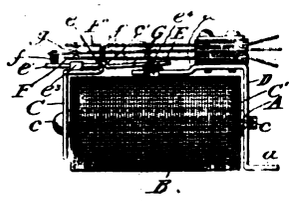
then flow over the tip circuit of the cord to ground through winding i^2 of relay *i*. Circuit 6 will then be closed and relays *f* and *h* actuated, causing the disconnection of the operator's receiver from the line and the application of the busy test, the circuit of which is completed through contacts of relay *h* to the receiver ground.

When a calling plug is inserted in a jack, circuit 4 is completed and the relay *f* actuated by means of winding f^1. It will be apparent by tracing out this circuit that an operator is enabled to answer a call and ascertain the number desired, but after the calling plug has been inserted in a jack it is impossible for her to listen, owing to the fact that the wiring to her receiver is open at the relay contacts.

RELAY.

Charles Lane Goodrum, Rochester, N. Y., patents (No. 808,834; dated Jan. 2, 1906; filed November 11, 1905, serial No. 286,925) a relay.

In this invention is shown a new design for a relay which has for its object the arrangement of the parts to obtain a maximum effect with a given current and to secure facility in assembling. Attached to the core *A* of the magnet B are two pole pieces *C* and *D*. Pole piece C is provided with an upturned knife edge ridge c^1 which forms the pivot for the armature *E*. Pole piece *D* is utilized as a support for the circuit changing springs. The armature *E* is provided with a notch *e*, which engages in the ridge c^1 of the pole piece *C*, and forms a pivotal point for the movement of the armature in a vertical direction. Insulating pins f^2 perform the double function of holding the armature in position



by reason of a downward pressure exerted by the circuit changing springs and also of preventing a lateral movement of the armature. Strips of non-magnetic material, e^3 and e^4, prevent actual contact between the armature and pole pieces, and thereby eliminate danger of these parts sticking together when no current flows through the relay winding.

The inventor describes in detail means for manufacture which reduce the cost, and which also enable the coil to be readily removed when so desired without altering the adjustment for the contact members.

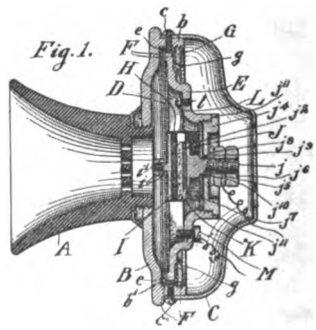
TRANSMITTER.

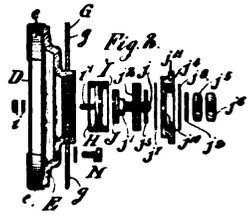
Michael Setter, Chicago, Ill., patents (No. 819,084; dated May 1, 1906; filed October 31, 1904; serial No. 230,759) and assigns to the Automatic Electric Company, Chicago, Ill., a transmitter.

In this invention means are disclosed for the design of a transmitter in which the transmitting mechanism consisting of the diaphragm, carbon chamber electrodes, and rear support are constructed in the form of a unitary structure, interchangeable with the containing case.

Referring to the illustrations, the frequently used bridge support is supplanted by a cup or cone plate *E*. To this the diaphragm *D* is attached by a clamping ring *e*. The carbon chamber *H* is clamped to the diaphragm by means of the stem i^1 and nut *i*. The rear of the chamber is closed by the felt ring j^2 held in position by clamping ring j^3 pressing it against the rear electrode, which is held in position by the externally threaded supporting member j^4, which also serves to adjust the distance between the electrodes by means of the direct pressure it exerts upon the clamping ring j^5. Mica rings j^7 and j^8 insulate the rear electrode from the containing case and adjusting member j^4.

The transmitter front plate, *B*, is formed with an internally





threaded flange *b*, which engages the clamping ring *G* of the containing case *E*, and holds it in position. With this construction it will be evident that the transmitting unit can be readily removed for repairs or substitution; and that the rear electrode can be withdrawn from the unit by unscrewing the adjusting member j^4.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

MAKING A CALCULAGRAPH RECORD.

EXACT accounting for all toll conversations by means of legibly stamped and accurately timed toll tickets may be obtained through the proper use of the calculagraph.

To commence a record a toll ticket is placed in the left hand end of the slot with the printed side downward. The back of the ticket should be pressed lightly against the rear of the slot, and with the fingers resting lightly upon its surface it should be slid to the right until it strikes the guide post. When it has reached this point it is in the correct position to be stamped, and the right hand lever should be pushed in the direction away from the operator, as shown in Fig. 1. Considerable force should be exerted and the lever kept moving until the rear end of the cam touches the top of the main plate. This prints upon the face of the ticket the time of day. The ticket should be left in the same position, where it should have been held constantly by the pressure of the fingers, and immediately after the lever has been pushed in the direction away from the operator as far as it will go it should be pulled sharply toward her until the front end of the cam touches the main plate (Fig. 2). This prints upon the ticket the two "elapsed time" dials. The ticket should then be removed and the operator is ready for printing similar records upon other tickets as the connections are put up.

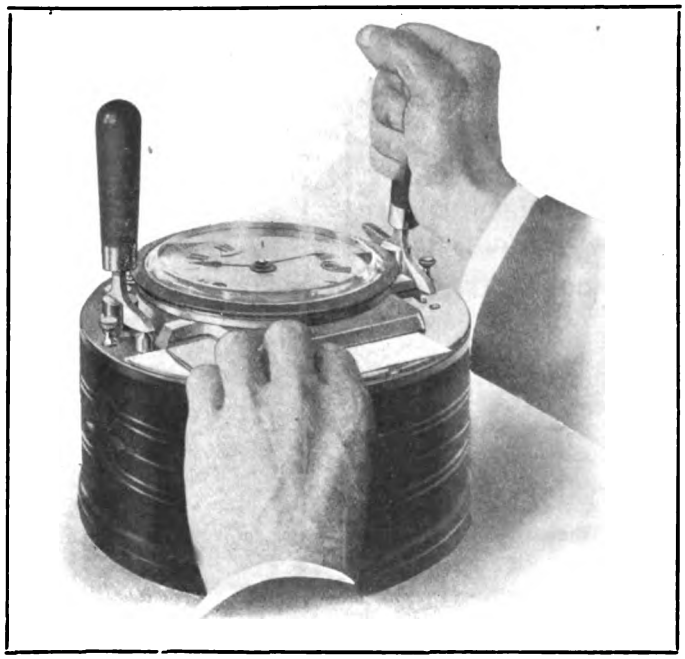

Fig. 2. Immediately after the time of day has been printed the operator pulls the same lever forward, thus printing the elapsed time dials.

When it is desired to record the end of a conversation the proper ticket should be taken up and again inserted in the slot in the same position as at first. This time, however, the left hand lever is used to stamp the marks which complete the record. It is pulled forward—that is, toward the operator—until its cam point touches the plate, as illustrated in Fig. 3. The pull should in this case also be vigorous. This operation prints arrows in the centre of the two elapsed time dials, and the arrows are pointed to figures on the dials which represent the time which has elapsed since that record was commenced. Exchange managers who are having trouble in checking their toll business by other means may obtain valuable information by writing the Calculagraph Company, 1437 Jewelers' Building, New York City.

THE TRUMBULL ELECTRIC MANUFACTURING CO., Plainville, Conn., has recently issued the sixth edition of its catalogue dealing with switch and panel board apparatus. In it are listed switches for all purposes and current carrying capacities, each type being accompanied by a table which gives full information relative to the different sizes and prices. Particular attention is drawn to the switch adapted to the needs of telephone or battery service. This is an all copper switch mounted on porcelain with self-adjusting jaws. In the rear portion of the catalogue, panel boxes and small switchboards are listed and described. Copies will be mailed to parties interested upon receipt of a request.

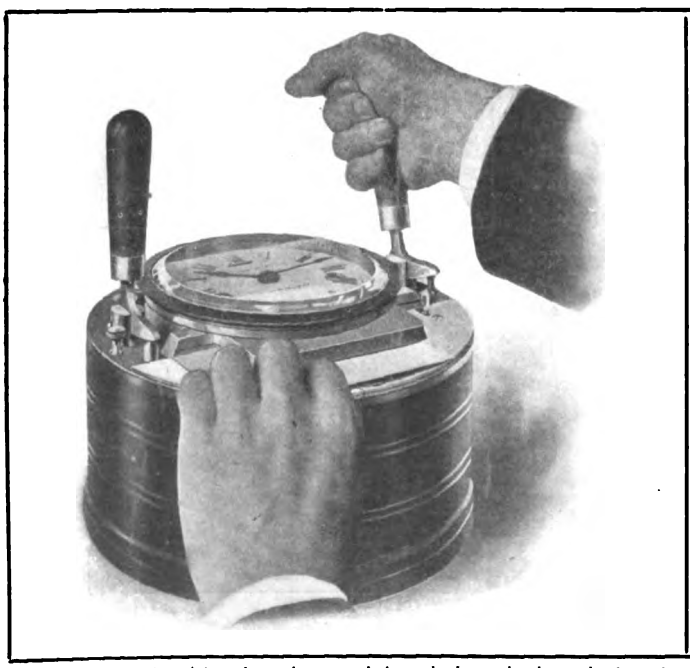

Fig. 1. With the ticket face downward in calculagraph slot a backward motion of the right hand lever prints the time of day.

Fig. 3. The record is completed by a strong forward pull on the left hand lever, which prints arrows in the elapsed time dials.

IN THE MANUFACTURING FIELD

A NEW V. B. RINGER.

SIMPLICITY of adjustments and wearing parts is the most striking feature of the ringer recently brought out by the Vote-Berger Company, of La Crosse, Wis.

In its general construction the company states that care has been taken to make a piece of apparatus in which the working parts are all accurate, the winding perfect and the magnet made from the best steel obtainable, highly and permanently tempered. The cores and armature are made from the best quality of Norway iron, annealed after all machine work is finished. In place of the cone point screw, used by most manufacturers to support the armature, a pinion bearing is employed, which not only allows a free movement but prevents the possibility of the ringer being put out of adjustment by inexperienced help. The armature is adjusted when it leaves the factory and cannot be changed by the inefficient trouble men in exchanges that cannot afford high class help able to do this work properly.

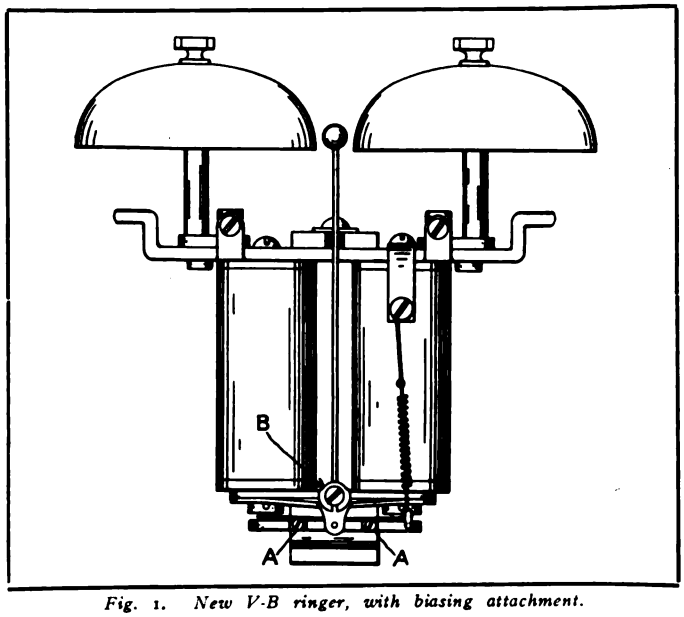

Fig. 1. New V-B ringer, with biasing attachment.

The adjustments are the main feature of the ringer and are certainly unique. Fig. 1 shows a drawing of the ringer, with the biasing attachment. In order to set the support of the armature farther from the cores all that is needed is to twist the screw B to the right. Twisting it to the left draws the armature support closer to the cores. The screws A-A are only used when the ringer is biased and are for the purpose of adjusting the distance from each core to each end of the armature. A mere twist of these screws to the right increases the length of the stop on the armature, and hence does not allow it to come so close to the core at the end of the stroke. This ringer can be adjusted for pulsating currents in not more than thirty seconds.

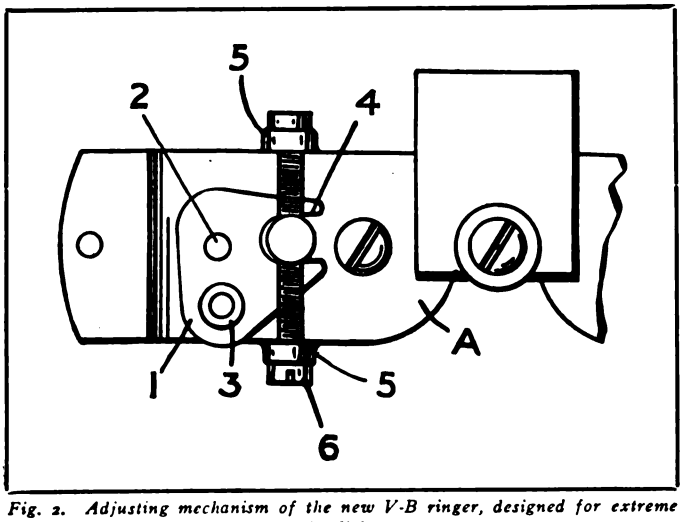

Fig. 2. Adjusting mechanism of the new V-B ringer, designed for extreme simplicity.

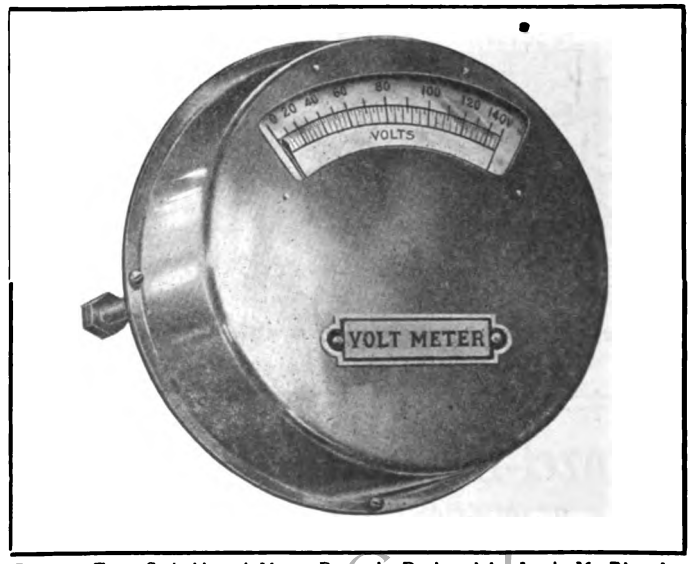
The gongs are adjusted by means of the screw shown at the top, and the means of adjustment are more fully shown in Fig. 2. By turning to the right the screw marked No. 6 in Fig. 2 the gong is swung away from the centre. This is accomplished by means of a bell crank, 1. This crank is riveted to the frame A by the rivet 2, about which it turns. The gong post, 3, is riveted to this bell crank. The stud, 4, plays freely in the slot of the bell crank and is threaded to fit the screw 6. When the screw 6 is twisted to the right, the bell crank is drawn down by the traveler 4, so that the gong post 3 is swung outwardly. This not only makes an extremely rigid construction, as everything is mounted firmly on the frame, but also makes the adjustment extremely simple.

It will be noticed that all adjustments are made with an ordinary screw driver, no wrenches being required; also that in making the screw driver adjustments it is never necessary to get at the back of the ringer nor to get at it from either end.

THE PIGNOLET SWITCHBOARD METERS.

ESPECIALLY adapted to conditions prevailing in many telephone exchanges is the style of measuring instrument recently developed by Louis N. Pignolet, 78 Cortlandt street, New York. Both voltmeters and ammeters are furnished in various readings up to 150 volts and 50 amperes respectively. The instrument is enclosed in a cylindrical case 5 inches in diameter and 1½ inches deep, which, although in keeping with the simplicity of the instrument which assists in securing economical construction, is attractive in design. It is finished in polished nickel, but this may be changed to other styles if specified.

The instruments are especially designed to permit of attachment to switchboards by two bolts, which are provided on the back of each meter. These also serve to convey the current, so that but two holes in the board are required. The permanent magnet principle, which enables high accuracy and an even scale division to be secured, has been adopted for the working parts of



Compact Type Switchboard Meter Recently Designed by Louis M. Pignolet.

HAVING specified GORDON CELLS for your switchboard transmitters, small central energy systems, etc., you need not worry further about the battery part of your equipment. You may then enjoy that peculiar sense of satisfaction which comes in knowing that you have ordered the BEST; a battery which has been used on all kinds of telephone work for the past ten years and, under all conditions, has given such entire satisfaction that it is now the STANDARD TELEPHONE BATTERY.

The first cost may be a little higher, but ask some disinterested telephone man who has used GORDON CELLS for several years, and he will tell you that the original investment was a wise one, for he realizes now that he has saved MONEY—not to mention the fact that he has not had to worry about his battery, and has given it no attention since he set it up.

Those manufacturers who send GORDON CELLS with their equipment are WISE; they realize that the BEST battery contributes in no small degree to the successful working of their apparatus.

It is no trouble to recharge the GORDON CELL now because complete interiors are sent with each recharge.

4-Bar, Bridging, Type "L"
with any ringer resistance desired.

Western Pioneer Telephone

Five-Bar Bridging

Our **New Western Pioneer** telephone can be furnished for all classes of **special service** such as **ring through, non-interfering, divided circuit, central checking party line** and in fact can be used where any generator call telephone is now being used. The apparatus used in this instrument is of **New Western design.**

The **common battery type** of **magneto telephone** is becoming popular. The cabinet is compact and neat in appearance, all parts are **conveniently mounted,** the wiring is simple and the cabinet will accommodate a **three, four or five-bar generator.** We manufacture all of the parts used in this instrument. When the upper compartment is open the generator, ringer, hook switch, induction coil and receiver binding posts are exposed. When the battery box is removed by sliding downward, the batteries and battery connections are exposed.

the instrument. The magnets are of imported special steel, carefully treated to insure permanency. The designer of this instrument claims that it fully meets the requirements of telephone managers who desire to secure accurate measuring instruments at prices which permit of their use for general testing.

GORDON CELLS.

LOWERING the cost of battery maintenance to a very small amount is said to have been accomplished by the designer of the improved Gordon cell, several parts of which are illustrated upon this page. Although all of the fundamental parts which have contributed to the success of this cell in its old form have been retained they have been so simplified that they may be quickly and easily handled. The complete cell has only seven parts. The copper oxide or negative element is used in flake form and is shipped in perforated metal cylinders of the type illustrated in Fig. 2. The perforations of the cylinder are closed in such a way as to prevent leakage in shipment.

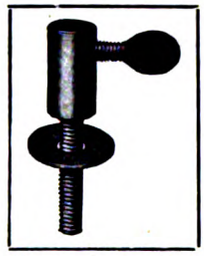

Fig. 1. Gordon binding post.

Attached to the outside are three porcelain insulating supports upon which rests the zinc. By this means it is prevented from coming in contact with the copper to form a short circuit within the cell. The circular form of the zinc (Fig. 3) enables it to be slipped over the cylinder, where it is supported by the lugs. A heavy insulated wire is attached to the zinc and is run through the cover of the jar, being left long enough for making a connection with the next cell. The solution contains a high grade of caustic soda, which is shipped in powdered form in sealed metal cans (Fig. 5).

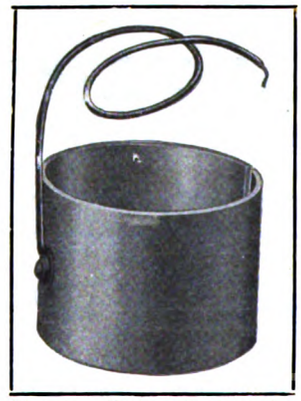

Fig. 3. Zinc and connecting wire used in new Gordon battery.

The jars are made of glass, porcelain and enameled steel and are fitted with tin, porcelain and fibre covers. The binding post used by the company is illustrated in Fig. 1. As will be seen, it is simple in construction, strong and neat appearing, and as it is manufactured with considerable care, is durable.

The creeping of the solution by evaporation is prevented by pouring on the top of the cell the contents of a small bottle of paraffine oil (Fig. 4), which is shipped with each cell or recharge. The company claims for a battery of this type, in addition to its simplicity of construction, the advantages of a strong and constant current and guarantees for various types and sizes a specific number of ampere hours. The battery is said to work equally well upon an open or closed circuit. The cost of renewal is small and the nature of the elements is such that local action is eliminated and the internal resistance of the cell is extremely small. Low temperature does not interfere with the working of the battery. The cell may be easily kept clean and the absence of unpleasant odors is an important feature. As the life of the cell is long and the cost of material and labor for making renewals is very small the company is meeting with gratifying success. It will be pleased to send further information to whoever makes inquiries.

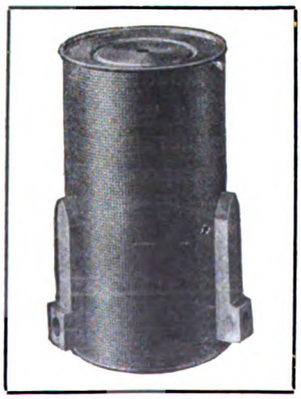

Fig. 2. Cylinder containing negative element of Gordon cell.

Fig. 4. Bottle of paraffine oil for Gordon battery.

THE GRAY TELEPHONE PAY STATION COMPANY, 64 Asylum street, Hartford, Conn., has recently filled an order for what is probably the largest number of slot machines ever installed in a single store. This was for 1,600 of the company's new model No. 24 pay stations, which were recently placed in John Wanamaker's in Philadelphia. These instruments are for use with a branch exchange system where telephones are provided at every counter. The slot machines are used for the collection of coins from customers of the company who are allowed to talk from any instrument in the retail dept.

THE W. G. NAGEL ELECTRIC COMPANY, Toledo, O., has been paying especial attention to the design of appliances fitted to meet both regular and special needs of high grade distribution work. Its line of material deserves careful consideration by managers who are anxious to reduce maintenance expenses.

THE INDIANA STEEL AND WIRE COMPANY, Muncie, Ind., has issued some very interesting information concerning its double galvanized telephone and telegraph wire. The company states that it employs improved processes of galvanizing by means of which a coating is given to the wire which will withstand the severest tests of a telephone company. It is said that experiments conducted in some of the leading college laboratories have shown that this wire is above the ordinary standard, and the company will be pleased to have an opportunity to give definite information concerning these tests to all persons who are interested.

STROMBERG-CARLSON CABLE PLANT ENLARGED.

ABOUT two weeks ago the Stromberg-Carlson Telephone Manufacturing Company, Rochester, N. Y., broke ground for a large extension to its cable plant. This new building will cover a ground space of 313x175 feet. It is to be one story with saw-toothed roof to correspond with the balance of the plant. To take care of this large extension the company has provided a new 750 horse-power Hamilton-Corliss engine direct connected with a 550 K. W. direct current generator. There have been also provided two additional boilers of the Murphy type of 191 horse-power each. This large addition to the plant requires the erection of another stack or chimney equal in size to the present stack.

Fig. 5. Sealed metal can of caustic soda for Gordon battery.

The building is to be used for the manufacture of aerial and underground cable, also the various insulated wires, cords, etc., made by this company, the business in which has been growing so rapidly.

THE WEEK'S MESSAGES

NEW COMPANIES.

TROY, ALA.—The Orion Telephone Company has been organized at Troy. It will build a line from Troy to Orion, Pine Level and China Grove. W. C. Starke, of Troy, is president, and W. G. Chancy, of Orion, secretary and treasurer.

DURANGO, COL.—The Florida Mesa Telephone Company has been incorporated with a capital stock of $1,000. The incorporators are G. W. Spencer, R. L. Alexander, P. A. Stark, of Durango.

PAONIA, COL.—The Grand Mesa Telephone Company has been incorporated with a capital stock of $5,000. The incorporators are A. L. Binford, C. C. Hawkins, W. W. Follanshie, Paonia.

CARLYLE ILL.—The Citizens Telephone and Telegraph Company has been incorporated with a capital stock of $15,000. The incorporators are T. E. Ford, A. Westermann, H. V. Murray.

STRASBURG, ILL.—The Strasburg Mutual Telephone Company has been incorporated with a capital stock of $10,000. The incorporators are J. F. Kull, Martin Hamm and L. J. Kircher.

SPURGEON, IND.—The Spurgeon Telephone Company has been incorporated with a capital stock of $2,000. B. A. Humphrey is president.

OLATHE, KAS.—The Olathe & Pioneer Telephone Company has been incorporated with a capital stock of $5,000.

ROSSVILLE, KAS.—The Farmers' Mutual Telephone Company has been incorporated with a capital stock of $5,000. The directors are C. A. Taft and D. Kerr, Meeker, Okla.; W. G. Hall and T. A. Ward, Rossville, and L. J. Hardan, Midlothian, Okla.

SOUTH EVERETT, MICH.—The South Everett Farmers' Telephone Company has been organized with the following officers: President, E. L. Hornbeck; secretary, H. E. Douglass; treasurer, M. H. Angevine; superintendent construction, E. L. Hornbeck. The company's lines will connect with those of the Citizens Company at Newaygo.

PALO, MICH.—The Fenwick Telephone Company, Palo, has been incorporated with a capital stock of $8,000.

TWINING, MICH.—The Arenac-Ogemaw & Losco Telephone Company, Twining, has been incorporated with a capital stock of $1,000.

HANLEY FALLS, MINN.—The Hanley Falls Telephone Company has been organized with a capital stock of $10,000. The officers are I. Johnson, president; L. S. Orwoll, vice-president; W. E. Hanson, secretary; H. M. Hanson, treasurer.

RICH HILL, MO.—Gander Bros. are interested in the formation of an Independent telephone company at Rich Hill.

SWANTON, NEB.—The Swanton Mutual Telephone Company has been incorporated with a capital stock of $5,000. The company will construct and operate a telephone system in and around Swanton.

AVON, O.—A new Independent Telephone Company is being formed with a capital of $20,000, to give service to Avon, French Creek and Dover Center. The company will be controlled by capitalists at Lorain, but will be independent of the Black River Telephone Company. The central exchange will be at Avon.

IRONTON, O.—Robert A. Knapp contemplates the formation of a new Independent Telephone Company at Ironton. The company will be capitalized at $5,000, and it is the intention of the incorporators to install one of the best plants to be found in southern Ohio.

TORONTO, O.—The Toronto & New Cumberland Telephone & Telegraph Company has been organized with a capital stock of $15,000 by Salem business men, including W. S. Holloway, R. V. Hampton, M. L. Young, Harry Young and C. L. Smith. Franchises have been secured at Toronto and New Cumberland, and the new company will install a system throughout that territory.

SPENCER, OKLA.—The Spencer Mutual Telephone Company has been incorporated with a capital stock of $3,300. The incorporators are C. C. Kramer, W. L. White and H. W. Malott, of Spencer; H. L. Lain and D. P. Sweeney, of Jones City.

TYRONE, OKLA.—The Tyrone Local & Long Distance Telephone Company has been incorporated with a capital stock of $5,000. The incorporators are C. L. Clark, A. J. Hughes and others.

LEESPORT, PA.—The Farmers' Rural Telephone Company has been organized at Leesport.

MILWAUKEE, WIS.—The Wisconsin Metropolis Telephone Company has been incorporated with a capital stock of $100,000. The incorporators are L. N. Biron, of Bloodgood, Kemper & Bloodgood; J. A. Wallis and A. C. Moeller.

STOCKBRIDGE, WIS.—The Stockbridge and Sherwood Telephone Company has been incorporated with a capital stock of $2,000. The incorporators are Jos. Bast, G. P. McKenney and Henry Hoffman.

SELKIRK, ONT., CAN.—The Erie Telephone Company has been incorporated with a capital stock of $10,000. The directors of the company are E. Hoover, A. Yager, G. E. Dashner, all of the township of Rainham, Ont.

TORONTO, ONT., CAN.—The Norton-System Telephone Company has recently been organized with a capital stock of $100,000.

FRANCHISES.

PORTERSVILLE, CAL.—An application for a franchise to build and operate a telephone system in Portersville has been filed by H. F. Scorrille, of Corona.

YUBA CITY, CAL.—E. V. Jacobs, of Meridian, has applied for a franchise to construct and operate a telephone system in Yuba City.

WINSTED, CONN.—The Farmington Valley Telephone Company, owning an Independent line running from New Britain to Winsted, has been granted a franchise to build through Cornwall and Goshen.

WORCESTER, MASS.—The Citizens Telephone and Telegraph Company, of Worcester, has applied for a franchise at Leominster.

ST. HILAIRE, MINN.—Messrs. Simons and Bourdon, of Red Lake Falls, have been granted a franchise to construct a telephone system at St. Hilaire. Their lines will be connected with those of the Tri-State Company when that company builds through St. Hilaire.

BARLOW, N. D.—The Farmers' Mutual Telephone Company, of Barlow, has been granted a franchise to construct a telephone system in Foster county.

NECHE, N. D.—F. E. Corson, of Fargo, N. D., has been granted a telephone franchise at Neche.

NEW STRAITSVILLE, O.—The Home Telephone Company, of Logan, is endeavoring to obtain a franchise at New Straitsville. The company's intention is to establish direct connections between New Straitsville and Logan, Columbus and other points.

CLEAR LAKE, S. D.—The Citizens Electric Light and Telephone Company has ben granted a franchise to construct a telephone system at Clear Lake.

ANACORTES, WASH.—The Farmers' Mutual Independent Telephone Company has applied for a franchise to construct a telephone system to connect with the Independent system in Seattle.

LOYAL, WIS.—The Local Telephone Exchange Company has been granted a franchise at Loyal, Wis.

INGERSOLL, ONT., CAN.—The Ingersoll Telephone Company has been granted a twenty-five year franchise at Ingersoll.

FINANCIAL.

DES PLAINES, ILL.—The Des Plaines Telephone Company has increased its capital stock from $10,000 to $14,000.

EMINGTON, ILL.—The Emington Telephone Company has declared a dividend of $5.00 on each share of its stock.

COMFREY, MINN.—The Comfrey Rural Telephone Company at its annual meeting declared a dividend of 15 per cent.

MONROE CITY, MO.—The Farmers & Merchants Telephone Company has increased its capital stock from $3,000 to $6,000.

CLEVELAND, O.—The Cuyahoga Telephone Company is to declare a 4 per cent annual dividend on its common stock.

LOGAN, O.—The Logan Home Telephone Company has increased its capital stock from $50,000 to $75,000 and will make many improvements in its system.

COMBINATIONS.

FAYETTE, MO.—The Mutual Telephone Company has purchased the Shepler Telephone System.

NORTH LOUP, NEB.—The Ord Telephone Company, of Ord, has purchased the business of the local telephone company at North Loup.

ELECTIONS.

AVON, ILL.—The Avon Mutual Telephone Company has elected the following directors: G. C. Osborn, G. E. Simmons, S. S. Clayberg, A. Sundberg, O. Crissy, G. E. Merrill, A. Merrill, L. R. Lockwood and W. H. Clayberg.

MILLSTADT, ILL.—The Millstadt Telephone Company has elected the following officers: President, Geo. Sauthoff; vice-president, A. Marxer, Sr.; secretary, A. C. Kern; treasurer, G. F. Baltz.

PEKIN, ILL.—The Citizens Telephone Company has elected the following directors: J. W. Barrett, John Fitzgerald, J. A. Roelfs, V. P. Turner, E. R. Peyton, Henry Roos and W. B. Cooney.

NEW ALBANY, IND.—The Eureka Telephone Company has elected the following officers: President, E. F. Windell; secretary, H. C. Beanclossom; treasurer, H. C. Hays.

MT. ORAB, O.—The Mt. Orab Telephone Company has elected the following officers: Geo. Kratzer, president; Cary Layman, vice president; I. L. Edgington, secretary; P. A. Wickerman, treasurer; A. R. Watson, general manager.

BLOSERVILLE, PA.—The Bloserville Telephone Company has elected the following officers: President, J. S. Darr; vice-president, C. H. Leib; secretary, A. H. Calaman; treasurer, G. R. Fry; manager, J. E. Barrick.

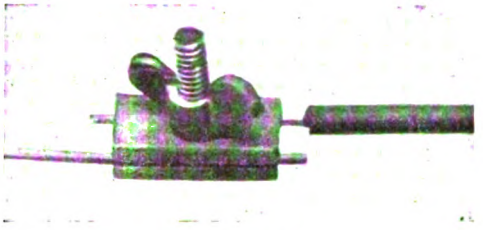
THE SUCCESS

UNIVERSAL IRON.

of a telephone system depends to a very great extent on the character of the line construction. The larger part of the companies' capital is invested in this portion of the plant.



TEST CLAMP.

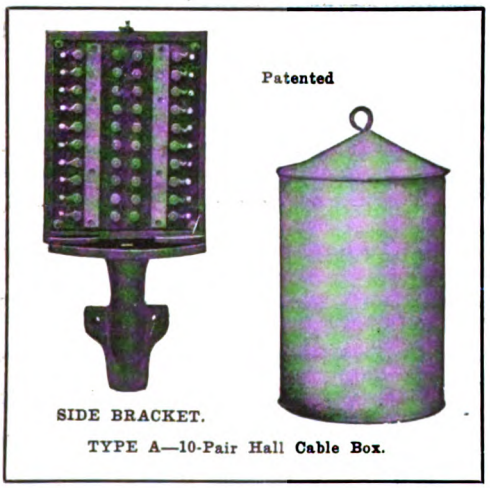
That is why it doesn't pay in the long run to put in cheap line material and haphazard fittings selected at random. The result of such false economy is poor service and construction that quickly deteriorates. You must use well designed fittings, that while electrically and mechanically right, are moderate in price Hallett specialties are of this character.

Let us send you a catalogue.

THE HALLETT IRON WORKS

92-96 West Polk Street CHICAGO, ILL.

USE THE HALL CABLE TERMINAL FOR CABLE DISTRIBUTION



Patented

SIDE BRACKET.

TYPE A—10-Pair Hall Cable Box.

"The Hall Cable Terminal" is unique; its claims to superiority are under rather than overestimated. It infringes no patents and is therefore worthy of special consideration, as the purchaser's property is protected both legally and physically.

THE WEEK'S MESSAGES

ORANGE, TEXAS.—The Orange Telephone Company has elected the following officers: President, E. L. Bruce; vice president, A. L. Ford; secretary and general manager, E. P. Weber; treasurer, W. D. Dean.

SHERMAN, TEXAS.—The Grayson County Telephone Company has elected the following directors: W. B. Ritchie, Ed. Christian, W. J. Ritchie, C. D. Crites, Lima, O., and S. W. Porter and C. A. Shock, Sherman, Texas.

BARABOO, WIS.—The Farmers' Mutual Telephone Company has elected the following officers: Robert Attridge, president; E. R. Thomas, vice-president; L. H. Palmer, secretary; O. A. Getchell, treasurer.

MOEVILLE, WIS.—The Moeville Farmers' Telephone Company has elected the following officers: Ole Erickson, president; S. S. Reitan, vice president; Martin Kjelstad, secretary; T. S. Fidem, treasurer.

JANE LEW, WEST VA.—The People's United Telephone Company, of Jane Lew, has elected the following directors: S. G. Hall, G. W. Forinash, C. W. Davisson, J. A. Oldaker and M. J. Kester. The company expects to make many extensions to its lines.

BELOIT, WIS.—The Beloit Telephone Company has elected the following officers: President. M. J. Ward; vice-president, W. H. Grinnell; secretary and manager, Alfred Slater; treasurer, W. M. Brittan. The additional directors are W. W. Lufkin and C. B. Salmon.

LA CROSSE, WIS.—The La Crosse Telephone Company has elected the following directors: W. W. Cargill, F. P. Hixon, Henry Gund, G. H. Gordon and I. H. Moulton.

PERSONAL.

VERNON L. CLARK has been appointed local manager for the Consolidated Telephone Company at Phoenix, Ariz.

A. C. DOTY has been appointed manager of the plant of the Delaware & Madison Counties Telephone Company at Elwood, Ind.

JOHN DUFF has been appointed manager of its exchange at Blair, Neb., by the Nebraska Telephone Company.

JOHN FAINT, of Philadelphia, has been appointed manager of the system of the Bedford County Telephone Company with headquarters at Bedford, Pa.

A. C. MILLER, who has been manager of the Redwood County Rural Telephone Company, of Minnesota, has accepted a position as salesman with the Vote-Berger Telephone Manufacturing Company, of LaCrosse, Wis.

L. J. OLIVER, formerly manager of the Southern Bell Telephone & Telegraph Company's exchange at Columbus, Ga., has been promoted to the office of superintendent of the seventh district.

RAY B. POOLE has been made superintendent of the Rome Home Telephone Company, with headquarters at Rome, N. Y.

L. W. RIGBY has been transferred to the exchange at Ensley, Ala., of which he will have charge, by the Southern Bell Telephone and Telegraph Company.

W. B. ROBERTS has been promoted from the position of manager of the Atlanta exchange of the Southern Bell Telephone & Telegraph Company to that of assistant superintendent of the district. He will retain the active management of the Atlanta exchange as a part of his new duties.

H. L. SMITH has returned to Atlanta, Ga., from Savannah, where he has made his headquarters as superintendent of the fifth district of the Southern Bell Telephone & Telegraph Co., in order that he might take up new work as special agent to the general manager.

F. M. SOMMERKAMP has been appointed manager of the Southern Bell Telephone Company's exchange at Columbus, Ga.

W. E. SUMNER has been promoted to the office of auditor for the Consolidated Telephone Company, with headquarters at Tucson, Ariz.

F. A. VAN DORSTEN has been made manager of the exchanges of the Sunset Telephone Company at San Jose and Santa Clara, Cal.

MISCELLANEOUS.

LONG BEACH, CAL.—The Long Beach Home Telephone Company, formerly owned by W. L. Porterfield, with exchanges at San Pedro, Santa Ana, San Bernardino, Ventura and a number of other places has been acquired by a number of Los Angeles men headed by J. M. C. Marble. The price paid for these properties was $1,350,000.

MONMOUTH, ILL.—Henry S. Brown, of Monmouth, has purchased a controlling interest in the Roseville Telephone Company. The system will probably be extended.

VIRGINIA, ILL.—J. G. Pratt has purchased the Ashland, Ill., telephone exchange.

TOLEDO, O.—The Toledo Home Telephone Company has closed a contract to install a private branch exchange to replace that of the Bell company, for the Pope Motor Car Company.

New Construction in the Field

BENTON, ARK.—The Benton Telephone Company is to be connected with Detoni, Corwin, Nuna, Shaw, Belfast and Sheridan.

WEISER, IDAHO.—The Idaho Independent Telephone Company, of Boise, is to install a telephone system at Weiser. It is contemplated that the company will expend about $10,000 on this work.

YATES CITY, ILL.—The Ideal Telephone Company of Yates City is to make many improvements in its system.

CHICKASHA, I. T.—The Topeka & El Reno Telephone Company is installing a new switchboard at Chickasha, and is to give its system a general overhauling at that point.

CEDAR FALLS, IA.—The Corn Belt Telephone Company is to spend between $15,000 and $25,000 in improving its system at Cedar Falls.

COUNCIL BLUFFS, IA.—The Independent Telephone Company, of Council Bluffs, is building a line to Balfour, and expects to extend the line on south and west.

DYERSVILLE, IA.—The Interstate Telephone Company is to build a line from Dyersville to Farley and one from Farley to Metsington.

KELLERTON, IA.—The Kellerton Mutual Central Telephone Company is considering the advisability of building a line to Mt. Ayr.

PERRY, IA.—The Hawkeye Telephone Company is to rebuild and enlarge its exchange at Perry, Ia.

AITKIN, MINN.—The Aitken Telephone Company is to extend its lines from Nichols to Wealthwood, and later on to Malmo.

NEW ULM, MINN.—The New Ulm Rural Telephone Company is preparing to construct lines in Lafayette, Courtland, Cottonwood, Milford and Sigel.

WILLMAR, MINN.—The Willmar Telephone Company will spend $11,000 in improving its plant.

MOUND CITY, MO.—The Mound City Independent Telephone Company will soon be connected with the Hanamo Telegraph & Telephone Company.

FREDONIA, N. Y.—The Fredonia Telephone Company is to establish an exchange at Cassadaga, and operate a branch system covering Lily Dale and Stockton.

PALMYRA, N. Y.—The Wayne-Monroe Telephone Company is to enlarge its plant at Palmyra.

ASHEVILLE, N. C.—The Asheville Telephone Company is making many improvements in its system.

IREDELL, N. C.—The Iredell Telephone Company will begin the construction of its system as soon as the necessary supplies are procured.

CADIZ, O.—The Harrison County Telephone Company is extending its lines in Cadiz.

DANVILLE, O.—The Citizens Telephone Company is extending its lines.

NEW CARLISLE, O.—The Home Telephone Company is installing its system at New Carlisle, O.

LEETONIA, O.—The Salem Township Rural Telephone Company is to build lines west of Leetonia.

NEW SPRINGFIELD, O.—The Beaver County Telephone Company is building a line between New Springfield, O., and North Lima.

SIDNEY, O.—The Sidney Telephone Company is making many improvements in its system.

TAPPAN, O.—The Tappan Telephone Exchange is to install a new switchboard and is also to make other improvements in its system.

CONESTOGA, PA.—The Conestoga Telephone and Telegraph Company is building a line from Stonersville to Amityville.

HOPE VALLEY, R. I.—The Hope Valley Telephone Company is building a line from Hope Valley to Canonchet.

RAPID CITY, S. D.—The Black Hills Telephone Company is to repair and enlarge its entire system at Rapid City.

LA SAL, UTAH.—The La Sal Mt. Telephone & Electric Company is to extend its lines to the Wilson Mesa Placer Camp.

ENTERPRISE, W. VA.—The Enterprise Telephone Company contemplates installing an exchange at Middlebourne.

BRODHEAD, WIS.—The Brodhead Telephone Company is extending its lines.

HILLSBORO, TEXAS.—The Independent Telephone Company is to extend its underground work in Hillsboro, Texas.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

REPEAT ORDERS.

Nearly four years ago a prominent telephone company placed its first order for a Gould Storage Battery. The installation proved so completely satisfactory that six additional exchanges of this company were subsequently equipped with Gould Batteries. Frequent repeat orders like these from telephone companies throughout the country are *proof positive* of the satisfaction and economy of the Gould Storage Battery.

Full particulars and prices upon request.

COOK'S
POLE CABLE TERMINALS AND JUNCTION BOXES

FOR

Multiple Tap Cable Distribution

Cook's Terminals furnish the most approved forms of protection, and the best and simplest means of cable distribution.

Cook's Junction boxes are best for cable splicing. They can be used in conjunction with the terminals or alone. At points where you desire to dead-end your cable use Cook's Junction Box. You can add a cable Terminal later if you wish.

SELF SOLDERING NOZZLES
Are Furnished With Both Terminals and Boxes

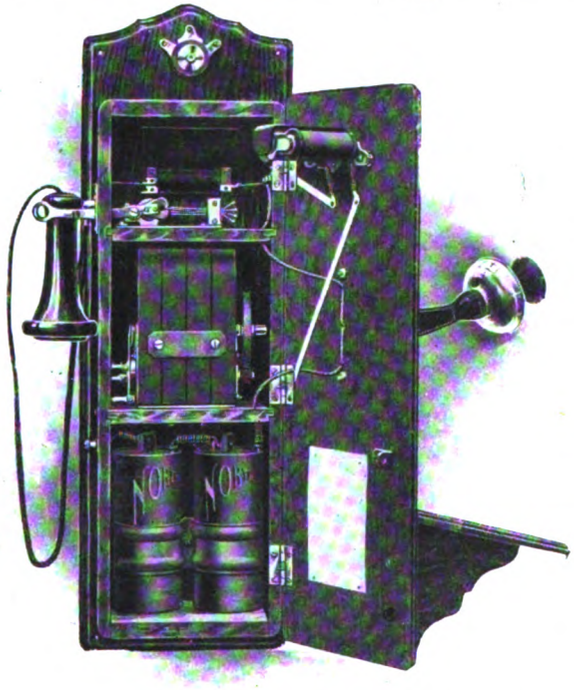
North Magneto Telephones



North's compact telephone—Type K—for exchange and rural service, has a wide popularity which it well deserves. We have been selling many thousands of these annually and our sales continue to increase.

These telephones are built for service—continuous and efficient. The first thought in designing them has been to produce a first-class, durable instrument, wherein the item of repairs and attention after installing has been reduced to the minimum. To produce this result requires the best design, material and workmanship that can be had.

You can increase the popularity of your service and decrease your expenses with this telephone.

CENTURY
100 % GOOD

DOLLARS FOR YOU!

You operate your telephone system for profit.
You wish the profits were larger.
How to make them so puzzles you.

THERE'S A WAY

Cut down your maintenance cost.

This can be done by using telephone equipment, the development of which is the result of many years' practical exchange operation.

We have constructed and operated a large number of exchanges.

Our profits were increased by putting only the very best of material and workmanship into our apparatus.

Because our trouble bills were smaller.

Yours will be also.

We can prove to you that we can increase the earning capacity of your exchange system.

MONARCH

THE reputation of Monarch transmitters and receivers has been secured by five years of successful operation. The transmitter not only excels in talking qualities, but has the additional advantage of being cheap to operate. Accurate and extensive tests show that the Monarch transmitter can be operated on one-half the amount of current required to satisfactorily operate other makes. This feature is certainly a valuable one.

The construction of the Monarch receiver is such that satisfactory results are a natural consequence. It is a well made receiver worthy to be the companion piece of the Monarch transmitter. The mounting of the coils is a unique feature and one which is appreciated, as either or both coils can be readily removed, repaired or interchanged.

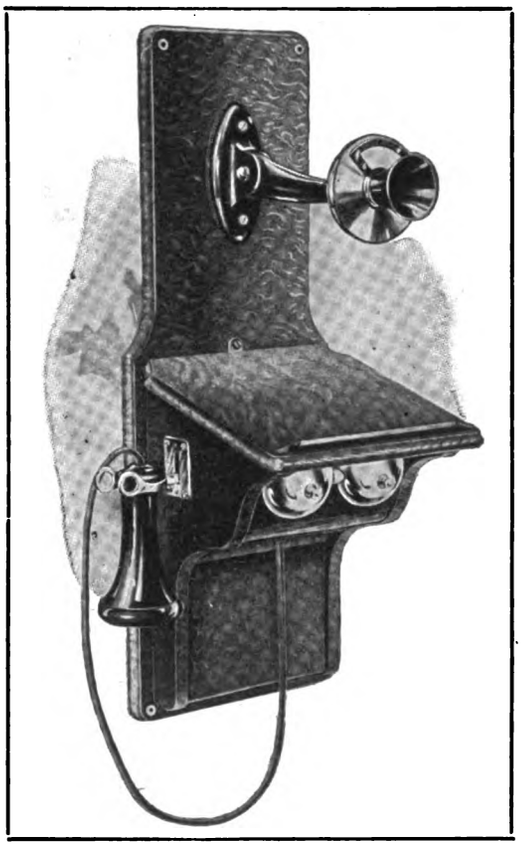
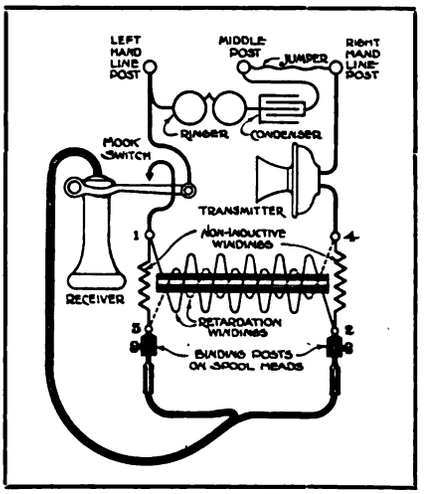
DEAN TELEPHONE APPARATUS

OUR COMMON BATTERY TELEPHONES

We show in the accompanying illustrations our COMMON BATTERY BUSINESS TYPE TELEPHONE, and the most efficient TALKING CIRCUIT ever devised, which is used exclusively in all of our common battery telephones.





This circuit consists of our celebrated coil, employing the principle of the balanced Wheatstone bridge, which keeps the direct current flow from the receiver, while the voice current which is alternating in effect is received at maximum value, thus with the Dean transmitter and receiver the service received is of the highest efficiency. The condenser performs but one function, that of preventing the direct current from flowing in the ringer circuit.

Our New Bulletin No. 102-A on Common Battery Telephones, giving descriptions and circuits from the early forms of common battery to those used in modern telephony, will be mailed to you for the asking

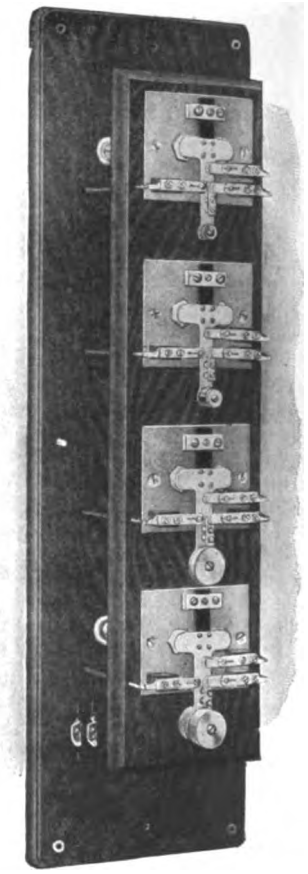
KELLOGG

FREQUENCY POLE CHANGER

Utmost SIMPLICITY of operation

THIS POLE CHANGER can be used on common battery or magneto exchanges.



"POLE CHANGER" COVER REMOVED

Advantages:

1. Requires very little attention after once set up and put in working condition.
2. The tuned vibrating reeds are absolutely adjusted and will not depart from their regular periodicity.
3. Operates from Primary or Storage Batteries.
4. They can be operated from the regular storage battery of the exchange without affecting the talking circuits.
5. Operates successfully on any standard voltage of a telephone exchange.
6. Practically noiseless in operation.
7. Only THREE contacts on each Vibrator.
8. The vibrators have a very long spring, hence they will not break or change the frequency.

THE TRANSFORMER CABINET contains all necessary Switches, Fuses, etc.
Pole changer cabinet and transformer cabinet separate.
Can be put in different rooms if desired.
Sold separately or complete.
No additional apparatus needed on power board already installed.

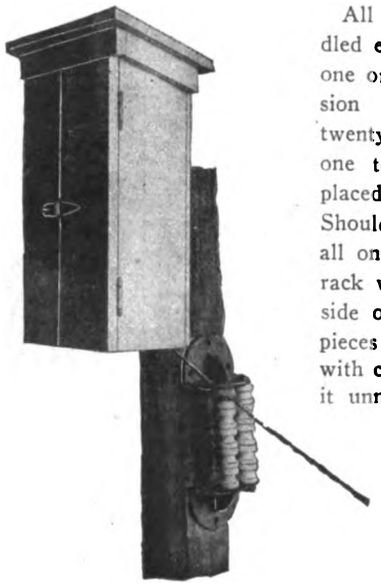
Robinson Pole Distribution Rack

(PATENT PENDING)

SIMPLE INEXPENSIVE PRACTICAL

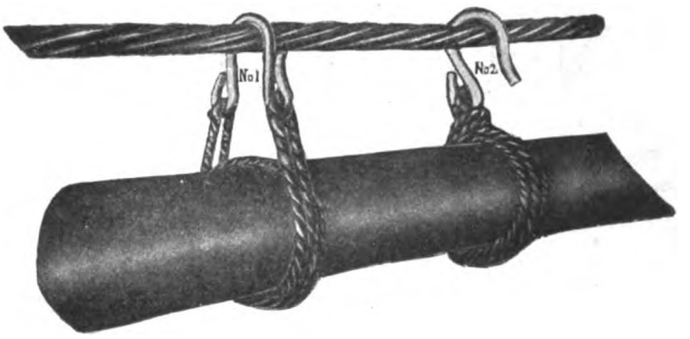


All drops can be easily handled either by placing rack on one or both sides as the occasion demands. In case of twenty drops equally divided, one ten pair rack would be placed on each side of pole. Should the twenty drops be all on one side, a twenty pair rack would be placed on that side of pole. Top and lower pieces heavy malleable castings with convexed surface, making it unnecessary to gain pole.

Send for Catalog No. 8 of Nagel Specialties

Swisher Marline Cable Hanger

(PATENT APPLIED FOR)

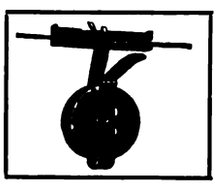


In the above illustration we show in figure No. 1 the Swisher Marline Hanger, in figure No. 2 the old style now in common use. The advantages we claim for the Swisher Hanger are: First, easy to install. Second, greater strength. Third, hook cannot become detached from strand. Fourth, hook cannot straighten under strain and let cable down. Fifth, in stringing of wires over cable, wires sagging will not catch under hook as in old style. Sixth, after cable has been installed, same can be pulled without opening the hooks.

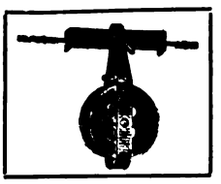
We use only the best grades of marline and No. 9 hooks galvanized after forming. Our No. 9 hook on account of its construction will stand a greater strain than a No. 6 hook of old style.

The W. G. NAGEL ELECTRIC CO., 26-30 St. Clair Street TOLEDO, OHIO

All Sorts of Schemes



have been suggested for stringing cables, but nothing found



so good as our effective

Security Trolleys

We find the best wheel for this purpose is malleable iron, yet the weight of our trolley is only twelve pounds. They stand exposure and abuse, and will not chip. Wood wheels, however, if you wish, at same price.

Security Trolleys are made on scientific lines throughout, but are rugged; easily put up and taken down. Two men can pull a thousand feet of cable in ten minutes with ease after the trolleys are in place—a matter of half an hour.

Don't you want our prices?

IF

there were only one or two reasons why operating telephone companies should use the POOLE PARTY-LINE LOCK-OUT SYSTEM, we wouldn't make them, but there are several.

The Lock-Out feature for party lines is more important than selective signalling.

From the subscriber's standpoint selective signalling is used to eliminate annoyance from ringing of bells when other parties on the same line are called, and not notify all parties when one party is called. What does "A" care if "B" is in the same business, on the same party-line and knows "A's" ring. "A" knows absolutely that "B" can't hear his conversation because his party-line is equipped with the POOLE Lock-Out System.

Put it up to the subscriber, and after explaining both selective signalling and POOLE Lock-Out to him, give him his choice. He will select Lock-Out because SECRECY is of MORE IMPORTANCE to him than annoyance from bells.

Both features are very desirable on party lines, but the Lock-Out is most desirable.

And, Mr. Manager, we can prove to you that your OPERATING EXPENSES ARE REDUCED by the use of our Lock-Out System.

Operators handle greater number of lines.

No Central Office equipment required; it is merely an attachment to the subscriber's instrument.

Works on ANY make of Central Energy telephone with any straight or selective signalling system. Simplicity is its crowning feature.

Write for more reasons why. Ask for Booklet—"POOLE LOCK-OUT SYSTEM."

CENTRAL TELEPHONE & ELECTRIC COMPANY

Manufacturers of High Grade Telephone Apparatus **Dealers in Telephone Supplies (Exclusively)**

2131-37 Lucas Avenue, St. Louis, U. S. A.

WHAT'S WRONG

with that TELEPHONE INVESTMENT of yours?

Why doesn't it pay you as well as the best of your investments?

Is the reason bad management or bad equipment? More likely the latter.

Probably the company is trying to do a 20th Century business with 19th Century apparatus.

If that's the case, it is spending more and earning less than it might if it had our Automatic Telephone equipment.

This is the only really modern telephone system. It produces the ideal telephone service—quick, sure and secret—at half the operating expense of a manual equipment, and this service commands better rates.

It costs a fixed price per hundred lines to enlarge the automatic exchange, instead of an increased price per each hundred lines, as in the manual equipment.

The automatic exchange is never outgrown; it never has to be "scrapped" and replaced by a complete new one, as with the manual. You just add to it as you do to a sectional book-case.

All these points bear upon the stability and value of your telephone securities. They mean dividends to you.

Over ninety per cent. of all the large orders placed during the past few years, either for new installations or replacements, have been for our automatic system, and all the companies adopting it have, from the increased earnings, been able to pay the interest on their bonds and a good dividend on their stock.

Our Automatic System has been adopted in the following cities:

Aberdeen, S. D.	Clayton, Mo.	Hazleton, Pa.	New Bedford, Mass.	Sioux City, Ia.
Akron, Ohio.	Cleburne, Texas.	Hopkinsville, Ky.	Oakland, Cal.	South Bend, Ind.
Albuquerque, N. M.	Columbus, Ga.	Jonesboro, Ark.	Ocean Park, Cal.	St. Marys, Ohio.

Proceedings at the Convention

THE annual convention of the National-Interstate Telephone Association was held as usual at the Auditorium Hotel, beginning Monday, June 25, and closing June 28. Monday was devoted to the meetings of various committees and of the executive council. The deliberations of the convention proper began Tuesday afternoon, shortly after two o'clock.

Before the meeting was called to order by President James B. Hoge of Cleveland, Ohio, it was evident that the largest and most successful convention in the history of Independent telephony was about to sit. The banquet room of the hotel in which the meetings have been held year after year was filled to overflowing with enthusiastic delegates from all parts of the country.

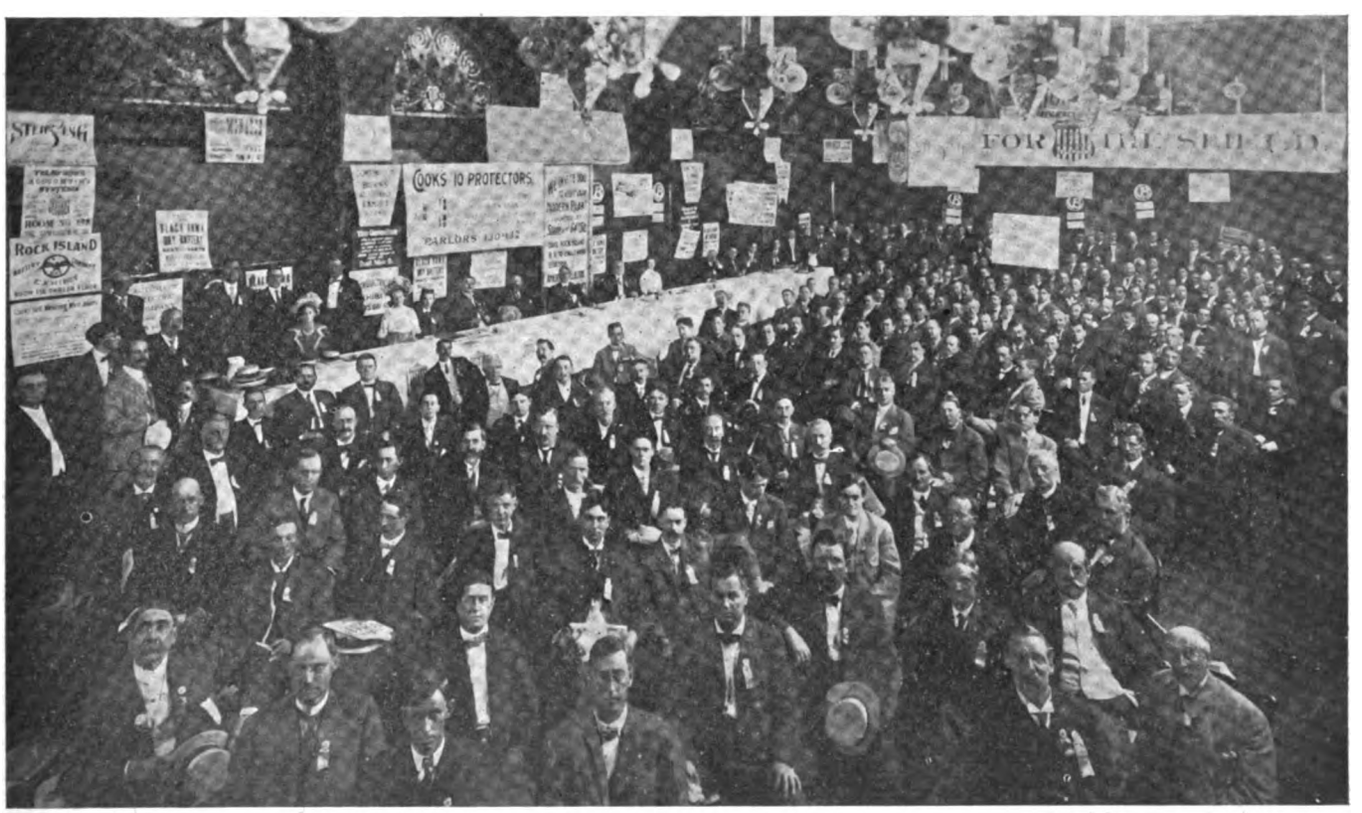
Hon. Edward F. Dunne, Mayor of Chicago, was to have delivered the customary address of welcome. Unexpected events, occurring the day before the convention, prevented his attendance, greatly to the regret of the assembled delegates. He, however, furnished a welcome substitute in the person of Chicago's famous corporation counsel, Hon. J. Hamilton Lewis.

Mr. Lewis first called the convention's attention to the presence of a distinguished gentleman from New York, Hon. Martin W. Littleton, who, he declared, had once defeated him in debate, for which he now proposed to get even. A most eloquent address of welcome followed, the best which it has been the good fortune of the association to hear. Mr. Lewis is far-famed as an orator, and on this occasion his evident sympathy with his subject lent additional force and beauty to his remarks.

He began by expressing the regret of the mayor that he was unable to be present. It had been his desire from the first to welcome the convention in person, as the meeting typified a purpose to which he had devoted a great part of his life. After expressing his own sympathy with the movement, Mr. Lewis said that the association could not have chosen a city more appropriate to its purposes and work than Chicago. No city had so incessantly warred against monopoly as had Chicago. Yet she was in the grasp of a most relentless monopoly which if permitted would interfere with her manifest destiny. No monopoly existed to-day more relentless and more grasping than the telephone monopoly. But he was glad to say that at last the gates of Chicago were open to those who would enter and offer some relief through honest competition.

When after a most beautiful peroration the speaker welcomed as Chicago's guests the assembled delegates, the convention was loath to let him go and applauded loud and long after he had taken his seat. Again when, after the responding address, Mr. Lewis tried to pass unnoticed out of the room, the delegates gave him another round of applause.

The response was made by E. H. Moulton, president of the Tri-State Telephone Company of Minneapolis and St. Paul.



Delegates to the Convention of the National-Interstate Telephone Association at Chicago, June 26th.

Digitized by Google

Theodore Gary, Representative from Missouri, Re-elected Vice-President.

E. B. Fisher, of Grand Rapids, Who Took a Prominent Part in the Proceedings.

J. B. Ware, One of the Leaders in Michigan's Independent Development.

Mr. Moulton gracefully replied to the expressions of hospitality and closed by calling Chicago's attention to the fact that the number of Independent telephones in the country tributary to Chicago is conservatively placed at 1,250,000, fully double the number operated by the Bell company in the same territory, and that nearly all the great Independent factories, employing 5,000 men, are located in the city.

The annual address of the president followed. Mr. Hoge referred to the great work which has been accomplished through the office which the executive committee had instructed him to open at Cleveland. In order that the Independents of the country might be kept informed of the progress of the work, monthly bulletins have been sent to the various telephone journals and magazines. These periodicals have in addition published various articles prepared by friends and officers of the association. The past year was a red letter year for the association. The National plans for organization have been adopted in twenty-two States and the benefits resulting from such a compact organization had been very great. The "shield" is being used by most of the leading companies in forty-one States, and the public everywhere is beginning to recognize it as the emblem of the movement which has increased the telephones in use from 300,000 to over 5,000,000, of which 3,000,000 are connected with Independent systems. He predicted that the next three years would see 3,000,000 more Independent telephones added. He called attention to the need for a better and stronger organization and a campaign of publicity to give complete information concerning the greatest industry in the country. The president closed by acknowledging the honor which had been paid him and by expressing his thanks.

The Chair announced that it had been planned to make the question box an important factor in the deliberations of the convention and that the box would be in charge of Mr. Gary, of Missouri, Mr. West, of Pennsylvania, and Mr. Rhodes, of Ohio.

The following committees were appointed:

Ways and Means—J. G. Splane, of Pennsylvania; R. B. McPherson, of Michigan; Henry Barnhart, of Indiana; J. S. Brailey, Jr., of Ohio; Charles E. Sumner, of Oregon.

Amendments to Constitution—Senator Kline, of Pennsylvania; Cyrus Huling, of Ohio; J. B. Ware, of Michigan; J. B. Earle, of Texas; E. R. Conklin, of Illinois.

Nominations—E. H. Moulton, Minnesota; O. C. Snider, of Missouri; M. B. Overly, of Kentucky; W. Gilbert Thompson, of Ohio; P. C. Holdoegel, of Iowa.

Photographs—George T. Hewes, of Iowa; R. E. Mattison, of Nebraska; Wm. L. Moellering, of Indiana.

Credentials—A. C. Davis, of West Virginia; Lewis Brucker, of Ohio; A. C. Lindemuth, of Indiana; Linton Reber, of Ohio; Louis Beaukenhorn, of California.

Entertainment—C. W. Stiger, J. G. Ihmsen, E. B. Overshiner, J. F. Cracraft, W. H. McDonough, W. W. Dean, C. D. Newton, H. B. McMeal, F. M. Bailey, C. Y. McVey and George N. Bandy.

In his report Assistant Secretary J. A. Harney gave an account of what was being accomplished in the national office opened by the executive committee at Cleveland, Ohio. The first thing attempted was to get a complete card system record of every Independent company in the country, together with the towns and cities operated, etc. According to this record, which is as complete as it has been possible to get the information, there are 7,550 Independent telephone companies in the United States, operating in 12,125 cities and towns. Making due allowance for Bell companies posing as Independents, there are at a conservative estimate not less than 7,400 Independent companies, operating in not less than 11,125 cities and towns. All data secured has been indexed, and monthly bulletins have been sent out to telephone journals and officers of State associations to keep them in touch with the situation. There is a substantial balance in the treasury. The supply department has been run at an actual profit.

Mr. Harney explained that it was not the intention of the supply department to enter into competition with firms supplying telephone apparatus and supplies, but merely to help the Independent companies in advertising their business by means of the shield emblem. He said the business of supplying emblems, etc., had not been intended as a profit making undertaking. By buying in large quantities the association was able, however, to sell the companies very reasonably and also show a small profit which helped defray the expenses of carrying on the work.

The shield, he reported, is being displayed in some forty-four States. The work of mapping the Independent field has been prosecuted with such vigor that already 920 separate maps have been submitted, and several State maps completed. A clipping bureau has been patronized and the newspaper articles adverse to Independent telephony have been investigated. In nearly every case the statements have been found to be false and misleading. Letters and telegrams indorsing a competing telephone system have been secured from prominent men and such like data used to assist Independent companies to obtain franchises. The secretary closed by urging the members to comply promptly with every request for data in order that the work might be economically carried on and the results made quickly available.

In lieu of the report of the secretary, A. L. Têtu, a letter from Mr. Têtu was read, in which he expressed regrets that he should not be able to attend the convention, at least on the opening days, on account of sickness in his family.

The convention adjourned until ten o'clock Wednesday morning.

Southern Toll Lines and Exchange Development*

By L. G. Parker.

THE section commonly known as "The South" is the group of ten States lying east of the Mississippi River and south of the Ohio. It embraces the Virginias, the Carolinas, Kentucky, Tennessee, Georgia, Florida, Alabama, Mississippi and Louisiana.

What are most commonly known, however, are the immense resources of this small area, the dominant part that it is now playing in our Nation's work, and the almost absolute certainty that it will be inside of twenty years the central and controlling factor of the productive, manufacturing and business enterprise of the United States.

And these are the reasons:

These States contain one-fourth of our population; they have one-third of all our coal lands with thickness of vein and quality of product that make the deposits in the balance of the country appear insignificant. One little State, West Virginia, has more coal than Great Britain and Germany combined, and its quality is famous the country over; this old South contains one-half of all the standing timber in our domain, being the principal source for the valuable hard woods, white oak and walnut; it contains more iron ore than all the balance of our land. The Birmingham district in Alabama alone has inexhaustible quantities; it now produces three-fourths of the cotton supply of the entire world, and if necessity demands it can produce three times as much as the world now uses.

Most important of all, our countrymen in these States have no superiors on earth. Hospitality and fair dealing are placed above dollars and deceit. Courtesy and kindness stand before selfishness and ill will. There live men and women who are fearless, brave and true. In them lie strength for the Nation and from their ideals will come far-reaching forces for cleanliness and honor in the business world.

While the Northern, Eastern and Western States have been crowding forward in the past twenty years, engrossed by what seemed to them their unequalled advance in fortunes, the fact has been generally overlooked that their sister States in the South have been doing a substantial thing or two themselves, and true to their code, have been saying little about it.

It has been estimated that the loss to this district in the strife of the early 60's amounted in men and means to over $8,000,000,000—more than eight times our National debt. The true meaning of this may be obtained if one stops to think that the Japanese Nation with its 50,000,000 inhabitants was practically exhausted by the expenditure of only $1,000,000,000 in their recent war with Russia—lasting only one year.

In addition to recovering from this staggering load the South has erected mills that now spin one-half of all the cotton used in this country; has built furnaces and rolling mills that turn out more iron and steel than was produced by the entire Nation twenty years ago, and has sprinkled the land over with factories of all kinds.

This has been due to the riches that nature has showered upon this country as apparently it has given to no other. After furnishing its full proportion of staple crops on which the Nation feeds—and drinks; after this vast garden spot has furnished the sister States with its berries, fruits and vegetables, the South this year, as in the past, will take from its soil to place in its pocket, $40,000,000 in iron, $40,000,000 in tobacco, $90,000,000 in coal, $250,000,000 in timber, $440,000,000 in cotton, or a total of $860,000,000 for one year. This is the value of its raw material ready for shipment, and, bear in mind, is entirely over and above the prodigious output of pure farm products that in themselves equal what other States are doing, $1,300,000,000 annually outside of cotton and tobacco.

These things have been recited for the sole purpose of giving you the proper setting for the next view.

These States have a population of nineteen and one-half million of people. They have only about 135,000 Independent telephones or one to every 145 inhabitants. Do you see now the possibilities in the telephone field in that section, what is bound to come, and the fortunes that will be made in this field?

And now for the existing conditions. From the best information available, the Independent telephone movement really started in 1895, by the building of an exchange in Knoxville, Tenn. At the same time one was being constructed at Owensboro, Ky., which went into service in 1896. The instability of financial conditions in the two or three years following prevented much further development, although here and there a few exchanges were started under adverse conditions. Henderson, Kentucky, was built in 1897 and '98 with the second central energy system installed in the United States by Independents, the first having gone in at Battle Creek, Michigan. Maysville, Kentucky, on the Ohio River also sprouted a plant. Small mutual concerns of fifteen or twenty telephones also took root.

But in 1899 the real work began. At the present time out of 75 cities in this section having 7,000 inhabitants, 37 are equipped with Independent exchanges of modern construction and are in successful earning condition. Among them are Louisville, Lexington, Paducah, Owensboro and Frankfort in Kentucky; Memphis, Knoxville, Clarksville and Jackson in Tennessee; Savannah, Columbus and Atlanta in Georgia; Birmingham, Bessemer and Mobile in Alabama; Meridian in Mississippi; Shreveport in Louisiana; Tampa in Florida; Wheeling, Huntington, Parkersburg and Charleston in West Virginia; Norfolk, Newport News and Roanoke in Virginia; Raleigh and Concord in North Carolina.

In West Virginia every other city is equipped. They have done good work. In Kentucky, every city is built except Newport and Covington, which really form a part of Cincinnati. In Tennessee only two cities are groping in the darkness—Nashville and Chattanooga.

This makes an ideal condition for long distance operations. In the Middle and Western States the small towns were built before the cities and the long distance struggled for quite a long time cut off from entrance into the seats of power and wealth. In the South, the cities largely are built and are crying for outside connections. A few of them, absolutely unable to withstand the strain, were forced to give their subscribers a connection with the other system, but fortunately they are few. The people are heartily supporting the home companies wherever installed and are patiently waiting their deliverance by long distance lines. And their deliverance is near at hand.

While Parkersburg and Wheeling have toll lines into their tributary towns, Wheeling has also a fine line to Pittsburg, Charleston and Huntington are connected, and a corporation of adequate size and scope is now operating and building to give the South the necessary facilities.

The Central Home Telephone Company of Louisville has in active operation throughout Kentucky and southern Indiana about 700 miles of pole line connected with the New Long Distance Company of Indiana. It is building in that State about 550 miles more. Its affiliated company, the Long Distance Telephone & Telegraph Company of Alabama, has in operation and is building 800 miles more, or a total of 2,050 pole line miles, representing an expenditure of about two million dollars, all financed and going. This company's lines will connect with those of the long distance companies in Ohio, Indiana and Missouri. It will have a trunk line running straight from Louisville to Mobile, Alabama, one circuit of which is made of No. 6 copper wire. It will have lines to Memphis, to Atlanta, to Florida and to such other points as seem desirable.

These are the existing conditions. What the future will bring

*Abstract of paper read at the Convention of the National-Interstate Telephone Association.

Digitized by Google

forth is difficult to prophesy—because the imagination is apt to stop far from the ultimate limit.

As Richard Edmunds wrote in the February number of the *American Monthly Review of Reviews,* putting words into the mouth of the South, "We are independent, we can stand alone, we have accumulated enough money and experience to assure a great and steady advance; but so vast is the field, so sure are the returns that we bid the world a welcome: that all may share in the utilization of our resources and the consequent wealth to be created."

WEDNESDAY'S PROCEEDINGS--THE ROLL CALL OF STATES

Uniform Reports of Rapid Development, Successful Competition and Wholehearted Support From the Public Made by Representative Delegates From Many Parts of the Country.

As soon as the convention was reopened at ten o'clock Wednesday morning, the president appointed a committee to confer with the Chicago Commercial Association regarding the telephone situation. The committee named was C. B. Cheadle, F. Dagger, E. R. Conklin and Manford Savage.

Nearly the entire forenoon session was given up to some very interesting reports brought out by a roll call of States.

Arkansas was represented by Mack Hammett. According to Mr. Hammett the Arkansas toll lines average from $8 to $9 per subscriber each year. The Texarkana toll line earns 22 per cent. and that at Ozark 20 per cent. It is an interesting fact that many bankers are owners of exchanges. In the State there are all told 8,980 Independent telephones, while the Bell company has 11,885.

Louis Blankenhorn spoke for Southern California. In that State the Independents are now reaching out to San Francisco and Oakland. In Oakland an Independent company will start in six months with 5,000 subscribers. A franchise has been given to the Home Company at San Francisco which expects to start with at least 1,500 subscribers. There are 30 companies with an investment of $30,000,000 in southern California, all on a substantial footing, with at least 43,000 telephones, as against 33,000 Bell.

There were several spokesmen from Canada. Dr. J. F. Demers spoke for the province of Quebec where the Independent movement has been making great progress, notwithstanding conditions are very different from those in the States. There are about 7,000 Independent telephones in the province and some $1,000,000 invested.

Mr. Wilson and Mr. Mayberry spoke for Ontario, where there are over sixty companies and systems. The province of New Brunswick is also developing rapidly.

Frank L. Beam spoke for Ohio. He said that one year ago there were in the State 248,304 Independent telephones, as against 130,080 Bell and that during the year the Independents had increased over 54,000 telephones. He had been told that this was 15,000 more than the total increase of the Central Union Company operating in Ohio, Indiana and Illinois.

Charles S. Norton spoke for Indiana, pointing dramatically to Indiana's huge sign placed over the door and reading "400 companies, 1,500 stockholders, 200,000 telephone subscribers, $20,000,000 capital invested." In the State there are five times as many Independent telephones as there are Bell, one-fourth of whose patrons are in the cities of Evansville and Indianapolis. The speaker predicted that inside of one year Evansville would be rescued from the trust.

Iowa was represented by P. C. Holdoegel. He reported that the Independents of the State had placed a State agent in the field on a salary with excellent results. The increase during the year was ten per cent. and the Independents now reach practically every part of Iowa and are still growing. Nearly 1,500 Independent telephone companies reported for taxation and paid more taxes than the Bell, Western Union and Postal combined.

M. G. Miller responded for Kansas and reported great growth.

Mr. Cole reported that in Kentucky a majority of the towns of from 1,500 population up have Independent exchanges. Development of the long distance service had begun and is being rapidly pushed.

When E. B. Fisher arose to speak for Michigan he was received with applause. He spoke briefly concerning the advantages of organizing according to the Ohio idea. He was followed by J. B. Ware, secretary of the Michigan association. According to Mr. Ware Michigan has over 80,000 Independent telephones. Six years ago after Detroit and Kalamazoo sold to the Bell there were less than 30,000. The State is owned largely by a few companies, the Grand Rapids company alone having over 27,000 telephones in use at the present time. This has been a banner year for growth. In the entire State the Bell company probably has a few more telephones than have the Independents; but in the lower peninsula, outside of Detroit, where the Bell has from 15,000 to 18,000 telephones, the Independents have fifty per cent. more. In Detroit an Independent company has secured a franchise and has $3,000,000 at its disposal. The work of laying conduits has commenced. The outlook throughout the State is very satisfactory.

W. B. Scruggs reported for Missouri. The State is in excellent condition as far as Independent telephony is concerned. Only one section remains unorganized. There are about 50,000 Independent telephones in the State. Splendid results were obtained during the past year by the employment of a traveling secretary for purposes of organization.

R. E. Mattison spoke for Nebraska, where 265 Independent exchanges are being operated with 75,000 telephones. The Bell has far less than this number. All this has been accomplished within six years. The State is organized on the Ohio plan, five districts having been established this year.

C. B. Cheadle responded for Illinois. After welcoming the delegates in behalf of the State, he said that Illinois had been divided into eleven districts, in nine of which effective organizations exist. In the State there are 160,000 Independent telephones, and over 30,000 subscribers of Bell sub-licensees, most of whom will become absolutely Independent as soon as they can secure proper long distance facilities. He spoke of the great need of connection with Chicago.

Charles E. Sumner of Portland, Oregon, gave a most interesting account of his fight with Bell influences in his effort to organize the States of Oregon and Washington. Mr. Sumner and his associates have organized on a broad basis with the expectation of ultimately developing the entire district. They have the Bell monopoly on the run and the people on the side of the Independents.

Senator Kline of Pennsylvania reported that the Keystone State has 150,000 Independent telephones, 25,000 miles of toll lines, 300 exchanges and 2,486 toll stations. He closed with a parting admonition: "The Independents have enough to do to fight the Bell; let us not fight each other."

Theodore Gary presented the report of the executive committee to which had been referred a petition from the Independent manufacturers to be permitted to join the association and send representatives. The committee recommended that for the period of one year the manufacturers be received into membership on the following basis: (1) That the arrangement be for one year; (2) that the manufacturers contribute $10,000 for the year commencing May 1; (3) that they be allowed one representative on the advisory board; (4) that they be allowed twenty-five representatives.

Digitized by Google

Mr. Gary moved the adoption of the report. This was opposed by J. B. Ware of Grand Rapids, Mich., who moved as a substitute that the matter be referred to the committee on amendments in order to receive thorough consideration before being passed upon. He was supported by J. G. Thompson of Ohio, Senator Kline of Pennsylvania, Mr. Holdoegel of Iowa and others. The substitute was adopted.

An invitation was received asking the delegates to visit the plant of the American Steel Wire Company at Waukegan, and a number decided to remain over until Friday to do so.

"Look For The Shield!"

By R. A. Walker, Des Moines, Ia.

OPPORTUNITY does not as a rule make many stops at the same door, but it would appear that we have been chosen as a glaring exception to that rule, that we may again and again have the chance to take up the thread where we have left or deserted it, and be allowed the privilege of taking our time and inclination of placing ourselves as a power and a unit before the people.

One year ago this organization adopted as an Emblem, a standard that we all might and must use, the "Shield," with a standard wording well adapted to our use. No wiser thing could have been done from the standpoint of unity and the means of showing that unity before the telephone using public.

It remains for us to make this "Shield" the greatest advertising symbol that the country has ever known. We'll make ourselves into a Lodge, with this "Shield" as a Badge that will identify us and serve as an introduction between Independent telephone men from one end of the country to the other. Our interests are common, our action *must* be in unity. Remember then that if we are to show a common front the Emblem must be the same everywhere. Our "Shield" has the orthodox form with these additions: the interlined word "Independent," surmounted by nine stars and underlined with thirteen, while across the two color body appear the words "Local and Long Distance" and below in the blue stripe "Telephone." Let there be no changes, not the omission of a single star nor the change of a word. Make this thing the same from coast to coast. Some have already placed their own or corporate name in the place of the word Independent. STOP IT. DON'T DO IT. Every change that you may make will detract from the power that the universal sign should be. Let's have a Badge to tie to.

The means are at hand and have been lying dormant for the many years past that will give us the end that we desire. In the Independent telephone industry we have banded together through this organization thousands of telephone men and operating companies whose aggregate yearly expenditure for printing and advertising of all kinds would astound the heaviest publicity agents and advertisers of this advertising age. What then should be the result if the more than 6,000 Independent telephone companies will use the "Shield" on everything that they print, such as stationery, letter heads, bills, cards, forms of all kinds, posters, directories; place a standard sign bearing the "Shield" at every Toll station, office and booth; and upon every suit of clothes wear the Badge in button or pin and see that every employee, every officer and director, is so equipped. If this were done in Iowa alone there would be more than 13,000 wearers of the "Shield" and throughout the country this Emblem would be placed before the public eye ten times a day for every telephone that we have in operation or billions of times in the year. Could you imagine that the American public would not take notice of such a thing as this? Everlasting persistence is the price of success. Then let us begin now. Are you wearing a "Shield"—if not, why not? Look for the Shield! Has the man next to you a "Shield"? If not, have his credentials looked into. You are appointed on the committee to "Look for the Shield." When you go home announce to your Editor that you have been appointed on this committee and tell him that the wearers of the "Shield" are entitled to talk everywhere in the United States. At the same time put up the new sign, and pull down the Maltese Cross or any other sign that you may have been using; they may lead some poor unsophisticated one to think that you are not one of us.

Men—here lies an opportunity such as the big advertiser of "trade marks" would have been glad to have poured out a rain of gold to have duplicated and it costs you mighty little. We'll have an agent in every hamlet, village and town in every state in the Union working with an enthusiasm that salaries fail to buy.

Don't have to be pulled and carried along, be a part of this great combined effort that is going to place this "Shield" where it will become synonymous with Independent telephony and the definition will be changed in the dictionaries and all past meanings will be marked obsolete.

When you get a letter from a telephone man on which the "Shield" does not appear, remind him of the error, and if he hasn't them, that his association can furnish him with the necessary cuts, and to the faithful brother we'll write, "Yours bearing the Shield," etc. It will take but a few of these little things to bring the Emblem into universal use and it will so predominate as to make the "Blue Bell" one of the great finds of the "antiquity hunters."

Undoubtedly you have read the very thorough and interesting as well as effective articles by Mr. Latzke, which are now being published in the Success Magazine. You have read the excellent articles appearing in the Chicago Tribune covering the Chicago situation and in your mind's eye have seen the time when Chicago connections would be made; but what one thing have you done to help and assist those that are pounding at Chicago's gates? They have been forced of necessity to make their fight a personal one with the small (considering the total) number that surround the city. What power is there in a few small telephone exchanges with no financial listing, under innumerable names and arrangements with as many different managements? Have we in the past shown a unity of action and organization that would discredit opinions of this kind? If so, what has been the sign? We must show these doubters that we are of one mind and of one purpose. When the 5,000 and more Independent telephone companies in this country, following the "shield" for a banner, shall march down on this commonwealth and show them that the Chicago of to-day is a "puny" thing compared to what it would be if connection were established with the millions of Independent telephones throughout this land, brought together under one organization, the National-Interstate Telephone Association, bearing but one sign, and shouting but one cry, there will be no need of clamoring and beseeching, but this city as well as New York will meet us more than half way.

Gold would lose one-half its value without the glitter. Independent telephony loses one-half its power without its "Sign of Unity," the shield.

At many points what has in the past been competition has now developed into war. Everything that can be thought of to obstruct the onward march of this Independent army is being done from Boston, the headquarters of the monopoly.

Every army must have a battle flag; let us not forget ours. As the "Star-Spangled Banner" served as the emblem of independence of our forefathers and is still revered and defended by us, so shall the "Stars and Bars of the Shield" stand to us and our posterity as the symbol of the independence of the American people from the control of the telephone trust.

Abstract from paper read before the Convention of the National-Interstate Telephone Association.

Digitized by Google

The Wednesday Afternoon Session

THE roll call of states was continued upon the opening of the afternoon session. West Virginia being called for, A. C. Davis responded. He reported that the Independent telephone companies of the state were on a dividend paying basis and making satisfactory progress.

Mr. Buzzell responded for Vermont and greatly entertained the convention by his account of the efforts made by the Bell company to get control of the Independent properties. Notwithstanding that he was in the hot-bed of the favorite district of the monopoly, covered by the New England Telephone Company, he said that Vermont has 28,000 Independent telephones. The states of New Hampshire and Vermont have one hundred Independent companies.

J. B. Earle responded for Texas. He made a very encouraging report of the successful fight against monopoly in the Lone Star State, where five or six companies represent more than one-half the investment in the state. He said it was only a question of time when Texas people would be willing to invest their money in telephone securities. They are at the present time so busy getting rich that six and eight per cent. on their money does not look good to them.

James B. Hoge, of Cleveland, re-elected President of the National-Interstate Telephone Association.

The report of the secretary of the Wisconsin association was presented by Mr. Webb. There are over 42,000 Independent telephones in the state. A very satisfactory sentiment prevails among Bell licensees and they stand ready to become full Independents as soon as the desired toll service is furnished them by Independents. The energy of the state association has been largely spent during the past year in assisting in obtaining an Independent franchise in Milwaukee.

Mr. Harper, of Wisconsin, gave a short explanation of the successful efforts made to compel the Bell people to maintain uniform rates in cities of the same class throughout the state.

President Folwell, of the Keystone Company, of Philadelphia, spoke. He declared competition to be the only method by which the public can secure good telephone service at reasonable rates. The securities of his company, he said, have been listed on the New York Stock Exchange, as far as he knew, the first instance where Independent securities had been so listed.

This completed the roll call.

Mr. Ivy L. Lee, of New York City, followed with his paper on "Telephone Publicity—Appealing to Public Opinion." After hearing it the convention tendered its thanks to Mr. Lee.

The convention adopted a very strong resolution, expressing its deep sympathy with every effort to establish Independent exchanges, and proffering such aid as is in its power to any movements in that direction.

Theodore Gary, of Missouri, precipitated a small storm by offering the following resolution:

"It is known that the Kellogg Switchboard & Supply Company, of Chicago, is owned by the Bell officials; therefore be it

"Resolved, That this association recommends that its members and all Independent telephone companies and individuals refrain from purchasing apparatus from them."

Judge V. P. Smith, of Niagara Falls, supported the resolution in a vigorous speech. Judge Taylor, of Fort Wayne, then arose to address the convention by unanimous consent, he not being a delegate. He had not proceeded far when Mr. Gary raised the point of order that being the paid attorney of the Kellogg company he should be denied the privileges of the floor. After a spirited discussion the convention voted to sustain the point of order and the Judge took his seat.

As there were several protests against the resolution as worded from companies who had been using Kellogg apparatus and were obliged to continue, the following amendment was made to the original motion and incorporated in it:

"Providing that those companies using the Kellogg equipment may continue to purchase additions and extensions without prejudice."

At this point H. D. Critchfield was permitted to explain in behalf of Mr. Milo G. Kellogg, who was in the room, that the sale of the Kellogg stock did not come to his knowledge until several months after it was made; that he immediately commenced litigation, now pending, to have the sale set aside, and every effort was being made to have it set aside. He asked the convention to do nothing which would reflect on the integrity and honesty of Mr. Kellogg as an Independent man.

Mr. Splane offered another amendment to the resolution, which was accepted, as follows: "Be it further resolved that in the event of the Kellogg Switchboard & Supply Company again coming into control of Independent people that this resolution be null and void and of no effect."

The motion with its amendments was unanimously adopted by the delegates to the convention.

Mr. Cheadle, of Illinois, thereupon moved the following resolution, which was adopted:

"Resolved, That the convention extend to Mr. Kellogg its heart-felt sympathy and encouragement in his efforts to regain his rights."

Mr. Critchfield again addressed the convention, calling attention to false and misleading statements which appeared from time to time in the Bulletin of the League of American Municipalities, especially to an article in the June number, concerning the telephone situation in Indiana. After considerable discussion, from which it appeared that the paper in question is in league with the Bell interests, the matter was referred to the press committee "for definite and positive action."

The convention, evidently regretting the necessity which had arisen for declaring the veteran Independent wheel-horse, Judge Taylor, out of order, passed a resolution recognizing the valuable services of the Judge, extending congratulations for his past successes and honorable career and best wishes for his future.

Judge Taylor was called for and feelingly responded, saying that he had never done anything in his life with such earnestness as he had felt in prosecuting the fights for Independent telephony. His brief speech was received with cheers.

The afternoon session concluded after a paper by R. A. Walker, of Des Moines, Iowa—"Look for the Shield."

Harmony and Good Fellowship at the Banquet

THE convention fairly took the White City by storm Wednesday evening. This was true, both literally and figuratively. It rained, and free from the restraining influences of a convention hall the delegates went in for a good time. The entertainment committee, in selecting the White City for the scene of the annual banquet and the evening's festivities, realized fully the possibilities which this popular resort offers to seekers after fun. They failed to realize that the noise and confusion inseparable from such a place would seriously interfere with the speakers and mar the after-dinner program. That the toastmaster, Colonel J. H. Powers, of Louisville, Kentucky, and those whom he summoned to the entertainment of the dele-

Digitized by Google

gates could acquit themselves so creditably in the midst of such confusion and distractions, was a genuine triumph.

About 9:30 o'clock the feasting ended and Col. Powers took charge of the program with the remark, "The solemn part of the exercises would now begin." He said he had noticed that when the band played Dixie every Yankee present yelled himself hoarse, and that when it struck up "The Star Spangled Banner," every old rebel in the room went crazy with joy. He concluded that not only are we a harmonious, but a homogeneous people. After some facetious references to the Waterloo of historic fame and to Napoleon, who in his person represented the monopoly of war, he called upon J. H. Shoemaker, of Waterloo, Iowa, to respond to the toast, "Change and Exchanges."

Mr. Shoemaker captured his audience from the start. "Don't make any mistake," he said, "I'm not Napoleon, nor am I Wellington. The toastmaster did not tell you who I am because he does not know. I am not a telephone man. I am not a poet. I am not from Indiana. I am not from Missouri. I came to find out some things." Mr. Shoemaker then proceeded to read his response in verse, which was exceedingly witty and clever and was greatly enjoyed.

Mr. Jesse W. Weik, of Greencastle, Indiana, was then called upon to speak of "The Land of the Jack Oak and the Paw Paw." Mr. Weik seemed to be possessed of the idea that Indiana is the greatest country on earth and he was not at all backward in saying so. He said it, too, in language both graceful and forcible. He closed with a glowing tribute to the cause of Independent telephony.

Charles E. Sumner, of Portland, Oregon, spoke of "The Great Northwest." He began by complimenting the marvelous development of Southern California. He said that there was a popular misconception concerning the Northwest. Some people seemed to think that it rained there during seven months of the year, and that people even had to climb upon tables to keep out of the way of the water. He had seen, on occasions like the present, men dancing on tables, but wanted to assure the convention that water had nothing to do with it. He spoke briefly of the great struggle which the Northwest had been making, and in conclusion said: "It is up to us, to this organization, to take up the shield and raise it onhigh, to go on and on and carry it forward until the battle is won and monopoly lies dead at our feet.

Nelman F. Wing, of Grass Lake, Michigan, spoke very pleasantly of "Our Rural Business. What Shall the Standard Be?" He raised a laugh at the outset by comparing the difficulties he was under, trying to make himself heard, to talking through a twenty-five party line with every receiver down and babies crying in every house. He spoke of the importance of the farmer to the telephone business and advocated a standardization of the treatment accorded various rural communities by the companies.

The concluding speech was by J. Walter Barnes, of Fairmont, W. Va., "Why Are We Here?" We are here, he said, among other things, to fight the common enemy; to consider the development of the individual companies and the connecting of districts by long distance service, and lastly to gather enthusiasm for the great work which must be accomplished by the closely affiliated companies in the future.

The Final Proceedings

UPON convening Thursday morning Messrs. West of Pennsylvania and Barnes of Virginia were added to the nominating committee.

L. G. Parker, of Louisville, Kentucky, read a very excellent paper on "Southern Toll Line and Exchange Development," which was received with great enthusiasm.

Senator Kline of the committee on Amendments to the Constitution reported that the committee had revised the whole constitution in accord with the conditions now surrounding the Association. The report in detail was read by Mr. Ware and adopted section by section. Many of the changes were verbal. One important amendment was the change of name to the "International Independent Telephone Association of America" in order to include the Independent companies in Canada and Cuba. The executive committee membership was reduced from nine to five. No provision was made for membership by individual companies, the idea being to foster the formation of state associations. Manufacturers of Independent telephone apparatus, dealers in poles and supplies, Independent telephone publications will be admitted to an Independent telephone contractors' associate members club without vote or right to hold office on approval of the executive committee and the payment of annual dues of $25. A further assessment may be made by the executive committee with the consent of these associate members. The advisory board is empowered each year to appoint committees on credentials, nominations and amendments to the constitution. The executive committee is required to approve all bills which are submitted to the association for payment.

W. B. Woodbury, Chairman of the Press Committee.

This revised constitution was adopted as a whole and five thousand copies were ordered printed for the members.

The following report of the committee on Standardization of Equipment was made and adopted:

1.—We endorse the resolution presented at the convention of 1905 by the preceding Committee on Standardization, recommending that a permanent Equipment Committee should exist and that a National Association Bureau of Standards and Engineering should be maintained.

2.—In our opinion the official selection of one unvarying type of telephone equipment as a standard for all companies in the Association is not feasible at present, and if it were effected it would probably discourage improvement and impede progress; but we believe that there can and should now be standards officially determined to which various kinds of material and equipment can be referred.

3.—In connection with the fixing of standards, it is highly desirable that many details affecting maintenance costs should be determined upon, specified and recommended for adoption by all operators and manufacturers as soon as possible. Examples of such details which have been fixed in other lines of business are, standard incandescent lamp base, standard threads on iron pipe, the standard system of machine screws and standard fittings for railroad practice.

4.—A unit of carrying value for telephone circuits should be determined as soon as possible, and the knowledge of it properly disseminated throughout the Association. The adoption and use of this standard unit will enable subscriber's lines, trunk circuits and long distance lines to be designed and treated in a uniform and definite way, and will render possible mutual understanding and co-operation in transactions involving such lines and line values, which has hitherto been impossible.

5.—We recommend that the Association carry the foregoing suggestions into effect, and to that end that a permanent committee be authorized, to be known as the Committee on Physical Standards; that this committee be apopinted immediately after the present convention to take the place of the present Committee on Standardization of Equipment, with power to carry on the required work under the direction of the proper officers of the Association. All determinations made by or under the direction of this committee should be recorded in the form of specifications, to be kept on file as a part of the permanent records of the Association, and standard materials as they are determined should immediately be given code marks and numbers for the convenience of maker, seller, purchaser and user.

6.—In addition to the foregoing, we further recommend that the officers of the Association be authorized and empowered to receive and act upon the recommendations of the Committee on Physical Standards, and to make the necessary business arrangements for carrying on the work of said committee, including provision for meeting expenses of the work, which, if possible, should be done without making it a charge upon the revenues of the Association.

All of which the committee respectfully submits.

SAMUEL G. McMEEN, Chairman. R. A. WALKER, Secretary.

Present at meetings: O. F. French, Edward E. Clement, J. W. Kelly, Edmund Land, R. A. Walker, Samuel G. McMeen, C. E. Stinson.

Digitized by Google

The committee on the Standardization of Operating Rules and Regulations presented a voluminous report which, without reading, was ordered printed in pamphlet form for the information of members. The report dealt at length with toll accounting; recommended the appointment of a permanent committee of five to receive suggestions from members, and provided for the circulation of the committee's recommendations among members of the association.

The convention adjourned for lunch and reassembled at 1.30 to hear the report of the Nominating Committee. As the first business they announced the nomination for officers of the association during the coming year as follows: President, J. B. Hoge, of Cleveland, O.; vice-presidents, Theodore Gary, Macon, Mo.; C. E. Sumner, Portland, Oregon; secretary, Charles C. Deering, Boone, Ia.; treasurer, J. G. Splane, Pittsburg, Pa.

The report was adopted by all of the members, and the secretary instructed to cast the ballot of the convention for the men named.

J. A. Harney, of Cleveland, O., was recommended for assistant secretary during the ensuing year. It was further recommended that his salary be increased as a recognition of the large amount of extremely valuable work he has accomplished during the time he has held this office. On motion of E. B. Fisher, of Michigan, a vote of thanks was given to the newspapers and trade journals for their treatment of the convention.

The committee on photographs reported concerning the competition, which was so interesting a feature of the convention. It was decided that the first prize should go to the collection furnished by the Keystone Telephone Company, of Philadelphia, Pa. The next award was to the Lincoln Telephone Company, of Lincoln, Neb., and the third prize went to the Sioux City Telephone Company, of Sioux City, Ia. Honorable mention was granted to the Louisville Home Telephone Company, of Louisville, Ky.

One thousand copies of the convention proceedings were ordered printed for distribution. The assistant secretary reported that over 700 people had registered. As representatives from al parts of the country were present, this alone is an indication of the extraordinary success achieved by this convention.

The Executive Committee was instructed to investigate the prospects of the granting of an Independent franchise in Chicago and report in sixty days.

The remaining papers and addresses were ordered printed.

A resolution was adopted sending the greetings of the association to the Mayor, Board of Public Works and Common Council of Evansville, Ind., urging upon them the importance of granting an Independent telephone franchise in that city. Also there was adopted a similar resolution addressed to Milwaukee. On motion of Cyrus Huling, of Columbus, O., a vote of thanks was extended to President Hoge.

Much interest was expressed in the views advanced by Prof. Smith of Purdue University, at Lafayette, Ind. He addressed the convention on behalf of the young men taking the telephone course. He said that at the present time graduates from this course were very much sought after by manufacturers, while it is his belief that it would be much better for them to go into the operating field. He asked what operating companies needed in their young employees, expressing his wish to obtain information in order that their training might be made to accord with the requirements of the work which is being done. Operating companies were urged to take this matter up with the schools by correspondence.

Messrs. Norton, Woodbury and Holdoegel were appointed a committee to wait on the officers of the League of American Municipalities and ask if they are willing to stand for the untrue reports concerning Independent telephony which had been printed in the Bulletin, which purports to be an official organ of the League. It is said that some time was recently spent in investigating this Bulletin, and it was found very difficult to trace the origin of the articles or establish any responsibility for their publication.

Texas

By J. B. Earle, Waco, Texas.

TEXAS is an empire in itself, too big to be properly handled in so limited a time, even from a telephone standpoint. It is 938 miles west from Orange to El Paso; it is 587 miles from Laredo north to Texarkana. The traveller from Texarkana makes a shorter journey to Chicago than to Texline on the Eastern boundary of New Mexico. With an area of 265,780 square miles, embracing lands of all descriptions, one can readily understand it is not a difficult matter to find abundant opportunities for development in almost any enterprise. If Texas were as densely populated as Illinois it would have 14½ million people. If as densely populated as New York, it would have a population of 28 million, or New Jersey, 64 million.

As it is, it has only a little more than three million; in our largest county, Dallas, we have 92 persons to the square mile, while in Castro County we have only one person to 100 square miles.

The tax valuations amount to over 946 million dollars, which, divided into population, would give an average value of $314 to each man, woman and child in the state.

Our pine forests furnish lumber to Canada and the Panama Canal zone. We compete with Cuba for the highest quality of tobacco. You can to-day buy our peaches on the streets of Chicago, and fruit lands developed would supply the United States. We are to-day producing a great proportion of the world's output of oil; the mineral resources are fast coming into prominence with the highest percentage grade of iron ore in the world; fortunes are being made in raising rice.

Most of you have doubtless heard of us as cattle raisers and of the vast ranches, but these must be seen to be appreciated. The telephone constructer will learn no ranchman is so poor as to deny himself the conviences and quick methods of doing business. I have simply mentioned these things without speaking of the "Black Land Belt," or the heart of the state. This is a strip of land about four or five counties of seventy-five to one hundred miles wide, extending from the Gulf of Mexico up through Central Texas and to and through the Indian Territory, and in it you have thousands of square miles of the richest land in the world on which we grow our great crops of corn, wheat, oats and cotton. The greater or less success of the Texas crop of the last, fixing in a large measure the price of the world. Each of these products we raise in such quantities as would almost cause you to doubt the Government statistics. Our climate is such that we carry on our out-door work the year round.

We endeavor to pay our employees a fair wage scale, and while it is less than you pay, it is more to them on account of much reduced cost of living.

We have no labor troubles, first, because we pay fair wages, and second, we treat our employees fairly and promote on merit only, working the open shop and giving preference to the men who deserve it. The Bell company with us does not employ union men when it knows it, except in cases of emergency.

Considering our soil, climatic conditions and labor, we off-set our higher freight rate, so the cost of telephone construction is about the same as with you, while maintenance, of course, is much less.

The time was when Texas had the reputation of passing most

TEXAS.

(*Continued from page 437.*)

drastic laws, unfair to foreign capital and especially to corporations. This was more in the reputation than the actual character of the laws, more a theory than a fact, and I believe today, taken as a whole, our laws are as favorable to telephone and telegraph companies as are the laws of any state in the union.

True, we do pay 1½ per cent. of gross receipts as a gross receipt tax, but in return we are given privileges not enjoyed by our friends from some other states. Art. 698 of the Revised Statutes of Texas gives "corporations created for the purpose of constructing and maintaining magnetic telegraph lines (and our Supreme Court construes a telephone line to be a telegraph line) authority to set their poles, piers, abutments, wires and other fixtures along, upon and across any of the public roads, streets and waters of this state in such manner as not to incommode the public in the use of the roads, streets and waters," and says further, "That such companies are also authorized to enter upon any lands, whether owned by private persons in fee or in any less estate, or by any corporation whether acquired by purchase or by virtue of any provision in the charter of such corporation, for the purpose of making preliminary surveys and examinations with a view to the erection of any telegraph lines, and from time to time to appropriate so much of said lands as may be necessary to erect such poles, abutments, wires and other necessary fixtures for magnetic telegraph lines and to make such changes of location of part of said lines as may from time to time be deemed necessary and shall have a right of access to construct said line and when erected, from time to time, may be required to repair the same, and may proceed to obtain the right of way and to condemn lands for the use of the corporation in the manner provided by law in the case of railway corporations No corporation shall have the power to contract with the owner of land for the right to erect and maintain a telegraph line over its lands to the exclusion of the lines of other companies." Our statute also provides for the joining and consolidation of telegraph or telephone companies.

As a result of these laws almost all our trunk toll lines are built on the right of way of the railways, the same as the Western Union Telegraph Company is in your territory. In condemning the right of way of a railway company we select three men, who, after sitting as a commission to fix values, usually find from three to five dollars per mile damages for the railway company, and you can at once proceed with your construction work, even in case of an appeal from the decision of the commission. In one suit you can condemn the right of way of a whole system, and not have to proceed against them in each separate county. The advantages in this are apparent; we distribute our poles, cross-arms, wire, etc. from a slow train, paying only regular local freight rate for material and regular passenger rates for the men necessary to unload the poles, etc. During the entire time of construction the facilities for getting the men to and from work is of no small advantage. No right of way to be cleared or trees trimmed, and no corners to hold, while the distance from one town to another is always the shortest possible route. These advantages do not stop with construction, but are equally important in the matter of maintenance. In case of toll line trouble we send a man in our district to the nearest station with his railroad velocipede and as soon as he clears the trouble he comes in easily at from ten to twelve miles an hour. If the trouble tests within a reasonable distance he goes and comes on his car.

With our land values increasing so rapidly and paying such interest in rents to landlords, producing such profitable crops for tenants, with resources without number, as we so often find in newly settled countries, our people are so much absorbed in these things, with which they are familiar; they have little idle money to put in stocks, while six per cent. bonds do not appeal to them. Vendor lien notes on black land farms bear more interest than this, and are as safe an investment as Government bonds, which are considered safer than most other investments.

In Texas the customary rate for telephone rentals in exchanges of more than four to five hundred telephones is $24 for residence and $36 for business telephones per annum. While in the smaller exchanges the rate is $18 for residence and $30 per annum for business telephones. In each case the rural party line telephone takes the exchange residence rate, with from six to ten on a line.

These we believe to be fair and just rates, inasmuch as our long distance and special wire leases are where we look most for profit. The adopted rate by Bell and Independent companies for long distance telephoning is one cent per mile for five minutes, sixty per cent. of this for the minimum of two minutes, seventy-three per cent. for three minutes, and eighty-six per cent. for four and one-fifth of the five-minute rate, for each additional minute, and one-half of this for night rate. Some of our companies have adopted the Bell minimum rate of twenty-five cents, but in Central Texas we allow a minimum rate of fifteen cents for two minutes on calls less than twenty miles.

Some of you will be surprised to know that the Bell's best long distance station west of Chicago is Dallas, Texas, where the average is, I am informed, about fifteen dollars per telephone per annum.

People in our state have the telephone habit, and on account of our methods of handling, especially the grain and cotton crops, the long distance business is probably greater than any other section of the world on a basis of population. Our cotton harvest begins about the first of August and lasts six to eight months. The price of cotton is talked every minute of every day during the season. The farmer rings his exchange merchants, who in turn get the three markets, Liverpool, New York and New Orleans, not less than three times a day, and at times of many fluctuations, leaves notice with his cotton exchange to ring him on each variation of five points. Some merchants make arrangements to have us keep them posted and pay for the market $25 per month; this is given at a distance of not more than forty miles.

It is the medium cotton buyer who has a toll bill of from one to three hundred dollars per month, while I know factors whose wire rent and tolls in Texas alone amount to more than a thousand dollars per month during the cotton season.

In addition to our toll service we have some lines composited and receive for the telegraph privilege about $18 to $20 per mile per annum. This in no way interferes with the telephone service. In this last matter the Independent companies are much handicapped, as all these lines are for great distances, 200 to 500 miles, and altogether for cotton business. The price of a message is never thought of when selling even one bale of cotton, as a few points more than cover the toll charge. A bale of cotton is the same as money to us, yet the amount of money is a question, when it has been known to vary more than five dollars per bale in one day; you can readily see the man holding from 100 to a 1,000 bales, buying and selling all day, wants the market each minute. They all, in addition to having their telephones with the exchange, run specials direct to the long distance board on what we term "toll loops," and in many instances a special direct to the local cotton exchange. In many instances a cotton factor will have printed a list of from twenty to fifty of his agents in the field, simply giving each a number, and when he wants them he gives his code of numbers, frequently twenty at a call. Again our people have never learned to economize, and too frequently the telephone is used where a letter would have as well served the purpose. At fifty dollars per bale with Texas producing 3,000,000 bales, or twenty-three per cent. of the world's output, and each bale handled several times over the wires, one can readily understand how the Bell company in Texas can show in its tax report a gross receipt account of $2,381,699.57 for the telephone receipts, and $50,483.78 from six months' special wire rentals, and in a measure it shows the need of the many circuits they have through

Seattle, the Coming Independent City

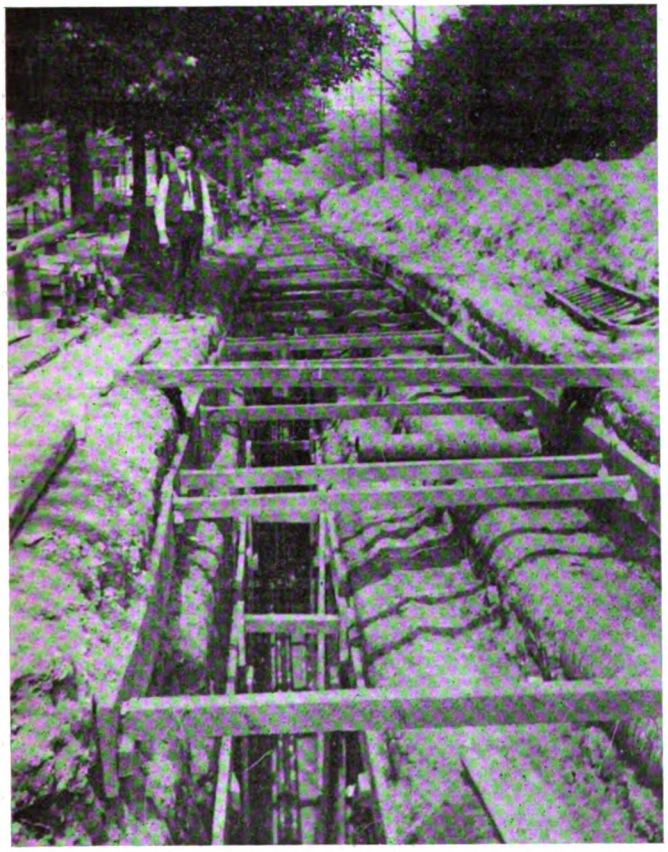
By William Johnson.

ORGANIZED at a time when only the Bell lines gave service to the people of the Puget Sound district and Western Washington, the Independent Telephone Company, of Seattle, has met the opposition of a well established and powerful competitor. After a fierce struggle it has gained a firm foothold and its great success promises to make Seattle a city of remarkable development of Independent service, and the starting point for the system which is being extended to cover the State.

One year ago there were in Seattle 7,236 subscribers for the Independent service; a few days since there were 11,471. Thus in a city of about 160,000 people the additions have reached the remarkable figure of 4,235 subscribers in eleven months. Considering with this the fact that on November 1, 1903, there were only about 2,000 paying telephones, and that new subscribers are now coming in at the rate of about 600 per month, the extent of the public approval of the efficient service which is being given may be readily grasped.

It is a fact, too, that this growth could have been increased if the company had been equipped to handle the business, and as soon as large extensions which are in progress under the direction of C. H. Judson are completed a great number of new installations will be made.

Work upon extensions of the plant is proceeding rapidly. Although a large cable plant is now in service, during the next

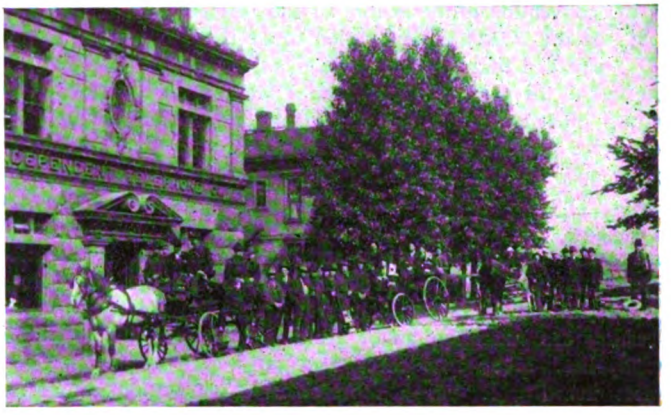


Underground work in progress in Seattle street. Conduits must be lowered on account of regrading being done by city.

few months it will be increased by nearly 50 per cent. Much new conduit is being placed, in spite of difficulties which have arisen owing to the extensive regrading of streets being carried on by the city.

In addition to the three present common battery exchanges two new offices are now being built, and when the switchboard work is completed there will be a sufficient capacity for about 27,000 lines. It is expected that about $500,000 will be spent upon the plant this year.

Since the success of the Seattle company has become an assured thing other cities in this region have hastened to give rights to Independent companies. Every important town in western Washington has now an Independent system in process of construction, and they will soon be connected with one another by long distance lines. A system at Portland Ore., is now being



Installers in front of the building of the Independent Telephone Company, Seattle. This crew put in 876 telephones during the month of May.

built. Independent plants are being put in at Tacoma, Walla Walla, Spokane, Everett, Bellingham, Port Townsend, and one is in successful operation at Port Angeles. A long distance company has been organized and has contracted to build long distance lines connecting all of these points, and work on the principal line is now being done. It will run from Portland, Ore., to British Columbia along the coast and connect with all points in Western Washington where Independent plants are established.

At present long distance lines are in use between the Seattle company and the Farmers' Mutual Telephone Company, which connects with thirty-one small points to the north of the city. Within the next twelve or eighteen months it is expected that the whole western part of the State of Washington, covering the whole of the busy Puget Sound district, will be completed and in full operation, with Seattle and its present company as the hub of this large and valuable system.

The extension of the system at the present extraordinary rate is due to the broad policy and able management of a group of men who are doing much for Independent telephony in the West.

BLOTTER SUGGESTIONS FOR BLOTTING OUT ALL MEMORY OF THE BELL.

L. A. HERRICK, manager of the Stephenson County Telephone Company, Freeport, Ill., has achieved considerable success in gaining new business through the proper use of effective advertising copy. Here is one of the verses which he suggests for use upon a blotter of the standard size, with the general arrangement that has been shown in reproductions of advertising matter of this nature which he contributed to a previous issue.

Not only in Freeport but in towns far away
The new local and toll service has come to stay.
Don't write or travel, just ask for "Toll,"
And if you don't get your party you are not in the hole.

The use of appropriate telephone advertising matter on blotters is rapidly gaining in favor. When a business man receives a neat blotter bearing a short verse or a concise argument he is favorably impressed with the Independent service.

THE EDITOR'S PAGE

CHICAGO APPROVES INDEPENDENT TELEPHONE MEN.

NO convention in the history of Independent telephony, either of the National Association or of those preceding it, has equalled that which assembled for deliberation in Chicago this week. In point of attendance it was far in the lead. The seating capacity of the hall was insufficient to accommodate all who were present, and some were standing at every session.

Not only did the convention excel in numbers, but in enthusiasm. The very air was charged with optimism which was contagious. It was impossible to enter the hall without being impressed with the earnestness and enthusiastic zeal of the delegates assembled. There were not a few of the old war horses of Independent telephony, pioneers in that movement, which is wresting the American public from the grasp of the worst of monopolies. Many new faces were also seen and many new voices heard. It was a representative convention of strong men. It was moreover a gathering of fighters, for the struggles of the past ten years have developed the fighting instinct, even where before it had lain dormant. Whether the voice came from the great Northwest, or from New England itself, the breeding place of the Bell monopoly, it told of a winning fight against monopolistic greed and underhand methods.

In some respects the most notable feature of the convention was the address of welcome by Hon. J. Hamilton Lewis, the corporation counsel of Chicago, who appeared in behalf of the mayor. Like so many sons of the South, Mr. Lewis has the gift of true eloquence, making it a delight to listen to his easily flowing sentences and rounded periods. But it was neither his oratory nor his gracious words of welcome which most concerned the convention. He voiced the sympathy of Mayor Dunne, no less than of himself, with the cause to which the assembled delegates stand pledged.

The mayor, he said, had been especially anxious to greet the convention in person, for a great part of his life had been devoted to the same great principles and purposes which inspire Independent telephony. He himself recently had a part in investigating and controlling the Bell company in Chicago, which he did not hesitate to characterize as the most grasping and most relentless monopoly in existence. To-day, he said, the barriers have been thrown down and the gates of Chicago opened to those who would enter in the right spirit to give relief to a long suffering people.

It must be remembered that through the voice of Mr. Lewis the Mayor of Chicago was speaking—the executive head of a mighty city.

The companies which long have been seeking connection with this populous commercial center have a right to feel encouraged. Mayor Dunne sympathizes with the movement because it is in harmony with all of his ideals. Mr. Lewis is in sympathy because investigations made by virtue of his official position have led him to see the real nature of the Bell organization. It does not seem too much to hope that the business men of Chicago will at last awaken to the situation and demand access to the great channels of trade which are now closed to them.

Chicago business men ordinarily are not in the habit of overlooking opportunity, nor are they wanting in enterprise. Yet here are a million and a half Independent telephones in daily use throughout a great commercial district of which Chicago justly considers herself the focal point. Through these million and a half telephones the people talk with each other and across whole states; they can talk nearly from one end of the country to the other; but if they would talk with the business men of Chicago they are forced to patronize a monopoly in the grasp of which even Chicago is growing restive.

With the active co-operation of Mayor Dunne and his energetic and able corporation counsel, the Independent movement must succeed. Chicago will at last awaken to a realization of a long neglected opportunity and wonder why it did not happen before.

OBTAINING PUBLICITY.

DESERVING of the strongest emphasis is the point so well brought out by the speakers at the Convention that the way for a telephone company to keep the public interested in its work is to tell the people about the things which are new. Telephone service is a subject in which everybody is interested. Every manager knows how his subscribers get together and tell their troubles—that proves it. It is for the manager to give them something else to talk about.

If a man makes a call and has to wait thirty seconds for an answer he knows that he is not getting what he is paying for. The far greater number of calls, however, that are answered in three seconds pass by without comment. If each individual can only be made to understand that the long wait is an exception, he will be able to take a view which is not only favorable to the telephone company but which is just. Then if he will bring his occasional difficulties to the attention of the manager in a friendly way, so much the better for the company. This is an easy way to find out where the conditions need to be improved.

Newspapers are eager to tell every subscriber what is going on in every line of local business. If things are going well it gives them a chance to appeal to local pride, and news that helps them to this is good, and printable. It only remains for the manager to give information at the earliest possible moment, and in the right spirit.

A good many telephone men are prone to look upon the obtaining of publicity for their work as an attempt to gain free advertising, and they shun or seek methods looking toward this end according to their natural feelings on the subject. This, however, is far from being the correct view to take. Telephone companies should realize that newspapers are perfectly willing, and often eager to obtain matter of just the sort they are able to give out. The first aim of the manager should be to hold his service up to the highest standard and plan for frequent improvements; the second, to get the improvements he has planned into operation, and the third, to make them known to all the people in his town.

KEEPING THE STANDARD SHIELD.

R. A. WALKER in his address before the delegates to the convention brought out the necessity for avoiding any changes in the recognized emblem of Independent telephony. Above everything else the shield stands for unity of purpose. It is the symbol of the solid front presented by the firmly associated companies.

To be thoroughly representative of this high and useful sentiment, and incidentally to achieve its highest business value, the emblem must be universal. It is imperative that no change should be made from the standard form.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

HEIGHT OF TELEPHONE WIRES IN NEW YORK.

Will you kindly tell me what distance above a telephone line another company is required to place its wires. Also, would the first party be justified in raising its wires or placing guard wires higher than its poles, and if so, how much higher? J. M. G.

THERE is no specified distance that must be kept between an established telephone wire and another newly erected to parallel or cross the first. The rule is that the one subsequently strung must be constructed a sufficient distance from the other so as not to interfere unreasonably with the use of the first. The distance therefore depends upon the circumstances of each case. In an Iowa case it was decreed that a distance of ten inches should at all times be preserved between the wires of two companies upon a country highway. In the same case the companies were required to keep a distance of four feet between their wires in the public streets of a village. The court thought there was good reason for requiring the wires of the respective companies to be separated by a greater distance in the town than was necessary along the country highway. Northern Telephone Co. v. Iowa Telephone Co., 98 N. W. 113.

The facts might be such as to justify the first company in raising its wires or in placing guard wires higher than its poles, but how much higher cannot be determined without a fuller statement of the facts than you have made.

KIND OF PIKE POLES TO BE FURNISHED EMPLOYEES.

Is there any law requiring a telephone company which furnishes its employees pike poles to handle its telephone poles, to keep them in good condition and the points well sharpened? We have a case where a workman was injured by the pole slipping because he had let the point get dull, and the telephone pole fell on him, bruising his head. He claims it is our fault, but we think the whole trouble was caused by his own shiftlessness. S. V. T. CO.

YOUR company performed its duty by furnishing pike poles of the ordinary kind and in good condition and would not be liable for an injury to an employee caused by the use of a pole upon which the point had become blunted or dull so that it could no longer be relied upon as a brace for poles which are being taken down. Towne v. United Electric G. & P. Co. (Cal.), 70 L. R. A. 214.

WHERE COMMISSIONERS DO NOT LOCATE POLES, COMPANY LOCATES THEM AT ITS PERIL.

THE town of Towanda, Ill., brought suit against the Interstate Independent Telephone and Telegraph Company to recover a penalty prescribed by the State law for alleged obstruction of the public highways of the town by placing telephone poles therein. The company was found guilty in both justice and circuit courts and appealed the case to the Supreme Court of the State. It appeared from the evidence that the telephone company, before it commenced erecting its line, caused the highway commissioners of the town to be served with a notice, according to law, that it proposed to construct a telephone line through the town and over certain highways and requested the commissioners to designate the portion of the highways in which it should place its poles. The commissioners read the notice, but not understanding its legal import, determined to consult their attorney about it and took no action. Subsequently the attorney for the commissioners prepared a notice which was served upon the telephone company protesting against the use of the highway by the company and instructing it, in case it did place any poles in the highways, to locate them immediately adjoining the fences. The company constructed about six miles of telephone lines in the town, many of the poles being placed from one to sixteen feet inside the lines of the highways. The circuit court held that the action taken by the commissioners was void and not binding on the telephone company because it was not taken at a regular or called meeting of the commissioners and that the company therefore had the right to place its poles in the highways, if in so doing it did not incommode the public, but held that the evidence showed the poles to be placed so that they did interfere with the proper use of the highways by the public. The Supreme Court affirmed the judgment of the Circuit Court in favor of the town and held that where highway commissioners failed to specify the portion of the highway to be used by a telephone company the company in placing its lines acted at its peril and was bound to so place them as not to interfere with the use of the highway by the public or to suffer the penalty prescribed. Interstate Independent T. & T. Co. v. Town of Towanda, 77 N. E. 456.

TWENTY DOLLARS PER MILE FOR ERECTING POLES.

JUDGMENT was rendered at Jackson, Miss., in the eminent domain case of the Cumberland Telephone and Telegraph Company vs. the Gulf and Ship Island Railroad Company. The court decreed that the Cumberland Telephone Company should pay to the Gulf and Ship Island Railroad Company the sum of $20 per mile for the privilege of erecting poles and lines for the operation of the telephone company along the railroad right of way. The judgment applies to all lines on the Gulf and Ship Island Railway in the State of Mississippi and amounts to $6,644.04, with the addition of costs in the sum of $94.70, which was promptly paid by the general superintendent of the Cumberland Telephone Company.

NEGLIGENCE IN HANDLING DEAD WIRES.

AN interesting discussion appears in the April number of "Case and Comment" under the above caption. The discussion has for its text a recent decision of the United States Supreme Court in Looney v. Metropolitan Ry. Co., Adv. S. U. S. 1905, Pg. 303, 26 Sup. Ct. Rep. 303. The question discussed is whether an employee should be held to the same standard of care and caution in handling an electric wire which he has the right to assume is "dead," that he is bound to exercise in handling what is known to be a "live" wire. The court held in this case that the defendant was not liable because the deceased employee for whom the suit was brought unnecessarily touched uninsulated "leads" in making a connection. The article cites a number of cases which hold that the employee need not be so careful in handling wires which he has a right to assume are "dead" as those that are "live" and characterizes the doctrine laid down in this recent decision as extraordinary. Among cases cited as illustrating the same theory as is now enunciated by the Supreme Court are two decisions holding that an experienced lineman employed by a telephone company who receives a shock because of the "live" condition of a guy or span wire belonging to a street railway company, which would have been "dead" but for a defect in the insulator or circuit breaker, is chargeable with negligence which will defeat his right to recover any damages from the telephone company where he failed to make any insulation test, although he had apparatus for the purpose and knew that defects in the insulation of such guy or span wires were common and that there was no one besides him to make such test. Bergin v. Southern New England Telephone Co., 70 Conn. 54, 39 L. R. A. 192, 38 At. 888; Anderson v. Inland Telephone and Telegraph Co., 19 Wash. 575, 41 L. R. A. 410, 53 Pac. 657.

TEXAS.

(*Continued from page 439.*)

the black land belt. What this would amount to if they or the Independents had the state thoroughly covered, one can hardly foretell.

The Southwestern, or Bell is developing as rapidly as possible and the local Independents are doing well, but both together cannot take care of business. In no place do I believe there is a stronger sentiment or a stronger spirit in favor of developing the resources of a state. To this is added an opposition to all monopolies than runs through almost every individual in all classes of society. Texas offers no inducement for the telephone man who is strictly a promoter; and it is not a good field in which a man can invest his money and leave it to take care of itself. But to the man or set of men who will come to Texas and become associates with our people and secure the advantage of the personal element from association and friendship, I believe no field offers a greater opportunity for telephone investments, either in exchanges or toll lines.

Independent telephone exchanges have been built in most of the large cities of the state and are prosperous where they have been properly constructed, good service is given and the property well maintained. You can readily understand from what I have said that the one thing our telephone users demand is the best of service. The man who took time to go across the street for a drink and while he was gone lost fifteen hundred dollars on a cotton transaction has no use for telephone service where it takes him half an hour to get the toll operator. Trunk toll lines have been constructed through most of the black land district, but not nearly all of the valuable territory in this portion of the state is yet developed. There are a number of small towns in rich agricultural belts which have as yet no Independent telephone exchanges, and a fine field is open to the investor who builds such an exchange and connects the same with the smaller surrounding towns, most of which will support excellent telephone exchanges. I have under my management a town of not more than three thousand population in which we have an exchange of 287 telephones, at the rate of $18 and $30 per annum per instrument. This is one town located in a county having nearly 2,500 telephones in operation. Many of these smaller towns having a population of 10,000 or less have been built within the last year or are now being built, and the most valuable territory in the state will soon be taken up.

To the men who wish to construct good telephone exchanges and toll lines, among people predisposed to the Independent telephone movement, and will give the best of service and the business personal attention, our great state offers many attractions and good opportunities for profit.

The homeseekers' excursions run by the great railway systems give any man an opportunity at a small expense to visit the state and see for himself that the conditions exist as I have stated.

DELEGATES ENTERTAINED IN ROTUNDA OF AUDITORIUM BY SELECTIONS TRANSMITTED BY TELEPHONE.

ONE of the most interesting features in the exhibit line at the Convention, was the transmitter test given by the INTERNATIONAL TELEPHONE M'F'G. Co., Chicago, Ill., at its headquarters, Parlor 102.

This test was made by using a transmitter with 16 cells No. 1900 dry batteries direct in the circuit with the transmitter attached to a phonograph placed in the exhibit room, and connected to a receiver with megaphone attachment suspended in the rotunda of the hotel.

Though the transmitter became heated to such a degree that one could not bear to touch it after a half hour's continued usage with sixteen cells of battery, the transmission remained equally clear and distinct during the entire entertainment.

The delegates and visitors were also highly entertained a number of times through this circuit, with selections by E. H. Martin of the E. H. Martin Telephone Co. of Webster City, Iowa, the well-known whistler and impersonator.

These tests not only demonstrated the high quality of carbon used in the International transmitters and the durability of these transmitters under heavy usage, but they also showed the possibility of transmitting speeches or music to a large audience through one instrument.

The International company also showed various parts of its "growing exchange" switchboard system, lamp signal central energy multiple and trunking boards, including a full line of telephone apparatus.

The company was represented at the Convention by Henry Shafer, president; W. E. McCormick, vice-president; F. L. Middleton, sales manager, and A. W. McKay.

Some Prominent Men in the Manufacturing and Supply Fields

E. V. Brown, Electric Appliance Co., Chicago; J. H. Bell, Eureka Elec. Co., Genoa; G. S. C. Bauer, Century Tel. Cons. Co., Buffalo; J. G. Brobeck, Simplex Electrical Co., Boston; J. B. Bradley, Duluth Log Co., Central Tel. & Elec. Co., St. Louis; C. R. Baldwin, Baldwin Tel. Supply Co., Kansas City; M. I Berger, Vote-Berger Co., La Crosse; P. A. Rogers, Gen. Elec. Co., Chicago; M. E. Brown, Raber & Watson, Chicago; Chas. G. Ashley, McMeen & Miller, Chicago; C. E. Brown, Coml. Elec. Supply Co., St. Louis; O. Borchert, Julius Andrae & Sons Co., Milwaukee; W. C. Bogue, American Steel & Wire Co., Chicago; A. E. Barker, The Dean Electric Co., Elyria, O.; F. R. Bryant, Central Elec. Co., Chicago; C. S. Bundeman, Dean Elec. Co., Elyria, O.; W. I Blakemar, Elec. Appliance Co., Chicago; E. C. Brown, Elec. Appliance Co., Chicago; Jos. C. Belden, Belden Mfg. Co., Chicago; Geo. Metcalfe, Sterling Elec. Co., Lafayette; Frank B. Cook, Chicago; Geo. W. Brown, Chicago Tel. Supply Co., Elkhart; Wm. W. Dean, Dean Elec. Co., Elyria, O.; C. B. Clements, Chicago, Tel. Supply Co., Elkhart, Ind.; A. B. Crawford, Stromberg-Carlson Tel. Mfg. Co., Rochester, N. Y.; S. A. Dinsmore, Elec. Appliance Co., Chicago; H. M. Coulter, Central Elec. Co., Chicago; Geo. W. Dain, Standard Underground Cable Co., Pittsburg, Pa.; W. H. Crumb, W. H. Crumb & Co., Chicago; H. Cleaver, Elliot-Blair Steel Co., Chicago; J. P. Cracraft, Stromberg-Carlson Tel. Mfg. Co., Rochester, N. Y.; C. A. McCarthy, Elec. App. Co., Chicago; F. J. Conklin, American Steel & Wire Co., Chicago; W. E. Cook, Aut. Electric Co., Chicago; R. W. Craig, Amer. Elec. Novelty & Mfg. Co., Chicago; W. C. Doolittle, Sterling Electric Co., Lafayette, Ind.; H. S. Durant, Durant Elec. Sup. Co., Chicago; J. F. Crook, Aut. Elec. Co., Chicago; Interstate Ind. Tel. Co., Aurora, Ill.; F. J. Donnergal, K. S. & S. Co., Chicago; O. Brubon, Advance Pay Sta. Co., Chicago; F. J. Goodman, Century Tel. Const. Co., Buffalo, N. Y.; Arthur E. Einstein, Manhattan Elec. Supply Co., Chicago; J. E. Epper, Gould Storage Battery Co., Chicago; Geo. H. Fister, Stromberg-Carlson Tel. Co., Chicago; H. W. Eldred, Standard Tel. & Elec. Co., Milwaukee, Wis.; P. J. Eubanks, Stromberg-Carlson Tel. Co., Chicago; D. Gould, Stromberg-Carlson Tel. Co., Rochester, N. Y.; C. L. Fisher, Aut. Elec. Co., Chicago; Frederic Greer, Harvard Elec. Co., Chicago; E. N. Ford, Dean Elec. Co., Elyria, O.; R. S. Fields, Korsmeyer Co., Lincoln, Neb.; John Erickson, Aut. Electric Co., Chicago; H. Guttman, Aut. Electric Co., Chicago; A. D. Gillespie, Monarch Elec. & Wire Co., Chicago; P. W. Telephone Publicity—Appealing to Public Opinion

By Ivy L. Lee.

THE art of appealing to public opinion on behalf of commercial enterprises is a matter of recent development. From time immemorial appeals to public sentiment have been made by politicians and social reformers with the result that the press has been freely open to them, thus leaving them an unobstructed avenue to the ears of the world. Up to a few years ago American corporations had proceeded upon the assumption that only two courses were necessary for them to pursue: First, to produce a commodity which the public needed and would purchase; and secondly, to fortify themselves behind all the safeguards created by the law. They were confident that their rights would be protected by the courts against all the caprices and clamorings of the people.

Within recent years there has been an awakening. Business men have come to see that the tribunal of last resort is found in the judgment seat of public opinion—a tribunal which even influences courts of law, and sways houses of Congress and marts of trade.

At a time when franchises were obtained for the asking, with a government or local subsidy sometimes thrown in, it was hardly necessary for a corporation to make an appeal to the public. Franchise rights were then of very doubtful value. But with the extraordinary increase of urban population, the marvellous progress of modern engineering science and the demonstrated revenue producing value of public franchises, the entire situation has changed. Corporations now realize that they must take the public into their confidence and that they must justify their very existence. Corporations are now coming to see that they must approach the court of public opinion exactly as they approach a court of law, and that this appeal must be made with due regard to the peculiarities and the machinery of the tribunal itself.

Many business institutions within the last two years might have said: "Your theory is entirely correct, but the principal avenue of approach to the public is the press, and in it we are not able to make our appeal except in the advertising columns, something expensive to the point of prohibition." This statement would have involved the thought that although the corporation was willing for the public to know those facts about itself which it wished to offer, it was unwilling to give the public the benefit of that information which the public had a right to have. The public is not unreasonable, but if there is one thing that it does demand, it is perfect frankness. A study of the art of appealing to public opinion, therefore, has involved two important questions: First, what it is that the public is legitimately entitled to know and wants to know concerning an enterprise? Second, what is the best means of presenting this material in a way to command a hearing? The fundamental fact upon which every intelligent appeal to public opinion must be based is a willingness to make the appeal to public opinon with the same frankness and thoroughness as an honest, straightforward business man would employ in presenting his side of a case before a court and jury.

With perfect truth, many corporate managers are constantly saying: "We feel that our business is honorably conducted, and that our purposes should commend themselves to the public, and yet we are constantly misrepresented in the newspapers." Granting that these premises are correct, a mistake has been made in not presenting the cause to the newspapers in accordance with the rules and technicalities which surround this powerful tribunal.

A newspaper lives to print news and advertising matter. There are, indeed, many occasions when it is but proper that business men should address the public only through the advertising columns. However, there are other occasions when the news and editorial columns are the only places to which access is desired, or where the publication of matter would be of the slightest value. This was very apparent in New York a few weeks ago when the Bell interests spent a vast sum of money in paid advertising to prevent the issuance of a franchise to the Atlantic Telephone Company. Had the campaign been planned plenty of time in advance, this extravagant outlay of money would not have been required and the public mind would have been very much more seriously impressed. Therefore, the problem is, how can we reach the news columns? The answer is obvious, though not altogether simple: The way to reach the news columns is to give the papers NEWS! What then, you will inquire, is news? I have never seen a better definition than that given by Goethe, who, nearly a century ago, wrote in his one great novel, "Wilhelm Meister," this paragraph:

"Ask yourself, or ask others, what invests a piece of news with its greatest charm. Not its importance, not its influence, but its mere novelty."

You must give the newspapers, therefore, matter which has about it some element of novelty. If this is done, and if the item is true, you need never fear that it will not be printed. Let the other side of the case be printed, too, but continue to present your own side, honestly and persistently, confident that, upon the examination of the evidence, the "jury" will decide justly.

My personal judgement based on a study of this subject covering a considerable period is that the appeal to public opinion on behalf of the Independent telephone should not be made with the idea of breaking down or eliminating the Bell telephone; but it should proceed upon the principle that competing telephone systems are of great advantage to the public, that just as a man can see less if he has only one eye, and can hear less if he has only one ear, just so is he robbed of his proper share of comfort and business efficiency by the use of only one telephone. The lesson should be driven home that the telegraph business in this country was never so effective or so cheap as it is now with two companies actively competing for the business. Let the position be assumed that the Independent telephone bases its claim for support solely upon its better service.

The telephone is one of the most interesting subjects before the world to-day. It is estimated that it has added 15 per cent of efficiency to the businesses which utilize it. It has been of infinitely greater value to the people who have used it than the rural free delivery service. It has made steps lighter; it has protected life; it has relieved panics; it has lightened the hearts and burdens of millions of people and it promises to save country life and bring back its charm. The people to-day are interested in everything that concerns the telephone, no matter whether it is the Bell or the Independent. The Independent movement is full of the most interesting news material, which the public will read eagerly and the newspapers will print gladly if it is only supplied to them in the right way. Every bit of your progress, the human interest incidents connected with the growth of your business, the facts concerning the resistless, inevitable march of your armies toward the great cities of the country—all these are of vital interest to the whole American people.

Abstract from the paper read at the Convention of the National-Interstate Telephone Association.

Delegates and Guests at the Convention

ALABAMA.—Frank B. Jones, manager Morgan Co. Tel. Co., New Decatur, Morgan county.

ARKANSAS.—Mack Hammett, manager Pine Bluff Telephone Co., Pine Bluff, Ark.

DISTRICT OF COLUMBIA.—Edward E. Clement, Washington, D. C., member of Committees on Litigation and Legislation and Standardization of Appliances.

ILLINOIS.—L. S. Bowen, Carroll Co. Ind. Tel. Co., Savanna, Carroll county; J. A. Bortz, Ind. Tel. & Tel. Co., Nauvoo, Hancock county; P. M. Biever, Central Ill. Tel. & Tel. Co., Lincoln; Ed. T. Biever, Lincoln; Harry C. Barbour, manager Ottawa Home Tel. Co., Ottawa; T. T. Bridges, Mahomet Tel. Co., Mahomet; Undin Babcock, Pekin; A. J Bohymer, Petersburg; C. B. Cheadle, Interstate Ind. Tel. & Tel. Co., Joliet; E. R. Conklin, Interstate Ind. Tel. & Tel. Co., Aurora; J. S. Daily, Peoples Tel. Co., Chillicothe; John H. Drawyer, Empire Tel. Co., Bradford; Chas. E. Drew, Bunker Hill Tel. Co., Bunker Hill; C. M. Erwin, Ill. Western Tel. Co., Macomb; C. W. Forbes, United Tel., Tel. & Elec. Co., Chicago; Geo. H. Glass, Citizens Tel. Co., Pekin; Jos. N. Gamache, Home Tel. Co., Hospital, Kankakee county; R. A. Gates, The Illinois Tel. Co., Jacksonville; J. H. Hackett, Ill. Tel. Co., Jacksonville; E. C. Hennis, Northern Ill. Tel. Co., Sandwich; L. A. Herrick, Stephenson Co. Tel. Co., Freeport; Amy Hills, Citizens Home Tel. Co., Pekin; W. B. Lathrop, Jr., Citizens Home Tel. Co., Champaign; Lon Lee, Citizens Home Tel. Co., Champaign; Kempster B. Miller, McMeen & Miller, Chicago; S. G. McMeen, Chicago; H. Minkel, Bunker Hill Tel. Co., Bunker Hill; E. A. Quarfot, Ill. Electric Co., Chicago; W. H. Ramsey, Auburn Telephone Co., Auburn; C. W. Steiger, Inter-State Tel. & Tel. Co., Aurora; T. M. Sherman, Citizens Tel. Co., Cooperville; C. A. Stromberg, Inter-State Ind. Tel. Co., Aurora.

INDIANA.—W. M. Bailey, Richmond Home Tel. Co., Richmond; H. M. Berry, Bedford Home Tel. Co., Bedford; Mark P. Boone, Peru Home Tel. Co., Peru; R. F. Blount, Home Tel. Co., Wabash; F. J. Beaucord, Home Tel. Co., New Albany; J. A. Browne, Eastern Ind. Tel. Co., Winchester; Wm. E. Bowers, Home Tel. & Tel. Co. of Ft. Wayne; Chas. Cassidy, Mitchell Tel. Co., Mitchell; L. G. Davis, Hoosier Tel. Co., Salem; R. R. Faulkner, Newcastle Tel. Co., Newcastle; Thad. E. Honway, Monticello Tel. Co., Monticello; N. C. Hunter, Home Tel. Co., Wabash; Walter Jones, New Castle Tel. Co., Newcastle; Chas. D. Knoefel, New Albany Home Tel. Co., New Albany; A. C. Lindemuth, Richmond Home Tel. Co., also representing the Indiana Independent Telephone Association, Richmond; Wm. Haney, Mitchell Tel. Co., Mitchell; John L. Osborn, Veedersburg Tel. Co., Veedersburg; L. M. Noher, Royal Tel. Co., Milford; Chas. S. Norton, Long Distance Tel. Co., Indianapolis; W. M. Schimseyer, Citizens Tel. Co., Decatur; J. S. Shoemaker, Bloomington Home Tel. Co., Bloomington; B. F. Stevens, Hazelton Tel. Co., Hazelton; Theodore Thorward, Home Tel. Co., South Bend; W. A. Wright, Hillsboro Tel. Co., Hillsboro, Ind.; Jesse W. Weik, Greencastle Telephone Co., Greencastle.

IOWA.—Geo. N. Bandy, Hawkeye Tel. Co., Des Moines; John A. Baxter, Winfield Tel. Co., Winfield; J. S. Bellamy, Knoxville Elec. Co., Knoxville; Chas. G. Cockrill, New State Tel. Co., Sioux City; Chas. C. Deering, Boone Co. Tel. Co., Boone; Hal. C. Fuller, Lehigh Tel. Co., Lehigh; S. A. Gregory, Union Tel. Co., Stockport; Geo. T. Hewes, Ind. Tel. Clearing House, Des Moines; P. C. Holdoegel, Central Mut. Tel. Co., Rockwell City; G. M. Heiserman, Albia Tel. Co., Albia; J. Ed. Huston, Winfield Tel. Co., Winfield; C. A. Hollis, Ind. Tel. Assn., Hudson; S. S. Co., Atlantic; Jos. M. Plaister, Fort Dodge Tel. Co., Ft. Dodge; R. R. Smith, Southen Iowa Tel. Co., Des Moines; W. J. Stanton, Corn Belt Tel. Co., Waterloo; J. C. Thorne, Jefferson Co. Tel. Co., Fairfield; T. A. Thompson, Sioux City Tel. Co., Sioux City; R. A. Walker, Mutual Tel. Co., Des Moines; A. F. Whittier, Corn Belt Tel. Co., Waterloo.

KANSAS.—C. L. Brown, Brown Telephone Co., Abilene; J. C. Kelsey, N. E. K. Tel. Co., Hiawatha; M. G. Miller, Olathe Citizens Tel. Co., Olathe; W. H. Nelson, Exchange Tel. Co., Smith Center; M. S. Taylor, Fayette Home Tel. Co., Lexington.

KENTUCKY.—Frank G. Hoge, Hopkinsville Home Tel. Co., Hopkinsville; L. G. Parker, Central Home Tel. Co., Louisville; M. B. Overly, Central Home Tel. Co., Louisville.

MICHIGAN.—J. R. Fuller, Union Tel. Co., Alma; John Babcock, Quincy Ind. Tel. Co., Quincy; A. R. Burch, Citizens Tel. Co., Battle Creek; F. O. Hughes, Citizens Tel. Co., Lansing; Frank B. Howard, Saginaw Valley Tel. Co., Saginaw; A. C. Hinebaugh, Southern Mich. Tel. Co., Burr Oak; Edmund Land, Citizens Tel. Co., Grand Rapids; J. C. Lees, Citizens Tel. Co., Grand Rapids; W. J. Molchers, Union Tel. Co., Alma; R. L. McCoy, So. Mich. Tel. Co., Burr Oak; B. A. Price, Saginaw Valley Tel. Co., Saginaw; Wm. Robinson, Citizens Tel. Co. of Muskegon, Muskegon; P. Wm. Schafer, Ida Tel. Co., Ida; J. G. Smith, Citizens Tel. Co., Jackson; C. E. Tarte, Citizens Tel. Co., Grand Rapids; H. H. Taylor, Citizens Tel. Co., Marshall; J. B. Ware, Secretary State Association, Grand Rapids; W. B. Woodbury, Home Tel. Co. Detroit, Detroit.

MINNESOTA.—R. S. Barry, Tri-State Tel. & Tel. Co., St. Paul; E. H. Moulton, Tri-State Tel. & Tel. Co. Minneapolis & St. Paul; H. W. Spooner, Tri-State Tel. & Tel. Co. Minneapolis.

MISSISSIPPI.—J. P. Helfenstein, Meridian Home Tel. Co., Meridian.

MISSOURI.—Jas. F. Barnett, Mo. Ind. Tel. Asso., Rutledge; Wm. H. Bassett, Kinloch Long Distance Tel. Co., St. Louis, Mo.; John F. Casey, Kinloch Tel. Co., St. Louis, Mo.; H. L. Gary, Nevada Tel. Co., Nevada; Theodore Gary, Home Tel. Co., Joplin; Mrs. H. L. Gary, Macon; Miss Mary B. Gary, Macon; H. L. Gary, Macon Tel. Co., Macon; M. L. Galladay, The Holden Tel. Co., Holden; R. W. Garner, Home Tel. Co., Joplin; A. B. Hughes, Hardin Tel. Co., Hardin; J. S. Haley, Lee's Summit Home Tel. Co., Lee's Summit; J. A. Hudson, Columbia Tel. Co., Columbia; Jas. F. Hudson, Columbia Tel. Co., Columbia; Ed. Lister, Capital Tel. Co., Jefferson City; Arnold Kolman, Kansas City Home Tel. Co., Kansas City; A. L. La Force, Columbia Tel. Co., Columbia; John H. Rogers, Kansas City Home Tel. Co., Kansas City; Hank McHenry, Capital Tel. Co., Jefferson City; M. R. Martin, Oregon & Forest City Tel. Co., Oregon; W. B. Scruggs, Cass Co. Tel. Co., Harrisonville; O. C. Snider, Kansas City Home Tel. Co., Kansas City.

MONTANA.—Thaddeus S. Lane, Montana Ind. Tel. Co., Butte.

NEBRASKA.—W. G. Francis, New Home Telephone Co., Beatrice; F. E. Ebersole, Lincoln Tel Co., Lincoln; R. F. Mattison, Nebraska Ind. Tel. Assn., Lincoln; Frank H. Woods, Lincoln Tel. Co., also Western Tel. Co., Lincoln.

NEW YORK.—John A. L. Campbell, Atlantic Tel. Co., New York, N. Y.; Martin W. Littleton, Atlantic Tel. Co., New York, N. Y.; Albert R. Smith, Niagara Co. Home Tel. Co., Niagara Falls, N. Y.; John M. Shaw, Atlantic Tel. Co., New York, N. Y.

OHIO.—J. H. Ainsworth, Home Tel. Co., Dayton; Lewis Brucker, Mansfield Tel. Co., Mansfield; E. L. Barber, Central Home Tel. Co., Louisville; Burton H. Brooks, Columbus Citizens Tel. Co., Columbus; C. S. Brewer, Ada Tel. Express Co., Ada; J. S. Chapman, Kenton Tel. Co., Kenton; Wm. Day, Bradford Home Tel. Co., Bradford; E. L. Coen, Vermilion Tel. Co., Vermilion; C. E. Cox, Eaton Tel. Co., Eaton; Henry A. Clark, Ada Tel. Express Co., Ada; Chas. D. Duncan, Home Tel. Co., Chillicothe; H. P. Folsom, Citizens Tel. Co., Circleville; O. F. French, Cuyahoga Tel. Co., Cleveland; Wm. R. Fee, Portsmouth Tel. Co., Portsmouth; Wm. R. Fee, New Citizens Tel. Co., Milford; Graham, Oberlin Tel. Co., Oberlin; Jas. B. Hoge, U. S. Tel. Co., Cleveland; J. A. Harney, N. I. & A. Tel. Co., Cleveland; W. B. Iles, New Citizens, Batavia; T. J. Hanna, Home Tel. Co., Dayton; Chas E. Hollander, Newark Tel. Co., Newark; G. R. Johnston, Columbus Citizens Tel. Co., Columbus; Washington Hyde, The Warren & Niles Tel. Co., Warren, Ohio; C. Y. McVey, U. S. & Cuyahoga Tel. Co., Cleveland; E. G. Miller, Warren & Niles Tel. Co., Warren, Ohio; Roy Owens, Citizens Tel. Co., Columbus; J. B. Rhodes, Zanesville Tel. & Tel. Co., Zanesville; D. Steel, Springfield & Xenia Tel. Co., Springfield; S. H. Statler, Piqua, Ohio; A. D. Schrader, National Interstate Tel. Assn., Cleveland; C. E. Stinson, Cuyahoga Tel. Co., Cleveland; T. J. Smith, Citizens Ind. Tel. Co., New Lexington; W. Gilbert Thompson, Hamilton Home Tel. Co., Hamilton; I. H. Thedick, Sidney Tel. Co., Sidney; C. D. Young, Citizens Tel. Co., Delaware; S. E. Ward, Mansfield Tel. Co., Mansfield.

OREGON.—Wm. N. Mead, W. Long Distance, Portland, Ore.; Chas. E. Sumner, Home Tel. Co., Portland, Ore.

PENNSYLVANIA.—H. E. Bradley, Eastern Traffic Assn., Philadelphia; Chas. F. Bender, Pittsburg & Allegheny Tel. Co., Pittsburg; Chas. Griffith, Johnstown Tel. Co., Johnstown; N. T. Folwell, Keystone Tel. Co., Philadelphia; J. P. Helfenstein, Consol. Tel. Cos. of Pa., Allentown; Frank Hart, P. & A. Tel. Co., Pittsburg; John W. Kelly, Jr., Keystone Tel. Co., Philadelphia; Chas. J. Mayer, Pittsburg, Johnstown Long Distance Tel., Johnstown; J. C. Sheahan, Keystone Tel. Co., Philadelphia; J. G. Splane, P. & A. Tel., Pittsburg; C. E. Wilson, Keystone Tel. Co., Philadelphia; Chas. West, Consol. Tel. Cos. of Pa., Allentown; W. R. Wilson, Union Tel. Co., Erie.

TENNESSEE.—Albert Parlett, Bristol Tel. Co., Bristol.

TEXAS.—J. B. Earle, Texas Tel. Co. & Brazos Valley Tel. Co., Waco; C. L. Simpson, Texas Cons. Long Distance Tel. Co., Dallas; J. B. Seeger, Texas Cons. Long Distance Tel. Co., Dallas.

VERMONT.—G. W. Buzzell, Citizens Tel. & Tel. Exchange, St. Johnsbury.

WEST VIRGINIA.—J. Walter Barnes, Cons. Tel. Co., Fairmount; A. C. Davis, W. Va. Western Tel. Co., Parkersburg; Jas. Knight, Cons. Tel. Co., Fairmount.

WISCONSIN.—M. S. Berger, La Crosse Tel. Co., La Crosse; W. F. Goodrich, La Crosse Tel. Co., La Crosse; J. C. Harper, Dane Co. Tel. Co., Madison; B. B. Harper, Dane Co. Tel. Co., Madison; J. A. Murray, Baraboo Tel. Co., Baraboo; J. U. Schmidt, Troy & Honey Creek Tel. Co., Prairie du Sac; Chas. Schumacher, Interurban Tel. Co., Sun Prairie; Will Van Middlesworth, Citizens Tel. Co., Racine; G. W. Wilder, Cambridge Tel. Co., Cambridge; H. G. Winter, Dane Co. Rural Tel. Co., Madison.

CANADA.—A. Hoover, Green River, Ont.; J. F. Demers, M.D., general manager Bellechase Tel. Co., Levis P. O.; Francis Dagger, technical adviser to recent Dominion Select Committee on Telephone Systems, Canada, Toronto; T. R. Mayberry, Ingersoll Telephone Co., Ingersoll, Oxford Co., Ont.; H. L. Gamel, Luther, Ont.; A. F. Wilson, Canadian Ind. Tel. Asso., Markham, Ont.

Digitized by Google

Manufacturers' Exhibits

THE following brief mention will give some idea of the large and complete display of apparatus and specialties grouped by the various Independent manufacturers and supply houses:

THE NUNGESSER ELECTRIC BATTERY COMPANY, of Cleveland, Ohio, showed a line of its famous "1900 Dry Batteries." In the center of the room to attract the attention of all who passed along the corridor a spark coil was operated with 10,000 volts, showing a three-inch spark. Very pretty initial watch fobs were given away for souvenirs. In charge of this exhibit were H. G. Robbins, of Cleveland, treasurer; Thomas G. Grier, of Chicago, general sales manager, and H. S. Green.

THE AMERICAN ELECTRICAL NOVELTY AND MANUFATURING COMPANY and THE AMERICAN MIN. AND DECORATIVE LAMP COMPANY, of Chicago and New York, were represented by Alfred J. Jackson and a fine line of exhibits. The first mentioned company manufactures the "Ever Ready" dry battery, and the latter, switchboard lamps.

THE F. BISSELL COMPANY, of Toledo, Ohio, was represented by A. F. Knierim. The company showed among other things its new can top terminal and cable car, novelty sleeves and pot heads, and many other "Security" specialties.

THE NATIONAL TELEPHONE SUPPLY COMPANY, of Cleveland, Ohio, in charge of Fred Auxer, made a specialty of marline cable hangers and Blackburn ground wire clamps.

HUBBARD & COMPANY, of Pittsburgh, Pa., showed an assortment of general line hardware in charge of S. Seyler.

THE WOOD-CARNAHAN COMPANY, of Indianapolis, Ind., was represented by Marshall D. Binford. This company was an entirely new exhibitor, showing a line of books and accounting systems for the use of telephone companies.

THE SELECT TELEPHONE MANUFACTURING COMPANY, of Springfield, Ohio, showed its new farmer line lock out telephones. C. D. Juvenal, secretary and treasurer, and Wm. M. Bruce, Jr., vice president and manager, were in charge.

THE CENTRAL TELEPHONE AND ELECTRIC COMPANY, of St. Louis, had a large display of protective apparatus. It showed the Becker cable heads, fuse blocks, switchboard apparatus, telephones, lineman's test set, etc. In charge were L. G. LeBorveau, G. F. Poertner, J. A. Becker, Charles Wallis and J. S. Cumming, president.

THE MICHIGAN ELECTRIC SPECIALTY COMPANY, of Muskegon, Mich., showed the Michigan improved party line telephone. V. A. Chapman was in charge.

THE CENTRAL ELECTRIC MANUFACTURING COMPANY, of Rock Island, Ill., was represented by Joseph L. Haas, secretary and treasurer, and I. G. Kusel. This company makes a specialty of the Black Hawk dry battery. It is the only battery made with corrugated zinc, which, it is claimed, gives larger surface, higher amperage and longer life. The battery is different also in that the other elements are seated in cloth.

THE MONARCH TELEPHONE MANUFACTURING COMPANY, of Chicago, had a large and fine exhibit in charge of Ernest E. Yaxley, W. H. Trimm, sales manager, and T. S. Dunlap, of Springfield, Ohio. The exhibit included switchboards and apparatus, various kinds of telephones, both central energy and magneto. Visitors were decorated with handsome scarf pins, miniatures of the Monarch transmitter. In the same room THE STEEL GAIN MANUFACTURING COMPANY showed the Bulldog steel gain. Kempster B. Miller is president of this company, W. H. Trimm secretary, and E. E. Yaxley treasurer.

THE MILLER ANCHOR COMPANY, of Norwalk, Ohio, showed the Miller guy anchors, which "never pull up." G. H. Miller, president, was in charge.

THE FIBRE CONDUIT COMPANY, of Orangeburg, N. Y., had a display of underground conduits in charge of Mr. Smythe, western representative.

THE W. G. NAGEL ELECTRIC COMPANY, of Toledo, Ohio, had an interesting exhibit of Hercules anchors, "Swisher" marline cable hangers, tools, etc., in charge of H. E. Adams, sales manager.

THE U. S. COIN REGISTER COMPANY, of Toledo, was represented by Gary S. Powell. This coin register is a new pay station which gives the subscriber a record of the number of calls he has made and makes a tape record of the amount of money deposited in the coin box. The collector turns the tape in with the amount collected.

A display of the EQUIPOISE TELEPHONE ARM was made by George W. Conover, of Chicago.

THE WARNER ELECTRIC COMPANY, of Muncie, Ind., showed the Warner pole changer, with W. M. Sample in charge. In the same room the INDIANA STEEL AND WIRE COMPANY, of Muncie, had a display of steel telephone wire, with Harry L. Kitselman in charge.

THE WESTERN TELEPHONE MANUFACTURING COMPANY, of Chicago, showed a new line of common battery apparatus, switchboards and compact telephones. A "full line" sign in the corridor attracted a great deal of attention. On a full clothes line hung a large sized family wash, printed with proper advertisements of the company's goods.

THE AMERICAN ELECTRIC FUSE COMPANY, of Muskegon, Mich., showed a full line of terminal heads, distributing rings and protective apparatus. Frank G. Jones, president; J. A. Kenny, and G. W. Rodermer were present.

THE CHICAGO TELEPHONE SUPPLY COMPANY, of Elkhart, Ind., showed among other things a new selective lock out system, which works on either grounded line or metallic, a new type of visual signal board, which does not require battery power to hold up drop, and a new thing in a test set; also a new detachable hook and new receiver, the Lundquist automatic telephone system, and a new party line silent ringer, by which a party line subscriber those of the other subscribers. The company was represented by those of the other subscribers. The company was represetnted by G. A. Briggs, president; A. J. Briggs, H. C. Randall, F. R. Locke, E. L. Kerstetter, C. B. Clemons, G. W. Brown, D. F. Roseborough, F. A. Lundquist and N. E. Norsham.

RABER & WATSON, of Chicago, producers of cedar poles, had their usual exhibit. The green ends of cedar boughs were scattered through the corridor, as evidence of their line.

THE AMERICAN ELECTRIC TELEPHONE CO., in addition to its large Chicago factory, where numbers of the delegates were entertained, had a complete exhibit in several rooms. The most conspicuous exhibits were the Burns Adjustable Telephone, which is so well known that no description is necessary, and the Zabel 8-party selective ringing system, which was shown in full operation. An illustrated description of this will appear in an early issue of the JOURNAL. The company has just put on the market a new magneto generator built with round bars. It is claimed that the construction of this generator affords an exceptionally large output of current, the air gap being very small. Souvenirs in the form of miniature "American" receivers of hard rubber were distributed. The company was represented by P. C. Burns, president; J. G. Ihmsen, general manager; Max W. Zabel, sales manager; J. C. Henderson, W. R. Hauptmann, W. E. Herron, H. B. Blackledge, Gilbert Gislasen, H. P. Clausen and H. B. Hewitt.

THE EUREKA ELECTRIC CO., Genoa, Illinois, was represented by V. H. Meissenger, M. V. Mehren, Fred Holroyd. It displayed a central energy board equiped with a new visual target signal and also a lamp signal full central energy board, a late type magneto board, and a full line of magneto and central energy telephones. The feature of the exhibit was the new Eureka switchboard drop, so constructed as to permit of the easy removal of the coil from the shell without disturbing the armature. This drop is constructed with a laminated coil, it has an all rubber front and is mechanically self-restoring.

THE HOOSIER PIN & INSULATOR CO., of Salem, Indiana, exhibited for the first time a new combination insulator and pin.

Digitized by Google

The pin is made in two wedge-shaped parts, so arranged as to hold the glass, which is also made in two parts, firmly on the line wire when the pin is in position in the cross-arm. L. G. Davis, president of the company and inventor of the new pin, was on hand to explain its merits to the delegates.

The Rock Island Battery Co., of Rock Island, Ill., had a splendid exhibit of the well known Rock Island batteries. The Rock Island Company has received many favorable reports from users of the battery, and received many satisfactory contracts from convention visitors. The company was represented by Louis Loeb and L. J. May.

Frank B. Cook, of Chicago, the well known manufacturer of protectors and protective devices, had a doubled barreled exhibit on the sixth floor of the Auditorium. The company was represented by Mr. Cook, F. W. Pardee, S. C. Platt, F. A. Raider, J. M. Moore, R. E. Macduff, H. R. Cook, F. R. Parker. Among other devices exhibited were the well known Cook pole top terminals, various types of protectors, guy clamps, wire connectors, test connectors, subscriber's station protectors and line fuses.

The Advance Pay Station Co., of Chicago, displayed a new type of pay station, which seemed to attract very favorable attention.

The Century Telephone Construction Co., of Buffalo, N. Y., was most ably represented and advertised by W. W. Kidney, G. F. C. Bauer and Frank J. Goodman. Four-party magneto selective switchboards and telephones, common battery 4-party selective party line system, an up-to-date power switchboard, magneto and common battery telephones, a new type of wire chief's desk for medium sized common battery exchanges, standard private branch switchboard, including a number of new features not previously shown, cable heads and telephone and switchboard parts, comprised a splendid exhibit which attracted many delegates.

The Leeds & Northrup Co., of Philadelphia, were represented by W. E. Weinsheimer, of the Minerallac Company, Chicago representative. Various types of cable test sets, fault-finders, portable test-sets and wall type galvanometers, particularly suitable for telephone work, made up the exhibit.

The Swedish-American Telephone Co., of Chicago, had a particularly attractive exhibit in the hotel, in addition to leaving the latch-string on its Chicago factory doors in plain view of every one making the trip to the Ravenswood district. The company was represented by its president, E. B. Overshiner, A. V. Overshiner, J. A. Russell and C. H. Macklin. At the hotel exhibit, the regular standard line of magneto apparatus, switchboards and equipment, and the company's combination lightning arrester and cross connecting cabinet were shown. A number of telephones made up in special woodwork designs and special finishes to match different interior treatment, attracted much attention and favorable comment. A souvenir watch charm, being a miniature of the company's regular receiver, was given out to new and old friends.

The North Electric Co., of Cleveland, had an attractive exhibit in the hotel, in charge of C. H. North, C. D. Boyd, Raymond Henderson and G. B. Pratt. The company showed a new magneto visual electric self-restoring signal, a line of small iron box switching stations for use on rural lines, a full line of magneto and common battery apparatus and a new train set for inter-urban electric lines. This set is carried on the motorman's paltform and is fitted with a large plug and flexible cord. Various poles along the right-of-way have a jack-box attached to the line wire. A gold plated souvenir hat pin representing the North transmitter made the company particularly popular with those of the delegates who brought along their women folks.

The National Carbon Co., of Cleveland, exhibited the well-known Columbia dry cells.

The Fisk-Newhall Telephone Mfg. Co., of Chicago, had a small exhibit of its motor coil winder, the Fi-ne Tubular Fuse, Fi-ne Generator Winder, etc.

The Electric Appliance Co., of Chicago, was ably represented by S. A. Dinsmore, manager of the telephone department; R. S. Mitten, H. N. Remington, A. J. Seltzer, E. C. Brown, E. V. Brown, J. B. McMullin and P. R. Boole. It had a complete line of "Eaco" telephones, switchboards and supplies, a line of Pierce specialties, among which may be mentioned the new jumperless transposition for toll lines, and Stombaugh guy anchors. On Wednesday night, after the banquet at the White City, the company sprung a surprise on the visiting delegates and made a distinct impression which will in all probability last until the next year's meeting, by presenting each delegate with a very large yellow ticket, admitting the holder to the fire show. During the show, which every one attended, one of the company's wagons, loaded with cross-arms, brackets, insulators, wire, etc., paraded the streets of the miniature city.

Dinsmore & Lawton, of Chicago, displayed a new flashing sign. They have gotten out a new Independent shield sign, all metal, with glass front, which they are selling at a very reasonable price. At the fire show, they had one of these signs on one of the buildings which was burned down.

Marke P. Boone, of the Peru Common Battery Lookout Telephone Co., Peru, Indiana, exhibited new lockout telephone, an illustrated description of which will appear in a later issue of the Journal.

The American Steel & Wire Co. had an exhibit of galvanized iron line wire and a huge punch bowl cheered the thirsty delegates. The company invited the delegates to the convention to visit its factory at Waukegan, Ill., placing a special train of Pullman cars at the disposal of the convention. On account, however, of the pressure of important business facing the convention, it was regretfully decided that it would be impossible to accept the invitation. The company was represented by Mr. Burley Ayres, advertising manager; C. S. Knight, manager of the electrical department; W. C. Bogue, George E. Quigley and F. J. Conklin.

The Chicago Writing Machine Co., of Galesburg, Ill., displayed the well known Adjustaphone, being represented by Mr. H. A. Weyl.

The Stromberg-Carlson Telephone Mfg. Co., Rochester and Chicago, was especially well represented in numbers and quality, both in the matter of its exhibit and its representatives. The company displayed a 140-line equipped section lamp line trunking board, and standard central energy telephones connected, and also a 4-party, 4-frequency system operating on the same board; a 200-line section generator call visual signal, electrical restoring drop board, with magneto instruments operating on it; a standard private branch exchange board, with lamp line signals of the desk type; mine telephones, street railway telephones, and inter-communicating telephones. The company has just opened a new department in the Chicago office to be devoted exclusively to line construction material. A very large stock of everything necessary in line construction materials will be carried, thus insuring prompt shipments. This department is in charge of B. J. Mockenhaupt. A new catalogue of line construction materials, together with net price list, will be mailed to those interested. The company was represented by T. W. Finucane, T. R. Finucane, A. J. Mahon, F. W. King, sales manager, H. A. Jones, A. B. Crawford, J. P. Cracraft, J. J. Nate, William Bowen, Jr., Wm. Bowen, Sr., C. S. Sifferd, N. C. Hyde, C. F. Speed, J. B. Wilkinson, Paul D. Myers, E. P. Shafer, Sam Menifee, George F. Fister, E. C. Lewis, A. O. Stigberg, J. H. Wagner, Carl W. Schafer, H. J. Wilms, F. G. Hutchins and B. J. Mockenhaupt.

The Mountain State Electrical Co., of Wheeling, W. Va., was represented by Frank B. Hall, A. F. Poole and H. L. Parker. For the first time the Poole Lockout System for party lines was displayed. This system will operate on any common battery exchange, either 24 or 40 volts, and there is no apparatus in the central office and no additional operation required on the part of the central office operator—in fact, it is claimed that an operator can handle 30 per cent. more lines with this system, because she has no arguing to do with subscribers. The

Digitized by Google

system can be applied to any make of telephone. The company also exhibited the "No-Key" electric self-winding clock.

THE McROY CLAY WORKS, of Brazil, Indiana, was looked after by the genial "Kirk" Kirkpatrick.

THE VOTE-BERGER CO., of La Crosse, Wis., had a very comprehensive exhibit on the parlor floor of the Auditorium Hotel. Very great interest was shown in the new common battery ballast switchboard. There is not a relay in the entire switchboard, with the exception of that required to operate the night-bell. The company also showed a new plunger type intercommunicating system, the pendent telephone, which is claimed to be more popular than ever, and an express drop switchboard. A new wax finish is being used on the company's magneto telephones, which prevents scratching or marring of any description. The Vote-Berger Co. also exhibited the drive and twist anchors, manufactured by the D. & T. Anchor Co. The company was represented by M. I. Berger, secretary and treasurer, P. W. Goodman, E. C. Brewer and J. W. Johnston.

THE COMMERCIAL ELECTRICAL SUPPLY CO., of St. Louis, was represented by the general manager of its telephone department, Mr. E. C. Brewer.

THE EDWARDS-HINE CO., of Grand Rapids, Mich., was represented by Mr. Chas. C. Wilmot, manager of the telephone systems department, and Mr. F. M. Howard. They had a large exhibit, showing complete accounting systems for all telephone companies, from the smallest local system up to the largest company operating many exchanges. They also had a line of samples showing complete systems of clearing house records for traffic associations, filing cabinets specially arranged for telephone filing, one specialty being a cabinet arranged for the filing of toll tickets and toll bills, making a great saving in space and also insuring quick and ready reference to any toll bill or ticket of any subscriber. Mr. Wilmot demonstrated a new ledger binder known as the Proudfit loose leaf spring back blank book. It is very economical as a space saver over the ordinary type of loose leaf binder and attracted very favorable comment.

THE STERLING ELECTRIC CO. had perhaps one of the most beautiful exhibits at the hotel, occupying the room usually given over on the ground floor to the writing tables. On account of this location, the company's exhibit was the headquarters for a large number of delegates all day long, and sometimes quite late in the night. A full common battery multiple switchboard in operation, a full line of protective apparatus, a new can top terminal which made a decided hit, army type switchboard, the usual line of desk sets and telephones, and accessories and parts made up a very attractive exhibit. The company was represented by its president, W. E. Doolittle, H. T. Doolittle, Evan Shelby, Edward Clay, H. Mower, George W. Metcalf, W. R. Coffroth, O. P. Reed and C. E. Meyers. The company distributed miniature gold-plated models of the standard Sterling desk sets as souvenirs.

THE GENERAL ELECTRIC CO., Schenectady, N. Y., had an exhibit of its Mercury Arc Rectifier run in conjunction with the display of the Sterling Electric Co., and was represented by R. E. Russell.

THE VALENTINE-CLARK CO., of Chicago, was represented by its president, Eugene Clark, I. B. Eberhardt and F. L. McGillan.

THE AUTOMATIC ELECTRIC CO., of Chicago, exhibited in its headquarters, Rooms 604-608, a new type of automatic switchboard, such as will be used in San Francisco and Oakland, Cal., where the automatic system has been adopted by the Home Telephone Company.

The new system is known as the "Unit Type System" and marks a new departure in automatic telephony. It occupies about one-fifth the space of the previous type board made by the Automatic Electric Company, and will mean an enormous saving in outside construction. It is designed to be used in substation work. It has all the new features of the automatic, including common battery.

The Automatic Electric Company also exhibited a line of small magneto manual apparatus, such as is used for toll boards, etc., in connection with its automatic system.

Those representing the Automatic Electric Company at the convention were H. H. Woodworth, advertising manager; J. F. Crook, sales department; C. L. Fisher, sales department; E. K. Seymour, sales department; R. Brink Tyler, sales department; E. A. Mellinger, inspector installation department; E. E. Meyer, installation department; P. R. Davenport, installation department; C. C. Waggoner, installation department.

THE ELECTRICAL TRADES EXPOSITION CO., which gives its second annual show at the Chicago Coliseum January 11-26, was represented among the exhibitors by its managing director, Homer E. Niesz.

THE DEAN ELECTRIC CO. OF ELYRIA, OHIO, had a very interesting exhibit of standard Dean apparatus, common battery and magneto, and more especially was showing its "harmonic converter." The converter exhibited was on its way to Quincy, Ill. It is a pole changing device for supplying four frequencies, and sufficient to operate any exchange up to 75,000 lines. Ringing 300 bells through 75 operators' positions requires but thirteen amperes, and it will run light with one-third of an ampere. The company was represented by S. B. Rawson, William W. Dean, A. E. Barker, Ray H. Manson, W. H. Scott, A. B. Smith, Fred R. Freers, E. M. Ford, Frank Slough, Major Hoxhurst and C. S. Bundesman.

THE SANDWICH POLE CHANGER CO. OF SANDWICH, ILL., was represented by A. C. Kirkpatrick and E. C. Hennis, manager. It exhibited a pole changer and a duplexer which makes two circuits out of one and three out of two.

THE HARVARD ELECTRIC CO., of Chicago, represented by P. C. Lenz and Frederick Greer, showed the latest types in lightning arresters, fuse blocks, fuse wire and distributing boards. These were equipped with either the old style or new style fuse clips, the latter of German silver giving a full contact.

W. S. PEARNE and H. D. STROUD represented the Baird Manufacturing Co. of Chicago. This company showed its lock out telephones by which the talking circuit is cut off from all parties on the line except those for whom the connection is made. There is, however, an emergency signal by which the operator can be called if it should become necessary. The company also showed its new cash register pay station made of pressed steel.

THE GENERAL ENGINEERING CO., Chicago, was represented by E. W. Hammer.

THE WILLIAMS-ABBOTT ELECTRIC CO., Cleveland, Ohio, had an exhibition of its new switchboard drop, embodying several novel features, its standard desk set, various types of telephones, etc. Representing the company were L. Sands and H. J. Kusel.

THE STANDARD TELEPHONE & ELECTRIC CO. of Milwaukee, Wis., was represented by its general manager H. M. Eldred.

THE NORTH PENN IRON CO., Philadelphia, Pa., exhibited telephone construction material, pole ring terminals, pole seats, etc.

THE AMERICAN TELEGRAPHONE CO., Wheeling, W. Va., exhibited the telegraphone in Room 540. J. Shirley Eaton represented the company.

THE WILLIAMS TELEPHONE & SUPPLY CO. of Cleveland, Ohio, was represented by C. M. Hunt.

THE HAMILTON STEEL ARM CO., Adrian, Mich., exhibited a new type of steel cross arm which attracted favorable comment. The company was represented by its president and general manager, E. S. Hamilton.

THE JOSEPH STOKES RUBBER CO. of Trenton, N. J., manufacturers of hard rubber receiver sheels, mouthpieces, etc., was represented by Joseph Stokes and Messrs. Boyer and Carew.

THE AMERICAN ELECTRIC SIGN CO., Chicago, exhibited a number of novelties in electrical shield signs, for outdoor and indoor work. The company was represented by H. C. Dodge, manager of the city office.

THE MONARCH ELECTRIC & WIRE CO., Chicago, had quite an interesting exhibit of telephone wire, and construction hardware and tools. In charge of the exhibit were S. Mankowitz, C. L. Schwab, Louis Schwab and H. Gillespie.

THE AUTOMATIC TIME STAMP CO. of Boston, represented by its

Digitized by Google

president and general manager, John C. Wilson, exhibited the timometer, a device comparatively low in price, for measuring the duration of telephone conversations over toll lines. The timometer being absolutely accurate, furnishing a printed record, being automatic in its action and requiring but a fraction of the operator's time for the pulling of a lever, drew practically every delegate's attention.

THE DAWES MANUFACTURING CO., Pitsburg, Pa., exhibited a new type of iron shield pay station sign made of opalescent glass. It was represented by J. A. Kerr and J. L. Dawes.

THE CHURCHILL CABINET CO., Chicago, represented by O. Gullickson and John J. Keenan, exhibited switchboard cabinet and telephone cabinet woodwork, presenting several finishes distinctly new to the telephone trade.

THE STANDARD UNDERGROUND CABLE CO. of Pittsburg, Pa., was represented by J. R. Wiley, W. M. Rogers, J. E. O'Neill, C. W. Davis, A. A. Andrews, E. J. Pietzcker.

W. H. JOHNSTON was on hand to give information concerning the specialties manufactured by the Hallett Iron Works of Chicago.

The Illinois State Convention

WITH an attendance of nearly 150 delegates from all parts of the State, the first annual convention of the Illinois Independent Telephone Association, which came to a close on June 20, was a great success. The association was formed at Peoria last year and this meeting was the first State session since its organization. Reports from the various officers showed that since its birth the association has advanced rapidly and papers presented during the meeting were of much interest to the visiting delegates.

The convention was opened Tuesday afternoon in the Coliseum, Peoria's largest assembly hall, by Mayor Tolson, who welcomed the delegates to the city, and President Conklin, of Aurora, general manager of the Interstate Independent Telephone and Telegraph Company, responded.

After the minutes had been read reports were heard from the following officers: President E. R. Conklin, Secretary C. B. Cheadle, Treasurer C. S. Hankins, Vice Presidents, first district, A. J. Vernier; second district, Frank Zinnell; third district, F. M. Ashe; fourth district, B. F. Wasson; fifth district, J. S. Dailey; sixth district, W. J. McQuiston; seventh district. W. H. Ramsey; eighth district, C. W. Shimel; ninth district, W. H. Bassett; tenth district, Hon. C. E. Hull; eleventh district, H. R. Aisthorpe.

A general discussion followed.

On Tuesday evening the most delightful social event of the session was held when a smoker was given visiting delegates at the Fey Hotel, the convention headquarters.

The program, which was unique, was as follows:

"Central Energy Supplies."

"Cross-connecting" Sandwiches. "Short Circuit" Punch.

"Magneto" Cigars. "Construction Gang."

"Straw Boss," F. W. Kelley, Springfield.

"Dead Lines," Retrospection—L. A. Herrick, Freeport.

"Live Wires," Introspection—C. S. Hankins, Decatur.

"Contracts," Getting Together, How and Why to Organize—C. A. Camp, Henry.

"Induction Coils," Financing a Telephone Property—J. H. Hackett, Jacksonville.

"Lag Screws," Little Things and How to Take Care of Them—A. E. Fleming, El Paso.

"Lightning Protectors," Public Confidence, What It Is and How to Get It—J. W. Barrett, Pekin.

"Self-soldering Fuses," Amity Among Independents—W. P. Landon, Rochelle.

"Alternating Currents," Ups and Downs in the Telephone Business—H. H. Bratt, Rock Island.

"A Busy Test," Getting Ahead of the Enemy—Hart F. Farwell, Bloomington.

"Wiping Joints," Leaks and How to Stop Them—E. D. Glandon, Pittsfield.

"Pole Steps," Climbing Higher Through Discipline—A. B. Conklin, Aurora.

"Anchor Rods," Business Men in the Telephone Business—Joseph Balliott, Belvidere.

"Hello Heaven," Contemplation—F. C. Woods, Galesburg.

Number, Please," The Telephone Girl, God Bless Her—Manford Savage, Champaign.

The response of Manford Savage, first vice president, to the toast, "The Telephone Girl," was especially approprate and well received.

At the Wednesday morning session the committee reports were heard. The reports of the various officers of the association showed that the Independent companies are making rapid strides in this state, and Secretary Cheadle advised the organization of associations in all states, and showed the benefit of state and national organizations of this sort. The constitution was changed to read two state meetings yearly instead of four.

When a special committee appointed to make certain changes in the boundary lines of the district association reported, its report was adopted without opposition. These changes were made in order that the various districts might be arranged to better advantage. The committee having this matter in charge consisted of the following delegates: Bassett, St. Louis; Daily, Chillicothe; Ash, Kewanee; Hackett, Jacksonville, and Aisthorpe, Cairo.

The most interesting address of the morning was that of Hon. F. Dagger, expert to the House of Commons' select committee on telephone systems of the Dominion of Canada, on "Telephone Competition vs. Monopoly."

Hon. E. H. Moulton, president of the Tri-State Telephone Company, of Minneapolis, told of the system used in handling the business of his exchange.

The paper of Miss Barnes, chief operator at the Springfield exchange, on "Discipline in the Switchroom," was listened to with keen interest.

All of the principal officers were chosen for additional terms, the election resulting as follows:

President—E. R. Conklin, Aurora.

Vice President—Manford Savage, Champaign.

Secretary—C. B. Cheadle, Joliet.

Treasurer—C. B. Hankins, Decatur.

Members of the executive committee—E. R. Conklin, Aurora; C. B. Cheadle, Joliet; C. O. White, Princeton; J. W. Barrett, Pekin; Manford Savage, Champaign; C. S. Hankins, Decatur, and W. H. Bassett, St. Louis.

Delegates to the National-Interstate Convention were elected as follows: E. R. Conklin, Aurora; L. S. Bowen, Savanna; H. C. Barborn, Ottawa; B. F. Wasson, Clinton; G. H. Glass; Pekin; C. S. Hankins, Decatur; C. L. Chapman, Tuscola; A. F. Loehr, Carlinville; C. E. Hull, Salem; H. L. Liebig, St. Louis; J. Manford Savage, Champaign; W. H. Bassett, St. Louis; C. B. Cheadle, Joliet; W. H. Ramsey, Auburn; J. S. Daily, Chillicothe; J. H. Hackett, Jacksonville.

NEW LINES TO CONNECT MISSOURI AND ILLINOIS.

A RIVER crossing between Hannibal, Mo., and Quincy, Ill., is being designed as a means of carrying some important new toll lines. These will connect Quincy and St. Louis via Hannibal, and also provide for messages between Quincy and Kansas City, taking in all intermediate points. This will give Hannibal long distance Independent service to all points in Missouri, Western Kansas, Iowa and Illinois. The new lines are to be of the most approved construction with ample circuits of copper wire to properly handle long distance service.

Digitized by Google

QUERIES

SIGNALLING SYSTEM ON TOLL TRUNKING CIRCUIT.—(715.)

Upon our switchboard there was formerly used a trunking circuit from the toll board wired as shown by dotted lines in the enclosed diagram. Recently, however, the circuit has been changed by the addition of a relay, and other alterations, so that the wires which formerly went directly to the toll board contacts are wired throuh the relay contacts. As there was no trouble in the working of the circuit before I am unable to see any reason for the change. Can you explain it to me? R. R. L.

In Fig. 715 is shown the circuit you have sent. According to the original arrangement, shown by dotted lines, battery would flow continuously over the trunk and keep the lamp at the toll switchboard lighted all the time the subscriber is connected to a trunk. The addition of the relay X enables the relay V to be controlled by the operation of the relay W, but as, while it is operated, current through the windings of relay V passes through the 250 ohm coil bridge across contacts of relay X, there is no current on the line, and the disconnect relay at the toll board remains unoperated. When the subscriber hangs up his telephone the armature of relay W drops back, relay X is de-energized, and current from the battery passes out over the line, operating the disconnect signal at the toll board. It will thus be seen that the change brings about an improvement in the operating conditions, as the supervisory light at the toll board is illuminated only at the time disconnection is desired.

THROUGH TOLL LINE CIRCUITS.—(716.)

Will you please explain the nature of a "through" toll line circuit, stating why three jacks are required in the switchboard? J. E. N.

A through toll line may be considered, for example, as one which passes between two offices, A and B, one located to the west and the other to the east of an office C, situated midway between them. It is cut into the switchboard at C in such a way that messages may be sent from A to B or simultaneously from C to B and C to A. It is customary to use a single line signal at C, and three adjacent multiple jacks. The line signal is connected to the middle jack in such a way that a plug in this jack cuts it out of circuit. If a plug is inserted in the left hand jack, connected to the line to A the listening jack and jack connected to B are cut out of circuit. As the listening jack and its signal are still connected to line B, signals may still be received from that office, and connection established. The same holds true with regard to the line to A when the original connection is with office B. Thus the mere insertion of the plugs in the end, or line jacks, cuts the through line into independent sections. Code ringing actuating a drop is customarily used in order that the operator at exchange C may know when she is called. Unless a separate code is used by offices A and B it is necessary for the operator at C, when she receives a call, to plug into the listening jack and inquire which line is calling. She then puts up the connection on the proper line jack.

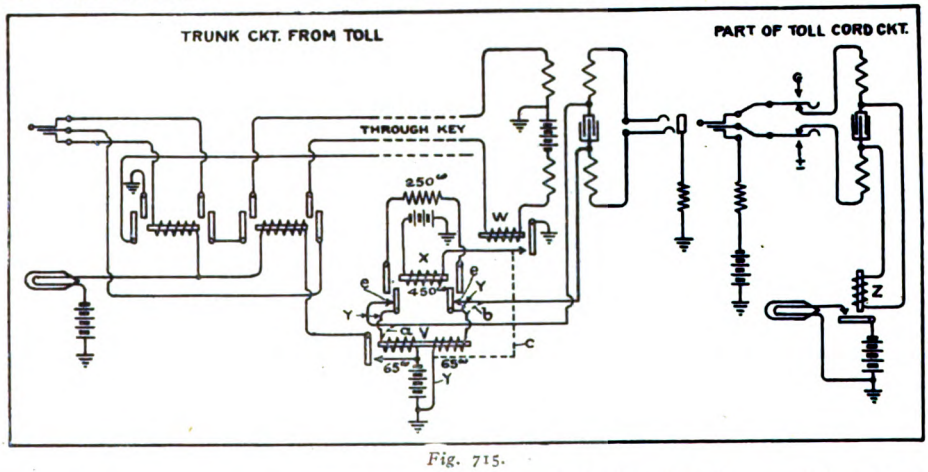

Fig. 715.

In common battery toll boards a circuit may be arranged to accomplish these results by a suitable arrangement of relays. In this case the listening jack is cross wired to an answering jack, but the drop is usually employed as a signal, as in the ordinary magneto board.

USE OF CHOKE COIL WITH RINGING MOTOR.—(717.)

Will you please explain why a choke coil is used between the battery and motor side of a 24-volt dynamotor used for ringing? N. L.

If you refer to a machine which is run by current supplied from the central office battery, the choke coil is inserted to prevent an objectionable noise from being heard by subscribers and operators when the machine is running. This noise would be produced on account of the variation of the comparatively large current passing through the armature, and tending to rise and fall with the movement of the commutator beneath the brushes.

By insertion of a choke coil these variations in the battery current are smothed down, so that no abrupt change in potential is produced at the battery terminals; consequently no humming noise is produced in the receiver.

It should be noted in this connection that the direct cause of any noise produced in this manner is due to a variation of potential at the battery terminals due to the variable C R drop introduced. Assuming that the resistance of the storage battery is a negligable quantity, as is practically true, if the motor were connected to the battery terminals, so that there would be no resistance between the end poles of the battery and the point of attachment, there would be no need of using a choke coil. It has, however, been found to be more practical and more economical to use a properly designed coil.

SIZE OF RELAY RACK BUS BAR (718).

Will you please tell me why it is customary to use large copper bus bars for the relay rack ground. In our exchange the sum of the areas of wires used to supply current from the negative side of the battery is far less than the area of the ground bus bars. As the latter can carry no more current than the sum of the separate currents flowing in the former it would seem like a wasteful use of copper. Can you tell me if this is so? N. J. B.

The use of a large bus bar is necessary on account of its entering into the busy test circuit. It will be remembered that in the ordinary central energy switchboard the busy test is obtained when the passage of current from the sleeve strand of a connected plug has made a difference of potential between the sleeve of the multiple jack and ground. If the sleeve were made to have a different potential by any other method the effect would be the same. If a small ground lead were used for the relay rack it would have a measurable resistance, and when several relays were working there would be a measurable drop in potential (the C R drop). It is evident, therefore, that the sleeves of jacks, connetced to this bar through the windings of cut-off relays, would no longer be exactly at ground potential, and every line in the board would test "busy."

It is solely to avoid this condition, and provide a reasonable margin, that the bus bar is made so large as to have practically no resistance.

IN THE OPERATING FIELD

HOME TELEPHONE COMPANY OF OSKALOOSA TO HAVE LARGE BUILDING.

PREPARATORY to erecting a modern building for its new exchange the Home Telephone Company of Oskaloosa, Ia., has purchased property in the business district of the city. The building will cover an area of 40 x 120 feet. Its construction will be modern in every respect.

The company contemplates extensive improvements to its system, which will include reconstruction of many lines, and the installation of a considerable amount of underground and aerial cable. A central energy switchboard of standard construction will enable the company to give excellent service to its subscribers.

BUFFALO BELL COMPANY LOSES LARGE CONTRACT.

TAKING advantage of the recent expiration of its sub-license contract with the Buffalo Telephone Company, the Darien Telephone Company, of Darien, N. Y., has entered into a contract for long distance service with the Inter Ocean Telephone & Telegraph Company. Each subscriber will be enabled to call Buffalo and Rochester direct over the Independent lines, and will receive the benefit of connections to a large number of subscribers of other local exchanges in nearby towns.

LEXINGTON TO HAVE A NEW POLICE CALL SYSTEM.

FORTY police telephones connected with a central office have just been installed in Lexington, Ky. The system will not only allow the central office to keep track of the policemen, who are expected to report every hour, but it will enable any one at the station to summon all the members of the force in about three minutes. It is expected that the new telephones will render the work of the men more efficient.

EXCELLENT DEVELOPMENT IN LEE COUNTY, ILLINOIS.

FROM Dixon, Ill., comes the usual report of rapid growth for Independent companies. About one year ago the Home company commenced giving service with 700 subscribers connected to its new plant. At the present time it has 1,130, an increase of over 60 per cent., with orders for 25 telephones, which have been so recently received they could not be installed. To the switchboard 240 lines have been recently added, although the original installation was intended to provide for all growth expected for some time. General satisfaction prevails amongst the company's subscribers.

New lines are being built out of the village in different directions, and trunk lines to various neighboring points will provide a means for still further increasing the value of this system, which has so thoroughly attained the approval of the people in the town which it serves.

REMEMBER
You Were At the Mercy of a
Grinding Monopoly Once
With Their
High Rate and Generally
Poor Service.
IT'S DIFFERENT NOW.

Every Fight the People Have Made for Low Rates Has Been Fought Through the Medium of the INDEPENDENT SERVICE.

Do You Know There Are 90,000 INDEPENDENT TELEPHONES in Western New York That Can Be Reached Over No Other System?

Nearly Every Town, Village and Hamlet Is Enjoying INDEPENDENT SERVICE.

The Growth Has Been TREMENDOUS.

Rates Have Been REDUCED.

Service Been Made PROMPT AND RELIABLE.

Everybody Has An INDEPENDENT TELEPHONE.

ISN'T IT SO?
And
We Admit
WE ARE RESPONSIBLE.

The First Part of this Advertising Folder, Furnished by Wm. A. Wadsworth of the Inter Ocean Telephone & Telegraph Company, Buffalo, N. Y., was Reproduced in our Issue of May 19th.

INQUIRING MANAGER GETS IT STRAIGHT.

NOT long ago the district manager of the Bell Telephone Company operating in Rochester, N. Y., believed that his company was trying so hard to make up for past delinquencies that people ought to be pleased with its service. So he sent out many copies of a letter reading as follows:

Mr. ————, City.

Dear Sir: Mr. ————, our contract manager, has again reminded me that he has addressed a number of communications to you concerning the Bell telephone and its installation in your residence. He also tells me that he has not been, so far, favored with a reply.

As I must consider the matter of present, and very real, importance, not only to us but to you, I am taking it up in this more personal manner to ask if you will be kind enough to state your opinion concerning the (Bell) telephone and its desirability as a residence convenience.

There has been a most gratifying growth in the number of our subscribers in Rochester, until every district of the city, all kinds of shops and business places, and all classes of Rochester's citizens are thoroughly well represented. This growth has been due, in some measure to increasing knowledge of the convenience the Bell telephone affords; but I like to think that, in part, it is due to the better Bell conditions now prevailing in Rochester, to the promptness with which every telephone improvement has been added to our equipment here, and to the careful, vigilant manner in which all the requirements of our subscribers have been met.

It may be that you would prefer to express by word of mouth the opinion I seek. In that case please use the enclosed card addressed to me and I will personally see that it has immediate attention.

Thanking you in advance for your courtesy and attention, I am Yours very truly,

Rochester District Manager.

As was to be expected, at least one of the men who received one of these "form" letters had the courage of his convictions, and here is the decidedly straight and forcible reply he made:

June 14, 1906.

———— Esq., District Manager,
Bell Tel. Co., Rochester.

Dear Sir: I have your communication of June 4th. It is true, as you state therein, that I have received a large number of communications from you concerning the installation of a Bell telephone in my residence and that I have never replied to any of those communications. I think my refusal to reply should be regarded as a plain indication that I do not care for your telephone. A refusal to reply to a long series of communications would ordinarily indicate that those communications contained nothing of interest to the party to whom they were addressed.

You next ask if I "will be kind enough to state your (my) opinion concerning the Bell telephone and its desirability as a residence convenience." I believe it is commonly conceded that an opinion founded upon actual experience is entitled to some weight. I used the Bell telephone in my house for a number of years. I paid an exorbitant rate, ninety-five dollars per year. The service rendered was absolutely abominable. I seldom used the phone without being strongly tempted to order it out of my house. I have always felt that the money I paid your company was wholly wasted. There is a maxim to the effect that "a burnt child dreads the fire." That is particularly applicable to my experience with the Bell Telephone Company.

There are some other suggestions in your letter to which I might properly reply, but I think the foregoing will sufficiently indicate my views.

Yours very truly,

That's good! It ought to "hold him for a while."

IN THE OPERATING FIELD

STEADY PROGRESS AND IMPROVEMENT IN SERVICE OF JOPLIN INDEPENDENT COMPANY.

NUMEROUS instances of expansion and important reconstruction characterize the growth of the Home Telephone Company, of Joplin, Mo., during the past year. Theodore Gary, as President and Manager of this company, has succeeded in building up an extremely well developed and efficient system operating in Jasper County, with exchanges at Joplin, Carthage, Webb City, Carterville and Purcell, of which the four latter have been added since the last convention.

Service is given to 4,500 subscribers, of which 2,200 are in Joplin, 1,300 in Carthage, and the remainder divided between the other three towns. Service from 13 toll stations connected with the company's lines is given, and it also has 250 rural line subscribers, of which about 70 per cent. have been added within a year. A considerable toll line plant is in service. Forty-four miles of new line have been constructed since the early summer of 1905. A great deal of aerial cable of different sizes has been installed, bringing the total number of miles in the several towns up to 40. Reconstruction and extensions for new subscribers has caused the building of 15 miles of this class of work during the past twelve months. It is regularly interchanging service with the Kinloch Telephone Company, of St. Louis; the Kinloch Long Distance Company, the Kansas City Home Telephone Company, Kansas City, and the Galena Telephone Company, at Galena.

VOLTAGE INDICATING DEVICE FOR SELECTIVE RINGING GENERATORS.

By Edward B. Jackson.

IN exchanges where selective ringing is used upon subscribers' lines nothing is more important than that the voltage of the ringing generator should be kept constant. Where the machine is run from a source of power which is fairly steady, but subject to changes in voltage which when established continue for a reasonable length of time, it is easy to regulate the voltage of the generator by keeping a close watch, and making suitable changes in the position of the rheostat.

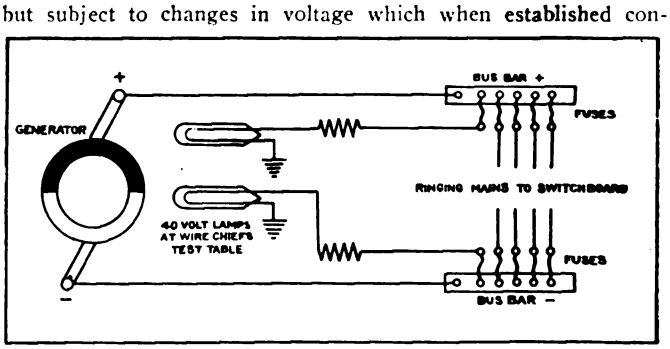

Fig. A. Connections of lamps for indicating voltage of generator for selective ringing.

A method of observing the variation which has been found to give very good results consists in the employment of lamps, so placed as to be constantly under the observation of the wire chief. For this purpose two switchboard lamps should be connected, one to the positive lead and the other to the negative lead, as shown in Fig. A, resistance being inserted between the lamp and the ringing main. These lamps should be mounted upon the wire chief's test table, or adjacent to it, in such a way that every time he looks up his attention may be attracted to them. He soon becomes accustomed to make observations from time to time, and the slightest variation in pulsations or brilliancy of the lamps will be observed. Proper action may then be taken to regulate the speed of the generator.

It may be objected that the constant use of a lamp will cause it to burn out within a few days. The author, however, has had two [illegible] lamps connected through a 400 ohm resistance, and these have been burning steadily for a period of two months and are still as bright as ever. The amount of current consumed is very small.

OVER SIXTY PER CENT. INCREASE MADE BY INDEPENDENT COMPANY IN DES MOINES.

SEVENTEEN hundred and forty-eight subscribers, bringing the total number connected to its exchange at Des Moines, Ia., up to 4,643, have been added by the Mutual Telephone Company during the past year. This company covers Polk County. Nearly all the subscribers are located in the city, only one hundred being connected to rural lines. The distribution of the plant is chiefly effected by means of aerial cable, of which there are 42 miles, the greater part having been in service since the plant was originally built. There are, however, 3½ miles of underground cable for carrying the larger leads. Business is regularly interchanged with the Southern Iowa Tel. Co., the Hawkeye Tel. Co., Des Moines; Boone County Tel. Co., Boone; Jasper County Tel. Co., Newton; Knoxville Tel. Co., Knoxville; while the toll companies supply service to nearly all points in Iowa.

The management is in charge of J. S. Bellamy, President; J. C. Hume, Secretary; L. M. Graves, Treasurer, and R. A. Walker, Manager. Provided with an efficient plant, the company is giving service the character of which may be readily appreciated from the figures showing the great increase in the number of subscribers.

REPRESENTATIVES OF LARGE INDEPENDENT INTERESTS FORM ASSOCIATION IN NEBRASKA.

AT a meeting of representatives of about a dozen Independent telephone companies of the southeastern section of the State held recently at Lincoln, the first division of the Nebraska Independent Telephone Association was formed. The following counties were represented in the meeting: Cass, Lancaster, Washington, Douglas, York, Saline, Gage and Seward. Sarpy and Fillmore counties are included in the district, but were not represented in the meeting. The total number of Independent telephones in the district is about 17,700.

The following officers were elected: President, T. H. Pollock, of Plattsmouth; vice-president, C. W. Nunemaker, of Tobias; secretary-treasurer, R. E. Mattison, of Lincoln. It was decided to issue a directory immediately, containing all the telephones in the district. The district will soon be given direct connection with Kansas City, St. Louis and other large cities in the southeast. A line is now being built from Lincoln to Falls City, and this will be connected with the lines running to Kansas City. It was announced that the association will continue to fight for entrance into Omaha.

NORTHEASTERN MAINE HAS DECIDED TO SUPPORT AN INDEPENDENT TELEPHONE COMPANY.

STRONGLY intrenched in the ground which it has so long held successfully, the Bell company has bitterly opposed the attempt of the Independent Telephone Company, of Houlton, Maine, to obtain a franchise in Fort Fairfield in the northern part of Aroostook County. However, the desired permission has at last been obtained, and work on the system will at once be started. This is an entering wedge, and the company intends to push business into that section vigorously. The country which will be opened up to the Independent interests has some of the richest farm lands in the State, and the service will be much appreciated by the rural population. The hearty support of the people has been won by the Independent company, and its progress from now on, although it will no doubt be bitterly opposed, is expected to be more rapid than it has been in the past.

A GENTLEMAN prominent in the Independent operating telephone field, and a telephone engineer, recently wrote us, "I wish to again thank you for the pleasant trip, and the privilege of seeing your apparatus, which I consider the most revolutionary of any yet produced in the telephone business." He voices the sentiment of all who have seen it.

Our system is simply perfection in perfect simplicity. We have, as pronounced by prominent telephone engineers, a thoroughly complete, simple and perfect system, by which we do automatically everything necessary in a thoroughly up-to-date telephone system; a number of things never before thought possible in either manual or automatics, and many things which cannot be done manually. We use less switches and parts than any other system.

We can change your present central energy manual system to automatic without the necessity of changing the telephones. This is an enormous saving, and it will pay you to investigate.

We install exchanges of any capacity.

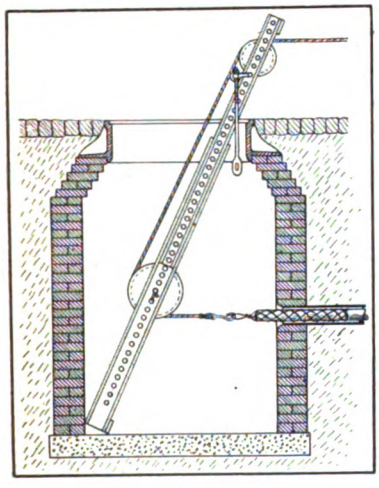
Write us for our pamphlet No. 666, which describes our system.

AMERICAN AUTOMATIC TELEPHONE CO.

200-206 SOUTH AVENUE, ROCHESTER, N. Y.

It Saves Its Cost in the First Pull

IMITATION is the sincerest flattery. Others have tried to imitate our **"Gem" Wire Grip.** The tremendous number of orders received since January 1, 1906—being over 3,000 more up to date than we received during the whole year o 1905—makes us feel that our device has passed from the experimental stage. We can offer no better testimonial than this, and feel positive that nobody else can.



All large telephone and power companies are now using our **"Gem" Wire Grip** to the exclusion of all other methods, thus its practicability is assured.

We solicit your inquiries.

This illustration shows our **"Rigid" Uprights,** which are adjustable, our **Mul Type Sheaves,** made with curved rims, and our **"Perfection" Upright Clamp,** which obviates the necessity of kick pieces at the bottom of the well. Also the application of the "Gem" Wire Grip.

We make other goods of this kind, and will be pleased to quote you.

TELEPHONE PATENTS

RECEIVER HOLDER.

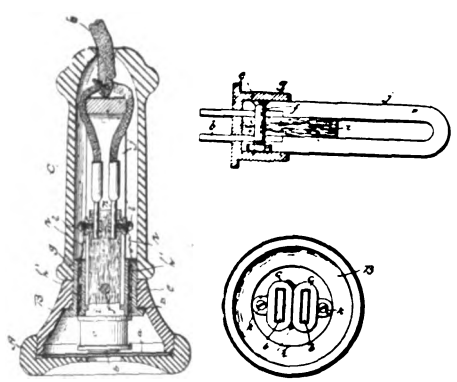
Casper Zimmerman, Aberdeen, So. Dakota, patents (No. 820,463; dated May 15, 1906; filed November 4, 1905; serial No. 285,901) a receiver holder.

The object of this invention is to provide a device which, while holding a receiver to one of the ears of the person using it, will exclude all noise from the other. It consists of a semi-circular band to one end of which is attached a clamp to hold a receiver, while the other end is provided with a pad that presses against the ear.

TELEPHONE RECEIVER.

Charles T. Mason, Sumter, S. C., patents (No. 823,061, dated June 12, 1906; filed March 17, 1905; serial No. 250,524) and assigns to the Sumter Telephone Mfg. Company, Sumter, S. C., a telephone receiver.

Improvements in the method of manufacturing telephone receivers are claimed for an instrument characterized by a magnet structure moulded in a soft metal section, which is screwed and cemented into the cup forming part of the receiver casing. The magnet is thus rigidly retained, and the casing is completed by a removable cap. Referring to the drawing it will be seen that cup B supports the magnet structure and forms a rigid and permanent union therewith, and thus avoids the necessity for separate cup and casing sections. Around the magnet structure is moulded a block *e* of soft metal, in which the magnet structure is rigidly fixed. The block *e* is threaded and secured into the cup B, and has a projecting portion G upon which the handle C is screwed. In assembling the parts a small space *p* is left between the ledge at the front end of the block *e* and the bottom of the cup to allow of the adjustment of the magnet structure to bring the pole piece in proper relation to the face of the cup and con-



sequently to the diaphragm. This space is filled with a suitable cement, and after the receiver has been adjusted this permanently retains the parts in their proper relations. Unloosening the screws *l* allows the magnet coils *c* to be disconnected and removed without unsoldering their wires.

PORTABLE POTENTIAL INDICATOR.

John B. Taylor, Schenectady, N. Y., patents and assigns to the General Electric Company, New York, N. Y. (No. 822,319; dated June 5, 1906; filed June 10, 1905; serial No. 264,606), portable potential indicator.

This invention consists of a device for indicating whether or not an electrical conductor is alive. In Fig. 1 it will be seen that the device includes a hard rubber handle in which is inserted a rod, 2, of metal, having a tubular extension or sleeve, 3, which projects beyond the end of the handle. Within this is a glass tube 4, which is hermetically sealed at each end and contains an inner tube 5. A metal electrode 6 projects beyond the end of the tube at 7. The space between the inner and outer tubes is filled with a liquid insulator 8, such as gasoline, benzine, etc., having

Fig. 2.

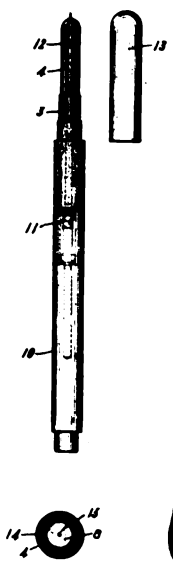


Fig. 1.

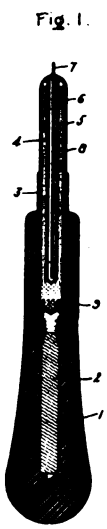

Fig. 3

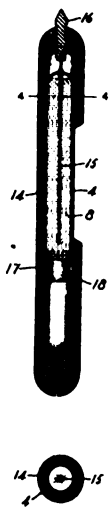

in suspension in it some powerful substance such as sulphide of tin or aluminum powder. A small quantity of mercury 9 provides a means for scouring the inner walls of the tube upon agitation. In Fig. 2 is shown another form of the device, in which the electrode is in the form of a strip 12 directly in contact with the liquid. In Fig. 3 the tube is enclosed in a sheath 14 of hard rubber and electrode 15 is directly immersed in the liquid. In operation the device is held in the hands of the operator and the projecting end of the electrode is approached to a conductor. If the latter is charged the floating particles in the liquid become electrified inductively and are attracted to the inside of the glass tube and to the electrode, or the outside of the inner glass tube if one is used. In the form show in Fig. 1 the device is virtually several condensers in series. The motion of the conducting particles causes a change in the appearance of the liquid and powder, which is an indication that the conductor is charged.

VISUAL INDICATOR.

Frank R. Lay, Greenfield, Ind., patents (No. 820,213; dated May 8, 1906; filed April 22, 1905; serial No. 256,882), and assigns one-half to Walter W. McCole, Greenfield, Ind., a visual indicator for telephones.

The object of this invention is to visually indicate whether or not a telephone bell has been rung in the absence of a subscriber; and, in case there should be a plurality of telephones, to indicate which one was signalled, to avoid possible confusion arising from the ringing of two bells. This the inventor accomplishes by means of electromagnets connected with each circuit and contained within a case on the front of which are pointers. When a signal is received over a line the associated magnet is energized, causing it to operate its pointer.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

SWEDISH AMERICAN COMPANY'S PROGRESS.

AMONG the leading exhibitors at the convention was the Swedish-American Telephone Company, which occupied Room 612. The company displayed in a unique and interesting manner a complete line of its well known product, and it is safe to say that the company did its share of the business.

The company also entertained a number of visitors at its new factory, which is located at No. 1760 East Ravenswood Park Ave., and it was agreed that the Swedish-American company has one of the most complete and up-to-date plants of this character in existence.

Its new factory building, which it owns and occupies exclusively, contains about 200,000 feet of floor space, all of which is devoted to the manufacture of telephone equipment.

A number of the company's traveling salesmen were also in attendance at the convention, renewing old acquaintances and making many new ones. Among them were Mr. W. O. Rhode, who has charge of the branch at Kansas City; Mr. F. M. Ferguson, who is in charge of the branch at Omaha; and Mr. C. L. Ward, who has a branch office at Fargo, N. D. Also Mr. J. A. Russell and Mr. Fred Seeley, traveling representatives.

The Swedish-American Company has maintained its reputation for quality and up-to-date displays. It reported the closing of a number of good size contracts, among them being one for The Enterprise Telephone Company of Phillipsburg, Kans., for a 300 line equipment complete; 100 line equipment complete for the Mercer Company at Bryant, Ind.; 100 line equipment for the Henry Union Telephone Co. of Henry, S. D. Also 200 line equipment for the North Western Ind. Tel. Co. of Lowell, Ind., and numerous other smaller orders.

THE DEAN ELECTRIC CO., Elyria, Ohio, among others, reports orders from the Inter-State Telephone Company, Little Falls, New York, to change a six hundred line board to Dean harmonic selective 4-party system, changing all the key shelves, keys and plugs and installing a Dean harmonic converter. Also the Shelby Telephone Company, Shelby, Ohio, has arranged for a fifteen hundred line multiple switchboard, equipped for five hundred (500) local and sixty (60) magneto lines. This switchboard is to be completely equipped for Dean harmonic selective party line system, with power plant and duplicate harmonic converters.

A NEW AUTOMATIC SYSTEM.

A YEAR or two ago, when automatic telephony was beginning to receive serious consideration at the hands of the telephone public, Mr. J. W. Lattig and Mr. Chas. L. Goodrum, then of Philadelphia, Pa., the General Superintendent and Chief Engineer respectively of an Independent telephone company operating upward of two hundred exchanges, became associated in the development of a system in which their constant aim has been to produce thoroughly simple and reliable apparatus and circuits. Later Mr. B. G. Dunham, formerly of the Automatic Electric Co., of Chicago, became associated with them, and the present system, which is the result of their combined efforts, has resulted in the incorporation of the American Automatic Telephone Co., of Rochester, N. Y., whose advertisement appears in this issue. The company has a capitalization of $1,500,000.

The officers of the company are: President, Hon. John Raines; vice-president and general manager, Mr. J. W. Lattig; secretary and treasurer, Mr. B. J. Williams.

The directors are: Hon. John Raines, President pro tem of the New York State Senate; J. W. Lattig; B. J. Williams, President of the First National Bank of Shelby, Ohio; Alvarc L. Thompson, of Ingmire & Thompson, Rochester; Geo. R. Raines and Joseph R. Webster, of the law firm of Webster, Meade, Straus & Raines; H. H. Stebbins, Jr., a rising young business man of Rochester; H. H. Hutchinson, a retired business man; and John F. Brayer, a director and superintendent of the Co-Operative Foundry Co., and treasurer of the Mechanics Institute of Rochester.

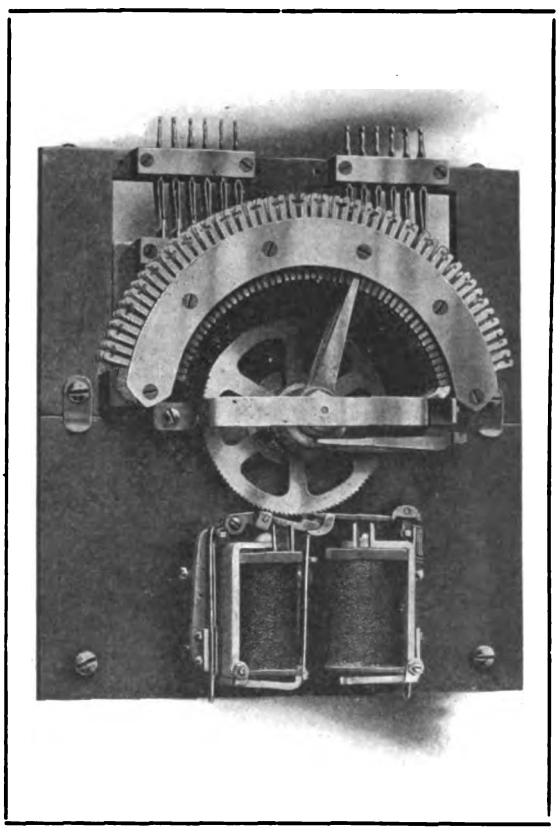

Fig. 1. Switch used in the system of the American Automatic Telephone Company.

The switches (Fig. 1) are entirely different from any heretofore placed on the market; the electrical part consisting of but two magnets, one driving the switch forward to any selected point, and the other serving as a release magnet to restore the switch to normal when the receiver is hung up. The mechanical movements are extremely simple, and are the same throughout the system. All parts are interchangeable. Each switch has but one ratchet wheel and two pawls, which are made of hardened steel, thus insuring great durability. The great simplicity is accounted for by the fact that most of the control is accomplished electrically and not mechanically, as has been the custom; also that all movements are in one plane—the horizontal. No fine and exact adjustment of the wipers is required, because they are always in engagement with the bank contacts over which they sweep to select a line.

The bank base is equipped with female jacks and the switch base with male jacks, which makes possible a replacement of one switch by another within a couple of seconds.

There are no conducting cords to become entangled with the switch mechanism, as the bank contact wipers are supplied with current by metal feeders, or brushes.

The switches are mounted on angle iron frames, each frame built to accommodate twenty, and so arranged that the capacity of any exchange can be increased from time to time by adding sections in sectional bookcase form. These sections are enclosed by cabinet work and glass, and are dust proof.

Each subscriber's line, instead of an individual switch, is represented in the central office by two relays (Fig. 2), the combination being similar to the line and cut-off relays used in manual practice.

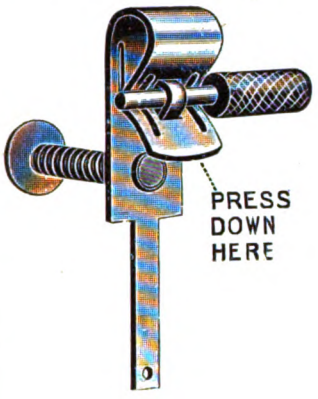
A NECESSITY



On distributing frames, dry batteries, and wherever permanent or temporary electrical connections are made

THE NO. 11

Fahnestock Spring Binding Post

was made to the special order of a large telephone company. It has an extra long lug and is well suited for use on distributing boards and other places about an exchange. Manufacturers of the leading dry batteries will supply their cells fitted with Fahnestock post without extra charge.

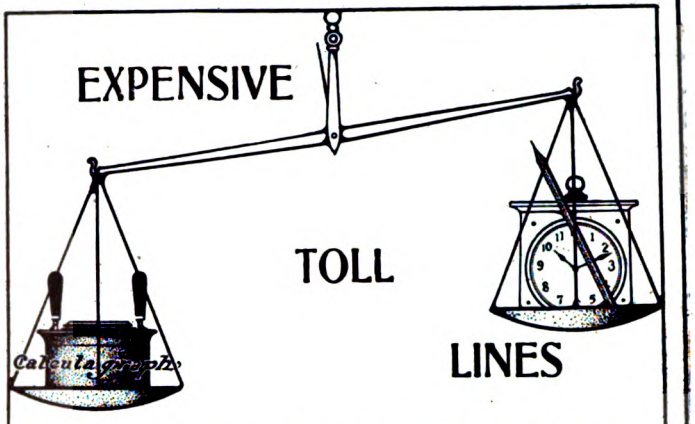
We carry a number of different styles in stock. Write for our new booklet.

Special designs made to order.

Fahnestock Electric Company

129 Patchen Avenue, Brooklyn, N. Y.

EXPENSIVE



TOLL LINES

must be worked to their fullest capacity in order to secure a maximum return on the invested capital.

The Calculagraph

will increase the capacity of your toll lines. It counts every second the line is in use and prints the elapsed time and time connected on a card.

It Makes No Clerical Errors

IN THE MANUFACTURING FIELD

All central office apparatus has lamp supervision. A lamp associated with each switch, and numbered to agree with the switch to which it pertains, is mounted on the wire chief's desk. As soon as any switch starts to operate, its lamp lights and burns until it has performed its proper function, thus trouble of any sort will immediately become evident to the wire chief.

The sub-station selector on the telephone, Fig. 3, is a remarkably simple piece of apparatus. Special effort has been exerted in this direction because it is the only piece of equipment placed beyond the sight of the central office wire chief. It is therefore exceedingly desirable that it should be simple, durable and reliable, thereby avoiding frequent inspection, adjustment and repairs, as such trips are expensive. It consists merely of a case, a dial, one gear wheel, one contact wheel, a governor, and one single electrical contact normally closed. This great simplicity is largely due to the fact that the ground is not used. It is self-contained, and can be attached to any standard central energy wall or desk telephone. There is a lamp attached to the sub-station set, receiving its current from the central office over the telephone wires, which throws a light on the dial as soon as the subscriber removes his receiver from the hook, thus enabling him to call at any hour of the night, or to find numbers in his directory without first illuminating the room.

The method used in calling a sub-station is entirely different from any other. It is what is called a hyphen number system. For example, 3333 would be called 33-33. By the old method to call 3333 would require four movements of the dial, while in the hyphen number system but two movements are necessary. This method is used not only to reduce the number of operations, and the length of time required of a subscriber to make a call, but to enable the subscriber to more easily remember the combination.

The hanging up of the receiver restores all switches to normal instantly, and this will occur whenever the circuit is opened at any stage. Successive calls may be made without the necessity of the calling party first hanging up, that is to say, if the called party hangs up, the calling party is instantly ready to make another call, or vice versa.

Briefly stated, some of the points of the system set forth by the company are: Central energy; party lines, selective ringing with lock-out; automatic pay stations, arranged to: Discriminate between rates, measure time for both original and fractional periods, and compel the payment of proper amounts if conversations exceed predetermined period, return money if party called fails to answer, return change if more coins are deposited than is required by time of conversation, and register in central office number of coins collected by each pay [illegible] affording a check on collections; simplest circuits ever produced; disconnections are instantaneous; no use of ground; metered service; automatic fire alarms, district messenger or police patrol service, without additional exchange equipment; secret service; continuous service always uniform.

Further information will be given by The American Automatic Telephone Company, Rochester, N. Y.

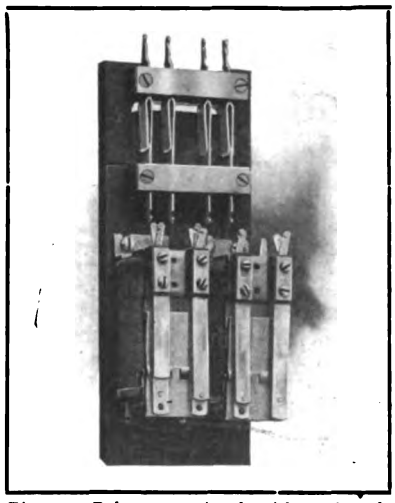

Fig. 2. Relays associated with each subscriber's line in new automatic system.

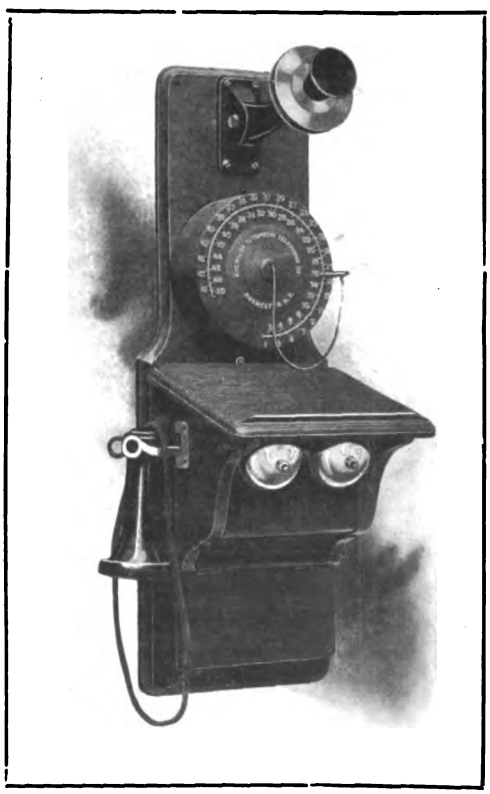

Fig. 3. Subscriber's telephone, with selector supplied by the American Automatic Telephone Company.

THE ELECTRICAL TRADES EXPOSITION COMPANY, Chicago, Ill., has already made arrangements for the allotment of a large amount of space for next winter's electrical show. The exhibition will surpass in variety and extent even the immensely successful show held last January.

THE MOUNTAIN STATE ELECTRICAL COMPANY, 911 Market street, Wheeling, W. Va., has put upon the market a lock-out system for central energy party lines which is extremely simple. The company claims that this will absolutely lock out every party on a line except the one talking. The essential apparatus includes no central office equipment, being simply attached to the subscriber's instrument. Its operation depends upon principles worked out by Arthur F. Poole. Its value is said to have been thoroughly demonstrated, and the manufacturers will be pleased to send further information to all inquirers.

THE CARBOLINEUM WOOD PRESERVING COMPANY, Milwaukee, Wis., reports that since the general recognition of the scarcity of suitable pole material by telephone companies large increases in sales of its preservative compound, Avenarius Carbolineum, have been made. As it is low in cost and easily applied it secures long life to poles of a comparatively low priced wood, and enables important economies to be effected in line construction.

THE WESTON ELECTRICAL INSTRUMENT COMPANY, Waverly Park, Newark, N. J., has this year taken its Mr. Caxton Brown into the Newark factory, as secretary of the company and sales manager, and in his place as manager of the New York office has put Mr. Stanley Brown.

In connection with this office there has been installed a Repair Department, whose duty it is to take care of the repairs in the metropolitan district, and particularly to look after emergency calls.

This new feature has been very warmly welcomed by the many users of Weston Instruments in New York City, and has enabled the manufacturer to insure a higher degree of satisfaction to his customer than ever before.

The company is very much pleased with the present instrument outlook, and is exceedingly busy preparing new models for measuring apparatus to meet the wider demands of modern electrical requirements.

Bridging Telephone.—Type M.
This style of cabinet also made into:
3-Bar, Series, Type "K"
4-Bar, Bridging, Type "L"
with any ringer resistance desired.

Western Pioneer Telephone

Five-Bar Bridging

Our **New Western Pioneer** telephone can be furnished for all classes of special **service** such as **ring through, non-interfering, divided circuit,** central **checking party line** and in fact can be used where any generator call telephone is now being used. The apparatus used in this instrument is of **New Western design.**

The **common battery type** of **magneto telephone** is becoming popular. The cabinet is compact and neat in appearance, all parts are **conveniently mounted,** the wiring is simple and the cabinet will accommodate a **three, four or five-bar generator.** We manufacture all of the parts used in this instrument. When the upper compartment is open the generator, ringer, hook switch, induction coil and receiver binding posts are exposed. When the battery box is removed by sliding downward, the batteries and battery connections are exposed.

THE WEEK'S MESSAGES

NEW COMPANIES.

BUFFALO SPRINGS, COL.—The Buffalo Springs Telephone Company has been incorporated with a capital stock of $2,000. Arthur Brady, J. J. S. Harvey, J. V. Fleming, W. L. Shane, G. L. Snyder, of Akron, are among the incorporators.

LONGMONT, COL.—The Northwestern Telephone Company has been organized to operate in Boulder, Routt, Larimer, Arapahoe and Denver counties, with headquarters at Longmont. The capital stock is placed at $50,000, and the incorporators are M. H. Spere, J. K. Brown, E. V. Bowles, J. A. McCollister and W. W. McCollister.

SHELBYVILLE, IND.—A new Independent Telephone Company is being organized at Shelbyville to take the place of the one which recently sold out to the Bell Company. The company is being financed and organized by Charles H. Tinall, attorney, of Shelbyville, and Charles L. Wedding, of Indianapolis.

EDGEWOOD, MO.—At a meeting held by the citizens of Edgewood it was decided to organize an Independent company to be known as the Pike County Telephone Company. The company will construct lines in Pike County.

HANNIBAL, MO.—The New Canton, Cincinnati & Hannibal Telephone Company has been incorporated and will construct a line from Rockport to Cincinnati Landing, New Canton and Hannibal. The principal offices of the company will be located at Hannibal. Those interested in the formation of the company are Munger Bros. and J. N. Baskett, of Hannibal.

HOLT, MO.—The Clay County Telephone Company has been incorporated with a capital stock of $50,000. The incorporators are W. H. Smith, J. A. Eby, G. W. Sexton and others.

HUMBOLDT, NEB.—The City Mutual Telephone Company has been incorporated with a capital stock of $25,000.

MARTEL, NEB.—The Martel Farmers' Independent Telephone Company has been organized with a capital stock of $500. The officers are Albert Egger, president; J. A. Sittler, vice president; W. H. H. Moore, secretary; E. Bohmont, treasurer.

STELLA, NEB.—The Farmers' Mutual Telephone Company has been organized and has elected the following officers: W. J. McCray, president; H. W. Lowe, secretary; Morris Norris, treasurer.

OSWEGO, N. Y.—A new Independent Telephone Company is to be formed at Oswego with a capital stock of $125,000. Those interested in the formation of the company are J. F. Stockwell, manager of the Syracuse Independent Company; Alexander Cowie, secretary of the Rochester Company, and a number of the former stockholders of the Ontario Telephone Company.

BRAZIL, N. D.—The Brazil Telephone Company has been incorporated with a capital stock of $50,000. The incorporators are C. W. Glasgow, C. L. Buckholder, Fred Rousig, C. J. Kennedy, Joseph Barr, A. B. Lose, Brazil, N. D.; Tom O'kendale, Rugby, N. D.

CINCINNATI, OHIO.—The Cincinnati Independent Telephone Company has been incorporated with a capital stock of $10,000. Among the incorporators are Charles H. Urban and Arthur R. Morgan, members of the Cincinnati bar; Edward Puthoff, a Price Hill capitalist; William Klussman and Geo. W. Griffith. The company expects to establish a telephone system in the towns outside of Cincinnati, although it is incorporated to do business in Cincinnati. It will establish exchanges to be operated in competition with the Bell Company at Reading, Wyoming, Hartwell, Lockland, Madisonville, Elmwood Place, St. Bernard and other points.

CINCINNATI, O.—The Fitzsimmons Independent Telephone Company, of Cincinnati, is to be incorporated with a capital stock of $100,000. Philip Fitzsimmons, formerly of the Fitzsimmons Mfg. Company, and other Cincinnati and Chicago capitalists are among the incorporators.

GROVER HILL, O.—The Farmers' Telephone Company has been incorporated.

IRONTON, OHIO.—A new Independent Telephone Company has been formed at Ironton to take the place of the Home Telephone Company recently acquired by the Bell Company. The company has been organized by the Ironton Merchants Association, and a franchise has been applied for.

OLD FORT, OHIO.—The Old Fort Mutual Telephone Company has been incorporated with a capital stock of $10,000. The following are the incorporators: R. G. Shannon, H. S. Fry, C. J. Fry, W. S. Beck and G. E. Zimmerman.

PORTSMOUTH, O.—The Home Telephone Company has been organized by the election of the following officers: William R. Fee, Milford, president; J. S. McKell, Chillicothe, vice-president; W. D. Tremper, Portsmouth, treasurer; E. E. Knox, secretary and manager.

SALEM, OHIO.—The New Cumberland Telephone & Telegraph Company has been incorporated with the following incorporators: W. S. Holloway, C. L. Smith, H. W. Young, R. V. Hampson, Albert Hayes and M. L. Young, all of Salem. W. S. Holloway, formerly superintendent of the Columbiana County Telephone Company, is to be manager of the company.

GRAND, OKLA.—The Day County Telephone Company, with a capital stock of $5,000, has been incorporated. Among the incorporators are J. P. Johnson, E. S. Sharp, E. L. Mitchell, W. H. Hauser, S. Crim, Jr., and T. C. Moore.

NEWKIRK, OKLA.—The Alpha Mutual Telephone Company has been incorporated by E. Lindsay and others.

HONESDALE, PA.—The Wayne Telephone Company has been organized in Dyberry township with a capital stock of $3,000.

BERESFORD, S. D.—Articles of incorporation have been filed for the Gothard Telephone Company with a capital stock of $25,000. The incorporators are C. W. Deane, Wm. Murray, G. D. Williamson, S. Wilson and John Landeen, all of Beresford.

COOPER, TEX.—The Delta Telephone Company, Cooper, Delta County, has been incorporated with a capital stock of $15,000. The incorporators are C. H. Reid, R. M. Connell and R. M. Walker.

LOIS, VA.—Articles of incorporation have been filed by the Lois Mutual Telephone Company. The capital stock is placed at $5,000 and the following officers have been elected: J. M. Price, president; J. E. Stively, vice-president, both of Bealeton, Va.; George E. Bain, secretary and treasurer.

STEWARTSVILLE, VA.—The Bedford County Telephone & Telegraph Company has been incorporated with a capital stock of $5,000.

DALLAS, W. VA.—A telephone company has been formed by the farmers residing in the Beham neighborhood with a central office at Dallas, where connections will be made with a number of other farmers' lines. The company expects to extend its line to West Alexander and possibly Claysville.

GILBERT, W. VA.—The Gilbert Telephone Company has been incorporated with a capital stock of $5,000 by the following incorporators: J. E. Stafford, J. E. Elkins, John W. White, J. M. White and F. S. Stafford, of Gilbert.

FRANCHISES.

RED BLUFF, CAL.—O. B. Wheeler and F. A. Graves have been granted a franchise to construct and operate a telephone system in Tehama County.

WOODSTOCK, ILL.—The Spring Grove Telephone Company, of Spring Grove, will probably make application for a franchise at Woodstock within a short time.

EAGLE BEND, MINN.—A. King, of Frazee, has applied for a telephone franchise at Eagle Bend.

RED LAKE FALLS, MINN.—The franchise for which the Tri-State Telephone Company, of Minneapolis, Minn., recently applied has been granted.

FINANCIAL.

GENEVA, NEB.—The capital stock of the Fillmore County Telephone Company has been increased to $100,000.

TECUMSEH, NEB.—The Johnson County Home Telephone Company has increased its capital stock from $50,000 to $100,000. The money will be used in establishing a complete county service.

COMBINATIONS.

FLORA, IND.—The Home Telephone Company of Flora has been acquired by the Flora Telephone Company and it is expected that much better service will be given in the future.

PRESTON, IA.—The Farmers' Organization has purchased the Nate Millhaem telephone lines at Preston and Miles for $10,500.

EDINA, MO.—The Edina Telephone Company and the Farmers' Line have consolidated. The new company will make many improvements in its system.

COOK, NEB.—H. F. Cannon has sold his telephone business to the Johnson County Home Telephone Company.

BRADLEY JUNCTION, PA.—The Independent Telephone Lines of Cambria County are to be consolidated into one company, to be known as the Northern Cambria Farmers Telephone Company. James Farabaugh, of Bradley Junction, has been made president; Wm. Krumenacher, vice president; Frank Westrick, treasurer. The lines incorporated in the new company are the Bradley Junction-Chest Springs line, the Cross Roads line and the Carrolltown-Patton line. A charter has been applied for, and the service will be much improved.

SOUTH BOSTON, VA.—The Dan River Telephone Company has purchased the South Boston Telephone Company from R. A. Perkinson. The system will be greatly enlarged under the new management.

SASKATOON, SASK., CAN.—J. C. Drinkle, of Saskatoon, and John Wilhe, Moosomin, Alb., have taken over the plant of the Saskatchewan Telephone & Electric Supply Company, and will overhaul the entire system.

Actual Size of Instrument. Three in One---Ammeter, High and Low Reading Voltmeter.

Every Exchange Needs One

If you use one of our voltmeters once, you will acquire the voltmeter habit and never give it up.

Do You Know

that the instrument shown on the right gives both volt and ampere readings?

That you can use it for the measurement of resistances?

That it is low in price?

That it is accurate?

New Switchboard Instrument.

That our triple scale instruments will measure the voltage of a single cell or that of an electric light main?

That you can measure the resistance of your lines with it?

That you can measure the resistance of your ringers and induction coils with it?

That you can test insulation up to 100,000 ohms with it?

Yet the cost is low and if you write us we will make a price that you can afford to pay.

THE WEEK'S MESSAGES

ELECTIONS.

KEWANEE, ILL.—The Kewanee Home Telephone Company has elected the following officers: President, W. I. Hibbs; vice-president, F. A. Ellithorp; secretary and treasurer, A. C. Shoemaker; directors, J. N. Anderson, G. B. Thompson, J. A. Law, S. M. Parke and W. H. McMillen.

STORY CITY, IA.—The following officers have been elected by the Story City Mutual Telephone Company: A. M. Henderson, president; T. T. Henderson, secretary; B. R. Dawson, treasurer.

NORTH ORANGE, MASS.—The North Orange Telephone Company has elected the following officers: President, S. J. Oliver; secretary and treasurer, Adin Taylor.

LITCHFIELD, MINN.—At the annual meeting of the Litchfield Telephone Exchange Company the officers elected were: President, H. I. Peterson; vice president, G. H. Sullivan; secretary, T. F. McClure; treasurer, G. A. Settergren.

ST. PETER, MINN.—The Nicollet County Telephone Company has elected the following officers: P. P. Quist, president; M. B. Johnson, vice president; W. G. Lauman, secretary; F. M. Donahower, treasurer; C. C. Nelson, general manager.

BUTTE, MONTANA.—The Montana Independent Telephone Company has elected F. B. Moss, of Billings, first vice president; M. S. Largey, of Butte, second vice president; C. J. Kelley, of Butte, secretary and treasurer, and E. B. Jones of Salt Lake, managing director.

SCHENECTADY, N. Y.—The Home Telephone Company has elected the following officers: President, Chas. F. Veeder; vice president, Irving H. Griswold; secretary, F. M. Strong; treasurer, E. S. Kellogg.

PERSONALS.

H. S. KERBY has been promoted to the position of assistant superintendent of the Evansville district of the Cumberland Telephone and Telegraph Company.

E. E. MICHAEL has been appointed manager for the Northwestern Telephone Exchange Company at Mankato, Minn.

THOMAS B. PHILLIPS has been appointed manager of the Jackson County Home Telephone Company, at Jackson, O.

J. R. PORTER has been made manager of the Henderson, Ky., exchange of the Cumberland Telephone and Telegraph Company.

SAMUEL M. STRONG, who has recently resigned from the management of the Home Telephone Company of Schenectady, N. Y., to take charge of a branch of a banking house, will continue to hold the office of secretary of the telephone company.

H. B. TAYLOR, of Toledo, has been appointed Assistant Treasurer of the Federal and United States Telephone Companies, as well as Auditor and Treasurer of the Cuyahoga Telephone Company, with headquarters at Cleveland, O.

M. W. WATERS has assumed charge of the Consolidated Telephone Company's exchange at Scranton, Pa.

W. V. EATON has been appointed to a position in the construction department of the Northwestern Telephone Company, with headquarters at Minneapolis, Minn.

MISCELLANEOUS.

AVENUE CITY, MO.—The Avenue City Telephone Company has elected the following officers: Robert Archdeacon, president; T. J. Kelly, vice-president; E. D. Rucker, secretary; E. L. Schneider, treasurer.

MILWAUKEE, WIS.—The Milwaukee Independent Telephone Company has elected the following officers: President, H. D. Critchfield; vice-president, E. A. Wadhams; treasurer, Howard Greene; secretary, Clifford Arrick.

New Construction in the Field

MAHOMET, ILL.—The Mahomet Telephone Company is building a new line to Rising.

PLEASANT PLAINS, ILL.—The Boynton Telephone Company has under construction a new exchange at Pleasant Plains.

MEADOWS, IDAHO.—The Meadows-Warren-Roosevelt Telephone Company contemplates doubling its capital stock for the purpose of completing and extending its lines.

GARRETT, IND.—The Garrett Telephone Company will spend about $15,000 in increasing its plant, installing new switchboards and building large extensions to its lines.

NEW HAVEN, IND.—The Home Telephone Company is building 25 miles of new line for farmers in that vicinity.

RICHMOND, IND.—The Home Telephone Company is to install a complete, modern and up-to-date telephone system. It is planned to install new switchboards, telephones and other equipment to replace the present plant at Richmond.

WESTVILLE, IND.—The Westville Telephone Company will establish an exchange at Wanatah.

ARDMORE, I. T.—The Chickasaw Telephone Company contemplates many improvements in its system.

BODE, IA.—The Rural Union Telephone Company is to put in new switchboards at Bode and Bradgate.

BRONSON, IA.—A line from Bronson to Luton is being constructed by the Bronson Telephone Company.

IRVING, IOWA.—The Irving Telephone Company expects to extend and improve its system.

WAVERLY, IA.—The Corn Belt Telephone Company, which now has over 5,000 telephones in service, is building a number of farmers lines north of Waverly, around Tripoli and in the vicinity of Denver. The company also expects to complete its long distance toll lines from Sioux Falls, Sioux City and Council Bluffs on the west to Dubuque and Rock Island on the east.

SALINA, KAN.—The Salina Telephone Company is making arrangements for the construction of a new telephone exchange building at Salina.

NEWPORT, KY.—The Citizens Telephone Company is to place its wires underground in Newport.

CHINA, ME.—The Unity Telephone Company, of Unity, is building a line to China, Me.

LYLE, MINN.—The Interstate Telephone Company has installed an exchange at Lyle, giving connections with Austin.

HANLEY FALLS, MINN.—The Hanley Falls Telephone Company has been incorporated with a capital stock of $10,000. The officers of the company are I. Johnson, president; L. S. Orwoll, vice president; W. E. Hanson, secretary; H. M. Hanson, treasurer.

ROSEMOUNT, MINN.—The Star Telephone Company is building a number of rural lines.

LAMAR, MO.—The McGilvary Telephone Company, of Lamar, will commence the construction of two lines to Nashville in a short time.

VANDALIA, MO.—It is the intention of the Union Telephone Company to greatly improve its system, putting in new cables and making it strictly up to date in all particulars.

ANGUS, NEB.—The Independent Telephone Company, which is now completing a line between Angus and Edgar, expects to build two more new party lines out of Angus.

BLUE SPRINGS, NEB.—Numerous new lines are being constructed out of Blue Springs by the Farmers' Telephone Company.

ELGIN, NEB.—The Antelope County Mutual Telephone Company is to establish an exchange at Clearwater similar to the one at Elgin. It is also going to endeavor to secure a franchise at Neligh, with a view to establishing an exchange at that point also.

SOUTH OMAHA, NEB.—It is the intention of the Independent Telephone Company of Council Bluffs to build lines from South Omaha to Treynor and Bentley, also to Honey Creek.

TRENTON, NEB.—The lines of the Wray Telephone Company are being extended north and south of Trenton.

ASHLAND, N. H.—The Citizens' Telephone Company expects to build a line from Ashland to Holderness.

SCHENECTADY, N. Y.—The Home Telephone Company is planning extensive improvements in its system.

ATHENS, OHIO.—The Athens County Home Telephone Company is installing a new switchboard at Jerseyville, and making other improvements in its system.

TOLEDO, O.—The United States Telephone Company, of Cleveland, has decided to expend $200,000 for additional equipment and extension of its lines at Toledo.

MILLER, S. D.—The Ree Hills Telephone Company has under construction a number of farmers' lines.

WINNIPEG, MAN., CAN.—The Winnipeg Electric Street R. R. Company will install a telephone line between Winnipeg and Lac de Bonnet, a distance of about 60 miles. Wilford Phillips, general manager.

OUR MOTTO—QUALITY AND PROMPT SHIPMENTS.

KELLOGG "MICHIGAN WHITE" CEDAR POLES

THE poles we handle are all carefully selected, and are the best grade of stock.

All shipments are prompt, subject only to car supply.

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices.

We have recently published a little book giving some very valuable information about Cedar Poles. It contains Specifications, Inspection Comments, Shipping Data, Etc. "Yours for the asking."

TYPE A—10-Pair Hall Cable Box.

CABLE USERS

who are going to get the greatest benefit from the use of cable can secure it only by using high grade messenger clamps, cable hangers, etc.

THE HALL CABLE TERMINAL

is the result of experience and study. The fittings are mounted on hard rubber bases, the bases supported on cast iron frames. A heavy galvanized iron cover goes over all. Rigid, durable, absolutely watertight, put up with three lag screws. Standard sizes always in stock. Write for catalogue of cable specialties.

Mountain State Electrical Co.,
WHEELING, WEST VA.

As To Telephone Batteries

THERE may be better batteries made in years to come—no doubt there will be—we are improving every year—but there is no battery more favorably known to telephone managers or subscribers today than the "1900" dry batteries they are now using.

¶ It is called the "1900" because it is the embodiment of modern dry battery skill and experiment.

¶ None so strong, none so enduring and none that has stood so well the tests of experience.

¶ Other batteries for other uses. Catalogue on request.

TO GET THREE OUT OF TWO SEEMS IMPOSSIBLE

Yet the Illinois and Sandwich Duplexers easily make two metallic circuits into three

Just stop and think what this means to you in increased facilities without spending a cent for new line construction.

Here are the facts in the case: By connecting our duplexers to the two existing metallic circuits a new one is formed which utilizes each pair of wires as one side of an independent metallic line.

To eliminate all noise due to induction we provide a very simple and efficient balancing device which requires no skill in its manipulation and which will make the new circuit absolutely quiet.

Seems almost too good to be true. Let us prove it by sending a set on 30 days free trial.

We know you are interested; therefore don't delay, but write to-day

Sandwich Pole Changer Company
400 Eddy Street, Sandwich, Ills.
